从方法论的角度看，比较经济史研究中既可以采取纵向比较分析，又可以采取横向比较分析。纵向比较分析是指按照经济发展的历史过程分析一国不同历史时期或若干国家不同历史时期的变化，以探求经济发展的历史规律性。横向比较分析是指对一定时期内或一定时点上一国国内不同地区或若干国家的经济状况进行比较，以说明待比较的各国或各个地区的历史上的经济特色。在纵向比较分析时，重要的问题一是指标的选择，一是年代的选择。在指标方面，越是往前推，统计资料越不完整，从而比较越困难，并且不同的统计资料还必须经过换算，口径取得一致，然后才能使比较具有意义。在年代的选择上，主要的考虑在于防止选择的随意性，用来标志历史时期的年份或用来说明经济发展转折点的年份应当具有充足的依据，只有这样，才能通过纵向比较分析而得出较为可信的结论。

再就横向比较分析而言，除了同纵向比较分析一样要注意指标的选择（以及指标的可比性）与年代的选择而外，横向比较分析同纵向比较分析之间的联系也是必须重视的。这是因为，只有使横向比较分析与纵向比较分析相结合，才能更清楚地说明经济的历史发展的规律性，并能在某种程度上弥补一些国家的某个历史时期内统计资料的不足，而用另一些国家相应历史时期内已有的统计资料进行推算，得出近似值，作为参考。这也就进一步说明了数量研究方法的进展对于比较经济史学形成的意义。

三、比较经济史学与现代化问题研究

第二次世界大战结束以后，有关现代化问题的研究日益成为国际学术界注意的重大课题。发展经济学与比较经济史学都把现代化作为自己的研究任务，但发展经济史学在研究现代化问题时有着自己的特色。它更多地从经济史方面，也就是从人类社会经济的历史过程的比较方面来研究这一问题。较确切地说，在有关现代化的研究中，发展经济学侧重于从生产要素配置与流动、储蓄与消费之间的关系、市场机制与政府职能的作用、部门结构与地区经济结构、经济发展与技术创新、发展过程中的内外均衡等方面来研究经济发展的模式与政策。发展经济学虽然也把现代化问题同制度、文化等因素的作用结合在一起，但它的重点是放在当前，而不是放在历史的总结上。比较经济史学对现代化问题的研究的重点与此是有所不同的。

比较经济史学作为经济史学的一个分支，它不仅侧重于研究经济的历史发展，而且通常探讨一些更为广泛、更为深刻的问题。例如，传统文化、宗教、伦理观念在不同国家、不同地区的社会经济的历史过程中曾经起过多大的作用？不同国家、不同地区的社会经济史的差异在多大的程度上可以用传统文化、宗教、伦理观念的差异来加以解释？这些问题是比较经济史学考察的内容，而并非发展经济学的研究者们注意的焦点。又如，亚细亚生产方式的真正含义是什么？东方的前资本主义社会在经济上与西方的前资本主义社会的区别何在？这种区别是怎样形成的，它同此后的资本主义经济发展有着什么样的关系？如果不重视地理环境在这方面的作用，或者，过分渲染地理环境在这方面的作用，将会导致什么样的结论？这些结论是否经得起科学的检验？这些问题同样是比较经济史研究者关心的，而发展经济学则较少涉及这一类问题。

现代化是一个经济、社会、政治、文化的持续发展的过程，而以经济发展过程作为其主要的內容。尽管学术界对世界的现代化的开始日期有不同的看法，如有人认为应当从16世纪和17世纪的科学革命算起，有人认为应当从18世纪末的工业革命算起，也有人认为应当从更近一些算起，但不管怎样，至少从19世纪晚期以来的100年的历史，都被承认是人类社会经济发展中的现代化阶段，因此对现代化的研究无疑包含了对世界上各个国家最近100年经济发展的经验与教训的总结。已经实现现代化的国家固然需要总结自身经济发展的历史经验，以便正确对待经济发展所遗留下来的社会经济问题，寻求妥善的对策；而目前正在进行现代化的国家则更加需要总结本国和其他国家这些年来经济发展的经验和教训：如果没有这种总结，现代化过程中就会走弯路，就会重复自己走过的和别人走过的错误道路。从这个意义上说，不仅现代化的研究与比较经济史的研究是一致的，而且比较经济史研究还为现代化研究的深入准备了条件，比较经济史研究甚至可以被看成是现代化研究的一项不可替代的基础性研究。

在这里，不妨以布莱克（C. E. Black）等人合著的《日本和俄国的现代化》（1975年纽约版）一书中关于传统与现代化之间关系的比较研究为例，以说明比较经济史研究与现代化研究的结合。布莱克等人之所以选择日本和俄国的现代化过程进行比较，正因为这两个国家有着不同于西欧的传统，而同时又力求在适应过去传统的基础上实现现代化。关于传统与现代化的关系，根据布莱克等人对日本和俄国近代经济史的考察，日本和俄国现代化过程的一个显著特点是传统的東西在现代化过程中被保存下来，并且同现代化相适应，但这种传统已经不再是原来的传统了，它们变成了同现代化适应的传统。布莱克等人得出的一个重要结论是：现代化不等于“西方化”和“欧洲化”；“西方化”和“欧洲化”的含义在于：西方或欧洲的制度本身和价值观念本身被看成是现代化的主要内容，似乎其他社会可以忘掉自己的历史传统而采纳西方的或欧洲的价值标准与制度；但事实上，日本和俄国的现代化表明，现代化总是在传统与现代化相适应的基础上实现的。一个国家只有最大限度地利用过去遗留下来的财富，才能使现代化的努力富有成效，也才能对现代化的战略作出有益的选择，否则现代化可能是徒劳的。

应当承认，布莱克等人的比较经济史研究可以给人们这样一种启示，即现实与传统不可能割裂，任何一种成功的现代化必然是传统与现代化的统一。

四、为什么比较经济史研究引起了中国学术界的浓厚兴趣

进入80年代以后，中国社会各阶层都对现代化问题产生了浓厚兴趣。这种兴趣不仅反映于对中国现代化的途径和前景的关切，而且反映于对世界上其他许多国家和地区的现代化过程的注意。关于社会经济发展战略也就是现代化战略的研究之所以成为中国学术界深感兴趣的课题，正由于这种战略的研究是以其他国家现代化经验和教训的总结作为背景，而这些战略研究总结的是非得失又紧密地联系到中国今后的发展前途，联系到中国未来的体制模式和发展模式，从而具有十分重要的意义。不少学者从80年代一开始就参加了这方面的讨论。可以认为，比较经济史研究在80年代日益被中国的学术界所重视，与当时对社会经济发展战略的研究，即对其他国家现代化过程中经验和教训的总结是分不开的。

在中国学术界的比较经济史研究中，一种有深远意义的思路是：对人类社会经济发展而言，重要的不是经济增长，或者不仅仅是经济增长，而是经济与社会发展的协调，或主要是这种协调。以往，在长期的历史发展过程中，工业化往往被抬高到不适当的位置上，所以18世纪末期以来的传统发展战略是片面强调国民收入的增长，忽视为这种增长所付出的代价；片面强调工业，尤其是重工业，忽视农业的发展；片面强调对技术装备的投资，忽视对人力开发的投入；片面强调消费品的丰裕，忽视消费品丰裕和生活方式变化以后可能带来的不确定的后果，等等。总之，经济与社会发展的协调要比单纯的经济增长更加重要，更加值得落后的国家去追求。

根据这样一种思路，在对西方国家的工业革命进行评价时，十分自然地出现了如下的看法，这就是：18世纪末和整个19世纪内所经历的工业化主要以生产技术的革命作为特征，而不曾把智力的解放、智力资源的开发作为特征，后一方面的问题只是到了20世纪，甚至是到了20世纪中期以后才被重视。也就是说，与现代化有关的教育投资问题到很晚才被摆到恰当的位置上，这正是后进国家在现代化过程中必须吸取的教训。中国的现代化如果忽略了这一根据比较经济史研究所得出的经验、教训，仍然像19世纪某些国家的做法那样，开始时把人仅仅看成工具，看成机器设备的附属物，直到后来才重视智力的解放、智力资源的开发，那就会拖延现代化的进程，并会以经济与文化差距的扩大作为现代

化的沉重代价。

需要指出，在80年代内，中国学术界的一些人从比较经济史研究的角度考察现代化问题时，对德国社会学家、经济史学家马克斯·韦伯（Max Weber）的理论感兴趣，于是世界范围内的“韦伯热”也就对中国有所影响。为什么会有这种影响？这仍然要从中国现代化过程中所遇到的问题以及中国对世界上其他国家现代化的经验和教训的总结谈起。通过比较经济史研究，不难提出下列问题：为什么工业革命在不同的国家和地区有不同的进程？是哪些因素促成了这个国家或那个国家的工业革命？在促成工业革命的若干因素中，最重要的因素是什么？当然，经济史的研究者们可以列出资本形成、市场、劳动力及其素质、技术进步、政府的有关政策等因素在促成或阻碍某一国家的工业革命方面的作用。但在研究中也会产生问题：难道仅仅有了资本、市场、劳动力、技术或政策，就一定能够实现工业革命吗？毫无疑问，这些因素都是不可缺少的，但仅有这些，还不足以实现工业革命，需要从更深的层次上去发现促成或阻碍工业革命的因素，也就是需要从社会结构、文化、伦理等方面去寻找工业革命的原因。马克斯·韦伯在他的著作中，把经济史的研究同文化史、制度史的研究结合在一起，这就是他的论点引起目前研究现代化问题的学者们注意的基本理由。

关于马克斯·韦伯的论点，无疑是有争议的。但即使不同意韦伯论点的人，也并不否认这些论点有某种启发性。从韦伯的论述中可以得到的启发是：一个民族，虽然在某个发展阶段具备了生产要素条件，但如果不具备意识形态、伦理道德观念的条件，即缺乏产生工业革命或经济进步的社会环境和精神动力，那么工业革命仍然难以发生。换言之，在工业革命的背后，存在着一种不易被人们察觉的精神力量，它引导人们去为经济的成果而孜孜不倦地开拓、经营、获取利润。此外，按照韦伯的说法，工业发展过程同时也是人际关系的调整过程，前工业社会的人际关系（如世袭关系、家族统治、人身依附等）是不利于工业发展的。例如，在罗马帝国最盛时期，不是没有为工业发展所需要的资本和劳动力，市场的范围也不可谓不广，但当时的社会结构、制度的范围以及在此基础上形成的人际关系却不利于工业的发展，所以在罗马帝国不可能发生近代意义上的工业革命。又如，14~16世纪的意大利，资本相当充足，市场范围也相当宽广，那么，为什么这时的意大利不会发生工业革命，这同样只有从社会结构、制度环境和人际关系方面来解释。当时意大利的经济与社会进取精神并不是吻合的，结果在意大利已积累的财富

转化为非生产性的事业，而没有成为发展技术、发展工业的动力。韦伯的这些论述不仅表明了比较经济史研究对于现代化研究的意义，而且也表明对现代化问题的深入研究要求在社会、文化、伦理等领域内广泛开展研究。中国学术界中一些对韦伯理论感兴趣的人，认为韦伯著作所给予中国现代化研究者的启发，与其说是韦伯的理论本身，不如说是韦伯所提供的一种可以用于观察现代化过程的方法。

五、经济波动的历史比较

一个国家，在实现现代化以前，经济也可能有波动，但这种波动或者是由非经济原因（如战争、自然灾害、瘟疫）造成的，或者是外界传递而来的，因此这种经济波动一般并不引起比较经济史研究者的注意。进入现代化之后，情况便有所不同。现代化过程中，很可能由于内部原因、经济原因而发生经济的波动，波动带有一定的规律性。正因为如此，所以在中国现代化的研究中，对经济波动进行历史比较也成为一个新的课题。

约翰·希克斯（John Hicks）1969年所著《经济史理论》一书对中国的研究者在这个领域的探讨有参考价值。和熊彼特（J. A. Schumpeter）一样，希克斯感兴趣的是提出一种解释人类社会经济的理论，而不是专门去研究某一时期的某一类具体的经济史课题。^[3]在希克斯看来，当经济还是一个封闭体系的时候（例如工业革命以前），金银数量的变化引起物价的升降和经济的波动，是可以理解的。甚至在金本位制度下，货币数量的变化仍然可以作为物价升降和经济波动的一个原因。然而到了20世纪，由于货币的金属基础削弱了，对经济波动的原因必须寻找另外的解释方式。这时，经济的波动既不可能再用货币数量来解释，也不能单纯归因于某种货币政策的实施，而必须从经济内部投资、储蓄、消费的相互关系的角度，探讨经济增长与衰退的更替，并且还应当从商业的作用、劳动力的供求、市场规模等方面来说明经济波动的过程。这就是说，前工业社会的经济波动史、工业革命时期的经济波动史、20世纪中期以后的经济波动史，在性质上是不一样的，在研究方法上也应当有所不同。按照希克斯在《经济史理论》和他的其他一些著作（如《经济周期理论》、《经济学展望》、《凯恩斯经济学的危机》）中所表述的观点，现代化进程中的经济波动不仅是正常的，而且波动并不会阻碍经济增长，波动只是历史过程中的某种曲折或间歇而

已。

中国现代化的研究者显然不会以希克斯对经济波动的理论解释为满足。但从方法上看，历史比较研究方法（包括希克斯的周期分析方法在内）依然是一种有用的工具。80年代内，有关近四十年来的中国经济周期波动的过程和原因的分析，尽管观点不一致，但仍有两个基本结论是大体上接近的。一个基本结论是：中国和其他已经实现现代化或正在进行现代化的国家一样，在经济发展的道路上不可能是直线上升的，经济的波动在所难免；另一个基本结论是：同其他国家一样，中国在现代化过程中发生经济波动的原因应当主要从内部去寻找，来自国际市场的影响虽然存在，但却是次要的。至于造成波动的因素和波动时间的长短、间隔时间的大小，观点的分歧也相当明显。例如，究竟是货币数量重要还是商品供求状况重要；究竟是以投资因素为主还是投资与消费并重；在历次引起波动的部门中，究竟是农业起的作用大些还是建筑业起的作用大些；还有，波动过程中的变化，应当更多地归因于财政还是应当更多地归因于金融，应当更多地归因于计划还是应当更多地归因于市场，等等。肯定地说，中国现代化过程中的经济波动具有自身的特殊性，不仅不能用西方国家、东南亚国家的情况来类比，甚至也不能用前苏联、东欧国家的情况来类比，这一切都有赖于研究的继续深入。比较经济史研究可以为此提供较多的依据。

实际上，关于经济波动的历史比较研究必然同经济体制的历史比较研究联系在一起。这是因为，如果说投资数额或投资增长率的变动是导致现代化过程中经济波动的一个重要因素，那就会出现另一个问题：投资方面的变动难道不同一定的经济体制有关吗？同样的道理，如果说货币数量或货币供应增长率的变动是导致现代化过程中经济波动的一个重要因素，难道这些变动不是一定的经济体制下的产物吗？从宏观经济体制来考察，投资和货币供应量的变动在不同的经济体制之下有不同的原因和效应，这同财政体制、金融体制、计划体制和市场结构有密切关系。从微观经济体制来考察，投资和货币供应量的变动又同企业体制直接有关。例如，企业是不是真正的、有自主权的投资主体和利益主体，企业对于信贷和利率变动的反应是否灵敏，企业有没有技术进步和降低流动资金占有额的利益动机等等，都同投资和货币供应量的变动有着不可分割的联系。这样，对经济波动的比较研究实际上也就是对不同经济体制下经济波动原因和效应的比较研究。

在谈到经济体制的比较研究时，中国的现代化研究者们倾向于两种

看法。一种看法是：中国的经济体制与前苏联、东欧国家的经济体制有较大的可比性，特别是与前苏联的经济体制在历史上有较大的可比性。如果把1917年以后七十余年内苏联各个历史阶段的经济体制拿来同中国四十年来各个历史阶段的经济体制对应地进行比较，那么在某些历史阶段，这种相似性是相当明显的。所以，在分析中国现代化过程中的经济波动时，可以以前苏联、东欧国家的经济体制同各自国家的经济波动之间的历史关系作为参考。另一种看法是：按人均国民收入和农业人口在总人口中所占比例来看，中国的经济体制（就社会经济结构、市场组织、价格体系等方面而言）可能更类似于现代化程度较低的某些发展中国家，中国同它们之间有较大的可比性。这些发展中国家在现代化过程中，或者由于产业结构失调和资源供给不足，或者由于初级产品滞销和居民收入减少，都会引起经济波动。这种经济波动在很大程度上是同经济体制方面存在的问题有关的。因此，如果要联系经济体制来研究现代化过程中的经济波动，更需要把中国同某些发展中国家作一番经济的历史比较。

显然，以上两种看法都是有道理的，而且它们之间也没有什么不能相容之处。中国现代化过程中的经济波动，从经济体制上看，也许既有同前苏联、东欧国家的情况相似之处，又有同某些发展中国家相似之处。

六、一个深层次的问题：传统社会结构制动作用的评价

从经济体制的历史比较必然导致一个深层次的问题，这就是：一国在现代化过程中，传统的社会结构对于现代化是否存在制动作用（或阻滞作用）？如果存在这种作用的话，那么制动阻滞的程度有多大？如何才能减少这种制动的作用？格辛克隆（A. Gerschenkron）的比较经济史论著之所以引起了中国学术界的注意，梅洛蒂（U. Melotti）关于第三世界与多线发展模式的研究之所以对中国学术界有所启发，都因为他们涉及了上述这个深层次的问题，并提出了自己的独特的见解。

格辛克隆的论点是：传统社会结构对于现代化的制动作用主要反映于生产要素供给的约束上，这正是许多后进国家在发展中所遇到的严重障碍。与西欧国家相比，俄国和巴尔干半岛各国都表现出传统社会结构对于大工业发展的束缚和牵制。但值得注意的是，格辛克隆一方面承认传统社会结构对现代化的制动作用的存在，另一方面又强调后进国家一

旦决心实现现代化，也可能有着比较有利的条件。他使用了这样两个概念，即“后发性优势”与“后发性劣势”。比如说，传统社会结构之下的劳动力价格低廉，就是“后发性优势”之一；后进国家在技术上同先进国家的差距的扩大，则是“后发性劣势”之一。他指出，“后发性优势”往往与“后发性劣势”同时存在，并且二者可以相互转化。只要后进国家充分利用自己的优势（如工资低），那么劣势是可以克服的。反之，如果这些国家错过了机会，那就好像赶班车一样，错过了这一趟班车，就必须等很久才能搭上下一班车，“后发性优势”也就发挥不了作用，现代化也会延误。正是由于机会难得，所以经济发展中的“大突发”（指工业革命中的“猛烈的冲刺”）对传统社会结构有较大影响的国家说来是必要的，也是有利的。

梅洛蒂从不同的角度探讨了后进国家的传统社会结构对现代化的制动作用。他认为后进国家（主要指亚洲、非洲、拉丁美洲国家）辽阔土地上无数分散的村落经济成为一种特殊的稳定机制，它是封闭的、自给自足的，生产者被牢固地拴在土地上，拴在狭小的活动范围内，从而阻碍这些国家的经济发展以及与发展联系在一起的社会结构的变更。那么，为什么亚洲的日本能够在明治维新之后成功地实现了现代化呢？难道单纯用政治因素就能说明这一问题吗？梅洛蒂指出，不可否认，日本的社会结构和意识形态具有明显的亚洲特点，与西欧国家有一些差异，但重要的是，日本即使在明治维新之前，仍不像亚洲其他国家那样从社会经济上扼杀资本主义经济因素的产生。明治维新后日本之所以能够迅速转入资本主义发展轨道，主要不是取决于外部力量，而是由日本传统社会结构的特点决定的。

无论是格辛克隆的研究还是梅洛蒂的研究，对于研究中国现代化问题的人来说，都可以作为研究中国传统社会结构对现代化的制动作用的一种参考。实际上，对中国传统社会结构的上述作用的研究具有十分深刻的意义，它不仅与中国的经济体制改革的设计与进程有关，而且与中国的政治体制改革的设计与进程有关。在学术界有两种影响较为广泛的意见。一种意见是：根据中国传统社会结构的特点，中国在现代化过程中的政治体制改革和经济体制改革的难度很大，因此改革应当是渐进的，欲速则不达；改革与发展必须相互配合，稳步推进，这样才能既促进中国的现代化，又促成传统社会结构的逐渐转变。另一种意见是：由于传统社会结构对中国的现代化有很大的制动作用，如果不首先使传统社会结构解体，使其影响大大减弱，中国的现代化将难以获得进展。为

此，不仅中国的经济体制改革要加快，而且政治体制改革也要加快。渐进的改革只可能延续传统社会结构的存在，使得传统社会结构对现代化的制动作用依然是强有力的。介于这两种意见之间有下述这种折中见解，即认为经济体制改革应当加快，政治体制改革不妨以渐进的方式进行。也就是说，在经济体制改革取得一定的进展，经济发展取得一定的成就之后，政治体制改革的实行将较为顺利，传统社会结构变更过程中所带来的社会震荡也就相对地小一些，从而易于被社会所承受。中国的比较经济史研究者在分析各国现代化过程中发展与传统社会结构之间的关系时得出了不同的论点，虽然见仁见智，各持一端，但有一点是一致的，这就是：承认传统社会结构对中国现代化事业有着不可忽视的制动作用，因此必须正视这一问题，慎重地选择对策。由于中国的现代化是社会主义现代化，中国的经济体制改革和政治体制改革以社会主义制度的完善与发展作为目标，所以对策的选择应当以社会主义为方向，中国的比较经济史研究者探讨现代化问题时对这一点是有清醒认识的。

七、比较经济史研究的另一结论：世界现代化过程的多样性

从有关传统社会结构与现代化之间的关系的比较研究，必然导致另一个重要问题的探讨，即就全世界范围而言，现代化过程是单线的还是多线的？经济史资料充分说明，西欧的社会发展模式和工业革命的途径不一定适用于发展中国家的现代化。再往上推，究竟什么是典型的封建社会，它究竟存在于西欧，还是存在于东方，或者存在于东方的中国？甚至可以假定，西欧的、东方的、中国的封建社会都是典型的封建社会，这种观点也不一定就不正确。总之，在这个领域内，供讨论的问题还有很多，意见的分歧不可能在短期内消失。

早在第一次世界大战结束后不久，施本格勒（O. Spengler）在所著《西方的没落》一书中就曾指出，人类历史无非是各种不同的文明自行生长和衰亡的历史，这些文明彼此自成体系，自生自灭。施本格勒在研究了文明兴衰史之后认为，历史发展中因果关系是不存在的，因此西方文明同其他文明一样，也面临着衰亡的命运，这种衰亡仅仅是重复以往的一些文明（如埃及文明、巴比伦文明、玛雅文明等）经历过的路程而已。施本格勒对历史规律性的否定、对历史继承性和连续性的忽略以及对不同文明之间内在联系的漠视，尽管都有争论之必要，但他能够突破

西欧单线论，提出历史发展多样性的观点，无疑开拓了比较历史研究的视野。此后，阿诺德·汤因比在所著《历史研究》中，进一步发展了历史进程多样性的学说，认为各种文明的发展是平行的，一切文明都有自己的成长与衰亡的过程。而且，他不把每一种文明看成是孤立的、封闭的体系，而认为文明之间是相互联系的：即使历史上一一种文明衰亡了，但如果由它所创造的或在它影响之下产生的下一代文明能够成长，那么一种文明的衰亡可能就是另一种文明产生的起点。汤因比对人类历史的发展和文明的兴衰的论述中，确有过分夸大宗教的作用之处，但他同施本格勒一样，也强调历史发展的多线论，即以文明的多中心替代文明的单一中心。这一论点已被当代的比较历史研究者中的多数人所认可。

施本格勒和汤因比都是历史学家、历史哲学家，他们不是经济史学家。尽管他们在自己的著作中涉及了不少经济史问题，但他们并没有专门研究经济发展和经济变更的历史过程。希克斯在《经济史理论》中写道：“汤因比和施本格勒创制的历史模式，就其艺术感染力而言，在其科学吸引力之上。”^[5] 然而，不可否认的是，文明的比较研究作为一种历史哲学或作为一种历史研究方法，对经济史的比较研究是有启示的。虽然人们不一定接受施本格勒的历史悲观主义，也不一定赞同汤因比那种把宗教视为文明产生和发展的推动力量的观点，但仍应当承认，传统社会结构和传统观念的影响是综合的影响，它们从若干不同的方面对一种文明或一个区域的经济发生影响，从而形成文明之间的差异或不同区域经济活动方式、经济发展途径的差异。

在分析人类社会经济发展的多样性、现代化过程的多样性时，比较经济史的研究者时常考虑到：如果没有西方势力对东方社会的侵入，东方传统的社会结构是不是会自行解体呢？东方社会是不是会凭借自己的内部力量实现工业革命，走上现代化的道路呢？的确，在东方国家，传统的社会结构是强大的经济发展制约因素，古代和中古历史上的战争、社会动荡、朝代更迭等等并没有使社会结构发生实质性变化。古代和中古的东方也曾出现过较长时期的、阶段性的经济昌盛，但这与近代意义上的经济发展或工业革命不是一回事。因此，从表面上看，西方势力的入侵同东方传统社会结构的解体是直接有关的，似乎没有前者就没有后者，而没有后者也就没有工业革命和现代化了。尽管有些人同意这种推论，但这个问题仍然没有解决，争议继续存在。

关于传统社会结构是否由外部力量所破坏的讨论，研究者们表述过不同的看法。一种对中国现代化进程的研究可能有较大借鉴意义的见解

是：外部力量的侵入所能破坏的只是传统社会结构的表层，传统社会深层结构的瓦解则是内部力量作用的结果。拉丁美洲是较早的例证：西班牙的入侵和占领并不曾摧毁当地的社会经济结构。印度是较后的例证：直到20世纪40年代中期为止，印度的传统社会深层结构也未被英国经济力量所破坏，城市和乡村是两个不同的世界，如果说城市中的资本主义有一定程度的发展的话，那么广大农村却仍旧维持传统的社会结构。再一个例证是韩国：为什么它在第二次世界大战前的长时期内经济是落后的，日本的统治并没有破坏其传统社会结构，而从60年代以来，韩国的经济却有较快的发展，传统社会结构解体的速度大大加快了？难道这种促成传统社会结构解体速度加快的力量不是主要来自社会内部吗？从这些例证可以看出，所谓没有外来入侵就没有东方传统社会结构的解体，从而也就没有东方的工业革命和现代化的论点，是片面的、肤浅的。不从传统社会的深层结构进行分析，不对社会内部力量的作用进行研究并给予足够的重视，既说明不了东方传统社会结构解体的实际过程，也说明不了世界历史的多样性和现代化过程的多样性。当然，这并不否认西方势力入侵在东方传统社会结构解体过程中的应有的作用。这只不过是表明在现代化问题的研究中，包括在传统社会结构解体与现代化进程之间关系的研究中，要把社会内部力量的作用放在主要的位置上。

八、一国内部现代化进展的不平衡性

在研究各国现代化进程时，比较经济史的研究者几乎都注意到各国现代化进展的不平衡性。这一结论是很有价值的，它实际上等于否定了各国现代化按统一的模式进行的论点。在这方面，悉尼·波拉德（Sidney Pollard）的假设引起了中国的比较经济史研究者的兴趣。

波拉德指出，欧洲的工业化不应当按国别模式研究，而应当从工业发展本身的规律来考察。工业化过程好像“发疹”的过程：新兴工业城市好像一个个小红点，起初各国都有红点出现，但有稀有密；隔了一段时间之后，有些地方的红点增多了，红点更密了，红点与红点之间连成片了，而另一些地方的红点仍然是稀疏的、点缀性的。因此，波拉德认为，对工业化过程的研究不能采用国别研究方法，而只能采用区域研究方法，即用红点的分布和红点的扩散作为工业化进展的标志。波拉德写道：“19世纪欧洲的工业化是单一的过程，它有自己的经济逻辑。它像一场瘟疫，不受边界的限制；它轻而易举地越过了边界，但却使相邻的

国内领土未受瘟疫的波及。”^[7]

波拉德的“发疹”假设不仅有助于说明各国现代化进程的不平衡性，而且也有助于说明一国内部现代化进程的不平衡性。但波拉德的假设还包含了这样一个内容，即上述发展的不平衡性并不妨碍各国共同构成一个经济的整体，以及一国国内各个发展不平衡的区域共同构成一个经济的整体。他认为，在工业化时期，全欧洲是一个整体，欧洲市场也是一个整体，任何一个欧洲国家发展工业时都离不开这个整体，一个地区所实现的工业化从资本、劳动力、技术、进出口商品等方面对另一些地区的影响固然是重要的，但反过来，周围各个地区对这个工业化地区的影响同样不可忽视。一个地区在工业化方面先走一步之后，它往往给另一些后进的地区带来发展的机会，而后进地区的工业化虽然开始得较晚，但它们的周围还有一些更落后的地区，所以它们仍然有利可得，仍然有相对的优势可以利用。

在进行现代化的比较研究时，从波拉德的假设可以得到一些有益的启示。比如说，在一定时点上，中国各个不同的地区或不同的省份）都存在若干工业发展程度较高的城镇。它们好像是“红点”，分散在不同的地区，但与此同时，在任何一个地区，即使是工业发展程度较高的地区，仍会有大块空白，其中一个“红点”也不存在。不同的地区之间的区别表现为“红点”多少不等、“红点”分布的稀密程度不等以及“红点”本身的大小不等。这就是国内发展的不平衡。在研究时需要弄清楚的是：不同地区的上述区别是怎样形成的？各个地区的“红点”的扩散趋势如何？各个地区的“红点”之间有什么样的联系？

其实，波拉德的假设和他的区域研究方法不仅对中国的研究者在分析现代化进程时有参考之处，而且也可以用于对经济史上的地区发展不平衡性的探讨。例如，在研究明清两代带有工场手工业性质的、较大型的雇工企业的地区分布状况时，在研究19世纪末和20世纪初的近代工厂的地区分布状况时，都可以参考波拉德的假设，避免得出简单化的论断。

九、中国的比较经济史研究还有待于继续深入和拓宽

正如前面已经提到的，比较经济史学作为一门独立的学科形成较晚。而在中国，只能认为比较经济史方面的研究近年来开始受到重视，对它感兴趣的学者逐渐增多，但还不能认为比较经济史研究在中国已经

有较大的发展。加之，在现阶段的中国，关于比较经济史领域内的研究，主要围绕着现代化问题而进行。这个问题以外的许多重要的问题，或者尚未被研究者所涉及，或者只是在探讨现代化问题时才被提到。从方法上看，新经济史学的方法整个说来在中国还没有产生影响，个别的研究者在研究现代化问题时，曾使用经济计量方法来研究近几十年的历史过程，但这一方面由于经济史资料的限制，另一方面由于在中国经济发展过程中制度因素起的作用相当大，从而历史的计量研究的局限性是很明显的。当然，这并不等于说在研究中国经济史问题时不可能采取计量方法。可以认为，随着中国的经济史和比较经济史研究的深入与研究范围的拓宽，随着经济史资料整理工作的进展，历史计量研究是有前途的，研究的开展必然是渐进的。并且，在计量研究中，如何结合影响中国经济史的制度因素进行分析，也会有一个探索的过程。在这方面不能急于求成。

1985年，罗伯特·索洛（Robert M. Solow）在《美国经济评论》上谈到经济史与经济学的关系时，曾经这样写道：“现代的经济是十分复杂的体系。既然我们不能在其规模较小的一些局部进行有控制的试验，或者哪怕对它们作孤立的观察，我们就无法使用经典的、硬科学的手段来甄别相互挑战的那些假设。可供选择的另一种基本手段，就是按历史顺序进行统计分析。”^[9] 索洛的这番话是有一定道理的。这表明，既然不可能用物理或化学的实验方法来验证社会经济现象，于是历史统计方法就成为可供选择的一种替代了。但人们会进一步思考：假定经济的发展过程还不明朗，历史本身的许多事实还不清楚，那么历史统计方法即使可以被应用，但这又能在多大程度上说明问题呢？假定历史资料残缺不全，而某些年份的统计数字并不准确，那么历史统计方法又怎能得到有效的利用呢？我们丝毫没有贬低历史统计方法的意思，我们想指出的只是：在中国经济史的计量研究中，更为基本的工作应当以整理历史统计资料、去伪存真、填补某些空白为先，在这个基础上计量研究才有用武之地。

索洛在谈到经济史与经济学的关系时还说过：“经济史学家能够使用经济学家提供的工具，但除此以外还需要有想像力，想像事物变为如今这种状况以前，可能是怎样的。”^[10] 索洛在这里提到的“经济史学家在研究中需要有想像力”，很耐人寻味。其实，不仅索洛一个人有这种看法。在新经济史学的作品中，这已经不是一种设想，而且已被用于经济史分析之中了。例如，福格尔在研究美国经济在历史上所起过的作用

时，可以假定1890年的美国不存在铁路，然后进行考察；福格尔和恩格尔曼在研究美国南部奴隶制经济史时，可以假定1861~1865年的南北战争不曾发生，并由此出发来探讨种植园经济的前景。无怪乎诺思和托马斯（Robert Paul Thomas）在评论莱恩（Frederic C. Lane）的《政府在近代初期经济增长中所起的作用》时这样写道：“对比较经济史或任何其他经济史来说，最重要的是提出富于想像力的理论。”^[11] 我们不应把经济史研究中的“想像”理解为毫无根据的、漫无边际的臆测。经济史学家的“想像”——如果我们同意采用这一概念的话——必须以比较经济史的事实和研究成果为基础，这样的“想像”才是有学术价值的。

为什么在这里强调比较经济史研究同经济史学家的“想像”之间的关系？理由是很清楚的。通过经济史的纵向比较与横向比较的结合，可以用历史上其他国家或地区在相似的阶段所经历的发展过程和当时面临的经济、社会问题来推测另一个国家在某一时期可能经历的发展过程和可能遇到的问题。这就是经济史学家想像力的一种应用。虽然历史不会简单地重复，但建立在比较经济史研究基础上的对一定阶段、一定国家或地区的经济演进过程的推断，要比纯粹主观的臆测具有大得多的可信性。从这个意义上说，中国的比较经济史研究者还有大量的工作需要去做。比较经济史的研究越扎实，越有成效，对经济演进的推断（包括对现代化过程中将会遇到的各种问题的估计和评价）就越有说服力。

Comparative economic history and the modernization of China (1993)

I. Economic history: an overview (prelude)

Economic history, as an academic discipline, studies the historical process of economic activity that involves the evolution of the economic system, the development of productivity as well as the interaction between the two. It is a hybrid of economics and history, as its name suggests. From the viewpoint of the history of economics, a lot has been said and written about past economic phenomena and issues, and many ideas have been put forth on the relationship between economics and history from perspectives ranging from mercantilism to classical economics. These efforts, however, were not systematic enough to give rise to economic history as an academic discipline. It was not until the late 19th century that economic history emerged in Western Europe as an independent discipline, thanks to contributions from numerous prominent European scholars. These included representatives of the German history of economics such as Gustav von Schmoller, Albert Eberhard Fridrich Schaffle and Karl Wilhelm Bücher, as well as their contemporaries James Edwin Thorold Rogers, Henry de Beltgens Gibbins, Arnold Toynbee and William James Ashley of Great Britain, Emile Levasseur of France, and Charles Franklin Dunbar, Henry Walcott Farnam, Gerald C. Gross and Richard Theodore Ely of the United States. Economic history came a long way in Europe and America in the first half of the 20th century. Scholars like Werner Sombart and Ernst Wagemann of Germany, John Harold Clapham, Michael Moissej Postan and Richard Henry Tawney of Great Britain, Henri Sée of France, Eli Filip Heckscher of Sweden, Alfons Dopsch of Austria, Henri Pirenne of Belgium, James Walter Thompson, Mikhail Ivanovich Rostovtzeff and Abbott Payson Usher of

the United States distinguished themselves with important works in their respective areas of this discipline.

Under the influence of various philosophical, historical, and economic thoughts, economists are divided in their outlook on such major issues as the relationship between theory and history, on the roles of geographical environment, population, and government in economic development, and on whether socioeconomic development is single- or multi-tracked, progressive, or radical. Many of their opinions on the history of humanity's economic activity, the metamorphosis of economic systems and the development of productivity may be blinkered or Euro-centric in their global overview of economic history, yet it has to be admitted that their achievements are valuable for later researchers, both in the collection and collation of historical archives on economics and in textual research on specific facts in economic history.

Comparative economic history as a branch of economic history mainly dwells on the similarities and differences between the economic processes of countries and regions in the world, and analyzes their causes and effects for a deeper understanding of the historical process of socioeconomic activity. In both genesis and development it is something of a latecomer in comparison with economic history. For a considerably long period of time after economic history was established as a field of study, many scholars – such as G. Schmoller, K. Bücher, W. J. Ashley,

H. Sée, H. Pirenne, E. F. Heckscher and J. H. Clapham – made comparative studies of the economic history of different countries, yet their efforts were hardly systematic. Moreover, because of their research focus on the establishment of a certain theoretical model for economic history, they tended to sort out and arrange the economic historical facts and figures of different countries in compliance with this established model. In other words, limited by the circumstances of the time, none of these European economists lived to see comparative economic history maturing into an independent discipline – it was a branch of economic history at best.

II. The rise of comparative economic history

It was not until the end of the Second World War, particularly after the mid-1960s, that the importance of comparative economic history came to be recognized by the academic world. This had something to do with the postwar world political and economic situation. Following the disintegration of the old world political order, and with many less developed nations embarking on the road of modernization, comparative studies of economic systems, economic growth, and economic policies caught on widely among scholars, thereby paving the way for the birth of comparative economic history as an academic discipline. Ragnar Nurkse, Simon Smith Kuznets, Walt Whitman Rostow, Alber Otto Hirschman, and other scholars who had made a name for themselves in their studies of economic growth, delved into comparative economic history and came up with groundbreaking discoveries and enunciations. Although these people, with the exception of W. W. Rostow, are not considered as economic historians, the important position of their works in comparative economic history can never be ignored. The advent and development of theories on human capital, institutional and technological innovation, political cycles, the long wave, the political market and public choices, either have provided new theoretical backing for the study of comparative economic history, or become vivid research topics.

The rise of econometric history, also known as cliometrics or new economic history, was yet another major factor that contributed to comparative economic history in its formative years. Econometric history first appeared in the late 1950s, and progressed swiftly after the mid-1960s. American economic historians Robert William Fogel, Douglass Cecil North and Stanley Lewis Engerman are its major representatives. These economic historians label past studies in this field "traditional economic history" for the reason that they have stopped at the level of historiography, fallen short of integrating economic theories with economic history, and failed to apply modern quantitative analysis in studying past historical events and economic

development processes. Accordingly, they believe they have remedied all these deficiencies with their brand of new economic history. During the period from the 1960s to the 1980s, the new economic history caught the attention of the academic world and gave a major impetus to comparative economic history by coming up with a series of works on the histories of technological innovation, institutional innovation, railways, the southern US economy, the Western European medieval manorial system, historical calculations of GNP and labor productivity, and the historiography of business cycles. This great impetus manifested itself mainly in improvements in research methodology. As R. W. Fogel and S. L. Engerman point out in *The Reinterpretation of American Economic History* (1971), "When the data are very good, simple statistical procedures will usually suffice. The poorer the data, the more powerful are the methods which have to be employed. Nevertheless, it is often true that the volume of data available is frequently below the minimum required for standard statistical procedures. In such instances the crucial determinant of success is the ability of the investigator to devise methods that are exceedingly efficient in the utilization of data – that is, to find a method that will permit one to achieve a solution with the limited data that are available." [2] Besides the support from certain theories, improved research methods, quantitative methods in particular, are also *sine qua non* for the achievements made in comparative studies of the economic development processes of different countries and regions.

From a methodological point of view, both vertical and lateral comparative approaches can be applied in comparative economic history. Vertical comparative analysis refers to a study of changes that have taken place in different periods in one or several countries along the historical course of economic development, so as to discover the norms governing economic development. Lateral comparative analysis refers to a comparison of the economic situations in different areas of a country or in several countries over a certain period or at a given time, so as to illustrate the distinctive economic features of the areas or countries being compared. Choices of economic indicators and of

years are pivotal to the success of vertical comparison. The older the indicators, the more fragmented the statistical data tend to be, and the more difficult the comparison becomes. Moreover, such a comparison can make sense only when different statistics are converted into something that can be measured with the same benchmark. As to the choice of years, arbitrariness must be avoided – the years chosen to represent certain turning points or historical periods in economic development should be solidly grounded. Only thus can convincing conclusions be derived from such a vertical comparison. As to lateral comparative analysis, apart from the above-mentioned caution in the choice of economic indicators and years (as well as the comparability of such indicators), due attention should be paid to the connection between lateral and vertical comparisons. This is because only by putting the two kinds of comparison together can the regular pattern of the economy's historical development be seen more clearly, and only thus can the deficiencies of statistics concerning a certain historical period in a certain country be made up for with an approximate value derived from corresponding data available for the same historical period in another country. This drives further home the significance of quantitative analysis to the rise of comparative economic history.

III. Comparative economic history and studies of modernization

The modernization issue has been drawing the attention of international academia as a major research topic since the end of the Second World War. Both development economics and comparative economic history have studied it, but the former has distinguished itself by approaching the topic more from the perspective of economic history, that is, by comparing the historical processes of socioeconomic development. To put it more exactly, development economics studies the mode and policy of economic development by leaning heavily on the allocation and flow of production factors, the relationship between saving and consumption, the roles of market

mechanism and government functionaries, the relationship between sectoral and regional economic structures as well as between economic development and technological innovation, and the internal-external balance in the development process. Although development economics also links the modernization issue with the roles of institutional, cultural and other factors, it puts a premium on the present situation instead of on historical summary. By comparison, comparative economic history has a different focus in modernization studies.

As a branch of economic history, comparative economic history not only is devoted to historical economic development, but also explores issues with more extensity and profundity. To name just a few: How important are the roles of traditional culture, religion and ethics in the historical process of socioeconomic development of different countries or regions? To what extent can the differences in socioeconomic history between countries (and regions) be interpreted in light of their differences in traditional culture, religion and ethics? Both questions, however, fall into the category of comparative economic history rather than development economics. To cite another group of questions: What are the implications of the Asian mode of production? What is the economic difference between Eastern and Western pre-capitalist societies? How did such a difference come about, and what is its relationship with the later capitalist economic development? What conclusions can be arrived at if the role of geographic environment in economic development is belittled or exaggerated? Can such conclusions stand the test of science? These questions are, likewise, concerns of comparative economic historians, and rarely dwelt on by development economists.

Modernization entails a process of sustained economic, social, political and cultural development, with economic development as the driving force behind it. The academic world is widely divided as to when worldwide modernization was started. It is dated back variously to the scientific revolution of the 16th and 17th centuries, to the industrial revolution towards the end of the 18th century, or to a more

recent date. The consensus, nevertheless, is that the hundred years beginning from the late 19th century constituted the modernization stage in the socioeconomic development of human history. Therefore, no research into modernization can be complete without summarizing the experiences and lessons of all nations in their economic development during those years. It goes without saying that modernized nations need to sum up their historical experiences so that they can address, with appropriate countermeasures, the socioeconomic problems arising from economic development. Nations that are striving for modernization, too, find it necessary to summarize their own experiences and those of others in economic development over the years. Without such summary, they may go astray or repeat other nations' mistakes in their modernization drive. In that sense, the study of modernization is synonymous with comparative economic history. More than that, because comparative economic history can prepare conditions for in-depth modernization studies, it is, indeed, an indispensable branch of foundational research for the latter.

In a comparative study of the relationship between tradition and modernization featured in the book *The Modernization of Japan and Russia* (Cyril Edwin Black et al, New York, 1975), I have discovered a typical example to illustrate the collaboration between comparative economic history and modernization research. C. E. Black and his co-authors chose to compare the Japanese modernization process with that of Russia precisely because the two nations, each with a heritage different from that of Western Europe, were seeking modernization and adapting it to their respective traditions. According to the authors' observations of modern economic history, Japan and Russia share a distinguished feature in their modernization processes in that they have both succeeded in preserving their traditions. However, such traditions are no longer the same as they were – they have been adapted to modernization. What the authors are saying is that, firstly, modernization is not the same as "Westernization" or "Europeanization"; secondly, these two terms imply that Western or European institutions and values are indispensable elements of

modernization, as if other nations could only adopt Western or European values and institutions at the expense of their own heritages; and thirdly, as the Japanese and Russian experiences indicate, modernization can in fact be realized only when it is adapted to local traditions. Only by making the most of its past accumulations of wealth can a nation achieve success in its modernization effort and choose the best modernization strategies. Otherwise, all such effort will prove worthless.

This comparative research in economic history by C. E. Black and others tells us that the present cannot be torn away from tradition and that any type of successful modernization is necessarily the unification of tradition with modernization.

IV. Why comparative economic history catches the fancy of Chinese academia

Since the 1980s, a wide spectrum of Chinese society has shown great interest in the issue of modernization, an interest that manifests itself in its concern not only for the approach to Chinese modernization and its prospects, but also for the modernization processes of many other countries and regions. The reason why studies of socioeconomic development strategies – or modernization strategies – have deeply interested Chinese academia is because such strategic studies are of paramount importance in that they take place against the background of summarizing the experiences and lessons of other countries' modernization drives, and that their successes and failures are closely related to China's future development and the institutional and development modes the nation is going to adopt. Many scholars have joined in such studies since the beginning of the 1980s. We have every reason to believe that these scholars' ever-increasing attention to comparative economic history is inseparable from the tangential and circumferential research on socioeconomic development strategy at that time, an inclusive summary of empirical results from the modernization process in fellow countries.

A thought of far-reaching influence has run through Chinese research into comparative economic history: What matters for socioeconomic development is not economic growth alone, but – at least mainly – coordinated economic and social development. For a long period of historical development, the role of industrialization has been over-estimated. That is why the traditional development strategy adopted since the late 18th century always emphasized the growth of gross national product to the neglect of the costs involved; stressed industry, heavy industry in particular, to the neglect of agricultural development; favored investment in technical equipment over investment in human resources; and went blindly after abundant supply of consumer goods while ignoring the uncertain aftermath of such an abundance and the resultant changing lifestyles. In a word, coordinated socioeconomic development is more important – and worth the effort of less developed countries – than single-minded pursuit of economic growth.

Such a thought naturally gives rise to the following statement when evaluating the Industrial Revolution: the industrialization that swept across the West from the late 18th century through the 19th century was about revolutionizing production technology rather than about emancipating and developing intellectual resources. It was not until the 20th century, or as late as the mid-20th century, that this resource gained the attention it deserves. In other words, it was not until very late that investment in education was given proper consideration in association with modernization. This is a good lesson for all developing nations in pursuit of modernization. If China ignored this lesson drawn from comparative economic history and followed the example of some countries in the 18th-19th centuries in regarding human beings merely as tools and appendages to machines and came tardily to emancipate and develop its intellectual resources, its modernization process would definitely be delayed, and the widening gap between the economy and culture would become a heavy price to be paid for modernization.

It need be pointed out that China was not immune to the

worldwide "Weber fever" of the 1980s, when some scholars in this nation were drawn to the German sociologist and economic historian Max Weber's theories in their studies of the crux of the modernization issue from a comparative research perspective. The spread of Weber's theories in China stemmed from the problems the nation had come across in its modernization drive and from the Chinese desire to learn from other nations' experiences and lessons in this regard. Comparative economic history posed the following questions: Why did the Industrial Revolution follow different courses in different countries and regions? Which factors precipitated the industrial revolution in one country after another? What was the most important of all these factors? Scholars of comparative economic history may list a host of factors that might have facilitated or hampered the industrial revolution in a given nation, such as the formation of capital, market, labor and its quality, technological progress and government policy. However, one may doubt if industrial revolution could take place by way of capital, market, labor, technology and policy alone. True, these factors are indispensable, but they are not sufficient to bring about industrial revolution. We have to delve into social structure, culture and ethics and look for the other factors that might have stimulated or hindered industrial revolution. In his works Weber made a point of integrating economic history with cultural and institutional histories. That is a basic reason why his theses have drawn the attention of scholars studying the issues pertinent to modernization.

Weber's ideas are, without doubt, controversial, but even his detractors have to concede that his ideas are quite illuminating. One of his revelations is that industrial revolution cannot take place in a nation that, despite having prepared the essential production factors, is ill prepared ideologically and ethically – meaning that the nation still lacks the social environment and mental driving force that are essential to industrial revolution or economic progress. In other words, there is a subtle spiritual force behind the industrial revolution that drives people to explore the unknown and run businesses in return for economic results. Furthermore, in Weber's own words, industrial development is also a process in which interpersonal

relationships are readjusted, for the interpersonal relationships prior to the industrial society – such as the hereditary hierarchy, clannish rule and vassalage fealty – are detrimental to industrial development. For example, even though the Roman Empire in its heyday had no lack of needed capital and labor and its market was wide enough, industrial revolution in the modern sense of the term did not take place in that empire because its social structure, institutional scope and the interpersonal relations based on it were hostile to industrial development. Take Italy for another example. That country had acquired adequate capital and developed a wide market during the 14th-16th centuries, but its social structure, institutional environment and interpersonal relations rendered an industrial revolution improbable on its land. In those years, the Italian economy was not matched with a compatible social enterprising spirit, and as a result, the nation's accumulated wealth was channeled into nonproductive undertakings and failed to fuel technological and industrial growth. Weber's expositions in this regard drive home not only what comparative economic history means for modernization research, but also that society, culture and ethics must be studied extensively if we are to deepen our study of the modernization issue. Hence it is justifiable for Weber's Chinese followers to believe that his revelations pertinent to China's modernization lie in his methodological approach rather than in his theories *per se*.

V. A historical comparison of economic fluctuations

A nation is likely to suffer economic fluctuations in its pre-modernization period. Such fluctuations, however, are either caused by noneconomic factors such as war, natural adversity, pestilence, or influences from the outside world. This being the case, pre-modernization economic fluctuations tend to evade the attention of comparative economic history researchers. But this is not the case when a nation has entered its modernization period. In the modernization process, economic fluctuations may be caused by internal and economic factors and show certain regularity. For this reason, the historical comparison of economic fluctuations has become

a new topic for studies of the Chinese style of modernization.

British economist John Hicks's work *A Theory of Economic History* (1969) is of great utility for its reference value to Chinese researchers in this field. Like American economist and political scientist Joseph Alois Schumpeter, Hicks is interested in mounting a descriptive theory of socioeconomic history rather than specific elaborations on a certain period involved in a certain research topic about economic history.^[4] In Hicks's view, it is understandable that quantitative changes in gold and silver can lead to fluctuations in prices within a secluded economy (for example, what it was prior to the Industrial Revolution). Even under the gold standard system, quantitative changes in a currency can still be counted as a reason for fluctuations in prices and the economy. However, in the 20th century, because the metallic basis of the currency was weakened, economic fluctuations could no longer be interpreted according to the amount of the currency, nor could it be simply ascribed to the adoption of a certain currency policy. The issue had to be seen in a new light. The cycle of economic growth and recession had to be probed from the perspective of the interaction between internal investment, savings and consumption. Moreover, the process of economic fluctuations could be illustrated by reference to the role of commerce, the supply of and demand for labor as well as the scope of market. That is to say, different research methods had to be applied to the history of economic fluctuations in the pre-industrialized society, during the Industrial Revolution and after the mid-20th century because each of these periods had its own peculiarities. According to Hicks's pronouncements in *A Theory of Economic History* and other works like *A Contribution to the Theory of the Trade Cycle*, *Journal of Economic Perspectives* and *Crisis in Keynesian Economics*, economic fluctuations are not uncommon in a modernization process, and pose no hindrance to economic growth – fluctuations are merely a temporary setback or slack in the historical course.

Obviously, researchers of China's modernization will not rest contented with Hicks's theoretical presentation of economic

fluctuations. But so far as methodology is concerned, historical comparison (Hicks's cycle analysis included) is still useful. In the 1980s, despite a divergence in opinions, scholars were basically unanimous on two basic conclusions in their analyses of the process and causes of the cyclical fluctuation of the Chinese economy over the previous 40 years. Firstly, economic fluctuations are unavoidable in China because, like other economies that are modernized or being modernized, the Chinese economy will never be in a rectilinear motion. Secondly, the causes of economic fluctuations in China's modernization drive are internal in the main, while the impact of the world market is secondary. However, scholars are strikingly divided on the causes of the fluctuations, the duration of each fluctuation, and the intervals between them. For example: Which is a more important cause of the fluctuations, the amount of currency or commodity demand and supply? Should the modernization drive be focused on investment or attach equal importance to investment and consumption? Which sector is more accountable for causing fluctuations, the agricultural sector or the construction industry? Which is more of a factor in the changing process of fluctuation: finance or banking, planning or market? With their own distinctive features, the economic fluctuations in China's modernization process can be analogized neither to those in Western and Southeast Asian countries, nor to those in the former Soviet Union and Eastern European countries. All this merits continued and in-depth study, for which comparative economic history may offer more support.

In historical comparative research, economic fluctuations are invariably connected with the economic system. If changes in the volume of investment or the growth rate of investment are regarded as a major cause for economic fluctuations in the modernization drive, this poses another question: Are changes in investment not related to a certain economic system? By the same token, if changes in the volume or supply of money are regarded as a major cause for fluctuations, are not these changes, too, an outcome of a certain economic system? From a macroeconomic point of view, changes in investment and money supply have different causes and effects under different

economic systems, a fact that has a great deal to do with fiscal, monetary, and planning systems and market structure. From a microeconomic point of view, changes in investment and money supply are also directly linked with the corporate system. For example, whether a business is a true investor and stakeholder that makes its own decisions, whether it is sensitive to changes in credit and interest rate, and whether it is motivated by its own interests to seek technological progress and reduce its share of the money flow are inseparable from the changes in investment and money supply. All these indicate that comparative studies of economic fluctuations are, as a matter of fact, concerned with comparing the causes and effects of fluctuations under different economic systems.

When it comes to comparative research on economic systems, Chinese modernization scholars tend to hold one of two opinions:

- Opinion 1: China's economic system is highly comparable with those of the former Soviet Union and Eastern European countries, historically so with the former Soviet economic system in particular. The analogy between the Soviet economic system over the 70 or so years since the Russian Revolution of 1917 and the Chinese economic system over the last 40 years is quite manifest in some historical periods. Thus the historical relationship between the economic systems of the former Soviet Union and Eastern European countries and their respective economic fluctuations can serve as a reference for studies of the economic fluctuations that have occurred in the modernization process of China.

- Opinion 2: In terms of GNP per capita and the percentage of agricultural population in the total population, the Chinese economic system is more akin to, and considerably more comparable with, some other developing countries insofar as socioeconomic structure, market organization and price system are concerned. These developing countries are susceptible to economic fluctuations on their road to modernization due to lopsided industrial structures and shortfalls in resource supply, or due to the unsalability of primary products and decreases in residents' income. Because these countries' fluctuations

are relevant to a great extent to the problems existing in their economic systems, it is necessary to make historical comparisons between the Chinese economy and those of the developing countries if economic fluctuations in the course of modernization are studied in the context of economic systems.

The above two opinions are both reasonable and not incompatible to each other. As seen from the perspective of its economic system, fluctuations in China's modernization process are similar not only to those in the former Soviet Union and Eastern European countries but also to some other developing countries.

VI. Deep-seated issue: traditional social structure as a brake

Historical comparison of economic systems brings to light a deep-seated issue, that is, whether or not the traditional social structure acts as a brake on the modernization process. If the answer is yes, how serious is that role? And how can it be mitigated? It is precisely because Alexander Gerschenkron and Umberto Melotti have dwelt on all these questions and come up with unique explanations that Chinese economists are drawn to the former's works on comparative economic history and find the latter's study of the Third World and multi-linear mode of growth enlightening.

Gerschenkron's view is that the retarding role of traditional social structure is reflected in its constraints on the supply of production factors, which is a major hindrance to the progress of underdeveloped countries. He thinks that large-scale industrial development in Russia and Balkan countries has been shackled by traditional social structure in comparison with Western Europe. But it is noteworthy that while Gerschenkron acknowledges the existence of the braking effect of traditional social structure in modernization, he also stresses that underdeveloped countries may find themselves at a relative advantage once they are resolved to achieve modernization. In this regard, he employs two terms: the "advantages of a latecomer," such as the

traditional social structure's low labor cost; and the "disadvantages of a latecomer," such as the yawning gap in technology between underdeveloped and developed countries. He also points out that the advantages and disadvantages are coexistent and mutually convertible. An underdeveloped country can overcome its disadvantage if it can make the most of its advantages, including low wages. If an underdeveloped country lets the opportunity slip through its fingers, its latecomer advantage may fail to play a role and its modernization process may be delayed, just like a man who, having missed a bus, has to wait for a long time before catching the next one. Because good opportunities are rare, a "major outburst" in economic development – akin to a sprint at the finish line of the industrial revolution race – is not only necessary but also beneficial to nations under the heavy influence of a deep-rooted traditional social structure.

For his part, Melotti elaborates from different perspectives on the retarding role a traditional structure plays in the modernization of underdeveloped countries. As he sees it, the vast land area of these countries (mainly in Asia, Africa and Latin America) is studded with numerous village-sized economies that have evolved into a stable but self-enclosed and self-sufficient economic setup that ties producers down to the narrow activity scope of their lands. The economic development and social structural changes are seriously held back as a result. But how is it that Japan, of all Asian countries, made its modernization drive a success after the Meiji Restoration? Is the political factor alone enough of an answer to that question? In answer to it, Melotti points out that despite its distinctive Asian characteristics and its differences from European countries, in its pre- Restoration years Japanese society did not attempt to nip capitalism in the bud the way the other Asian countries did socioeconomically. The reason why post-Restoration Japan wasted no time in embarking on the capitalist track of development was not because of any external factors but because of the salient features of its innate traditional social structure.

For researchers of the Chinese way of modernization, Gerschenkron and Melotti have provided valuable references to the

retarding role of traditional Chinese social structure in modernization. As a matter of fact, research on that role is highly relevant to the design and progress of the nation's economic restructuring and political reform. In this regard at least two views are prevalent among Chinese researchers: One view holds that haste makes waste, given the nature of the fabric of traditional society and the difficulties it poses, and that only by pushing political and economic reforms one step at a time and coordinating reform with development can progress be made in the modernization drive and gradual changes brought to the traditional social structure. The other view maintains that, bearing in mind the retarding impact of traditional social structure, modernization cannot be sustained without breaking up this structure or at least blunting its impact considerably, and that economic and political reforms should be sped up, since slowly progressing reforms can only prolong the survival of the traditional social structure and allow it to go on holding back the modernization process. A compromise between these two views suggests that economic restructuring should be accelerated and political institutional reform conducted in a progressive way. In other words, once economic restructuring and economic development make some headway, political reform will go more smoothly and become more acceptable to the public because it helps minimize the shock wave emanating from the ensuing reshuffling of the traditional social structure.

Although divided in their opinions on the relationship between development and traditional social structure in the modernization process of different countries, Chinese scholars of comparative economic history see eye to eye on the fact that the traditional social structure does have a retardant impact on the nation's modernization drive. They see this as something that cannot be tampered with carelessly, and unanimously suggest that prudence be applied when countermeasures are chosen. Ours is socialist modernization. Therefore, improving and developing the socialist system should be the ultimate goal for economic restructuring and political reform, and the steps to be taken should be socialism-oriented as well. In their modernization studies Chinese scholars of comparative economic

history are, indeed, sober-minded on this issue.

VII. Concluding remark: global diversity in the modernization process

Comparative research on the relationship between traditional social structure and modernization inevitably leads to another major issue as to whether modernization is single- or multi-tracked on a global scale. Historical materials on economic history have indicated that the Western European model of social development and its approaches to industrial revolution are not necessarily appropriate to the modernization process of developing countries. This issue can be traced back to some other questions: What did a typical feudal society look like? Where did it occur, in Western Europe, the East, or China specifically? The assumption that all Western European, Eastern and Chinese feudal societies were, without exception, typical ones may not be incorrect. In a word, there are a host of topics that are open for discussion, and the divergence of opinions can never evaporate into thin air overnight.

Shortly after the end of the First World War, Oswald Spengler pointed out in his book *The Decline of the West* that human history was about none other than the spontaneous rise and fall of civilizations, and that every civilization runs its own course, emerging and perishing on its own. His study of the rise and fall of civilizations convinced him that there is no cause-and-effect relationship in history, and Western civilization will eventually meet its demise along the same course followed by ancient Egyptian, Babylonian and Mayan civilizations. Spengler was able to broaden the vista of comparative history by eschewing the unilinear theory regarding Western Europe and embracing diversity in historical development, although his denial of the norms of historical development, his neglect of the successive and continuous nature of history, and his indifference to the intrinsic relationship between civilizations are open to question. Later, in his work *A Study of History*, Toynbee developed the theory on diversity in historical progress, believing that all civilizations are parallel in their

development but each follows its own course of rise and fall. He maintained that civilizations are not isolated but interrelated: If a demised civilization can give birth to – or influence the rise of – a second generation of lasting civilization, it is evidence that one civilization's fall is probably the starting point of another. True, Toynbee somewhat exaggerated the role of religion in his dissertations on human development and the rise and fall of civilizations; but like Spengler, he also stressed the multi-linear development of history and maintained that civilization is multi-centered instead of having only one center. Such a proposition was accepted by most of his fellow history researchers.

Nevertheless, Spengler and Toynbee were general historians and historical philosophers, not economic history scholars. Though they touched upon many issues pertinent to economic history in their works, they never delved into the historical process of economic development and changes. As Hicks commented in *A Theory of Economic History*, "... the grand designs of a Toynbee or a Spengler, the makers of historical patterns which have more aesthetic than scientific appeal."^[6] However, there is no denying the inspiration of comparative studies of civilizations to comparative economic history as an approach to historical philosophy or historical research. We may not accept Spengler's historical pessimism or condone Toynbee's belief in religion as the driving force behind the rise and development of civilizations. Nevertheless, we are obliged to admit that the influence of traditional social structures and concepts is comprehensive, and works on a civilization or a regional economy in many ways, resulting in differences in civilizations, regional economic activity and development modes.

Studies of diversity in socioeconomic development and modernization often put scholars of comparative economic history in mind of two questions: Would Eastern traditional social structures have crumbled without the invasion of the Western forces? Can Eastern nations accomplish industrial revolution and embark on modernization by their own bootstraps? The traditional social

structure in Eastern countries was a powerful constraint on their economic development, and no amount of war, social unrest and dynasty substitutions in ancient and medieval times could change it substantially. Economic booms, long or staggered, did occur in the East in those times, but they stood no comparison with the economic development or industrial revolution of modern times. On the surface, Western inroads are directly related to the disintegration of traditional social structures in the East, as if without the former, the latter would not have happened, or without the latter, there would not have been industrial revolution or modernization. Though some people accept this deduction, the issue remains unsettled, and the dispute continues.

Scholastic opinions vary as to whether the disintegration of traditional social structure resulted from external forces or not. One opinion that may be of high reference value for studies of the Chinese modernization process has this to say: the inroads of external forces could only destroy the surface of the traditional social structure – its collapse was caused by internal forces alone. An early case in point in this regard is Latin America, where Spanish invasion and occupation did not cause the local socioeconomic structures to crumble. A more recent example is India, whose deep-rooted social structure survived the invasion of British economic forces till the mid-1940s. In that country, cities and rural areas were two different worlds. If capitalism was able to make some headway in cities, the traditional social structure remained intact in the vast rural areas. A third case in point is South Korea: Why was the South Korean economy able to grow rapidly, beginning from the 1960s when the disintegration of its traditional social structure picked up speed, while its economy had lagged behind for a long time earlier as it kept its original social structure under Japanese rule before the Second World War? Is it not the case that the destructive factor came mainly from within the country? These examples show that it is prejudiced and superficial to assume that without foreign invasion there would not be the collapse of traditional social structure and the advent of industrial revolution and modernization in the East. Without dissecting the deep-seated structure of traditional society or putting a premium on studying the

role of internal forces within that society, there will be no way to account for the actual disintegration of traditional social structures in the East and the diversity in both world history and the modernization process. Of course, this is not to deny the role of the invading forces from the West in the collapse of the traditional social structures of the East. Instead, it is to say that the role of internal forces should be given center stage in studies of the modernization issue, including the relationship between the disintegration of traditional social structure and the process of modernization.

VIII. Disequilibrium in the modernization process within a country

The imbalanced nature of the modernization process has come to the attention of almost all researchers of comparative economic history in their study of different countries. This valuable finding virtually gainsays the assertion that countries follow a unified mode of modernization. In this respect, Sidney Pollard's hypothesis has attracted the notice of comparative history researchers in China.

Pollard points out that the study of European industrialization should be based on the innate laws of industrial development instead of on country-specific modes, and that the industrialization process looks like an outbreak of a skin rash epidemic. At the very beginning, new industrial cities emerge in a country like a rash of clustered spots in the human skin in varied quantity and density, some of which grow more densely clustered into an inflamed patch while others remain sparsely scattered after a certain period of time. Therefore he believes that studies of the industrialization process should not be based on countries but on regions, that is, by regarding the distribution and proliferation of the "red spots" as signals of the industrialization progress. As he puts it, "It is the argument of this article that the industrialization of 19th century Europe was a single process and had an economic logic of its own. Like an epidemic, it took little note of frontiers, crossing them with ease while leaving neighboring home territories untouched." [8]

Pollard's "red spots" hypothesis helps decode the imbalance in the modernization process between countries and in a given country. It also indicates that such imbalance does not impede the efforts of countries or of regions inside a country to form an economic body. According to him, during its period of industrialization Europe was an integral community and so was the European market, and no European country could do without this community in industrial development. The industrialization of one region often has a major impact on other regions with its capital, labor, technology and import and export commodities. But the impact of the latter on the former cannot be overlooked either. When one region makes the first step toward industrialization, it brings development opportunities to other regions. Although these regions are a step later, such opportunities still put them at an advantage over the neighboring regions that are relatively more backward.

Modernization researchers may draw inspiration from Pollard's assumption. For instance, at a certain point of time, China has a number of industrialized cities and towns scattered in various provinces. They look like "red spots" on the Map of China, but at the same time, every province still has large areas in which not a single "red spot" can be seen. Thus, the differences between the provinces – or rather, the disequilibrium between them in industrial development – find expression in their differences in the number, density and size of the "red spots." In modernization studies, we should figure out the reasons behind these differences in those regions, the diffusion trend of the "red spots" as well as the relationship between them in different provinces.

Pollard's assumption and regional research method are valuable to studies of Chinese modernization and unbalanced regional development in economic history. For example, they may help ward off over-simplified conclusions in studying the regional distribution of large handicraft workshops with hired labor in the Ming and Qing dynasties and modern factories of the late 19th and early 20th centuries.

IX. Comparative research on economic history yet to be deepened and widened

As mentioned earlier, comparative economic history is a relatively young academic discipline. In China, it did not begin to gain the importance it deserves until recently. It is drawing more and more researchers in this nation, but that is not reason enough to say that comparative economic history has come a long way in this nation. As things stand here, studies in comparative economic history are mainly centered on modernization, leaving many other important issues untouched or merely briefly mentioned. Insofar as methodology is concerned, the new economic history methodology has not had any influence on China so far. A few scholars have employed the econometric approach in their historical studies into recent decades; but their results have been obviously restricted by the lack of historical data for one thing, and by the institutional hindrance to Chinese economic development for another. But this does not mean that the econometric approach is not applicable to the study of Chinese economic history at all. With economic history and comparative economic history gaining steady ground and depth, the prospects of econometrics are becoming brighter in this nation. We have got to be patient, for it takes time to explore how to incorporate the institutional factor into the econometric study of Chinese economic history.

Discussing the relationship between economic history and economics in 1985, Robert M. Solow wrote in the *American Economic Review*: "A modern economy is a very complicated system. Since we cannot conduct controlled experiments on its smaller parts, or even observe them in isolation, the classical hard-science devices for discriminating between competing hypotheses are closed to us. The main alternative device is the statistical analysis of historical time-series."^[12] His statement is reasonable in that the historical statistics method would be the best choice wherever other physical and chemical types of scientific experiments failed in the study of socioeconomic events. But queries on its effectiveness arise. Supposing

the process of economic development and many historical facts are yet to be clarified, to what extent can a historical statistics method account for the issues even if it can be made to work? In the face of fragmented historical data and inaccurate figures concerning certain years, how can we guarantee the effectiveness of this method? We have no intention to play down the value of this method. We just want to point out that in quantitative studies of the Chinese economic history, only by collecting and collating historical data, and by weeding through falsehoods to fill in the blanks with nothing but authentic data, can full scope be given to quantitative analysis in studies of Chinese economic history.

As to the relationship between economic history and economics, Solow also points out: "So the economic historian can use the tools provided by the economist but will need, in addition, the ability to imagine how things might have been before they became as they now are."^[13] His mention of "imagination" in this context is quite thought-provoking. It turns out that this view is shared by many other new economic historians. Thus a hypothesis is turned into a tool in the hands of analysts of economic history. For example, R. W. Fogel studied the historical role of the American economy by assuming that the American continental railway did not exist at all in 1890. R. W. Fogel and S. L. Engerman also began their research on the slave economy in the southern United States under the assumption that there was no Civil War in 1861-1865, and then went on to discuss the prospects of plantation economy. No wonder in a journal review of Frederic C. Lane's thesis "Role of government in economic growth in early modern times," Douglass Cecil North and Robert Paul Thomas make this statement together: "The most crucial ingredient in comparative economic history, or any other economic history for that matter, is the development of imaginative theory."^[14] By the term "imagination," we do not mean groundless or wild guesses, but academic inferences based on facts and achievements in comparative research on economic history. Only this kind of "imagination" can be academically valuable.

Why so much ado about "imagination" in economic history research and its relevance to comparative economic history? The reason is apparent: Combining vertical and lateral comparisons in economic history makes it possible to use the development process and socioeconomic problems of one country to speculate on what problems another country might encountered in about the same stage of development. Such is one of the ways in which economic historians may bring their imagination into play. "History may not repeat itself, but it does rhyme a lot," as Mark Twain puts it. As to a particular economic period in a certain country or region, speculations based on comparative research into economic history are bound to be more accurate than mere wild guesswork. In this regard, researchers in this nation have a great deal of work ahead of them. The more solid the studies in comparative economic history are, the more fruitful such studies become, and the more convincing the inference from an economic process – the estimation and evaluation of problems to be confronted in the modernization process included – tends to be. (Translated by Ren Xiaomei)

非均衡条件下经济增长与波动的若干理论问题 (1993)

一、经济的非均衡对于经济增长与波动的制约

经济非均衡理论从20世纪60年代后期起有较大的发展。克劳威尔 (Robert Wayne Clower) 于1965年发表的《凯恩斯派反革命：理论上的再评价》(载于哈恩与布雷克林编《利率理论》，1965年伦敦版)和1967年发表的《货币理论的微观基础的再考虑》(载于《西方经济学杂志》，1967年6月)两篇重要论文中，就非均衡理论提出了一个与经济增长、经济波动有关的值得注意的论点，这就是：经济的不稳定并非来源于某一市场本身，而来源于包括各个市场之间的不协调。至于各个市场之间的不协调的存在，则又应当从各个市场的不完善性和信息传递机制的不健全方面来寻找原因。如果把这种非均衡分析方法运用于经济增长与波动分析的领域内，那么显而易见，不仅以储蓄全部转化为投资和已形成的生产能力得到充分利用为前提的均衡增长公式将失去作用，而且以有效需求受到收入及其变动的限制作为经济体系内在不稳定的主要因素的经济波动假设也将被看成是具有很大局限性的。

紧接着，莱荣霍夫德 (Axel Leijonhufvud) 出版了《论凯恩斯派经济学和凯恩斯的经济学》(1968年牛津版)一书和其他一些作品。他同克劳威尔一样，也以非均衡的分析方法来重新解释凯恩斯经济理论，并就经济稳定与不稳定的原因作了如下的分析。他认为，经济生活中，以劳动的供给为一端，以商品的销售为另一端，这两端之间有若干中间环节，如雇主雇用工人、雇工生产商品、雇主付给雇工工资、雇工用工资购买商品、雇主使商品销出等等。但由于价格刚性的存在、市场的不完善、信息的不通畅、传导机制的缺陷等原因，上述各个中间环节中只要有一处未能衔接，这个经济的链条就会中断，经济的不稳定也就难以避免。这正是经济非均衡的一种表现。如果把这种非均衡分析方法运用于

经济增长与波动的分析领域内，那就同样可以证实经济增长不可能按均衡增长论者所设想的那种均衡增长途径进行，经济波动也不是遵照国民收入均衡公式所要求的调节总需求与总供给之间的平衡关系的做法就能克服的。

70年代以来，贝纳西（Jean-Pascal Benassy）和科尔内（János Kornai）分别从不同的角度对非均衡理论作了深入的探讨。贝纳西的《市场非均衡经济学》（1982年纽约版）、《宏观经济学与非均衡理论》（1984年巴黎版）、《宏观经济学：非瓦尔拉分析方法导论》（1986年纽约版）等书，以及科尔内的《反均衡》（1971年阿姆斯特丹版）、《短缺经济学》（1980年阿姆斯特丹版）、《增长、短缺与效率》（1982年牛津版）等书，都在非均衡分析方面有不少突破。他们关于宏观经济运行的研究对于经济增长与波动的研究有着重要的意义。

贝纳西在非均衡理论分析中的主要贡献是在对于非均衡条件下的限制因素的分析方面以及数量配额的效应分析方面。按照贝纳西的观点，在价格不灵活时，交易者既要根据市场的价格信号来调整需求量和供给量，又要根据市场的数量信号来调整需求量和供给量，于是交易者受到双重限制，即价格限制和数量限制。数量限制的具体形式就是不同形式的数量配额，也就是：在供给小于需求时，如何把有限的供给分配给需求者们；而在供给大于需求时，如何把有限的需求分配给供给者们。通过数量配额而实现的均衡，称为配额均衡。它是一种非均衡，又是一种特定意义下的、暂时的、事后的均衡。这种均衡的位置是由供给或需求中的短线（短边）决定的。贝纳西认为，在考察非均衡经济时，不仅应当摒弃均衡假设中关于价格灵活性的前提，而且必须引入价格刚性与价格伸缩的不对称性。价格刚性与价格伸缩的不对称性固然有某种联系，但在实际经济生活中的效应则是有区别的。价格伸缩的不对称性使非均衡条件下的资源配置更为复杂，政策的作用也更加受到限制。如果再引入预期概念，即交易者对非均衡条件下的不规则的经济行为的个人预期，那么非均衡的经济更不易趋于稳定。

科尔内的非均衡理论分析另有特色。他着重考察的是抑制性通货膨胀条件下的经济非均衡，也就是以短缺作为特征的经济非均衡。这时，有限的商品供给通过数量配额而给予需求各方。在这种情况下，如果增加财政支出，那么商品市场上的需求会进一步扩大，有限的商品供给的分配会更加紧张、更加困难，抑制性的通货膨胀也会更加严重。反之，如果试图用紧缩财政支出的手段来减少商品市场上的需求，那么在需求

减少的同时供给量也将减少，其结果仍然没有解决供给缺口问题。科尔内在研究非均衡经济时，把企业的预算硬约束与软约束作为讨论的重点之一。他的这些观点是很有价值的，因为企业的预算软约束的存在将使经济长期处于非均衡状态，也就是使经济中的短缺现象难以消除。

从国外经济学界对于非均衡经济的研究可以清楚地了解到，无论是经济增长还是经济波动，都必然受到经济的非均衡的制约。

在以哈罗德—多马模型、新古典模型甚至新剑桥模型作为代表的流行于50~60年代的经济增长论中，经济均衡论的影响是很深的。这种影响不仅反映于哈罗德—多马模型和新古典模型内，而且也反映于新剑桥模型内。新剑桥模型与哈罗德—多马模型、新古典模型的一个重大的区别，是在模型中引入了两类不同的收入以及收入分配对经济增长的制约作用。这当然应当被承认为新剑桥模型的贡献。然而，即使是新剑桥模型，也没有摆脱市场完善、价格灵活、信息传递通畅等公开的或暗含的假设；新剑桥模型所反映的经济增长过程中遇到的困难，主要来自收入分配方面的矛盾，而不是主要来自市场机制的不完善以及各个不同市场之间的不协调。这样，新剑桥模型依然解释不了经济增长过程中供求缺口的持续存在对于经济增长的制约作用。

需要说明的是，新剑桥经济增长理论的主要代表人物如琼·罗宾逊等人，从经济理论上说，是反对经济均衡假设的。他们从凯恩斯的著作中找到了经济非均衡的论点，并由此提出了一系列不同意后凯恩斯主流经济学派的论点。但为什么在经济增长分析中却未能摆脱经济均衡论的影响呢？原因在于他们的微观经济理论是不足的、有弱点的。他们忽略了对市场交易行为的分析、企业运行机制的分析、信息传递机制的分析。这就决定了他们的经济增长模型的内在缺陷。

在经济波动的研究中，流行于50~60年代的经济波动论以IS—LM分析（投资·储蓄—流动偏好·货币供给分析）、乘数—加速原理分析为代表的学说，是以经济均衡假设和经济的均衡增长假设为前提的。根据这些分析，如果说经济中产生波动的话，那么这只是由于经济运行中出现的投资偏多或储蓄偏多，货币供给过多或货币供给过少，以及技术设备更新的自身规律所致，而与市场机制的缺陷、价格的不灵活、信息传递的不通畅等等没有直接的关系。再说，IS—LM分析还忽略了宏观经济的微观经济基础的分析，乘数—加速原理分析则偏重于经济中的技术性因素的考察，它们同样不考虑宏观经济的微观经济基础。这也就决定了这些流行于50~60年代的经济波动论的严重不足。

60年代后期起关于经济的非均衡理论分析的进展，对于经济增长与经济波动的研究有重要的启示。经济的非均衡性质对于经济增长与经济波动的制约作用，经过非均衡理论的研究者的探讨，已经日益被学术界与经济界所承认。这些探讨并不是一概否定哈罗德—多马模型、新古典模型、新剑桥模型在经济增长理论研究领域内的意义及其在某些方面的可借鉴性，也并不是一概否定IS—LM分析、乘数—加速原理在经济波动理论研究领域内的意义及其在某些方面的可借鉴性。这些探讨的重要性在于：它们从另一个角度来分析经济增长与经济波动，从而使经济增长与经济波动的分析具有一个新的、与现实状况联系更紧的立足点；它们所得出的某些结论，比流行于50～60年代的有关理论分析更为符合实际。

经济非均衡分析在经济增长与波动方面所得出的主要结论可以归纳为以下四点：

1．如果市场不完善、价格不灵活、信息传递不通畅，那么投资与储蓄之间的转化将受到阻碍，供给与需求之间的不平衡一旦出现，就不易消失。市场只可能使供给缺口或需求缺口有所缩小，但这些缺口仍将继续存在。于是将出现非零失业率条件下的均衡或非零通货膨胀率条件下的均衡，这就制约了经济增长或导致经济的较大波动。

2．经济的非均衡使得不同市场（商品市场、资金市场、劳动力市场等）之间的协调更为困难。一旦一个市场出现了供给缺口或需求缺口，不仅这个市场上的缺口难以消除，而且必将引起其他市场上的缺口的产生与扩大。这种情况成为经济增长的制约因素或成为经济较大波动的重要原因之一。

3．经济的非均衡以价格刚性的存在作为特征。价格刚性对于经济增长与经济波动的主要影响表现于交易者根据经济生活中的假象来制定供给与需求的决策。但价格刚性并不一定意味着价格永远不变，而很可能意味着价格的突然的、较大幅度的变动，而且是不对称的变动。这对于经济增长固然不利；更重要的是，这可能引发较大的经济波动或使波动加剧。

4．经济的非均衡以及非零失业率与非零通货膨胀率条件下均衡的存在，必将改变市场交易双方的预期。预期的不稳定或预期的紊乱，将导致经济行为的不规则，导致经济行为的短期化。这不仅是加剧经济波动的一个重要原因，而且也是阻碍经济稳定增长与持续增长的有力因

素。

二、两类非均衡的区分与经济增长、经济波动的分析

按照非均衡理论的分析，并且结合我国的实际经济情况进行考察，我们可以对当前经济体制改革的思路以及经济增长的途径有较深入的认识。

要知道，既然经济的非均衡状态来自市场的不完善、价格的不灵活、信息传递的不通畅等，那么按照这样的逻辑，从理论上必定得出下列两个论断中的一个：

甲：由于经济的非均衡来自市场的不完善、价格的不灵活、信息传递的不通畅，因此，要使非均衡条件下的经济避免较大的波动，使经济有比较稳定的增长率，在经济体制改革中首先要实现的是放开对价格的限制和完善市场，使经济生活中的交易各方都处于平等竞争的位置上。经济增长将在市场完善和价格放开的环境中实现。

乙：由于经济的非均衡来自市场的不完善、价格的不灵活、信息传递的不通畅，这些都反映了市场机制的局限性。因此，在经济体制改革中的首要任务应当是加强宏观经济管理，以政府的数量配额与价格调节来弥补市场机制之不足，纠正市场不完善所造成的经济中的偏差。在经济增长方面，为了维持较稳定的经济，政府的数量配额（包括资金配额、劳动力配额、生产资料配额等）将起着主要的作用。这就是说，非均衡条件下的经济增长应当是以政府的数量配额为主的经济增长。

以上所指出的甲、乙两种论断，都来自对经济的非均衡分析。论断甲是经济改革中的“价格改革主线论”的简要表述，论断乙是经济改革中的“宏观调控主线论”的简要表述。就经济增长与经济波动的分析而言，按照论断甲的说法，非均衡条件下的经济波动主要归因于市场不完善和价格不灵活，避免经济波动的主要改革措施或维持经济较稳定增长的主要改革措施就必然是放开价格和完善市场。按照论断乙的说法，非均衡条件下的经济波动主要归因于市场不完善或市场机制本身的局限性，避免经济波动的主要改革措施或维持经济较稳定增长的主要改革措施就必然是加强宏观经济管理，把政府的数量配额和价格调节放在主要地位。

然而，对我国的实际经济情况进行研究后却发现，无论是在经济体制改革中按照“价格改革主线论”的主张去做，还是按照“宏观调控主线

论”的主张去做，都不可能顺利地推进我国的经济体制改革，也不可能避免我国经济的较大波动或维持我国经济的较稳定的增长。换言之，“价格改革主线论”或“宏观调控主线论”都是不符合我国经济的实际状况的。

这样就产生了一个新的问题。要知道，经济改革中的“价格改革主线论”与“宏观调控主线论”都来自对经济的非均衡分析。既然这两种论点都不妥当，那么将会引起人们的进一步思考：究竟是非均衡理论错了呢，还是一般的非均衡理论分析不够完善，从而解释不了像我国经济体制改革、经济增长与波动这样复杂的问题呢？

非均衡理论相对于均衡理论而言，确实是经济理论的一种进展。经济均衡的假设依存于市场完善、价格灵活、信息畅通等前提。如果不具备这样一些前提，那么经济均衡的假设就不能成立，而现实经济必定是非均衡的经济，从而只能运用非均衡分析方法来进行分析。可见，我们不能由于“价格改革主线论”与“宏观调控主线论”不适合我国当前的经济现实而认为非均衡分析是错误的。问题不在于非均衡分析本身。

那么，问题究竟何在？问题在于一般的非均衡理论分析不够完善，以至于解释不了像我国经济体制改革、经济增长与波动这样复杂的问题。

需要指出的是：一般的非均衡理论分析并未把微观经济单位企业是否具有充分活力考虑在内，而是暗含了这样一个假定，即企业作为微观经济单位已经具有充分活力；因此，经济非均衡现象主要来自市场的不完善、价格的不灵活、信息传递的不通畅等。正因为如此，所以由此推出的结论或者是以价格改革为经济改革的主线，或者是以加强宏观经济管理为经济改革的主线。这就是一般的非均衡理论分析的不完善之处。我在《非均衡的中国经济》（1990年经济日报出版社版）一书中，就这一问题提出了如下的看法：经济的非均衡分为两种类型，第一类经济非均衡是指市场不完善条件下的非均衡，第二类经济非均衡是指市场不完善和企业缺乏活力条件下的非均衡。现阶段的中国处于第二类非均衡状态，中国的经济体制改革应当相应地分为两个阶段，即应当以深化企业改革为主线，使企业从缺乏活力转为具有充分活力，从不自愿经营和不自愿盈亏转为自愿经营和自愿盈亏，以便使中国经济由第二类非均衡状态过渡到第一类非均衡状态。然后，以完善市场和放开价格作为经济体制改革的主线，以便使中国经济由第一类非均衡状态逐渐向均衡状态靠拢。对两类经济非均衡的区分，以及针对第二类经济非均衡的特征进行研究，就是我所著《非均衡的中国经济》一书的基本论点，也是我

在非均衡分析中不同于一般的非均衡理论分析的地方。

区分两类不同的经济非均衡，对于研究中国的经济增长与波动是有意义的。经济增长在第二类非均衡条件下所受到的制约，要比在第一类非均衡条件下多得多；导致经济波动的因素在第二类非均衡条件下也要比在第一类非均衡条件下多得多。同样的道理，与在第一类非均衡条件下的情形相比，在第二类非均衡条件下，维持经济的较稳定增长或避免经济出现较大的波动要困难得多。如果我们不了解第二类非均衡状态与第一类非均衡状态的区别，只把市场的不完善、价格的不灵活、信息传递的不通畅看成是对于经济增长的主要制约因素，看成是引起经济产生较大波动的基本原因，从而根据这些判断来选择维持经济稳定增长的对策或制定防止、消除经济较大波动的对策，那么很可能不得要领，以至于选择的对策收不到应有的成效。正如医生在给病人治疗时，如果对病情的诊断有错误，对病因判断错了，那么就会开出不恰当的处方，不但医不好病，反会延误病情。

假定不区分两类不同的经济非均衡，不了解当前的中国经济正处于第二类非均衡状态，而是把完善市场和放开价格作为维持经济稳定增长与防止经济较大波动的主要对策，或者把加强宏观经济管理作为这样的对策，那就忽略了企业作为投资主体和消费基金发放主体的不自主经营、不自负盈亏对经济增长与波动的最有力的制约作用。在第二类非均衡条件下，企业还没有成为自主经营、自负盈亏的独立商品生产者；企业的投资主体、消费基金发放主体的地位，或者是虚的，或者不受约束，其结果必然造成以下的问题：

1. 企业想投资，但由于缺乏这方面的自主权，投资意愿未能实现，从而经济增长难以与企业经济效益的增长同步。

2. 企业不具有投资的自我约束机制，也不承担投资风险、生产经营风险，以至于在投资增长过程中，重复建设难以避免，规模效益无法实现，从而经济增长的过程可能同时就是库存品积压数量增长的过程、企业亏损额扩大的过程。

3. 企业的行为是短期化的，消费基金的发放是为了企业眼前利益，企业的经济增长后劲遭到破坏，设备老化，技术陈旧，经济增长将因此受到限制。

4. 企业缺乏内在约束机制，消费基金的发放可以不受本企业经济效益的限制，或者，工资奖金虽然同企业经济效益“挂钩”，但企业经济

效益却是掺了水的、虚假的。这样，工资奖金越是同企业经济效益挂钩（也就是不合理的挂钩），企业的实际损失就越大，国家因此遭受的实际损失也越大，这不能不限制经济增长。

5. 企业在投资方面缺乏自我约束以及在消费基金发放方面缺乏自我约束，对宏观经济的消极影响是不可低估的。消极影响之一是导致投资膨胀与消费基金增长过快。这时，即使经济增长率可能高一些，但经济增长却是依靠投资膨胀与消费基金增长过快支撑的。这样的经济增长不可能持久，而且很可能为此后的经济巨大震荡种下了根源。消极影响之二是企业的亏损面增加和财政收支的紧张，而财政收支的紧张又成为经济不稳定的重要原因和经济持续增长的巨大障碍。

6. 企业的不自负盈亏，特别是政企不分的事实，使得企业的关、停、并、转十分困难，企业资产存量的流动缺乏途径，生产要素也无法在社会范围内优化组合。其结果，产业结构的调整迟迟不能顺利进行，“瓶颈”现象也迟迟不能消除。这样就制约了持续的经济增长。

7. 在企业不自主经营、不自负盈亏的条件下，不仅企业资产存量难以流动，从而通过企业资产存量的流动来调整产业结构的意图不易实现，而且通过投资增量来调整产业结构的意图也是很难实现的。投资增量是有限的，有限的投资增量是不容易扭转整个产业结构失调的局面的。但问题不限于此。问题在于：企业资产存量好比一潭死水，投资增量好比活水，今年的投资增量一投入企业后，就转化为来年的企业资产存量。这就等于不断地把活水变为死水，活水再多也无济于事。其结果是“瓶颈”依然存在，经济增长依然受到巨大的限制。

8. 在第二类非均衡条件下，由于作为微观经济单位的企业往往同政府部门没有分开，在政府采取宏观经济调节手段时，企业或者难以通过调整自己的经济活动来适应宏观经济形势的变化，或者因缺乏自我约束机制而对宏观经济调节手段作不出适当的反应，于是宏观经济调节手段收不到应有的效果。诸如投资缺乏利息弹性、进出口缺乏汇率弹性、产量缺乏价格弹性等等，就是宏观经济调节手段效果差的反映。这样，一旦发生经济波动，经济内部就缺乏内在调节以趋向稳定的机制，而不得不依靠自上而下的行政干预措施来缓和矛盾。在第二类非均衡条件下，自上而下的行政干预措施往往是严重滞后的，即必须等到下面的问题已经相当尖锐了，上级（甚至是最高决策当局）才会下决心采取调整措施。加之，行政干预措施的不当给经济的稳定所带来的消极性后果，也是不容忽视的。

以上所说的这些，足以说明处于第二类非均衡条件下中国经济增长与经济波动的特殊性质。因此，在对现阶段中国的经济增长与波动问题进行研究时，不仅需要从经济增长与波动本身的有关因素来分析，而且需要以第二类非均衡作为整个分析的前提。

三、对非均衡理论中的“短线决定原则”的理解

在非均衡理论中，一个重要的原则是“短线决定原则”（或称“短边原则”）。这被认为是制约经济增长与经济波动的关键所在。“短线决定原则”之所以成立，是因为在非均衡经济中，由于市场不可能起着充分地协调供求关系的作用，短线的存在是不可避免的，而短线的存在则使得生产要素只可能按低限的要求进行组合。这种情况正如一个由若干块木板条所组装成的木桶一样：如果这些木板条长短不一，那么组装成的木桶究竟能够盛多少水不取决于较长的那些木板条，而惟一地取决于最短的那块木板条。把水注入这样的木桶后，只要水高于最短的那块木板条的长度，水就向外漏出了。这就是“短线决定原则”的含义。

研究非均衡经济中的经济增长与经济波动时，从“短线决定原则”来理解，至少有三个问题值得我们作进一步思考，这三个问题是：

1. 为什么短线会长期存在？若干年以前的短线，经过这些年的经济增长，至今仍然是短线，甚至短线更短了，即木桶的最短的那块木板条又缩短了，这是什么缘故呢？

2. 照理说，生产要素之间存在着一定程度的可替代性或互补性，也就是说，即使存在着短线，但短线不是不可以靠某些长线来替代和补充的。然而事实却表明，在非均衡经济中，长线的生产要素对短线的生产要素的替代和补充却是十分有限的，这对经济增长与经济波动有较大的影响。需要研究的是，为什么生产要素之间的替代与互补受到严重限制，从而使“短线决定原则”一直起着制约经济增长与经济波动的关键作用？

3. 为了缓和短线所造成的经济困难，在通常情况下，还可以采取生产要素重新组合的办法，以促进经济增长，减少经济波动。不妨仍以木桶为例。虽然木桶盛水量的多少取决于组装成木桶的最短的那块木板条，但未尝不可以采取下述两个办法之一作为补救措施。一是把长的木板条锯下一段，钉在最短的木板条之上。这就相当于上面提到的各种不

同的生产要素之间的互补，即以长线补短线、长线代短线的做法。二是把这个木桶拆开，用原有的各块木板条重新组装成一个容器，也许这个新组装成的容器可以盛较多的水。这就相当于这里所提到的生产要素的重新组合。然而事实同样表明，生产要素难以重新组合。也许是由于这个长短边不等的木桶组装得太牢了，难以拆开它，因此也就无法把各块木板条重新组装为一个新的容器。于是就应当思考：为什么原有的木桶组装得这么牢？难道就找不到把它拆开的办法吗？难道生产要素真的那么难以重新组合吗？

这三个问题都与非均衡条件下的经济增长与经济波动的特点有关。在研究中，我们必须结合两类非均衡的区分，结合我国当前正处于第二类非均衡状态这一事实，分别考察这三个问题，以便进一步理解“短线决定原则”。

（一）第二类非均衡经济中的“短线顽症”

这里所说的“短线顽症”，就是指经过多年的经济增长与结构调整而未能消除久已存在的短线甚至短线更为严重的状况。原因究竟何在？要知道，如果经济处于均衡状态，市场机制的作用将促进生产要素自由流动，资源将在价格信号指引之下重新配置，从而使短线消失。这种情况下，即使在经济增长过程中仍会出现新的短线，但“短线顽症”则是不存在的。可见，“短线顽症”的存在同生产要素不能自由流动有关，同资源难以重新配置有关。

假定经济处于第一类非均衡状态，即非均衡的根源在于市场不完善、价格不灵活、信息传递不通畅，那么通过完善市场和放开价格等措施，生产要素的流动性将显然增大，价格信号将对资源的重新配置发挥指引作用，“短线顽症”也就有可能逐渐被克服。某些资源的稀缺也许会给资源的重新配置带来困难，使得短线不容易迅速消失。但稀缺资源在相当大的程度上是可以通过资源的相互替代或国外资源的利用来加以缓和的，所以不至于形成“短线顽症”。

然而，正如前面所指出的，第二类非均衡下的情况远比第一类非均衡下的情况复杂。“短线顽症”是第二类非均衡状态中所特有的病症。生产要素流动的受阻、产业结构调整的难度、资源重新配置设想的难以落实，在第二类非均衡条件下，可以归结为“无信息、无动力、无渠道”所致。

“无信息”是指：由于缺乏活力的企业在不完善的市场上进行活动，价格方面的信息必然是不准确、不及时、不通畅的。由于作为微观经济单位的企业受到行政主管部门的严格控制，政府既无法从市场及时地获得准确的信息，又不能从企业那里及时地获得准确的信息。因此，政府的数量调节也往往同市场实际有所出入。其结果，资源的配置只好在缺乏信息的条件下进行。短线被误认为非短线，长线被误认为非长线，无效供给被误认为有效供给等现象也就屡见不鲜。

“无动力”是指：尽管客观上确实地存在产业结构失调的状况，企业也得到了有关短线与长线的确切信息，但由于企业不自主经营与不自负盈亏，不承担生产经营的风险，因而也就缺乏调整产品结构动力，不愿冒结构调整的风险。

“无渠道”是指：即使作为微观经济单位的企业和作为宏观经济管理部门的政府都得到了有关短线与长线的确切信息，并且都有结构调整的意愿，但在政企不分、企业附属于行政主管部门、经济被不合理地分割为“条条所有”、“块块所有”等条件下，生产要素的流动（姑且不谈自由流动）是没有渠道的，资源的重新配置（姑且不谈优化配置）也是难以落实的。这一切充分说明了“短线顽症”的不可避免性。

（二）第二类非均衡经济中生产要素替代的困难

前面曾指出，如果经济中存在着短线，那么只要存在着生产要素的可替代性，以长线补短线，那么短线便可以缓和下来。当然，生产要素的可替代，并不是绝对的，而是有条件的，即唯有在一定条件下才能实现生产要素的替代。此外，生产要素替代的结果，既有可能使效率不受损失，也有可能使效率下降。假定生产要素的替代使效率下降的幅度小于因缺乏某种生产要素而导致的效率下降幅度，那么替代仍是可行的。

在经济均衡状态中，凡有可能实现生产要素替代的场合，价格因素以及由此决定的成本与收益比较将促使企业选择生产要素替代的有效方式，从而缓和短线问题。假定经济处于第一类非均衡状态，那么尽管生产要素的替代会因价格的不灵活与价格信号的扭曲而遇到困难，但通过市场的完善化与价格的放开，生产要素替代中的障碍是可以克服的。然而，在第二类非均衡条件下，情况便大不相同了。问题不仅在于生产要素市场的不完善，而主要在于一些生产要素的供给与需求同生产要素供给者与需求者依附于行政主管部门的状况联系在一起。比如说，在资金

短缺而又可能以人力资源替代资金的场合，由于人力资源是被政府的数量配额所制约的，人力资源是被分割为部门持有、地方持有、单位持有的，于是生产要素替代便被置于难以实现的境地。又如，在某些物质的生产要素可以彼此替代的场合，往往需要追加投资、改造技术设备才能实现这种替代。但一方面，即使是物质的生产要素，由于它们分别由不同的部门和地方所提供，又被不同的部门和地方所需要，在条条块块分割的条件下，供求之间往往不易协调；另一方面，追加投资又必然涉及投资体制方面的问题，如果传统的投资体制不改革生产要素的替代仍然难以实现。

（三）第二类非均衡经济中生产要素重组的障碍

前面也已经指出，经济中的短线问题还可以通过生产要素的重新组合来加以缓和。但问题在于：在第二类非均衡经济中，为什么生产要素的重新组合如此困难？以木桶为例，为什么长短边不等的那个旧木桶如此牢固而不易拆开和重新组装？这正是在研究现阶段中国经济增长与经济波动时不能忽略的。

要实现生产要素的重新组合，至少需要三个条件：一是生产要素的产权十分明确；二是生产要素可以流动；三是生产要素的重新组合者是胜任此项工作的。

第二类非均衡经济中生产要素重新组合之所以困难，首先是由于上述第一个条件和第二个条件尚未具备。具体地说，第二类非均衡经济的特征是公有制的产权不够明确，政企不分，从而企业不能自主经营和自负盈亏，缺乏内在约束与外在约束。其结果，生产要素不易流动，生产要素重新组合后的收益归属不确定，生产要素重新组合过程中的风险承担责任不明确，这就是由于上述第一个条件和第二个条件不具备而导致的生产要素重新组合的困难。

再从上述第三个条件来看。生产要素重新组合的实现有赖于能够胜任生产要素重新组合工作并能因此获取潜在利益的生产要素重新组合者的存在。在第二类非均衡经济中，谁充任生产要素重新组合者？由于政企没有分开，企业尚未成为自主经营、自负盈亏的商品生产者，企业难以胜任生产要素重新组合者的工作。如果不由企业来重新组合生产要素，而由政府来重新组合生产要素，结果又将如何？当然，不是说不能由政府充当生产要素的重新组合者，而是说，在上述第一个条件和第二

个条件未具备时，即使由政府来重新组合生产要素，也未必能实现这一任务。这是因为，如果这里所说的政府是中央政府，那么中央政府虽然有很大权威性，也有相应的重新组合生产要素的手段，但中央政府毕竟是中央政府，它起着宏观经济管理者的作用，不可能从事直接的生产要素重新组合工作。实际上，这里所说的政府主要是指各级地方政府。试问：地方政府在遇到体制上的种种障碍而难以重新组合生产要素时，究竟能在多大程度上打破这些障碍？地方政府的权威性是否足以打破这些障碍？再者，由地方政府来直接从事生产要素的重新组合工作是否有效率？更重要的是，地方政府能否保证新的生产要素组合方式产生较高的效率？在第二类非均衡经济中，很难认为地方政府就一定能胜任生产要素重新组合工作。因此，这些情况说明了上述第三个条件同样是不具备的。加之，无论是企业充当生产要素的重新组合者还是政府充当生产要素的重新组合者，都需要有富于创新意识和现代生产组织能力的人来从事这项活动。而在中国的现实情况下，这样的创新者、组织者是远远不够的。这也可以从另一个侧面说明生产要素重新组合的困难。

四、经济增长过程中生产与流通之间的关系

在经济生活中，生产与流通之间的关系是值得研究的。一些著作在分析经济增长因素时，往往侧重于生产领域内的考察。这里包括：对投入的资金数量及其在国民收入中比例的考察，对投入与产出之间的比例的考察，对各种生产要素（包括技术、人力等）在经济增长中的贡献大小的考察，对生产要素组合方式及其对企业经济效益与宏观经济效益的作用等等。至于流通因素对经济增长，特别是对经济持续增长的影响，通常被置于较为次要的地位。造成这种情况的原因主要有三点。第一，只是片面地看到生产对流通的决定作用，而忽视了流通对生产的反作用。第二，以产值作为经济增长率计算的依据，似乎只要产值多了，就等于经济增长了，而不考虑产值中有多少是属于无效供给，而无效供给的增长是不能代表经济的实际增长的。第三，对流通因素的不重视与对市场作用的不理解，使得对流通的作用不认识或只有片面的认识。于是在经济增长与经济波动的分析中，流通因素的分析被置于次要地位就不足为奇了。

然而，在我国经济中，特别是在从传统经济体制向新的经济体制过渡的过程中，流通与消费对于生产与分配的重要性已经越来越明显。这

是因为，在走向新的经济体制的道路上，人们在经济生活中的自主性、积极性不断增长。人从事生产，而生产是为了满足人的需要。人的需要日益靠市场上的交易行为得到满足，生产出来的各种商品将越来越多地通过市场来实现。商业起着促进生产、协调分配、保证流通、指导消费的作用。就所有的个人消费品、绝大多数公共消费品以及相当数量的生产资料而言，供给的有效性与流通领域内的工作是否顺利展开有密切的关系。流通渠道的不通畅，必定把本来可以成为有效供给的供给变成无效供给，进而阻碍着经济的增长，导致经济的较大波动。

流通对于经济增长的重要意义还可以从生产要素的流动和重新组合方面进行分析。要知道，生产要素分为现实的生产要素和潜在的生产要素两类。流通所促成的生产要素的流动和重新组合，首先是指现实的生产要素的流动和重新组合而言。但毫无疑问，现实的生产要素的流动和重新组合必将促使潜在的生产要素被动员出来。比如说，对现实的劳动力资源的充分利用，以及现实的劳动力资源得

以在较大范围内自由流动和重新组合，必将导致潜在的劳动力资源投入市场，以增加现实的劳动力资源。资金的情况亦复如此。如果现实的资金得以充分利用，并得以自由流动，得以在效率增长的基础上同其他生产要素相结合，那么就会有更多的资金被动员出来。这些就是潜在的生产要素向现实的生产要素的转化，这种转化对经济增长是有利的。在我国现阶段，流通在这方面的作用尤其重要。由于我国存在着大量潜在的生产要素，于是在现实的生产要素不足（包括绝对意义上的不足和相对意义上的不足）的条件下，通过流通领域内的改革与努力开展工作，把潜在的生产要素转化为现实的生产要素，可以使经济持续增长。

关于流通问题在我国经济生活中的重要性，已如上述。但近年来，我们却在经济生活中发现了一种反常的现象，即“债务链”的存在。“债务链”虽然与经济紧缩、企业产成品积压、国家投资资金缺口的出现以及由此引起的企业之间的相互拖欠货款有直接的关系，但如果我们把分析的重点转向经济的非均衡，特别是转向第二类非均衡，那么对流通领域出现的这一问题将会有新的、较深刻的认识。

不能把“债务链”仅仅看成是由于产业结构的不协调或产品结构的不协调所致。当然，产业结构、产品结构的不协调会使得一些企业的产成品滞销、积压，从而无法按期向交易的另一方支付货款。但这绝不是造成“债务链”的基本原因。产业结构或产品结构的不协调已经好多年了，为什么以往不曾导致“债务链”而只是在近两年才出现“债务链”呢？再

说，即使产业结构与产品结构不协调，那么为什么不能采取有效措施予以调整呢？造成产业结构与产品结构不协调的原因，也就是造成“债务链”的深层次原因是什么呢？可见，对这个问题的分析不能仅限于结构不协调的分析。

假定认为“债务链”主要是由经济紧缩引起的，那么这种看法同样较为肤浅。这是因为，经济的紧缩是一种政策措施，“债务链”有其深刻的经济体制背景，并非因某种政策措施而出现。何况，在出现“债务链”之后，政策就不断由“紧”向“松”转变，例如信贷投放大量增加。然而，为解开“债务链”而注入的贷款并没有起到预期的作用，“债务链”依然存在。这不恰好说明紧的经济政策不是形成“债务链”的主要原因么？

根据对第二类非均衡的特征的分析，应当对“债务链”问题作如下的解释：政企不分是第二类非均衡的基本特征，而商品经济的发展又是同政企不分这种状况直接冲突的，因此，“债务链”的根源在于政企不分与商品经济发展之间的矛盾。具体地说，假定商品经济不发展，这时即使政企没有分开，但不会引起企业与企业之间的债务拖欠，“债务链”也不会出现。假定政企已经分开了，那么即使商品经济发展很快，甚至出现了经济的暂时不景气，“债务链”也不会出现。债权的一方可以根据法律向欠债的一方索债；欠债的一方还不起债，就以资产清偿债务，直到破产还债。现阶段中国经济的特点则是：一方面，商品经济与过去相比已有较大的发展；另一方面，第二类非均衡依然存在。换言之，在现阶段的中国，由于商品经济已经有较迅速的发展，而政企不分则依然成为经济生活中的现象。于是在企业之间的交易日趋频繁的情况下，一旦由于某种原因而出现了甲企业对乙企业的货款拖欠、乙企业对丙企业的货款拖欠，欠债的企业与债权人之间的关系就复杂了。所有欠债的企业后台都是政府部门，债权人无法要求欠债的企业如期清偿债务，也无法实现以欠债的企业资产来抵债。这种情况与欠债的一方是自负盈亏的企业是很不一样的。可见，只要“债务链”的各个环节上的企业是政企不分的企业，这些企业的后台都是政府部门，那么企业之间的债务纠纷实际上就是政府部门之间的一种纠纷，这种纠纷是不能靠破产还债的方式来解决的。于是债务越拖越多，“债务链”越拉越长。可见，这种债务无非是政企不分的企业欠政企不分的企业的债。要消除“债务链”，从根本上说，必须深化企业改革，使政企真正分开，使企业成为自主经营、自负盈亏的商品生产者，也就是使经济及早从第二类非均衡状态过渡到第一类非均衡状态。

从经济的非均衡性质可以进一步了解流通领域内的另一个重要问题，即流通的社会化问题。由于经济增长的持续与稳定不仅取决于生产因素，而且也取决于流通因素；由于经济的较大波动不仅来自生产领域内“瓶颈”的制约，而且也来自流通渠道的阻塞，来自供给的无效性，因此，对流通社会化问题的考察应当被视为经济增长与波动研究的一个不可缺少的组成部分。对当前中国经济增长与波动的研究尤其如此。

从现象上看，流通渠道不畅，某些商品的库存量过大而另一些商品的货源不足和供应紧张都值得注意，但不可能仅仅从流通渠道方面解决这些问题。在非均衡条件下，流通社会化的含义与均衡条件下是不相同的。如果经济处于均衡状态，市场完善，价格灵活，信息通畅，企业又是自主经营与自负盈亏的商品生产者，于是流通的社会化必然表现为价格放开条件下的自由流通与生产企业的自产自销。如果经济处于第一类非均衡状态，企业自主经营与自负盈亏，但市场不完善、价格不灵活、信息传递不通畅，这时，自由流通将受到阻碍，生产企业的自产自销在客观上会遇到困难，供给缺口或需求缺口的存在使得市场的价格调节发挥不了应有的作用，从而必须在一定程度上依赖数量调节，包括政府的数量调节或市场自发的数量调节。如果经济处于第二类非均衡状态，情况便更加复杂。这时，除了市场不完善、价格不灵活、信息传递不通畅而外，企业也并非自主经营和自负盈亏的企业，企业活力是远远不足的，生产资料的供求矛盾通常比消费品的供求矛盾更为尖锐，发展生产资料市场也比发展消费品市场更为迫切。按照这种观点，在第二类非均衡条件下，流通社会化应当被理解为：发展各类市场，尤其是生产资料市场，在有关市场上尤其是在关键性的生产资料市场上采取数量调节与价格调节相结合的调节措施，以减少流通中的阻碍，促进社会范围内生产要素的有效组合。至于数量调节与价格调节各自所占的比重，则依据经济的非均衡程度来确定。这是因为，在没有条件实现最优选择的场合，次优选择将是可行的。在非均衡经济中，按数量调节与价格调节相结合的方式来理解流通的社会化，符合次优选择原则。在这里，一个应当注意的问题是：经济非均衡中数量调节对价格调节的替代并不是不完全竞争对完全竞争的替代，而是一种不完全竞争对另一种不完全竞争的替代。既然非均衡条件下的市场不可能是完全竞争的市场，那么市场的完善化同数量调节之间肯定存在一些矛盾，否认这些矛盾的存在及其对经济增长与经济波动的影响是不现实的。现阶段我们应该做到的和能够做到的，是尽量提高流通领域的管理水平，减少流通渠道中的阻塞，深化商业改革来缩小流通社会化的阻力，以及从多方面着手以减少经济的

非均衡程度，从而达到缓解市场的完善化同数量调节之间的冲突。

以上我们着重探讨了非均衡条件下流通对经济增长与经济波动的制约，对我国近年来出现的“债务链”的深层次原因进行了分析，并对非均衡经济中的流通社会化问题作了解释。通过这些论述，我们对当前我国的经济增长与经济波动问题有了进一步的认识：

第一，即使单独从流通的角度来考察，我国经济所处的第二类非均衡的性质对流通领域的深刻影响也已成为制约经济增长与经济波动的有力因素。而只有把第二类非均衡的性质对生产领域的影响与对流通领域的影响综合起来考察，才能更好地说明我国经济增长与波动的特征。

第二，从流通领域的考察可以得出如下的结论，即如果不从增强企业活力着手进行经济体制改革，而听任政企不分的状况长期存在，那么不仅无法导致经济的持续增长，而且也无法避免经济的较大波动。这充分说明了第二类非均衡条件下经济体制改革的特点。

五、关于正常波动与非正常波动的思考

由于我们所要研究的是非均衡条件下的经济波动，而不是均衡条件下的经济波动，因此，我们不得不涉及正常波动与非正常波动的问题。这是因为，在均衡条件下，一切经济波动都可以被认为是非正常的，正常波动实际上并不存在。然而，在非均衡条件下，情况与此显然不同。非均衡条件下，或者存在着经常性的供给缺口，或者存在着经常性的需求缺口，市场的作用只表现为使缺口有所缩小，而不能使缺口消失。也就是，非均衡实质上是一种非零失业率与非零通货膨胀的均衡，即非均衡实质上是伴随着一定的失业率或一定的通货膨胀的均衡（伴随着一定的需求缺口或一定的供给缺口的均衡）。

我们可以把经济中的任何缺口都用“短缺”二字来表示。如果经济中出现的是物价上涨，那么这表明有过多的货币在追求较少的商品，从而可以用商品短缺来表示。如果经济中出现的是失业，那么这表明有过多的劳动者在追求较少的工作岗位，从而可以用工作岗位短缺表示。同样的道理，资金不足意味着资金的短缺，而资金过剩则意味着投资场所的短缺；资源供给中“瓶颈”的存在意味着相应的资源的短缺，而经济中的资源闲置则意味着相应的资源使用单位（资源用户）的短缺等等。既然任何缺口都可以用短缺来表示，那么在非均衡条件下，必然存在着两种

短缺，一是正常短缺，一是非正常短缺。

如上所述，在非均衡条件下，正常短缺是不足为奇的，也是难以避免的。当然，这并不是说无法以任何手段来消除某一种短缺；而是说，假定消除非均衡经济中的正常短缺，那么很可能要为此作出较大的牺牲，即必须以另一种效率损失更大的短缺作为代价，才能使某一种正常短缺消失。比如说，假定经济中的正常工作岗位短缺表现为失业率2%，这一失业率（2%）就是正常的工作岗位短缺度。如果硬要采取措施来消除这2%的失业率，即让失业者全部就业，那并不是说无法做到这一点，但要这样做，就可能造成一些工作场所的人浮于事，从而造成效率的较大损失。换言之，在上述情况下，正常短缺度之内的公开失业率的消失，是以隐蔽失业率的增长、效率的较大损失作为代价的。

我们也可以按类似的方式来分析非均衡条件下属于正常短缺度之内的公开通货膨胀率的消失如何以隐蔽通货膨胀率的增长、效率的较大损失作为代价。根据以上的分析，非均衡条件下宏观经济运行的“警戒线”不可能是一条以零短缺度（零失业率、零通货膨胀率等）为界的“警戒线”。这里所说的“警戒线”是指政府调节所依据的线。如果经济运行在“警戒线”以下，政府不需要调节；只有经济运行在“警戒线”以上时，政府才需要按照具体的情况采取适当的调节措施，对经济的运行进行协调。非均衡条件下的“警戒线”的位置与正常短缺度的大小直接有关。假定在经济中有一条零短缺度（零失业率、零通货膨胀率等）的线，这条线并不是非均衡条件下的警戒线。“警戒线”在这条零短缺度的线之上，二者之间有一段距离，这就是正常短缺度。“警戒线”之上，则是非正常短缺度。可以用下面的简图来表示（见图1）。

图1

在厉以宁等所著《走向繁荣的战略选择》一书第八章“计划与市场在

资源配置中的结合”中，对“警戒线”概念作了如下的表述：有两条“警戒线”，即“第一警戒线”与“第二警戒线”。“第一警戒线”是用以表明市场调节与计划调节之间的界限的，“第二警戒线”是在“第一警戒线”之上的又一条“警戒线”。究竟政府的计划调节是以直接调节为主还是以间接调节为主，则需要视超出“第一警戒线”的情况而定。在“第一警戒线”与“第二警戒线”之间，政府的计划调节以间接调节为主，而当“第二警戒线”被突破后，这表明以间接为主的调节方式未能达到预定的调节目标，所以有必要转为以直接调节为主。^[7]

图1中所标出的“警戒线”，相当于这里所提到的“第一警戒线”。这里，在加上“第二警戒线”之后，将得出下面这个简图（见图2）。

图2

在《走向繁荣的战略选择》一书中，对此曾说明如下：“这里所说的间接调节为主或直接调节为主时，都不排除少数产品在资源约束程度较强而短缺度较高时，需要采取计划配额；也不排除在进行间接调节和直接调节时，需要参照市场价格和市场供求的变动情况。”^[9]

以上，“第二警戒线”把非正常短缺度分为两部分。“第二警戒线”与“第一警戒线”之间的非正常短缺度，可以称为“非正常短缺度I”。这时，政府的调节以间接调节为主。“第二警戒线”以上的非正常短缺度，可以称为“非正常短缺度II”。这时，政府的调节以直接调节为主。如果经济中的非正常短缺度达到了非常严重的地步，以至于政府必须采取更强有力的干预措施，那么，政府可以动用“最后手段”，也就是非常

规的干预经济的手段。“最后手段”的存在及备用，表明了政府调节经济的决心和力量，表明了政府绝不会听任经济无休止地恶化下去。^[10]

于是可以得出下面的简图（见图3）。

图3

现在，我们在明确了零短缺度、正常短缺度、非正常短缺度I、非正常短缺度II、“第一警戒线”与“第二警戒线”等概念之后，就可进而理解正常波动与非正常波动了。

什么是非均衡条件下经济的正常波动？我们可以初步做出这样的判断：尽管经济运行离开了零短缺度线，但只要经济运行仍然在正常短缺度的范围内波动，而没有突破“第一警戒线”，那么这样的经济波动可以被视为正常波动。

什么是非均衡条件下经济的非正常波动？我们也可以初步做出这样的判断：经济运行突破了“第二警戒线”，而在非正常短缺度II的范围内波动，那么这样的经济波动可以被视为非正常波动。

如图3所示，零短缺度线与“第一警戒线”之间是正常短缺度，经济运行在这个范围内，呈现着非均衡条件下经济的正常波动；“第二警戒线”以上是非正常短缺度II，经济运行在非正常短缺度II的范围内，波动是非均衡条件下经济的非正常波动。那么，当经济运行在“第一警戒线”与“第二警戒线”之间时，这样的经济波动是非均衡条件下的正常波动还是非正常波动？这个问题需要进一步分析，而不能简单地认定是正常波动还是非正常波动。

我们知道，经济波动通常按经济增长率的变动来表示。经济增长率与经济生活中的短缺度并不是同一个概念。经济增长率大小并不能准确地反映短缺度。比如说，经济增长率高，既可能是在正常短缺的范围内实现的，也可能是在非正常短缺的范围内实现的。与此相似，低的经济增长率既可能是在非正常短缺的范围内实现，也可能在正常短缺的范围内实现。因此，当我们就个别年份或少数年份进行考察时，我们通常难以发现经济增长率与短缺度之间的紧密联系，而且使用经济增长率的大小作为衡量经济波动的依据还掩盖了短缺度的变动率。如果我们简单地以经济增长率变动的状况作为经济正常波动与非正常波动的判断标志，那么不可避免地会导致两个错误。

第一，这一切似乎与经济的非均衡性质无关。非均衡条件下的正常短缺与非正常短缺之间的区别在经济增长率变动的形式下被掩盖了，于是既说明不了波动的真相，更看不出波动的趋势。

第二，由于经济增长率高有可能在非正常短缺的范围内实现，而经济增长率低却有可能在正常短缺的范围内实现，因此，在依据经济增长率变动来判断经济波动时，特别是在制定消除经济波动的对策时，有可能把人们引入错误的途径，即宁肯以非正常短缺度的增大来维持较高的经济增长率，而不愿以非正常短缺度的缩小来维持较低的经济增长率。

由此可见，在判断非均衡条件下经济的正常波动与非正常波动时，不能简单地以经济增长率的变动情况或经济增长率的大小作为依据，而应当以短缺度的变动情况或短缺的多少作为依据。

如果按较长一段时间来分析，对这一点会有更清楚的认识。这是因为，在非均衡条件下，假定经济持续在非正常短缺度的范围内运行，因非正常短缺而造成的困难必定使经济增长率受到影响，经济增长必定会有较大的起落，经济的波动也就必定明显地表现出来。

现在让我们回到前面提出的问题上，即经济运行在“第一警戒线”与“第二警戒线”之间时，究竟是非均衡条件下的正常波动还是非正常波动？这就需要根据较长时间经济增长过程中短缺度的大小来判断。有两种不同的情形：

一种情形是：前一时期的经济运行于正常短缺度的范围内，经济增长一直是在正常短缺度的基础上实现的。这时，如果经济运行突破了“第一警戒线”，并且在“第一警戒线”与“第二警戒线”之间波动，那么可以认为这是一种非正常的波动。

另一种情形是：前一时期的经济运行于非正常短缺度II的范围内，即运行于“第二警戒线”之上，经济增长一直是在非正常短缺度II的基础上实现的。这时，如果经济运行落到了“第一警戒线”与“第二警戒线”之间，即在非正常短缺度I的范围内波动，那么可以认为这是一种正常的波动，因为相对于前一时期而言，经济波动已逐渐趋向于正常了。

Growth and fluctuations in economic disequilibrium (1993)

I. Restraints of disequilibrium on growth and fluctuations

The late 1960s witnessed a great stride made in disequilibrium theory. In his two papers, "The Keynesian counter-revolution: a theoretical appraisal"^[1] and "A reconsideration of the micro-foundations of monetary theory,"^[2] American economist Robert Wayne Clower came up with a notable argument on disequilibrium theory: Economic instability comes not from a specific market but from discordance between markets, a discordance that stems from the incompleteness of these markets and of the information transmission mechanism between them. If this argument on disequilibrium is applied to analysis of economic growth and fluctuations, the result will be obvious: Not only will the equilibrium equation of growth predicated on the complete conversion of savings into investment and the full utilization of the production capacities thus yielded become void, but the supposition about fluctuations that lists the restrictions of income and its changes on effective demand as a major destabilizing factor in an economic system will also be considered as having major limitations.

Shortly afterwards, Swedish economist Axel Leijonhufvud published *On Keynesian Economics and the Economics of Keynes*^[3] among other books. Like Clower, Leijonhufvud reinterpreted the Keynesian economic theory with a disequilibrium approach, and made his own analysis of the causes behind economic stability and instability. He maintains that between labor supply and commodity sales on the economic chain in real life, there are intermediary links, including

employers hiring workers, workers producing commodities, employers paying workers, workers buying commodities with their wages, and employers selling commodities. Nevertheless, price rigidity, incomplete markets, clogged information and flawed transmission mechanism may disconnect any one of these links, thereby severing the economic chain and inevitably destabilizing the economy. This is precisely a manifestation of economic disequilibrium. If this analytical method based on disequilibrium is applied to economic growth and fluctuations, it can likewise prove that it is neither possible for the economy to follow the road of balanced growth as designed by those who subscribe to the equilibrium theory of growth, nor can economic fluctuations be overcome by negotiating the balance between aggregate demand and aggregate supply on the basis of the equilibrium equation for national income.

From the 1970s onward, French economist Jean-Pascal Benassy and Hungarian economist János Kornai probed deeply into the theory of disequilibrium from different points of view. They have made quite a few breakthroughs in disequilibrium studies, which is evident in Benassy's *The Economics of Market Disequilibrium, Macroeconomics and Imperfect Competition* and *Macroeconomics: An Introduction to the Non-Walrasian Approach*^[4], and Kornai's *Anti-Equilibrium, Economics of Shortage and Growth, Shortage and Efficiency*^[5]. Their studies on macroeconomic operation contribute greatly to studies of economic growth and fluctuations.

Benassy's contribution to the theoretical study of disequilibrium lies mainly in his analyses of the restraining factors in economic disequilibrium and of the effects of quantitative quotas. According to him, when prices are rigid, traders ought to adjust demand and supply according to both market price and quantity signals. That is to say, traders are restrained by both prices and quantity. The quantity constraint is embodied in quantitative quotas of various forms. That is to say, the market rations the limited supply among demanders when supply falls short of demand, and apportions the limited demand among suppliers when supply outstrips demand. The equilibrium

achieved through quantitative quotas is called "rationed equilibrium," which is actually a kind of disequilibrium or, in a certain sense, temporary, ex post equilibrium. The position of this kind of equilibrium is determined by the shortest side in demand and supply. Benassy maintains that, when observing an economy in disequilibrium, not only should the presumption of price flexibility be abandoned, but price rigidity and asymmetric price elasticity should be taken into consideration as well. Although price rigidity is somewhat relevant to asymmetry in price elasticity, the two factors are different in their impact on actual economic activity. Asymmetry in price elasticity tends to complicate resource allocation in economic disequilibrium, and to further hold back the effectiveness of government policy. If the concept of expectation – that is, individual traders' expectations of uncertain behaviors in economic disequilibrium – is factored in, to stabilize the economy in disequilibrium will become a tougher proposition.

Kornai's analytical approach to the disequilibrium theory is distinctly his own. His study is focused on economic disequilibrium under repressed inflation, that is, disequilibrium characterized by supply shortfalls, where limited commodity supplies are rationed out to demanders by way of quantitative quotas. In that scenario, any increase in fiscal expenditure can further boost the demand on the commodity market, and further strain the distribution of the already limited supplies, thereby worsening the repressed inflation. If, on the contrary, the government attempts to curtail demand by tightening up expenditure, supply and demand will shrink simultaneously, thereby defeating the purpose of making up for supply shortages. Kornai's study of economic disequilibrium is valuable in that he focuses discussions on both hard and soft budget restraints, because the existence of firms' soft budget constraint can keep the economy in long-run disequilibrium and make it hard to eradicate supply shortfalls.

The studies by Western economists drive home clearly that both economic growth and fluctuation are inevitably restrained by

economic disequilibrium.

The influence of the equilibrium theory runs deeply in the economic growth theories represented by the Harrod-Domar model, Neo-classical model and Neo-Cambridge model that came in vogue in the 1950s and 1960s. What sets the Neo-Cambridge model far apart from the other two models is that it incorporates two different kinds of income and the restraints of income distribution on economic growth. However, even with this legitimate contribution to growth theories, the Neo-Cambridge model still fails to eschew explicit or implicit assumptions of a complete market, flexible prices, and smooth information transmission. As a result, this model ascribes the difficulties encountered in the process of economic growth mainly to income distribution problems rather than to market imperfections and the incompatibilities between markets. In this way, the Neo-Cambridge model falls short of accounting for the restraining impact of persistent supply shortages on economic growth.

One thing that should be noted is that Joan Robinson and other major advocates of the Neo-Cambridge model were, theoretically speaking, against assumptions of economic equilibrium. Proceeding from Keynes's viewpoints on economic disequilibrium, they raised a series of arguments against mainstream post-Keynesian theorists. But why was it that they could not shake off the influence of the equilibrium theory in their analysis of economic growth? It was because their microeconomic theory was inadequate and weak, and because their neglect of analyses of market transaction behaviors, corporate operational mechanisms, and information transmission mechanisms determined the inherent drawbacks in their model of economic growth.

In economic fluctuation studies, the relevant theory represented by the IS-LM (investment-savings – liquidity preference-money supply) and Multiplier-Accelerator models that were popular in the 1950s and 1960s is preconditioned by equilibrium and equilibrium growth assumptions. According to these models, economic fluctuations are caused by overinvestment, over-saving, over-supply, or inefficient

money supply, and by the inherent law of technology and equipment upgrading, and are not directly associated with market imperfections, price rigidity, and informational frictions. What is more, the IS-LM model also ignores the analysis of the microeconomic basis of the macroeconomy, while the Multiplier-Accelerator model does the same by leaning heavily on the economy's technical factors. Such oversight determines the serious flaw in the fluctuation theories that were current in the 1950s and 1960s.

The progress made in the late 1960s in researches on the disequilibrium theory provided no small inspiration for studies of economic growth and fluctuations. And the restraining effects of the imbalanced nature of the economy on growth and fluctuations were increasingly accepted in academic and economic circles thanks to constructive explorations made by researchers in the disequilibrium theory. These explorations were made without totally disallowing the significance and reference value of either the Harrod-Domar, Neo-classical and Neo-Cambridge models in the realm of theoretical research on economic growth, or the IS-LM and Multiplier-Accelerator models in their studies of the fluctuation theory. Such explorations were important in that they approached growth and fluctuations from a unique perspective, thereby putting their studies on a new and more realistic footing. That is why some of their conclusions are closer to reality than those derived from the theories popular in the 1950s and 1960s.

The studies of disequilibrium analyses of growth and fluctuations so far can be summarized in the following four major conclusions:

First, with incomplete markets, inflexible prices and inefficient information transmission, the conversion of savings into investment will be held back, and the imbalance between supply and demand, once it occurs, cannot be easily corrected. Shortages in supply and demand can be mitigated by the function of market to a certain extent, but will not disappear totally. The equilibrium thus achieved under a nonzero unemployment rate or a nonzero inflation rate can restrain economic growth or cause major fluctuations.

Second, disequilibrium makes it harder for markets (commodity market, capital market, labor market, etc.) to function in a coordinative way. Once supply or demand shortages occur in one market, they cannot possibly disappear and will go on to cause new shortages and exacerbate existing ones in other markets. This may become a restraint on growth or an importance cause behind major fluctuations.

Third, disequilibrium is characterized by price rigidity. The major impact of price rigidity on growth and fluctuations is manifested in that economic agents have to make supply-demand decisions based on imprecise signals. However, price rigidity does not mean that a price will hold forever. On the contrary, it may entail sudden, large-scale, and asymmetric price changes. This is detrimental to economic growth, to be sure, and more importantly, it may cause or aggravate fluctuations.

Fourth, the presence of disequilibrium or equilibrium under nonzero rates of unemployment and inflation is bound to alter the expectations of market participants, which in turn gives rise to irregular and shortsighted economic behaviors. Such behaviors are likely to become not only a major cause behind intensified fluctuations, but also a stubborn retardant on steady and sustained economic growth.

II. Telling two kinds of disequilibrium apart and a study of growth and fluctuations

Using disequilibrium analysis, and combining it with the country's actual economic situation, we will be able to get a better understanding of the guidelines for the ongoing economic reform and the way the economy develops.

Given that disequilibrium is caused by incomplete markets, inflexible prices and inefficient information transmission, either of the following arguments will make sense in theory:

Argument A: To avoid volatile fluctuations and stabilize the

growth rate, it is necessary to remove price restraints and improve market conditions, and to put economic agents on equal competitive footings. Economic growth will be realized in a relatively complete market with flexible prices.

Argument B: With market mechanism flaws such as incomplete markets, inflexible prices and inefficient information transmission, it is necessary to tighten up macroeconomic management to make up for market deficiencies and rectify economic deviations with government regulation of quotas and prices. Steady and sustainable economic growth will be achieved mainly by allocating capital, labor, and production materials via quantitative quota. To put it another way, economic growth under disequilibrium can be achieved mainly through quantitative quota implementation.

Both arguments stem from analyses of economic disequilibrium. In fact, Argument A is a succinct interpretation of the theory on "price reform as the centerpiece of economic reform," while Argument B emphasizes "macroeconomic stabilization as the centerpiece of economic reform." Insofar as economic growth and fluctuations are concerned, Argument A attributes economic fluctuations in disequilibrium to incomplete markets and inflexible prices, so that flexible prices and better market conditions are the first steps to take to avoid fluctuations or maintain stable economic growth; while Argument B ascribes fluctuations to incomplete markets or limitations in the market mechanism itself, so the inevitable reform step is to strengthen macroeconomic management through government quota and price regulation.

However, a study of the actual performance of the Chinese economy proves that neither price reform nor macroeconomic stabilization, if chosen as the centerpiece of economic reform, can ensure the smooth development of reform and ward off wild fluctuations or maintain steady economic growth. This means that neither Argument A nor Argument B tallies with the current Chinese economic situation.

Given that both arguments are based on studies of disequilibrium

assumptions and therefore inappropriate, one may wonder what really went wrong. Isn't it that the disequilibrium theory itself is wrong, or that analysis of this theory is not thorough enough to account for such complex issues as economic restructuring, growth, and fluctuations in this country?

In comparison with the equilibrium theory, the disequilibrium theory is, without a doubt, an advance in economics. Equilibrium assumptions are unwarranted in the absence of complete markets, flexible prices, and efficient information transmission. In reality, however, economies are always in disequilibrium; therefore, they can be observed only with disequilibrium analytical methods. For this reason, we cannot make light of the disequilibrium theory simply because the above two arguments do not fit. The problem does not lie in disequilibrium analysis itself.

What really went wrong? The problem dwells in the flaws of general disequilibrium analysis, so much so that it falls short of explaining such complicated issues as economic restructuring, growth, and fluctuations in China.

What merits attention is that general disequilibrium analysis does not take into account the dynamics of firms as microeconomic units. Instead, its assumption is that firms are dynamic enough. It thus follows that analysts attribute disequilibrium to incomplete markets, inflexible prices, and inefficient information transmission. This is how Arguments A and B are drawn, and why disequilibrium analysis is flawed. In my book *Disequilibrium in the Chinese Economy*^[6], I propose to divide disequilibrium into two categories, one with incomplete markets, and the other with both incomplete markets and enfeebled firms. The current Chinese economy falls into the second category. This being the case, economic restructuring in this nation should proceed in two stages: Firstly, to transform firms more deeply until they become dynamic and profit-maximizing entities that enjoy decision-making autonomy and are liable for their profits and losses, so that the Chinese economy can complete its transition from the second category of disequilibrium to the first category of it; and

secondly, to center economic restructuring on building a complete market and decentralizing prices, so that the economy can edge its way toward equilibrium. My book differs from the general studies of the disequilibrium theory in that I have differentiated between two categories of economic disequilibrium and observed the attributes of the second category of disequilibrium.

It makes sense to distinguish between these two kinds of disequilibrium, because it helps analyze Chinese economic growth and fluctuations. Economic growth is restricted to a larger extent and more vulnerable to fluctuations in the second category of disequilibrium. In the same vein, it is more difficult to maintain steady economic growth and avoid wild fluctuations under the second category of disequilibrium than under the first category of it. Without clarifying the difference between the two categories of disequilibrium, we may mistake incomplete markets, inflexible prices and inefficient information transmission for the main restraints on economic growth and the basic causes behind fluctuations. We will miss the point or only take ineffective measures if we adopt economic policies in light of these judgments. It is like a doctor who, acting on a false diagnosis, writes out an inappropriate prescription and leaves an illness untreated or even aggravated.

If, instead of telling the two kinds of economic disequilibrium apart and seeing that China is in the second kind of it, we set improving market conditions and decentralizing prices or intensifying macroeconomic management as our major policy decisions to stabilize economic growth and avert fluctuations, we are ignoring the most forceful restraints on economic growth and fluctuations imposed by weak firms that, as investors and consumption fund issuers, are not responsible for their management decisions, profits and losses. Under the second category of disequilibrium, firms are yet to become independent commodity producers liable for their management decisions, profits and losses, so their status as investors and consumption fund issuers is nominal and unrestrained. In that scenario, the following problems will occur:

(1) Owing to their lack of autonomy, firms may not be able to make investment even when it is profitable to do so, thus making it hard to keep overall economic growth in pace with these firms' increasing economic returns.

(2) Having no self-restraints on investment and bearing no investment, production and management risks, firms in the process of expanding investment will be susceptible to repetitive construction and fail to realize economies of scale. In that case, economic growth is likely to be a process of ballooning overstock and financial losses for such firms.

(3) Myopic economic decisions such as allocating the consumption fund to serve immediate interests will impair firms' growth potentials and leave them with outdated equipment and technology. Economic growth will be held back as a result.

(4) Firms with no self-restraints may issue more consumption fund than is allowed by their economic returns, and such economic returns are often adulterated even though they are pegged to wages and bonuses. Under these circumstances, the more tightly wages and bonuses are pegged to economic returns, the bigger the losses will become for firms and the state. Economic growth will invariably be held back as a result.

(5) The negative macroeconomic impact of the lack of self-restraints on investment and consumption fund cannot be underestimated. Overinvestment and runaway growth in consumption fund are one of the manifestations of this negative impact. In that case, even if the economic growth rate is increased, such an increase will be short lived and sow the seed for future economic disorder. Extended losses on firms and stressed fiscal balance are another manifestation of this negative impact, with stressed fiscal balance becoming a major cause behind economic instability and a huge obstacle to sustained economic growth.

(6) The fact that firms take no responsibility for their own profits and losses and, in particular, cannot stop production or be closed

down, merged or transferred because of government-business collusion, deprives the flow of corporate capital stock of proper channels and makes it impossible to optimize the reallocation of production factors. With bottlenecks like these, industrial restructuring can never go smoothly, and sustained economic growth is hamstrung as well.

(7) When firms have no decision-making autonomy and bear no responsibility for their profits and losses, neither can their capital stock be made to flow, nor can the purpose of industrial restructuring through reinvestment be served. Increases in investment are limited, and limited increases in investment can hardly put an end to the disproportionate industrial structure. The problem, however, does not stop here. If we liken corporate capital stock to a pool of stagnant water, and reinvestment to flowing water, the real problem is that when year's increased amount of investment is reinvested in a firm, it becomes part of the firm's capital stock the next year. If this cycle is made to last, it is tantamount to constantly turning running water into stagnant water – no amount of running water can put an end to the situation. Consequently, bottlenecks persist and economic growth is greatly held back.

(8) Under the second category of economic disequilibrium, because firms, as microeconomic units, remain as government appendages, whenever the government takes macroeconomic regulation steps, they either find it difficult to adapt their business activity to macroeconomic changes or cannot respond properly for lack of self-restraints. As a result, the government regulation steps fail to yield the desired results. The lack of elasticity – in the investment interest rate, the import-and-export exchange rate, and output prices – is exactly a telltale sign of the undesirable results of government regulation steps. In the absence of stability-oriented internal adjustment mechanisms, once economic fluctuations occur, the situation can only be tackled with government intervention. However, under the second category of disequilibrium, government intervention from top on down to the grassroots level often comes seriously

belatedly. The higher-up leadership (or decision-making authorities) will not take action until problems become serious enough. Furthermore, the negative impact of inappropriate government intervention on economy stability should never be overlooked.

These eight problems illustrate what is so unique about the growth and fluctuations in the Chinese economy in the second category of disequilibrium. Therefore, our studies of Chinese economic growth and fluctuations should proceed from the relevant factors, with the second category of disequilibrium as the precondition.

III. Understanding the wooden barrel principle in disequilibrium

An important principle in the disequilibrium theory is the "law of the shortest side," which is believed to be the key restraint on economic growth and the essential cause behind fluctuations. The "law of the shortest side" is tenable in this regard. This is because in a disequilibrium economy, the market cannot play a complete role in regulating the relationship between supply and demand, and therefore the existence of the shortest side becomes an inevitability, which forces production factors to be reallocated in compliance with the minimum demand. This is like a barrel composed of planks of different lengths. The capacity of the barrel is determined by the shortest plank rather than the longest one. If more water than the shortest plank allows is poured into the barrel, the water will spill out. This is what the "law of the shortest side" entails.

When applying the "law of the shortest side" to the study of growth and fluctuations in economic disequilibrium, the following problems are worth our further consideration:

(1) Why can the shortest side persist for a long time? Despite years of economic growth, the shortest side of previous years remains to this day or becomes even shorter. That is, the shortest plank of the barrel becomes still shorter. What has gone wrong?

(2) In theory, production factors are mutually replaceable and

supplementary to a certain extent. This means that the shortest side could be replaced or made up for by certain longer sides. In reality, however, the ability of longer-side production factors to replace or supplement shorter ones is very limited, a fact that has a considerable influence on economic growth and fluctuations. The issue here is: Why mutual replacement and complementation between production factors can be so difficult as to allow the "law of the shortest side" to become the key factor in inhibiting economic growth and causing fluctuations?

(3) Reallocation of production factors can address economic problems caused by shortest-side factors, boost economic growth and curtail fluctuations. Take, again, the barrel for example. Since how much water a barrel can contain is determined by its shortest plank, the situation can be remedied in two ways. One is to saw a certain length off the longest plank and nail it onto the shortest one, so that the two new planks are level with each other. This can happen only when production factors are mutually supplementary. The other is to dismantle the barrel and put the old planks together to make a new one, hopefully a larger one. This is tantamount to the aforementioned reallocation of production factors. Nevertheless, in reality, such reallocation is an unrealistic proposition probably because the barrel is too solid to be torn apart for reassembling. Then we should ask: Why is the barrel so solid? Why can't we break it apart? Is it really difficult to reallocate production factors?

All these problems are relevant to the characteristics of growth and fluctuations under economic disequilibrium. Bearing in mind the differentiation between the two types of disequilibrium, and combining it with the fact that the Chinese economy is in the second category of disequilibrium, let us proceed from the "law of the shortest side" to observe these three problems, so as to better understand the "law of the shortest side."

i. Problem 1: the shortest-side syndrome in the second category of disequilibrium

The shortest-side syndrome refers to the situation where shortest-side factors remain, or are growing even shorter in spite of years of economic growth and restructuring. Where is the problem? In economic equilibrium, shortest-side factors will disappear when the market mechanism promotes the free flow of production factors and resources are reallocated in response to price signals. In this way, even if new shortest-side factors emerge in the process of economic growth, the economy is immune to the shortest-side syndrome. Apparently, the shortest-side syndrome tends to occur when production-factor is stagnant and resources cannot be reallocated smoothly.

Supposing our economy is in the first category of disequilibrium, which is characterized by incomplete markets, inflexible prices and incomplete information, production factors can flow more freely by improving the markets and decentralizing the prices, and resource reallocation can take place in response to price signals. In this way, the shortest-side syndrome may disappear gradually. Though scarcity in some resources may make it difficult to reallocate resources and overcome the shortest sides, the syndrome can be avoided if this scarcity can be eased with replacements or imports.

However, the situation is more complicated in the second category of disequilibrium, which is peculiarly prone to the shortest-side syndrome. In this category of economic disequilibrium, clogged production-factor flow and troubles in industrial restructuring and resource reallocation can be imputed respectively to the "lack of information, incentive and channel."

"Lack of information" means that when faltering firms operate in an incomplete market, their access to price signals is bound to be inappropriate, untimely and incomplete. At the same time, because these firms, as microeconomic units, are under the strict control of their leadership authorities, the government cannot obtain timely and accurate information from both the market and these firms. Therefore, government quota adjustments are often at odds with market needs, and resources can only be reallocated in the absence of accurate information. As a result, shortest-side factors are mistaken for longest-

side ones, and vice versa; and ineffective supply is regarded as being effective.

"Lack of incentive" means that the lopsided industrial structure is a solid fact, and firms have obtained adequate information about shortest- and longest-side factors and can respond accordingly, but they are not motivated enough to take action and run the risks. This is because, as government appendages that have not the final say in management and are not liable for profits, losses and production and management risks, these forms are neither motivated to restructure their products and nor willing to run such risks.

"Lack of channels" means that even if firms as microeconomic units and the government as macroeconomic authorities have both received adequate information about shortest- and longest-side factors and are willing to restructure the economy, there are no channels to facilitate the free flow of production factors. This is because firms are mere government appendages while the economy has been sectioned by a labyrinth of ownership boundaries, making it difficult to reallocate resources, let alone optimize them. All this bears out the unavoidability of the shortest-side syndrome.

ii. Problem 2: difficulties in mutual replacement between production factors in the second category of disequilibrium

As mentioned above, as long as production factors are able to replace each other, shortest-side factors can be eased with the help of longest side ones. This is not to say, however, that such replacement is absolute; rather, it is relative, and cannot work under all circumstances. Moreover, the replacement of one factor by another can either improve or reduce efficiency. Only when the margin of drop in efficiency caused by such replacement is narrower than that caused by the scarcity of the factors in question can such replacement be deemed feasible.

In an economy in equilibrium, whenever production factor

replacement is possible, the price and cost-benefit ratio will motivate firms to alleviate the shortest-side syndrome by choosing effective methods for such replacement. In the first category of economic disequilibrium, replacement difficulties caused by inflexible prices and distorted price signals can be overcome by improving the market conditions and decontrolling the prices. However, the situation is worlds apart in the second category of economic disequilibrium, where the problem is not limited to the incomplete production-factor market. The fact that production factor suppliers and demanders are government appendages is more of a problem. For instance, when human resources are controlled by government quotas and sectioned to different departments, localities and firms, they are unable to make up for capital shortages even if replacement is possible. It is also necessary to make reinvestment and upgrade technology and equipment when there is a possibility of replacement between material production factors. On the one hand, because material production factors are supplied by some departments and localities, and demanded by others, it is hard to achieve supply-demand balance under intersected government administration. On the other, reinvestment involves problems concerning the investment system. If the old system continues, production factor replacement cannot take place. In a word, it is not easy for production factor replacement to be realized.

iii. Problem 3: hindrance to production factor reallocation in the second category of disequilibrium

We have noted that shortest-side factors can be compensated for through reallocating production factors. However, why is it so difficult to reallocate production factors in the second category of disequilibrium? Take the barrel again. Why is it so sturdy that it refuses to be torn apart and re-assembled? Herein lays the key to studies in the ongoing Chinese economic growth and fluctuations.

Production factor reallocation calls for at least three conditions: first, well-defined property rights; second, smooth flow of production

factors; and third, competence of the organizer of such reallocation.

The biggest reason why reallocation of production factors under the second category of disequilibrium is so difficult is that the first two conditions are not available. To be more specific, the second kind of disequilibrium is subject to ill-defined property rights under public ownership, business-government collusion, lack of responsibility for management, gains and losses, and lack of internal and external restraints on the part of firms. All these result in inefficient production factor flow, indeterminate beneficiaries of reallocation gains, and undefined risk bearers in such reallocation. These obstacles to reallocation arise when the first two conditions are not satisfied.

Judging from the third condition, the success of production factor reallocation lies in the organizer's proficiency for the task and ability to secure potential benefit from it. Who, then, is the eligible organizer in the second category of economic disequilibrium? As government appendages, firms have yet to become autonomous commodity producers, and are therefore not qualified. If firms cannot organize the reallocation of production factors, how about the government? It is not that the government cannot to do the job, but that it may not be able to fulfill the task in the absence of the first two conditions. Let me explain. If what is referred to here is the central government, it is powerful enough and in the possession of the means for such reallocation, but, as a macroeconomic regulatory institution, it cannot possibly be directly engaged in reallocating production factors. In fact, the government here refers to local authorities. Supposing a local government has difficulty in reallocating production factors due to institutional obstacles, to what extent can it break through those obstacles? Is it authoritative enough to overcome those obstacles? What's more, can a local government be highly efficient in directly organizing the reallocation of production factors? In any case, it is difficult for any local government to be fully competent in the second category of economic disequilibrium. Thus, the third condition is not available either. Furthermore, whether the organizer is a firm or a government, reallocation of production factors can succeed only when

it is handled by someone who is highly innovative and capable of organizing modern production. In fact, innovators and organizers of this type are rare, a fact that also accounts for what a difficult task allocating production factors can be in this nation.

IV. Production and circulation in economic growth

The relationship between production and circulation merits due attention. In analyzing economic growth factors, some authors tend to emphasize elements in the production field, such as investment quantity and its proportion in national income, the input-output ratio, the contribution of production factors (technology and human resources included) to economic growth, different combinations of production factors and their impact on corporate and macroeconomic returns. They tend to give a second seat to the circulation factor in economic growth in general and sustainable economic growth in particular. Three reasons may account for this analytical approach. First, they stress the decisive role of production in circulation to the neglect of the reaction of circulation to production. Second, they base their calculation of the economic growth rate on output value, as if increases in output value are equal to economic growth, regardless of the fact that the percentage of ineffective supply in output value cannot be counted as part of real economic growth. Third, insufficient attention to circulation and misunderstanding in the role of markets lead to inadequate understanding of circulation. Small wonder that circulation is held in a secondary seat in economic growth in these authors' analyses of economic fluctuations.

In the Chinese economy, however, the importance of circulation and consumption to production and distribution is becoming increasingly more pronounced in the traditional economic system's transition to a new one. It is because people's freedom and motivation in economic life are growing steadily. They are engaged in production to meet their needs. Those needs are satisfied on a daily basis through market transactions, and more and more commodities are reaching people through the market. Commerce promotes production,

coordinates distribution, ensures circulation and guides consumption. As to all the consumer goods, most of the public goods and a fair quantity of capital goods, the effectiveness of their supplies hinges on whether circulation can go smoothly. Poor circulation leads to ineffective supply, and goes further to hold back economic growth and give rise to major fluctuations.

The importance of circulation to economic growth is also evident in the flow and reallocation of production factors. Production factors fall into two categories: real ones and latent ones. The production factors that flow and reallocate through circulation are, first and foremost, real ones. And they are bound to activate latent ones. For instance, the full employment, free flow and reallocation of real labor resources will inevitably bring latent labor resources to the market to augment the real labor resources. The same is true with capital. If real capital is put to full use of and flows freely to effectively combine with other production factors, more latent capital will be brought forth. This is the way latent production factors are converted into real ones, to the benefit of economic growth. The role of circulation figures prominently in this regard in the current period of development in the Chinese economy. To maintain sustained economic growth in this country, which abounds in latent production factors but falls short in the supply of absolutely and relatively real ones, it is necessary to turn latent production factors into real ones through reform and hard work on circulation.

So much for the paramount importance of circulation to the Chinese economic life. In recent years, however, there has appeared an abnormal "debt chain" in circulation. Although this "debt chain" is directly related to economic austerity, overstocked inventory, shortage in capital investment and the ensuing overdue obligations to suppliers, however, we can understand it more profoundly and in a new light if we turn our attention to economic disequilibrium, the second category of it in particular.

The "debt chain" is not to be perceived merely as a result of an inordinate industrial or product structure. It is understood that this

inordinateness can lead to sluggish sales, overstocked inventory and overdue obligations to suppliers, but it is unfair to regard it as the fundamental cause behind the "debt chain." Inordinate industrial or product structure is nothing new, but why this "debt chain" has surfaced only in the last couple of years? What is more, why haven't we done anything about it? What has thrown the industrial or product structures off balance, or, in other words, what is the deep-seated cause behind the "debt chain"? Obviously, the answers cannot be found from structural inordinateness alone.

It is equally superficial to impute the "debt chain" to economic austerity. Austerity is nothing but a government policy, whereas the "debt chain" is deeply rooted in the economic system. It is thus unfair to blame the "debt chain" on a certain government policy, not to mention the fact that after this chain appeared, government policy has never stopped its move from austerity to relaxation, such as major increases in credit and loan grants. However, the loans issued to undo the "debt chain" never worked. It is all too obvious that austerity is not the culprit for the "debt chain."

In light of a study of the attributes of the second category of economic disequilibrium, the "debt chain" may be explained in this way: The development of a commodity economy is in direct conflict with government business collusion, which is a hallmark of this category of disequilibrium. Therefore, the "debt chain" was born of the contradiction between government-business collusion and the burgeoning commodity economy. To be more exact, without the commodity economy, government-business collusion would not have resulted in overdue obligations to suppliers, let alone a "debt chain." If government were detached from business, the "debt chain" would not appear no matter how fast the economic economy grows, not even when a temporary slump appeared. This is because when a creditor asks for repayment according to law, the debtor may liquidate his assets to honor the debt until he files for bankruptcy. However, this is not the case with present-day China. On the one hand, a commodity economy is emerging; and on the other, the second category of

disequilibrium persists. That is to say, the long-standing government-business collusion is yet to give way. When transactions between firms are taking place in increased frequency, if A is overdue in payment to B, and B to C, the debtor-creditor relationship can be very complicated. In government-business collusion, debtors are always backed by the government, so that creditors are not in a position to ask for due repayment, let alone demand for liquidating the assets. It is another story when a debtor is responsible for its own benefits and losses. This indicates that liability disputes between firms come down to disputes between government departments when the "debt chain" involves firms that are government appendages. Because such disputes cannot be settled by bankruptcies, the debts will be piled up, and the chain will grow in length with each passing day.

Fundamentally speaking, the "debt chain" can never be eradicated if we fail to deepen corporate reform, detach government from business, and turn firms into commodity producers making their own business decisions and bearing their own profits and losses. In other words, the transition from the second category of disequilibrium to the first category of it must be accomplished at an early date to get rid of the "debt chain."

The nature of economic disequilibrium also sheds light on another major issue in the field of circulation, the issue of the outsourcing of circulation. Stable and sustained economic growth is determined not only by production, but also by circulation. Production bottlenecks, clogged circulation channels and ineffective supply all play a part in volatile economic fluctuations. Therefore, the outsourcing of circulation should become an indispensable part in our study of economic growth and fluctuations, the growth and fluctuations in the Chinese economy in particular.

At the first glance, clogged circulation channels bring about an overstock of some commodities and shortages of others, and strain supply. These problems merit attention, but they cannot be addressed by improving circulation alone. The outsourcing of circulation takes on a different meaning in economic disequilibrium from in economic

equilibrium: In economic equilibrium, where the market is complete, prices are flexible, information transmission is smooth and firms are liable for their management decisions, benefits and losses, the outsourcing of circulation is inevitably characterized by free circulation of commodities at flexible prices and by production and sales in the interest of firms. In the first category of disequilibrium, firms are responsible for their own business management, benefits and losses. However, the market is incomplete, prices are inflexible, and information transmission is clogged. As a result, free circulation will run up against obstacles. Firms will find it hard to organize production and sell their products on their own. In addition, supply or demand shortfalls will make it hard for market prices to play a due role in economic adjustment, so much so that such shortfalls must be eased, to some extent, with quantitative adjustment either by the government or by the market. The situation is much more complicated in the second category of disequilibrium. Apart from an incomplete market, inflexible prices, and clogged information transmission, firms are failing and yet to become autonomous. The disparity between supply and demand is more acute in capital goods than in consumption goods, and therefore, it is more pressing to develop capital goods than to procure more consumer goods. According to this interpretation, the outsourcing of circulation in the second category of disequilibrium should be interpreted in this way: We should develop all sorts of markets, capital goods markets in particular, while combining quantity regulation with price regulation in relevant markets, particularly in the markets for pivotal capital goods. Only thus can obstacles to circulation be lifted, and the effective combination of production factors optimized nationwide. The percentage of quantity quotas and that of price regulation should be decided in light of the degree of economic disequilibrium, because we can always make do with the second best choice where and when the first best choice is hard to come by. It is in accord with the principle of the second best choice to understand the outsourcing of circulation in economic disequilibrium from the perspective of combining quantity and price regulation. What merits attention here is that the

replacement of price regulation with quantity regulation in economic disequilibrium is not the same as replacing complete competition with incomplete competition. Rather, it is the replacement of one kind of incomplete competition with another. In economic disequilibrium, there will never be a complete market, and therefore the effort to improve the market is invariably in conflict with quantity regulation. It is unrealistic to deny the existence of such a conflict and its effect on economic growth and fluctuations. In the current stage of economic development, what we should and can do is to improve the management of circulation as much as possible, dredge up the circulation channels, further the commercial reform to minimize obstacles to the outsourcing of circulation. In the meantime, we should also mitigate economic disequilibrium in multiple ways to ease the conflict between market improvement and quantity regulation.

We have elaborated on the restraining impact of circulation on economic growth and fluctuations, probed into the deep-seated causes behind the "debt chain," and elucidated the need to outsource circulation in economic disequilibrium. Thus, we are able to better understand the economic growth and fluctuations in China in two ways:

Firstly, observed from the viewpoint of circulation alone, the profound impact of the second category of disequilibrium on the realm of circulation has clearly become a potent restraint on economic growth and an essential cause behind fluctuations. Only by taking into consideration the effect of the second category of disequilibrium on both production and circulation can the economic growth and fluctuations in this country be better interpreted.

Secondly, from our observations of circulation we can arrive at this conclusion: If, instead of proceeding from invigorating our companies to push economic restructuring, we allow government-business collusion to persist in the long run, sustained economic growth will be out of the question, and major fluctuations will become unavoidable. This fully bears out what economic restructuring is all about in the second category of disequilibrium.

V. Thoughts on normal and abnormal fluctuations

The topic of this study being fluctuations in economic disequilibrium rather than in equilibrium, we are confronted with the issue of normal and abnormal fluctuations. Fluctuations are always deemed abnormal in economic equilibrium, where normal fluctuations are nonexistent. However, it is the other way round in disequilibrium, where gaps in either supply or demand are a common occurrence, and the market can bridge such gaps but cannot root them out. That is to say, disequilibrium is essentially balance with nonzero unemployment rate and nonzero inflation rate. To put it differently, disequilibrium is a kind of equilibrium that is accompanied by a certain unemployment rate or a certain inflation rate (or a balance with certain demand shortfalls and certain supply shortfalls).

Any economic gap can be interpreted as "shortage." For instance, a rise in prices, which means that excess money is chasing commodities that are in short supply, can be termed as "commodity shortage." Unemployment, which indicates that many workers are hunting for a few jobs, can be expressed as "job shortage." Similarly, undercapitalization denotes a "fund shortage," while overcapitalization points to "shortage in investment outlets." A bottleneck in resource supply indicates "shortage of a certain resource," while idle resources indicate "shortage of resource users." Since any gap can be regarded as a shortage, there must be two kinds of shortages in economic disequilibrium – normal shortages and abnormal shortages.

As stated above, normal shortages are common and inevitable in economic disequilibrium. However, it does not mean that a certain shortage cannot be eliminated by any means, but that one shortage can be eliminated probably at the cost of another shortage that causes even a greater loss in efficiency. For instance, a 2 percent unemployment rate is an indicator of a normal shortage of jobs, but someone insists to eliminate this normal unemployment rate. We are not saying that he has no way of accomplishing it, but that in doing so, some firms may be overstaffed and suffer major efficiency losses.

In other words, the normal job shortage is eradicated in return for a higher disguised unemployment rate and a greater loss in efficiency.

We may follow a similar line of thinking to prove how a visible inflation rate that is within a normal range of shortage in economic disequilibrium is made to disappear in return for an increased disguised inflation rate and a major efficiency loss. From this analysis, we can see that the alert line for macroeconomic operation in disequilibrium cannot be marked with zero shortages (zero unemployment rate, zero inflation rate, etc.). The alert line in question is designed to guide government regulation. When the economy runs below this line, there is no need to take action. Only when the economy surges above the line should the government take appropriate steps to regulate it. Under disequilibrium, the position of the alert line is directly relevant to the extent of normal shortages. Assuming there is a zero shortage level in the economy (zero unemployment rate, zero inflation rate, etc.), the alert line must be somewhere above this level. The space between the two lines represents normal shortage; the space above the alert line is abnormal shortage, as is shown in Figure 1:

Fig. 1

In the book *Strategic Choice for Prosperity* by Li Yining and others, the concept of "alert line" is explained in Chapter 8, "The integration of planning and market mechanism in resource allocation": There are two alert lines – the first alert line and the second alert line. The first line sets the boundary between market regulation and government-

planned regulation. The second line runs above the first one. Whether the government should give priority to direct regulation or indirect regulation depends on the space above the first alert line. When the economy operates between the two lines, it comes mainly under indirect government regulation. When it runs above the second alert line, it is evidence that indirect regulation has not achieved desired results and, therefore, it is time to shift the emphasis to direct regulation in place.[8]

With a second alert line added to Figure 1, Figure 2 is drawn. The alert line featured in Figure 1 is presented as the "first alert line" in Figure 2:

Fig. 2

In *Strategic Choice for Prosperity*, an additional explanation is made: "Whether it is indirect regulation or direct regulation that prevails, the adoption of planned quotas should not be excluded when restraints on resource become strong and shortages run high, and changes in market prices and supply and demand must be followed." [11]

As shown in Figure 2, the second alert line divides abnormal shortages into two sections. Let us call the section between the second and the first alert lines "abnormal shortage I," where the government gives priority to indirect regulation. The section above the second alert line is dubbed "abnormal shortage II," where the government gives priority to direct regulation. If abnormal shortage in the economy is serious enough to necessitate forceful intervention, the

government can turn to the "last resort," unconventional intervention in the economy. The reservation of this "last resort" testifies to the government's resolve and strength to regulate the economy – it will never look on with folded arms as the economy goes from bad to worse.^[12]

This can be shown in Figure 3:

Fig. 3

With these concepts in mind – zero shortage line, normal shortage, abnormal shortage I, abnormal shortage II, the first alert line and the second alert line – we gain a better understanding of what normal fluctuations and abnormal fluctuations are all about.

What are normal fluctuations in economic disequilibrium? We can reach this preliminary conclusion: When the economy operates above the zero shortage line and below the first alert line – that is, within the scope of normal shortage – fluctuations are normal.

What about abnormal fluctuations in economic disequilibrium? We can also arrive at the following preliminary conclusion: When the economy operates above the second alert line but is still within the scope of abnormal shortage II, fluctuations are abnormal.

Figure 3 indicates that the section between the zero shortage line and the first alert line represents normal shortage. When the economy runs within this range, normal fluctuations in economic disequilibrium occur; what happens in the section above the second alert line is abnormal shortage II, in which abnormal fluctuations in

disequilibrium take place. This poses the question: Are fluctuations normal or abnormal when the economy operates between the first and second alert lines? Further analysis is needed to give a reasonable answer.

Fluctuations are usually indicated with changes in the economic growth rate. However, the economic growth rate cannot accurately reflect shortages. A high growth rate can be achieved under both normal and abnormal shortages, and so can a low growth rate. Therefore, when studying the economy's performance in a specific year or a period of years, we find it hard to discover the close ties between economic growth rate and the degree of shortages. In addition, changes in the degree of shortages are concealed when fluctuations are measured by economic growth rate. Therefore, if we judge whether fluctuations are normal or not merely by changes in economic growth rate, we are courting two mistakes.

First, fluctuations seem to have nothing to do with economic disequilibrium. The difference between normal and abnormal fluctuations under disequilibrium conditions is concealed in the changes of economic growth rate. Thus we cannot see through fluctuations and predict their future course of development.

Second, a high economic growth rate can be achieved in the presence of abnormal shortages, whereas a low growth rate may happen amidst normal shortages. This being the case, if we judge fluctuations on the basis of growth rate changes, we will probably go astray in attempting to maintain a high economic growth rate by expanding abnormal shortages instead of maintaining a low growth rate by curtailing such shortages.

Obviously, we cannot jump to a conclusion on normal or abnormal fluctuations in economic disequilibrium simply according to changes in economic growth rate. Rather, we should base our observation on changes in the degree of shortages.

We will get a clearer picture of this if we observe the economy for a longer period of time. This is because, supposing the economy

operates within the range of abnormal shortages under disequilibrium conditions, problems caused by such shortages will definitely affect economic growth rate and betray themselves in the form of marked fluctuations.

Now let us return to the previous question: Is it normal or abnormal fluctuation under disequilibrium when the economy operates between the first and second alert lines? The answer should be based on changes in shortages during an extended period of economic growth. There are two scenarios:

The first scenario: The economy has been operating within a normal shortage range, and economic growth has been achieved on this basis. If the economy runs above the first alert line and fluctuates between the two alert lines, such fluctuations are deemed abnormal.

The second scenario: The economy has been operating within abnormal shortage II, that is, above the second alert line, and economic growth has been achieved on that basis. If the economy operates between the two alert lines and fluctuates within abnormal shortage I, it is considered a normal fluctuation, because compared to the previous period, the economic fluctuations are moving towards normalcy. 论乡镇企业的产权改革 (1994)

—

在当前的中国经济中，乡镇企业的重要性已经越来越被实践所证实，也已经越来越被人们所认识。在建立社会主义市场经济的过程中，改造原有的国有大中型企业和发展乡镇企业都是重新塑造社会主义市场经济微观基础的基本内容。关于国有大中型企业产权改革的意义，学术界讨论得比较充分，也比较具体。相比之下，对乡镇企业产权改革的意义与做法，就不那么充分，或者只提及发展“股份合作制”。其实，乡镇企业产权改革的重要性和这一改革中可能遇到的困难，并不亚于国有大中型企业的产权改革；而且，“股份合作制”一词的含义也不很明确，所以在这个领域内有深入研讨的必要。

首先，我们不能只注意近年来乡镇企业迅速发展的事实，而应该考虑市场环境对乡镇企业存在与发展的作用，考虑乡镇企业如何进一步适应市场的问题。

乡镇企业有不少竞争对手。在国内市场上，其竞争对手主要是国有企业、原来的城市“大集体”企业、中外合资企业、私营企业以及其他乡镇企业。此外，进口的商品也同乡镇企业的商品有竞争关系。乡镇企业建立和扩大生产规模后，必须考虑到自己的市场究竟在哪里，怎样才能使自己的产品在市场上占有一席之地，并使自己的产品在市场中所占的份额越来越大。

乡镇企业不能指望地方政府的特殊照顾、额外的优惠。如果乡镇企业把希望寄托于地方政府用行政干预的方式来保证本地的市场，排斥外地的企业进入本地的市场，或垄断本地的原材料供应，限制本地的原材料输往外地，那么，一方面，地方政府的这种保护本地乡镇企业的做法是与市场经济的原则相悖的。这种做法无论按计划经济体制的要求来看，还是按市场经济体制的要求来看，都必定受到抵制，必定行不通。

这是因为，从计划经济体制的角度看，地方垄断原材料供应和分割市场的做法不符合计划经济的高度集中原则、计划配额原则；而从市场经济体制的角度看，这种做法违背了市场公平竞争原则，违背了市场统一化的原则。另一方面，地方政府的这种保护本地乡镇企业的做法即使有可能在短时间内给这些乡镇企业带来某种好处。但从长期看，从根本利益上看，这种做法是不利于乡镇企业的发展的，因为这是一种保护落后和扼杀企业生命力的错误做法。乡镇企业应当在市场竞争中成长、壮大，企业的真正生命力在于自己的产品质量，在于自己的经济效益，在于自己的创新能力。

如果说乡镇企业在同计划经济体制下的企业（如国有企业、城市“大集体”企业）竞争时，可以凭借自己的机制灵活而占有一定优势的话，那么在同中外合资企业、私营企业竞争时，这种优势就不存在了。特别是乡镇企业之间相互竞争时，由于彼此都有相同的经营机制，而且也都能得到本地政府部门的优惠政策的照顾，任何一家乡镇企业的优势也就无法显示出来。市场竞争是无情的。竞争的结果，总会有一批乡镇企业垮掉，有一批乡镇企业发展壮大，还会出现一批新的乡镇企业。

由此可以断言，市场是乡镇企业的检验者。各地都兴建了乡镇企业，乡镇企业的数量越来越多。乡镇企业的数量这么多，发展速度这么快，会不会给国民经济带来灾难呢？对这个问题，可以这样看：假定处于计划经济体制之下，企业数量过多，发展速度过快，肯定使得国民经济承受不了；然而，目前的乡镇企业与计划经济体制下的企业是不一样的，乡镇企业必须面向市场，经受市场的检验。如果在竞争中失败，乡镇企业就会垮掉。而计划经济体制下的企业则不然，即使效益差，亏损累累，企业照样可以存在，照样消耗各种资源。因此，市场的检验固然是客观存在的，但计划经济体制下的企业却不在乎市场的这种检验，甚至可以说它们不惧怕市场的检验，它们对于市场的检验是麻木不仁、无动于衷的。而乡镇企业对于市场的检验却十分敏感，经不起市场检验的将被淘汰，这就迫使乡镇企业努力提高经济效益，努力生产市场所需要的产品。换句话说，计划经济体制之下，企业多了而企业效益又不佳，那就必定给国民经济带来灾难；因为企业只能生，不能死，只能存，不能亡。而乡镇企业则既能生，又能死，既能存，又能亡。效益差的乡镇企业将被无情地淘汰，国民经济就不会因乡镇企业数目增加而波动，社会也不会因乡镇企业中一批效益差的企业的倒闭而发生较大的震荡。从这一角度来看，我们不能不得出这样的结论：如果说企业多了，那是指

计划经济体制下的无效益企业多了，而适应市场经济要求和经得起市场检验的企业还不够多；如果说企业发展快了，那是指对市场不敏感，从而不面向市场而进行生产的企业的发展过快，而那些面向市场进行生产并受到市场欢迎的企业的发展速度还不够快。乡镇企业就属于后一类企业。

二

这里，需要对重复建设一词做一些分析。重复建设是不是必须取缔呢？一般说来，不应该从事重复建设，不容许重复建设的现象发生。这是因为，在资源供给为既定的条件下，重复建设意味着资源的浪费、资源的不合理利用，从而使本来就紧张的资源供给更加紧张。此外，在市场购买力为既定的条件下，重复建设意味着总有一些产品因缺乏市场而滞销积压，这同样是资源的浪费、资源的不合理利用。资源的双重浪费、双重不合理使用，这就是重复建设的代价或重复建设对经济的危害。

人们有时在谴责重复建设时，把乡镇企业同重复建设挂上钩，似乎乡镇企业的建立和扩大生产规模同重复建设之间结下了不解之缘；而忘却了同重复建设有着最密切关系的不在于企业是属于乡镇企业还是国有企业，而是企业的经营机制是否转换了，投资体制是新的还是旧的。乡镇企业有着自己的灵活机制，既自主经营，又自负盈亏。如果明知是重复建设的项目，资源供应紧张就必定导致生产成本的上升，市场购买力有限就必定导致销售困难，结果必定是得不偿失，那么谁会硬往重复建设的墙壁上撞呢？乡镇企业是不会往这堵墙上撞的，因为它们知道硬撞的后果是自己的倒闭。但那些不承担投资风险的计划经济体制下的企业却有可能不顾重复建设的后果，铺摊子、上项目，即使投资无效益也在所不惜。可见，问题恰恰在于企业作为投资主体是否承担着投资风险。乡镇企业之所以会避免无效益的投资，避免重复建设，原因正在于此。

从宏观经济的角度来看，对重复建设还需要做进一步的探讨。一般所说的重复建设，是指某种类型的产品已经有某家企业进行生产，如果再建设一家企业，生产同种类型的产品，那就是重复建设，就是资源的浪费。但需要研究的是：禁止重复建设是不是会造成保护垄断、保护落后的现象？重复建设是不是一律损害国民经济？同类产品生产者之间是否容许竞争？比如说，某种类型的产品已经由某家企业进行生产，但产

品数量不符合社会的需求，市场仍有较大的份额有待于企业去占据。在这种情况下，是只容许该家企业扩大生产规模呢，还是容许建立新的企业，由新建的企业的产品来填补市场的空缺？显然，新建的企业加入不应当被认为是重复建设。再说，假定原来生产某种类型产品的企业尽管能够提供市场所需要的足够多的产品，但价格比较高昂，产品质量仍有改进之必要；而新建的企业所生产出来的同类产品，却能以较低的价格供应给需求者或产品质量比较好。那么在这种情况下，难道只容许原来生产该种类型产品的企业垄断该类产品的生产，而不容许新企业的加入？难道宁肯要价格较高、质量较低的产品而拒绝新企业生产价格较低、质量较高的产品？这无疑是不合理的。这种情况下的新建企业的加入也不应当被认为是重复建设。总之，重复建设不应当被当成是保护垄断、保护落后的挡箭牌。

再看一看与重复建设有关的资源浪费问题。首先要指出，假定只容许原有的企业生产出价格较高、质量较低的产品，而不容许新建的企业去生产价格较低、质量较高的产品，这同样是一种资源的浪费、资源的不合理使用。一定数量的资源，既然有可能被某家新企业用于生产价格较低、质量较高的产品，但却以禁止重复建设为借口而不准这家新企业成立，宁肯让原有的某家企业用来生产价格较高、质量较低的产品，这不是资源的不合理使用又是什么？其次，需要说明的是：市场是企业（包括乡镇企业）的检验者，即使生产资料的供应有限，市场购买力为既定，只要经济中遵循的是“适者生存”原则，那么生产价格较高、质量较低的产品的企业将被淘汰，生产价格较低、质量较高的产品的企业将继续生存下来。有限的生产资料供应将属于后者而不属于前者，既定的市场份额将被后者所取得而把前者排除在外。这样，经过一定时间的较量之后，适者生存，不适者被淘汰，资源浪费问题也就自然而然地通过市场竞争而解决了。我们有什么理由认为重复建设一定是坏事呢？只有重复生产价格高和质量低的产品，才是必须取缔的；只有重复建立那些生产价格高和质量低的产品企业，才是必须禁止的，才是名副其实的重重复建设。不能看投资主体是国有资产管理部门还是乡镇企业。

从这里，我们有一个深切的体会：如果不加快产权改革，不能真正按照市场需求自主组织生产经营，不能真正把经济效益放在首位，不能真正建立激励和约束相结合的管理体制，乡镇企业是适应不了市场经济的要求的。我们甚至可以说，对某些现在虽然产权尚未明晰但仍能取得成绩的乡镇企业来说，它们的“好日子”可能不会太长了。市场经济的形

势逼得它们非改革不可，非抓紧改革不可。

三

由此我们可以对乡镇企业产权改革的重要意义进行较详细的分析。产权改革涉及的是市场主体的组织规范化和行为规范化的问题。在我国现阶段，产权改革是指如何把那些政企不分、产权不明、不自主经营、自负盈亏的企业改造成为政企分开、产权明确、自主经营、自负盈亏的企业。产权改革既与改造原有企业有关，也与建立新企业有关，因为根据产权改革的思想，新建的企业从一开始就应当按照政企分开、产权明确、自主经营、自负盈亏的模式来建立。

前面已经指出，市场对企业进行检验，市场竞争中盛行的是“适者生存”原则。要制止真正的重复建设，企业必须按照产权改革的思想改造或新建，以便它们既可以适应市场的变化而调整产品结构，避免生产社会所不需要、不欢迎的产品，而是生产社会需要、欢迎的产品；又可以用自己的价格较低、质量较高的产品去排挤竞争对手所生产的价格较高、质量较低的产品。更重要的是，通过产权改革，一切企业都处在平等的起跑线上，都同政府机构分开，都只是“遵守法律，照章纳税”，既不受政府机构的直接管辖，又不接受政府机构对自身的生产经营活动的直接干预。此外，通过产权改革，一切企业都承担投资风险，自负盈亏，而不再躺在国家身上吃大锅饭，也不受政府的偏爱和特殊照顾。产权改革是建设现代市场经济体制的基础性改革，其必要性与重要性是不言自明的。

至今依然有人怀疑，乡镇企业是不是同国有企业或原来的城市“大集体”企业一样需要进行产权改革？回答是明确的：乡镇企业同样需要产权改革。要知道，乡镇企业的继续存在和进一步发展是以乡镇企业转换经营机制，自主经营和自负盈亏，并且已经不再成为政府部门的附属物为前提的。这是因为，假定乡镇企业同国有企业、原来的城市“大集体”企业一样不能实现自主经营和自负盈亏，那又怎么谈得上乡镇企业经得起市场的检验，并能按照市场的“适者生存”原则在市场大海中拼搏、竞争呢？假定乡镇企业同国有企业、原有的城市“大集体”企业一样受到政府部门的严格限制和干预，那又怎么谈得上乡镇企业的建立和存在本身是对计划经济体制的有力冲击并使计划经济体制大堤的缺口越来越大？也就是说，不能笼统地认为乡镇企业在产权制度上不同于国有企业和原来

的城市“大集体”企业。事实并不完全如此。这可以从两方面来解释：

一方面，在所有的乡镇企业中，只有一部分乡镇企业实现了经营机制的转换，符合独立商品生产者的条件；还有一部分乡镇企业则尚未实现经营机制的转换，不符合独立商品生产者的条件。它们名为乡镇企业，实际上应当被称为“乡有企业”、“乡营企业”、“镇有企业”、“镇营企业”，即最基层的政权机构所拥有与直接经营的企业。对这部分乡镇企业而言，产权改革还没有开始，甚至当地的乡政府、镇政府还不懂得在乡镇企业中进行产权改革的必要性和重要性。正因为如此，所以绝不能认为乡镇企业已不需要产权改革了。

另一方面，即使以那些已经实现了经营机制转换的乡镇企业来说，它们的经营机制的转换也还只是初步的，它们的产权设置还有待于规范化，它们同乡镇政府之间的关系也还需要进一步调整，以符合乡镇企业作为独立商品生产者的要求。

当前，摆在乡镇企业面前的一项迫切任务应是大力推进产权改革，使乡镇企业的产权设置规范化，使乡镇企业的产权结构合理化。如果以为乡镇企业当前的迫切任务只是扩大生产规模和增加投入，那就是忽略了乡镇企业发展的关键所在。扩大乡镇企业的生产规模和增加投入当然也是很重要的，但这更可能是进行了认真的产权改革之后的必然结果，而不是对产权改革的取代。

乡镇企业产权改革的意义远远不止于此。关于乡镇企业产权改革的深远意义，可以从以下四方面来做进一步分析：（1）有利于大大提高农民作为乡镇企业所有者的主体意识，增加农民的生产积极性和建设新农村的决心；（2）有利于大大提高农民的文化技术与管理水平，使农村的社会经济得到迅速发展；（3）有利于推进乡镇基层政权机构的改革，加强乡镇基层政权建设；（4）有利于提高农民的收入，提高农村的生活水平，为农村的共同富裕创造条件。现具体论述如下：

第一，关于农民作为乡镇企业所有者的主体意识的增强问题。

要知道，如果乡镇企业不进行认真的产权改革，产权依然处于不清晰、不明确的状态，那么农民尽管作为乡镇企业的所有者（即使是部分所有者），但他们对乡镇企业的资产的关心程度必然受到很大的限制，他们对乡镇企业资产的较差的关心程度又必然挫伤他们的生产积极性和投资积极性。这是未进行产权改革的乡镇企业的严重缺陷。反之，只要认真地进行乡镇企业的产权改革，明确了产权，使每个投资者都在企业

的产权中有清晰的、确定的份额；这样，即使农民只是乡镇企业的资产的一部分所有者，他们作为所有者主体、投资主体的意识必将大大增强。农民将关心本企业的资产及其保值增值状况，将把企业的经营好坏视为自己所关心的主要问题之一。农民的生产积极性和投资积极性将大大提高。同时，只要乡镇企业通过产权改革后增加了活力，增加了盈利，扩大了生产规模，作为所有者、投资者的农民就可以由此看清农村建设的前景，看清乡镇企业经济力量的成长与壮大对于农村建设的意义，他们建设新农村的决心也会大大加强。经常听到有人说，农民不安心在农村中生活、工作，农村的人力纷纷外流，农村的健壮劳力都走了等等。不错，在一些农村确实存在这种情况。但我们同样可以看到，在乡镇企业发达的地区，特别是在乡镇企业发展后把自己的一部分盈利用于改善农村文化和生活设施的地区，农民的情绪则是较为稳定的。这些地区不但留住了本地的农民、本地的健壮劳力，而且还吸引外地的健壮劳力前来做工。因此，完全有理由认为，在通过产权改革而大大增强了农民作为所有者的主体意识，大大提高了乡镇企业活力之后，农村的面貌必将呈现巨大的变化，农民建设自己的家乡的热情也必将大为高涨。

第二，关于农民文化技术与管理水平的提高问题。

要提高农民的文化技术与管理水平，可以通过好多途径；但不能忽略的是，通过乡镇企业的产权改革，使农民成为名副其实的所有者主体、投资主体，使农民有机会参与乡镇企业的各种会议，也是提高农民文化技术与管理水平的一个重要途径。这是因为，在未明确乡镇企业的产权时，尽管农民是名义上的乡镇企业主人，但这是虚的，而不是实的。他们既没有机会参与乡镇企业的各种会议，也没有机会表达自己对乡镇企业发展业务的意见。这样，也就谈不上农民通过乡镇企业的活动而提高自身文化技术与管理水平。这种情况下的农民与乡镇企业之间的关系，或者是农民入厂做工，农民单纯充当劳动力，或者是农民单纯出钱，但乡镇企业却没有把农民当成是真正的主人。乡镇企业产权改革以后，情况将发生重大变化。这时，农民作为所有者、投资者的地位明确了，农民投资所形成的产权份额也清晰了。相应地，农民作为所有者、投资者将直接参与或选出代表参与乡镇企业的有关决策和参加有关会议，他们将逐渐懂得企业的经营和财务状况，进而对企业的兴衰和资产的增减原因有所了解。如果农民是企业的职工，他们在这里就不单纯充当劳动力，而且也直接或间接地参与生产经营决策。如果农民不是仅有一家乡镇企业作为投资对象，而是有可供选择的投资机会，他们就会

对各个投资机会进行比较，并从比较中增进自己的技术与经济知识。人们常说市场经济是一所大学校，从这里可以学习到许多书本上学不到的东西。但作为乡镇企业中的劳动力，农民真正从市场中所学到的并不多；而农民如果作为乡镇企业的所有者、投资者，并且真地能够参与决策，那么农民从市场经济中所学到的就得多得多。农民越懂得市场经济，市场经济就越能顺利地发展；而要农民比较深刻地了解市场经济，就应使农民不再局限于以消费者、劳动者、储蓄者的身份参加市场经济，而且也以投资者、经营者的身份参加市场经济。

第三，关于乡镇基层政权的建设问题。

乡镇基层政权的建设所涉及的问题较多，包括乡镇基层政权机构选举的民主化、乡镇基层的党组织自身的建设、乡镇基层政府工作人员素质的提高等等，也包括乡镇基层政权机构与乡镇企业之间关系的调整。乡镇基层政权机构的改革与乡镇企业的产权改革是密切相关的，关键在于乡镇企业应当成为政企分开、产权明确、自主经营、自负盈亏的独立商品生产者；乡镇企业不再是乡镇基层政权机构的附属物，乡镇基层政权机构不再把乡镇企业当做自己的直辖企业，不再把乡镇企业当做自己的“小金库”。如果不进行认真的产权改革，是做不到这一点的。不可否认，在某些地区，在乡镇企业产权不明确、不清晰的条件下，一些盈利的（甚至也有一些不盈利的）乡镇企业被当地的乡镇基层政权机构牢牢掌握在自己的手中，视为乡镇基层政权机构的“小金库”。于是，一方面乡镇企业的活力受到极大限制，农民的生产积极性和投资积极性大受挫折；另一方面，这也成为某些乡镇基层政府工作人员腐败的原因之一。而乡镇基层政府工作人员的腐败又破坏了乡镇基层政权的形象，失去群众对他们的信任，并使得乡镇的政治生活、经济生活不正常，使得当地社会难以安定。迄今为止，已有一些被揭露的乡镇干部胡作非为并造成严重后果的案件，他们的胡作非为往往同他们成为乡镇企业的实际主管人有关。他们把政治权力、经济权力集中于自己身上，从乡镇企业那里随意支取货币，或把各种开销拿到乡镇企业报账，或把持乡镇企业招工用人的大权。所有这些都是在市场经济的要求相背离的。难道不该在乡镇企业产权改革的过程中对这些现象来一番清理、整顿吗？由此可见，按照乡镇企业产权明确化的原则来调整乡镇基层政权机构与乡镇企业之间的关系，使乡镇企业成为政企分开、产权明确、自主经营、自负盈亏的独立商品生产者，并不单纯是一个至关重要的经济问题，而且是一个关系到今后能否巩固乡镇政权和保证乡镇社会安定的政治问题。我们决

不能轻视这一问题。

第四，关于农民收入的提高与农村共同富裕问题。

农民收入增长所带来的结果是生活水平的提高。问题在于农民怎样才能较迅速地增加收入？简单地说，主要有两条途径。一是农业（包括畜牧业、渔业、林业、副业）生产以较快的速度发展，劳动生产率有较大幅度提高，农民可以由此提高收入。二是乡镇企业（包括第一、二、三次产业中的乡镇企业）以较快的速度发展，劳动生产率有较大幅度提高，农民作为劳动者和作为投资者都可以由此提高收入。此外，乡镇企业还可以利用自己的一部分利润来支援农业或用于改善农村的文化与生活设施，提高农民的生活水平。即使农民外出做工，其中也有相当一部分是到外地的乡镇企业去工作。可见，乡镇企业的产权改革以及由此引起的乡镇企业活力的增强和乡镇企业的进一步发展，有利于提高农民的收入和改善农村的物质文化生活。那么，农村中的扶贫问题又将如何解决呢？乡镇企业的发展同农村中的扶贫有什么联系呢？在这里，首先需要指出，农村扶贫是一个社会问题，有赖于全社会的共同努力才能解决，包括各级政府对贫困地区和贫困户采取特殊的政策，城市各个企事业单位以不同方式支持贫困地区发展经济、技术、文化、教育、医疗卫生等，也包括农村中的先富裕农户对贫困户的帮助。乡镇企业对贫困地区和贫困户的扶植、帮助同样是扶贫的有效途径之一。比如说，乡镇企业从贫困地区招工；有较好效益的乡镇企业到贫困地区投资开发，既可利用当地的资源，又能增加贫困地区的收入；发达地区的乡镇企业同贫困地区的乡镇企业加强经济联系等。总之，有乡镇企业的积极参与，贫困户和贫困地区收入水平的提高将会大大加快。这也反映了产权改革后乡镇企业的发展对社会所做的贡献。

现在让我们来探讨乡镇企业产权改革的目标模式问题。承包制不能成为市场经济体制下的企业目标模式，这在经济学界已成定论，并且被许多有造诣的经济学家所公认，因此用不着再赘述了。那么乡镇企业产权改革的目标模式是什么？这倒是可以进一步研究的课题。

四

乡镇企业合作制是乡镇企业产权改革的目标模式之一。合作制既表明企业的经济性质，也表明企业的财产组织形式。合作制的优点可以简略地归结为：

1. 以合作制的形式组建或改造乡镇企业，能达到政企分开、产权明确、自主经营、自负盈亏的目的。

2. 以合作制的形式组建或改造乡镇企业，能把企业的投资者与企业的劳动者合为一体，从而调动农民作为企业投资者与企业劳动者的积极性。

3. 以合作制的形式组建或改造乡镇企业，能在企业内部造成一种比较协调的环境，从而有利于增强企业内部的凝聚力，促进生产力的发展。

4. 以合作制的形式组建或改造乡镇企业，能以规范的合作制企业章程来健全企业的管理制度，并对企业领导层进行约束，对企业职工和投资者的合法权益进行保护，从而有利于企业的顺利发展。

乡镇企业合作制的上述优点是明显的。因此在乡镇企业产权改革时，不应该忽视合作制这种企业财产组织形式。那种所谓合作制企业已经过时的说法，不符合实际。要知道，按照规范的原则组建或改造而成的乡镇企业不同于计划经济体制下曾经存在或至今仍然存在的集体所有制企业。那种集体所有制企业名为集体所有，实际上依旧是产权不明确、不清晰的企业，究竟是谁投资的，任何人也说不清楚。即使有些集体所有制企业当初由个人集资（或一部分由个人集资）而产生，但出了资的个人不仅没有被看成是企业的实际的主人，甚至他们本人也不认为自己是企业的实际的主人。然而，以合作制形式组建或改造的乡镇企业则使得乡镇企业的面貌一新，截然不同于以往那种集体所有制企业。合作制也可以称作集体所有制，但这是一种与社会主义市场经济体制相适应的新的集体所有制。

但乡镇企业合作制只是乡镇企业产权改革的目标模式之一，而不是乡镇企业产权改革的惟一模式。与股份制的乡镇企业相比，合作制的乡镇企业的不足主要有以下五点：

第一，在企业规模不大时，乡镇企业合作制的上述优点可以明显地表现出来；而当企业规模较大时，乡镇企业合作制就显得不够了。比如说，企业规模不大，以合作制形式组建或改造乡镇企业，可以把企业的投资者与企业的劳动者合为一体，在企业内部造成一种比较协调的环境，作为合作制特色的“一人一票制”也容易实现。但如果企业规模较大，人数较多，就不一定能发挥合作制的长处。“一人一票制”即使推行，也易于流于形式，而难以把企业内部的关系协调得如职工人数较少

时那样。

第二，从融资集资的角度来看，合作制的乡镇企业是明显地不如股份制的乡镇企业的。股份制的乡镇企业可以从社会广泛地筹集资金；而合作制的乡镇企业则受到从职工内部集资，特别是“一人一票制”的限制，难以筹集更多的资金。乡镇企业合作制的这一局限性在企业规模增大或在有盈利机会存在但由于缺乏资金而难以如愿时更为突出。

第三，从原有的乡镇企业改制为产权明确的乡镇企业时，经常会遇到资产存量折股问题。在股份制条件下，资产存量的折股问题比较容易解决；而在合作制条件下，通常只有把资产存量平均出售给每一个社员才能解决。如果企业规模不大，让全体社员买下资产存量仍是可行的；如果企业规模较大，全体社员买下资产存量这种做法的可行性较小。

第四，在企业发展过程中，有时需要对外参股、控投，有时需要吸收其他企业的参股，有时企业有可能成长为企业集团。这些经济行为完全是正常的。如果按照股份制形式来组建或改造乡镇企业，这些经济行为可以顺利地进行。如果按合作制形式来组建或改造乡镇企业，这些经济行为的实现就会困难得多。

第五，合作制与股份制的另一不同之处在于：当人们参加合作制的乡镇企业后，退出是自愿的，也是自由的；而当人们参加股份制的乡镇企业后，退股是不容许的，股份只能转让给另一人。因此，股份制有利于企业的生产经营规模的稳定，合作制则不利于企业的生产经营规模的稳定。此外，在股份制之下，股份转让时不是按参加时的价格转让，而是按照现行的价格转让，这对于投资者比较有利；而在合作制之下，退出时究竟按什么价格计算是一个难以解决的问题。如果退出时仍按入社时的价格计算，退出者岂不是吃亏？如果退出时按资产重估后的折价计算，那就有可能引发更多的人要求退出，生产又如何继续进行下去？假如合作制的乡镇企业不容许退出，不就与合作制的原则不符了吗？所以合作制乡镇企业在“自愿退出”问题上会遇到操作的困难。同样的道理，在对待新加入者方面，合作制的乡镇企业也会遇到类似的难处。允不允许新加入者进入？如果不允许新加入者进入而只允许原来的加入者退出，那么合作制的乡镇企业岂不是会越来越小，至少是社员人数越来越少？如果允许新加入者进入，那么新加入者按什么价格出资入社？按原来加入者所支付的价格，原加入者肯定吃亏，新加入者肯定占便宜。那又会促使更多的新加入者进入，原加入者与新加入者之间的矛盾必然加剧。新加入者按资产重估后的价格加入，则也会遇到操作的困难。在股

份制的乡镇企业中，由于不得退股而只能转让股份，问题会简单得多。

五

以上所说的这一切并不等于否认乡镇企业合作制的优点。从转换企业经营机制，实现政企分开、产权明确、自主经营、自负盈亏的角度来考察，乡镇企业合作制与乡镇企业股份制一样，都可以达到原定的目标。问题主要在于：乡镇企业规模不大时，合作制是较为适合的；而在乡镇企业规模扩大后，尤其是在新组建的大中型乡镇企业和原有的大中型乡镇企业改制时，合作制的不足之处将突出地暴露出来，所以它不如股份制。换言之，小型乡镇企业的产权改革适宜以合作制作为目标模式，而大中型乡镇企业的产权改革则以股份制作为目标模式为宜。

在这里，还有一个问题需要提出来进行讨论，这就是关于乡镇企业的“股份合作制”问题。究竟什么是“股份合作制”？从目前已经采取“股份合作制”的乡镇企业来看，其中多数是一种合伙制的小企业，还有一部分是不规范的股份制企业。真正实行规范的合作制的或规范的股份制的乡镇企业是少数。因此，不仅尚未进行产权改革的乡镇企业需要进行产权改革，而且已经被称为“股份合作制企业”的那些乡镇企业，也需要通过认真的产权改革使之规范化：或者向合作制的模式规范化；或者向股份制的模式规范化；或者按其本来的产权组成状况，名副其实地正名为私营企业，包括独资企业和合伙企业。

“股份合作制”这个名称并不科学。从企业财产组织形式上看，合作制与股份制是两种不同的企业财产组织形式。一个企业或者实行合作制，或者实行股份制，或者既不实行合作制又不实行股份制，而不可能同时实行合作制与股份制，也不可能把合作制与股份制合为一体。目前，不少乡镇企业喜欢采用“股份合作制”这种名称，可能有以下三个原因：

一是害怕被说成是资本主义性质的。这是因为，在过去较长时间内，一谈到合作制，就认为这是社会主义性质的；一谈到股份制，则被看成是资本主义性质的。因此，明明是按照股份制的方向来组建或改造乡镇企业（尽管组成的是不规范的股份制企业），但由于怕别人说三道四，就使用了“股份合作制”这个名称，以增加安全感。现在看来，这种顾虑是不必要的。股份制无非是企业财产组织形式的一种，它本身并不表明姓“社”还是姓“资”。是股份制就是股份制，不必硬套上“股份合作

制”这样一个不科学的帽子。

二是以为使用“合作”一词在政策上可以得到某些优惠，因此就在股份制之上加上“合作”一词。其实，这也是多余的。政策的优惠可能来自两个方面。一方面，如果符合国家或地区的产业结构调整的要求，那么从产业政策上考虑，政府是会给予优惠的。这时加不加上“合作”一词无关紧要，重要的是投资与生产的产业特征。另一方面，如果是真正的合作制企业，那么根据国家或地区对合作制企业的扶植的规定，企业可以得到一定的优惠。但这时必须确实把企业组建或改造为合作制企业，而不能只从表面上看是否加上“合作”一词。假定有些“股份合作制”的乡镇企业真的是合作制企业，何必不直接使用合作制的名义，而要用“股份合作制”名义呢？

三是把“股份合作制”看成是有中国特色的一种企业财产组织形式，即这类企业既不同于真正的合作制企业，又不同于规范的股份制企业。比如说，在股权设置中，有“集体股”、“企业股”这样的股份，这当然与规范的股份制不符。所以，有人认为不如改称“股份合作制”，因为“集体股”、“企业股”之类似乎带有合作制的成分。又如，有人认为，在合作制之下，出资人可以申请退股，在股份制之下，退股是不容许的。在合作制之下，一人一票；在股份制之下，按股份多少决定票数多少。假定采取“股份合作制”，那么既可以容许出资人退股，又可以按“一股一票”的原则吸收有实力的投资者（包括自然人和法人）加入，岂不是兼有合作制与股份制的特色？这样的企业财产组织形式——“股份合作制”——难道不就反映了“中国特色”吗？应当指出，以这种方式来理解“有中国特色的”乡镇企业财产组织形式，是不准确的。毫无疑问，乡镇企业的成长及其在中国经济建设中的巨大作用这一事实本身就已经具有“中国特色”了，有什么必要硬要从企业财产组织形式上去制造不规范的股份制或不规范的合作制呢？不规范的合作制或股份制只能阻碍乡镇企业的进一步发展，它们算不上什么“中国特色”。

六

乡镇企业的产权改革正在进行之中。已经存在的“股份合作制”的乡镇企业，不管怎么说，都应当被认为是近年来中国经济生活中出现的新事物。对于它们的不规范性，要予以指出，切切实实地给以帮助和指导，使它们走向规范化。不应当歧视它们，更不应当指责它们或取缔它

们。它们在很大程度上是自发地产生的。乡镇干部、群众的热情很高，有些做法（尽管不规范）来自群众的创造。如果说乡镇企业的兴起与发展对80年代的中国起过重要作用的话，那么其中也包括了“股份合作制”乡镇企业所起的作用。如果说乡镇企业的存在与成长是对计划经济体制的有力冲击的话，那么“股份合作制”乡镇企业的功劳也不可磨灭。实践已经充分证明，同以往那种名为集体所有的计划经济体制下的“正统”企业相比，“股份合作制”的乡镇企业可称做是“异端”。为了打破计划经济体制的严重束缚，多一些“异端”是好事。乡镇企业的产权改革可以因地制宜，采取不同的步骤来促进乡镇企业产权设置的规范化，而且在速度上必定有差别。总的趋势将是：小型乡镇企业产权改革的目标模式是合作制，大中型乡镇企业产权改革的目标模式是股份制。关于这一点，前面已经谈过，不再赘述了。

股份制的乡镇企业不是指一定要公开上市。在股份制条件下，公开上市的股份有限公司是极少数。乡镇企业中，够条件公开上市的，当然不排除这种可能性。大多数股份制的乡镇企业可以改为有限责任公司，这是一种普遍适用的乡镇企业财产组织形式。还有一定数量的股份制乡镇企业可以改为内部持股的股份有限公司。要知道，股份制就是股份制，它不分什么“城市企业股份制”和“乡镇企业股份制”，也不分什么“由国有企业改组的股份制”和“由原乡镇企业改组的股份制”。规范化是一个统一的标准，凡是股份制企业都适用。

有些企业由于种种考虑而宁肯保留“股份合作制”的名称，怎么办？对此不必操之过急。产权改革的目的是为了企业的政企分开、产权明确、自主经营、自负盈亏。只要乡镇企业通过产权改革达到了这一目的，有效地转换了企业经营机制，实际上已经按照规范的股份制或规范的合作制组建和运作了。它们愿意采取“股份合作制”这一名称，就听之任之，不要干涉。等到将来某一天，它们自己感到有必要正名为股份制企业或合作制企业之时，它们自己会不再使用“股份合作制”这一名称的。

不仅“股份合作制”这种企业财产组织形式是过渡性的，甚至可以认为，“乡镇企业”这种提法也具有过渡性质。在乡镇企业刚刚出现的时候，这些企业之所以被称为“乡镇企业”，一来是为了同当时占支配地位的计划经济体制下的企业（如国有企业、原来的城市“大集体”企业等）相区别。二来考虑这些企业设置于乡镇，而且劳动力也主要来自附近农村。那么今后呢？难道还有与“乡镇企业”相对而言的“城市企业”吗？难

道“乡镇企业”只可能设置于乡镇之中，企业所需要的劳动力仅限于农村吗？假定当初成立乡镇企业时，考虑到这些企业与计划经济体制下的企业的运作方式不同，即这些企业是“计划外的”商品生产者，所以要用“乡镇企业”来表示其运作方式的特点。那么今后在市场经济大环境中，还需要分什么“计划外的”商品生产者与“计划内的”商品生产者吗？正如前面已经指出的，企业就是企业，股份制企业就是股份制企业，用不着分什么“城市企业”与“乡镇企业”、“城市股份制企业”与“乡镇股份制企业”。迟早有这么一天，“乡镇企业”这一过渡性的称呼将不再存在，“乡镇股份制企业”这一说法也将消失。

这可能是若干年之后的事情，距现在还有一大段时间。因此，立足于现实，我们仍有必要着手乡镇企业的股份制改革，研讨乡镇股份制企业的组建与运行问题。而且，需要再重复一遍：尽管从理论上说“股份合作制”这种提法是不确切的，在组建与运行中也会碰到各种各样的困难，但考虑到“股份合作制”的名称已经在相当广的范围内被农村干部和农民接受，因此可以不必取消它。用“股份合作制”的名称也好，改用“股份制”的名称也好，都是在现有起点上的前进。可以这么说，在产权改革工作中，不要在名称上争论不休，而要看实质，即是否循着产权改革的道路往前走。“一步到位”是做不到的，“分步到位”更有现实意义。

（原载《学习与探索》，1994年第3期）

Property rights reform of rural enterprises (1994)

I

More and more people are coming to terms with the importance of rural enterprises to the Chinese economy, an importance that has been borne out by reality. The reform of large and medium-sized state enterprises and the development of rural enterprises are part and parcel of the effort to reshape the microeconomic foundation of the socialist market economy being developed in this nation. Academic discussions are elaborate and thorough concerning the property rights reform of large and medium-sized state enterprises, but somewhat lacking on the significance of similar reform of rural enterprises and the approaches to it. Indeed, discussions about the latter have merely touched upon the development of the "joint-stock cooperative system." In truth, the property rights reform of rural enterprises is no less important and difficult than that of state enterprises. Moreover, the term "joint-stock cooperative system" is yet to be clarified. All this necessitates some in-depth study.

To begin with, we should not take the burgeoning development of rural enterprises over the recent years for granted. Rather, we should contemplate the role of the market in the survival and development of these enterprises, and look at the question of what is to be done to adapt them further to the market.

Rural enterprises have no lack of competitors. On the home market, they compete with each other, but their competition comes mainly from state enterprises, large urban collectives^[1], private businesses, equity joint ventures with Chinese and foreign investment, and imported commodities. After a rural enterprise is built or expanded, its managers must think about where its market is, how to

carve out a niche in the market for its products, and how to expand its market shares.

Rural enterprises cannot count on local governments for incentives or fringe benefits. They are mistaken if they believe that local governments can help them secure local markets, bar the entry of outsiders, monopolize local supply of raw materials, and prevent local raw materials from being shipped to other areas. This is because local protectionism runs counter to market economy principles, and, judging from the requirements of either the planned economy or the market economy, is bound to be ditched. From the perspective of the planned economy, the practice of monopolizing the supply of raw materials and carving up local markets among local businesses flies in the face of the principle of centralization and of quota-based distribution. From the perspective of the market economy, local protectionism violates the principle of fair and square market competition and market unification. In the short run, this protectionist practice may benefit rural enterprises, but in the long run, it is wrong in that it protects backwardness, strangles businesses, and can backfire on rural enterprises themselves. Enterprises must grow in strength through market competition, because their survival hinges on product quality, profitability, and creativity.

If flexible business mechanisms can stand rural enterprises in good stead when competing with enterprises under the planned economy (state enterprises and big urban collectives), that competitive edge can do them little good when they are pitted against equity joint ventures and private enterprises. Competition between rural enterprises themselves can be tough, too, as their competitiveness is neutralized by the common business mechanisms they employ and the common incentives they receive from local governments. Market competition is merciless; its result is always the same: In the course of it, some rural enterprises collapse, some grow in strength, and new ones keep appearing.

Therefore, it is reasonable to conclude that market conditions are the test of rural enterprises. Today, such enterprises are burgeoning

everywhere in the country. Will this robust development grow to disastrous proportions? Under central planning, fast proliferation of rural enterprises would have been the undoing of the national economy. However, that was then, this is now. The rural enterprises we have today are worlds apart from their predecessors in that they must face the market and be tested by it. The underdogs in market competition are doomed. Their predecessors might have still been muddling along under central planning and gone on consuming all sorts of resources no matter how inefficient they were and how deeply they sank into debt. The test of the market was always there, but under central planning, businesses could ignore such a test or stay impervious to it. Not so for the rural enterprises of today. They are sensitive to the test of the market because their survival is on the line. They must strive to raise economic efficiency and produce nothing but what the market needs. In other words, under central planning, the existence of too many losing companies was a disaster to the national economy because they could be established but were not allowed to die, they were allowed to hang around but not allowed to disappear. By contrast, rural enterprises today are allowed to rise or fall of their own accord; those doing poorly are phased out without mercy; the national economy is immune to fluctuations caused by drastic increases in the number of rural enterprises; and society is in no danger of turmoil when large numbers of such enterprises collapse. This being the case, if people are saying there are too many enterprises, that is because too many ill-managed enterprises are still dragging along under old-fashioned central planning and because too few enterprises can measure up to market requirements and stand the test of the market. If people are saying enterprises are growing too fast, we know they are complaining about the unbridled development of enterprises that are insensitive to market changes and never bother to cater their production to market demand, while enterprises that produce only for the market and whose products sell briskly on the market are not growing fast enough. Rural enterprises of today belong in the latter category.

II

I deem it necessary to say something about repetitious construction. Should repetitious construction be discontinued? Generally speaking, it should be disallowed. This is because with a given supply of resources, repetitious production is synonymous with waste, or unwarranted use of resources that serves nothing but to aggravate the already strained supply. With a given level of market purchase power, repetitious construction or production often means that, for lack of demand, some products become a drag on the market or are stockpiled, which again is tantamount to wasting or abusing resources. This double waste or abuse of resources is a cost or a menace that repetitious construction poses for the economy.

When censuring repetitious production, people tend to lump rural enterprises in with it, as if there were an indissoluble bond between the rise and expansion of these enterprises and repetitious production. Yet they have forgotten what really matters with such production is not whether an enterprise is rural or state-owned, but whether it has changed its operational mechanisms and whether its investment system is new or old. Rural enterprises are flexible in management, and they make their own business decisions while bearing their own gains and losses. Common sense tells us that repetitious production is a losing cause because it inevitably strains resource supply, inflates production costs, and inhibits sales because of the market's limited purchasing power. Rural enterprises do not meddle in repetitious production in the same way that a man never bangs his head against a wall, knowing perfectly well that such an action spells nothing but headache. By contrast, enterprises that do not have to bear the consequence of investment risks under central planning may willingly go after large production scales and as many production projects as possible at all costs, even if such investment brings no returns at all. The crux of the issue is precisely whether an investing enterprise is accountable for the investment risks it chooses to run. Rural enterprises do not embrace redundant production because they can, of their own accord, shun investment and redundant production projects

that bring no economic returns.

From a macroeconomic point of view, we should go a little further in our observation of what people really want out of repetitious production. The term generally refers to building a new factory to make a product that someone else is already making. It is a typical behavior of waste. But the question here is: Does banning repetitious production protect monopoly and backwardness? Is repetitious construction detrimental to the national economy on all occasions? Should competition be allowed between manufacturers of the same product? Take, for instance, a certain product being manufactured by a factory, which is in short supply and leaves a considerable market share to be filled. The dilemma here is whether to allow the factory to expand production or to build a new one to make up for the shortage. In this case, construction of a new factory should obviously not be regarded as repetitious. Again, if the factory already in existence can meet market demand for the product in question but its price is too high and its quality leaves something to be desired, whereas the same product to be made by the factory to be built will be better in quality and lower in price, is it wise to allow the existing factory to monopolize the product and bar the participation of the new factory? It simply does not make sense to tolerate one factory making an inferior product and reject another factory that can offer the same product with a lower price and better quality. In all, repetitious construction should not be used as an excuse to justify protecting monopoly and backwardness.

Now, a look at the waste of resources associated with repetitious construction. It should be pointed out in the first place that it is a waste or abuse of resources to allow a factory to go on making a product at high price and with poor quality while banning the construction of a new factory to produce the same product more competitively. If, under the pretext of sanctioning repetitious construction, we choose to ban the construction of the new factory that can use the same amount of resources to produce a superior product, and tolerate the existing factory's poor performance, isn't that

an abuse of resources? Moreover, it should be reiterated that the market is the test of all enterprises, rural enterprises included. As long as the principle of "survival of the fittest" is followed in economic affairs, those making expensive and shabby products will be eliminated and those making cheaper and better products will survive even if both the amount of capital goods and the market purchasing power are limited. The limited supply of capital goods and market share should be awarded to the latter and denied to the former. Through a period of competition, the fittest survive, and the least fit are phased out. The waste of resources is naturally taken care of through market competition. Isn't there any reason for us to insist that repetitious production is bad? Overlapping production of expensive and shabby commodities should be banned, and so should the overlapping construction of factories producing such commodities, whether the factories involved are owned by the state or farmers.

A profound lesson to be drawn from practice is that rural enterprises can never measure up to the requirements of the market economy if they fail to speed up property rights reform, organize production according to market needs, give precedence to profitability, and establish a managerial system that fuses incentives with restraints. We dare say that the good days are numbered for those rural enterprises that are doing well despite their ill-defined property rights. The market economy is pressing them to overhaul and transform themselves before it is too late.

III

This justifies the need to elaborate on the importance of rural enterprise property rights reform. This reform is designed to standardize the organization and behavior of market participants. At the present stage of development in this nation, its mission is to revamp those enterprises in which government administration is entangled with business management and property rights are ill defined, and which cannot make their own management decisions and bear responsibility for their gains and losses. Only when management

is free from government intervention and property rights well defined can enterprises have the final say in economic activity, and account for their own profits and losses. The property rights reform entails transforming old enterprises and establishing new ones. According to the reform guideline, new enterprises should, from day one, have their management detached from government patronage and their property rights clarified, make their own decisions and be liable for their own gains and losses.

As is mentioned above, the market is the test for enterprises, and "survival of the fittest" the rule of market competition. To root out repetitious production, enterprises must be overhauled and new ones set up according to the guidelines for property rights reform. Only thus can they restructure their products in light of market changes, phase out unneeded products and turn out products that are needed and can elbow out competitors' high-priced shabby products. More importantly, property rights reform puts all enterprises on the same scratch line and detaches their management from government administration. Abiding by law and paying taxes according to rules, they are not directly under government administration and their production and business activity are immune from direct government intervention. Through property rights reform, every company bears investment risks and is liable for their gains and losses, instead of living off the government's egalitarian system of distribution and preferential treatments. The significance of property rights reform as a fundamental step towards a modern market economy is self-evident.

People are still wondering if property rights reform is as much needed by rural enterprises as by state enterprises or large urban collectives. The answer is in the positive: Rural enterprises need property rights reform. Such enterprises' survival and further growth are predicated on changing their operational mechanisms, making independent business decisions, bearing responsibility for their gains and losses, and ceasing to be government appendages. If they do not have the final say on business decisions and cannot take responsibility for their own profits and losses, how can it be said they have stood the

test of the market and followed the "survival of the fittest" rule to compete for all their worth? If they are still subject to stringent government restrictions and intervention the way state enterprises and large urban collectives used to be, how can it be said they are a force powerful enough to breach the dyke of central planning? The saying that rural enterprises are following a different property rights system than the state enterprises and urban collectives is a vague statement. It does not tally with reality in two ways.

On the one hand, only a fraction of rural enterprises have radically changed their business mechanisms to qualify as independent commodity producers. Many others are not qualified as such because they are still following the beaten track of central planning – they are rural enterprises in name but "rural-owned" or "town-owned" enterprises in reality. In other words, they are still appendages of local governments at the grass roots level. For them, property rights reform is yet to begin, and local rural or town governments are yet to come to terms with the necessity and importance of such reform. That is why it is absolutely wrong to believe property rights reform is not a requisite for rural enterprises.

On the other hand, even those rural enterprises said to have changed their operational mechanisms have, in fact, only begun to do so. Their property rights structure is yet to be standardized, and their relationship with rural governments is yet to be readjusted before they can qualify as one hundred percent independent commodity producers.

Therefore, the pressing task for rural enterprises today is to push property rights reform, standardize their property rights configurations, and put their property rights structure on a sound footing. To believe their immediate task is expanding production and increasing investment is to overlook the key to their development. It matters, of course, for rural enterprises to expand production and increase investment. But that should come as an inevitable result of property rights reform rather than a substitute for such reform.

The impact of rural enterprise property rights reform does not

stop just there. There are other aspects where its impact is apparent. Firstly, it enhances farmers' awareness of their status as owners of their enterprises and thereby fortifies their resolve to boost production and transform their homeland; secondly, it improves farmers' cultural endowment and business acumen and puts rural socioeconomic development on a fast track; thirdly, it promotes rural government reform and shores up the nation's political power at the grass roots level; and fourthly, it improves farmer income and livelihood and furnishes beneficial conditions for the achievement of common prosperity in rural areas. The following is a further elaboration of the impact of rural enterprise property rights reform in these four aspects.

(1) Enhancing farmers' awareness of their status as owners of rural enterprises.

It should be noted that without genuine property rights reform, the property rights of rural enterprises can remain vague and ill defined, and farmers' self-respect as owners – even if they are just partial owners – of rural enterprises will be hurt, and this will further shake their commitment to production and investment. If, on the contrary, property rights reform has been carried out in all seriousness so that every farmer-investor in such an enterprise becomes clear about his or her share of property rights, their awareness of themselves as owners of their enterprise will be vastly enhanced. They will become more attentive to the incremental value of the assets in their enterprise, and be personally concerned with their business performance and more enthusiastic for production and investment. When rural enterprises are energized by property rights reform to increase their profits and output, they can open the eyes of their farmer-owners and investors to the prospects of rural development and the impact of their economic growth on rural development. Their resolve to turn their villages into brand-new ones will be greatly fortified as a result. It is often reported that, bored or disheartened by village life, able-bodied farmers are quitting farming and leaving their country homes, causing a drain on the rural workforce. True, this is what happens in some rural areas. However, it is equally true that in

areas where rural enterprises have grown to a sizeable scale, and particularly where such enterprises are using part of their profits to improve rural cultural and living conditions, farmers are in a peaceful frame of mind and live a contented life. Not only are local able-bodied farmers staying put, but farmers are coming from elsewhere to join them as well. Therefore, there is every reason to believe that once property rights reform has boosted farmers' awareness as owners of rural enterprises and vastly energized their enterprises, tremendous changes are bound to take place in the rural economic and cultural landscape, and local farmers will become more committed to building up their homeland than ever before.

(2) Improving farmers' cultural and technical proficiency and management acumen.

Farmers' cultural and technical proficiency and business acumen can be improved in many ways. An important way is property rights reform of rural enterprises, which is meant to turn farmers into true owners and investors of such enterprises, give them the opportunity to attend enterprise meetings, and open up new avenues for them to improve their cultural endowment, skills, and business acumen. This is because without such a reform, farmers are just nominal owners of their enterprises, and have no opportunities to attend these enterprises' meetings and make their voice heard, to say nothing of improving themselves through the activities of these enterprises. Under these circumstances, farmers' relationship with their rural enterprise is reduced to the point where they are mere workers or people who have spent some money on them – no enterprise would regard them as its masters. That situation can change dramatically through property rights reform, which serves to clarify farmers' status as owners and investors as well as their share of property rights to rural enterprises. As owners and investors, they can take part in the decision-making process or send representatives to meetings. In this way they gain a gradual understanding of their enterprise's business and financial situation, and get to know the causes for their successes or failures behind the rise and fall of the value of their assets. If a

farmer happens to be working in the enterprise he owns or invests in, he is entitled to participate, directly or indirectly, in the making of production and business decisions. If several rural enterprises are presented to him as investment options, he may compare them, and upgrade his technological and economic know-how through such comparisons. The market economy is often said to be a great school in which people can learn a lot of things that cannot be learned from books. However, farmers can learn a lot more from the market economy as rural business owners and investors than if they are mere workers. The more they come to know the market economy, the more smoothly the market economy can grow. To help farmers understand the market economy deeply, it is necessary for them to participate not just as consumers, workers, or bank-savings depositors but as investors and managers as well.

(3) Bolstering up rural governments at the grass roots level.

The building of governments at the township level involves a number of issues, such as promotion of democracy in rural government elections, the building of Party organizations at the grass roots level, and the character building of rural government officials. It also involves readjusting the relationship between grass roots governments and rural enterprises. Rural government reform is intimately related to the property rights reform of rural enterprises, and the key to the success of both reforms lies in unfettering businesses from government intervention and turning rural enterprises into independent commodity producers with well-defined property rights and decision-making autonomy and bearing their own gains and losses. When rural enterprises cease to be government appendages, rural governments can no longer regard them as their own businesses, let alone turn them into their slush funds. This is something that can never be achieved without genuine property rights reform. As a matter of fact, there is no lack of local governments which, by capitalizing on rural enterprises' ill-defined property rights, put these enterprises under their control and turn them into their slush funds even if they are not making a profit. This inevitably saps the energy of these

enterprises and dampens their farmer-owners' ardor for production and investment. As a hotbed for corruption among rural government officials, these illegal "off-book coffers" also spoil the image of grass roots political power, rob local governments of popular support, and destabilize local political and economic life. The dire consequences of the wanton behaviors of rural government officials in this regard have been borne out by a series of legal cases that have been cracked in recent years. As de facto bosses of some rural enterprises with political and economic power in their control, these people have wantonly violated the norms of the market economy by willfully withdrawing money, extorting reimbursement for personal expenses, and practicing nepotism in enrolling workers. Shouldn't these behaviors be sternly sanctioned in the course of reforming the property rights of rural enterprises? Obviously, it is not just a paramount economic issue, but also a political issue with a close bearing on whether rural political power can be consolidated and whether rural social stability can be maintained. We have got to follow the principle of defining property rights and separating administration from management when we readjust the relationship of rural enterprises with grass roots governments and turn them into independent commodity producers that enjoy well defined property rights and decision making autonomy, and bear their own gains and losses. On no account should this task be taken lightly.

(4) Raising farmer income and striving for common prosperity in rural areas.

Improved rural livelihood is a fruit of increased farmer income. The issue here is how farmers can increase their income quickly. Simply put, there are two ways to achieve this. First, developing farm production (animal husbandry, fishery, forestry, sideline occupations included), and boosting labor productivity by a large margin. Second, striving for fast growth in rural enterprises in the primary, secondary, and tertiary industries and for major growth in labor productivity, so that farmers can make more money immediately as laborers and investors. In addition, rural enterprises may also use part of their

profits to support agriculture, improve rural cultural and living facilities and ameliorate farmers' livelihood. Some farmers have left their home villages for somewhere else, but many of them end up working in rural enterprises away from home. It is thus clear that the property rights reform of rural enterprises and the effort to revive rural enterprises for further development are conducive to increasing farmer income and improving rural material and cultural lives. What is to be done to help the rural poor to beat poverty? What is the relationship between the development of rural enterprises and the drive to help the rural poor? First of all, helping the rural poor is a social issue that can be addressed only by the concerted efforts of the entire society. This calls for special policies addressed to impoverished areas and households, aid from urban businesses and institutions for economic, technological, and educational and medicare development of underdeveloped areas, as well as help from families that have become affluent earlier than others to poor families. Another method that works is to enlist help from rural enterprises for poverty-stricken areas and underprivileged households. For instance, enrolling workers from poor areas and investing in these areas for developmental purposes helps tap local resources and boost local income. Rural enterprises in relatively more developed regions may pair up with counterparts in less developed regions. In all, the enthusiastic participation of rural enterprises can vastly accelerate increases in the income level of households and regions in financial difficulties. Such actions are an embodiment of the fruits of property rights reform.

IV

Now look at the target models for rural enterprise property rights reform. That the contract responsibility system cannot become a target model for enterprises under the market economy is a foregone conclusion among many accomplished economists, and therefore does not need further elaboration. Instead, what target model should be set for this field of property rights reform merits further study.

The cooperative system can be a target model for rural enterprise

property rights reform, as it defines the economic nature and organizational form of enterprise properties. What this goal can achieve can be summarized in four points.

First, when adopted to establish or transform rural enterprises, the cooperative system helps separate government administration from business management, clarify property rights and enable enterprises to enjoy business autonomy and handle gains and losses on their own.

Second, when employed to establish or transform rural enterprises, the cooperative system helps combine farmer-investors and farmer-workers into one, thereby motivating farmers as both investors and workers.

Third, when used to establish or transform rural enterprises, the cooperative system can foster a congenial internal environment, thereby enhancing internal cohesion, and promoting labor productivity.

Fourth, when applied to establish or transform rural enterprises, the cooperative system enables them to tighten up their management system under a standard corporate constitution, restrain their leaders and protect the lawful rights of workers and investors, thereby paving the way for their smooth development.

With the aforementioned strengths, the cooperative system for rural enterprises should not be overlooked as an organizational form for corporate properties. The notion that cooperative enterprises are outdated does not tally with reality. It need be stressed that the rural enterprises established or transformed according to a standard principle are different from their counterparts that existed under central planning or still exist nowadays. Ill-defined property rights make it hard for those rural enterprises that are known as collectives in name only to identify who their investors are. Some of these firms are established with money raised by individuals, but they do not treat their investors as owners, and the investors themselves do not regard themselves as owners, either. By contrast, the rural enterprises

that have adopted the cooperative system take on a new look that distinguishes themselves categorically from firms under collective ownership. The cooperative system may also be a form of collective ownership, but it is a new form of collective ownership adapted to the socialist market economic system.

The cooperative system, nevertheless, is just one of the target models for rural enterprise property rights reform. Compared with joint-stock rural enterprises, cooperative rural enterprises have five limits.

First, the cooperative system works smoothly when rural enterprises are small, but it falls somewhat short when they grow larger. When it is adopted to set up or transform a small rural enterprise, its investors are also its workers, thereby creating a congenial corporate atmosphere in which the "one man, one vote" decision-making system – the slogan of the cooperative system – works perfectly. But if the enterprise is big and has a lot of people on its payroll, the same decision-making system is likely to dwindle into a mere formality if it is put in place, for it cannot work as effectively in coordinating the enterprise's internal relationships as it does in a small enterprise.

Second, from a financing and fund-raising point of view, a cooperative rural enterprise compares unfavorably with a joint-stock one. A joint-stock rural enterprise can raise funds from a wide spectrum of public avenues, whereas a cooperative rural enterprise may have trouble raising more money than its internal fund-raising mechanism allows, especially under its "one man, one vote" decision-making system. This limit of the cooperative rural enterprise becomes more pronounced when it grows in size or when it lets a major profit-making opportunity slip through its fingers because of lack of money.

Third, when a rural enterprise sets about redefining its property rights, it is often harassed by the issue of converting its capital stock into stock shares. The same problem can be easily addressed under the joint-stock system. Yet under the cooperative system, it can be solved only by selling the capital stock evenly among members, something

that is easy for a small enterprise but becomes unwieldy for a large one.

Fourth, an enterprise in the course of development sometimes needs to acquire another enterprise's stock, or take control of it through such acquisition. Sometimes it needs to sell its stock shares to other enterprises. It may also grow into an enterprise group through mergers. These normal economic behaviors can go smoothly if rural enterprises are regrouped or transformed under the joint-stock system, but may hit some snags under the cooperative system.

Fifth, the cooperative system differs from the joint-stock system in that the stock shares of such a rural firm can be withdrawn freely, which can be a destabilizing factor for its production and business scale, whereas in a joint-stock rural enterprise, shares can change hands only among colleagues, which helps maintain its production and business scale. Moreover, under the joint-stock system, stock shares are transferred at the current price instead of the original price, which puts investors at a relative advantage. Under the cooperative system, it is hard to price the withdrawn shares – if the original price is applied, the man withdrawing his stock will find himself at the losing end of the deal, but if a higher price is set on the basis of reevaluating the assets, it may trigger off an exodus of stockholders. If that happens, how can the enterprise go on with its production? However, if a cooperative rural enterprise bans such withdrawal altogether, doesn't this violate the cooperative principle? Herein are some operational snags for such an enterprise in dealing with voluntary withdrawal of stock shares. Cooperative rural enterprises are also confronted with the quandary of whether or not to admit new participants. If they do not accept new members while allowing those on the payroll to withdraw freely, won't they shrink in size constantly? At least their membership will keep diminishing. If new participants are welcome, what price should they pay for admittance? If the original price is used, it will do a great favor to newcomers and attract more new arrivals, leaving old members to feel cheated. Thus the conflict between old and new members will go from bad to worse.

If newcomers are asked to pay at a price based on a reevaluation of the assets, the going will be tough for the enterprise. For joint-stock rural enterprises, where stock can only be transferred internally, the problem becomes a lot simpler.

V

Despite all that has been said, the beauty of the cooperative system for rural enterprises can hardly be gainsaid. It works as effectively as the joint-stock system in helping rural enterprises meet their goals by reforming their business mechanisms, keeping government administration from interfering in business management, defining their property rights, making their own business decisions and bearing responsibility for their gains and losses. The problem, however, is that the cooperative system works perfectly in small rural enterprises, but not as effectively as the joint-stock system in large rural enterprises, particularly where large and medium-sized enterprises are established or transformed. In other words, the cooperative system is appropriate for the property rights reform of small rural enterprises, while the joint-stock system should be pursued where the property rights of large and medium-sized enterprises are reformed.

This brings forth another topic for our discussion: the joint-stock cooperative system. What is the "joint-stock cooperative system" all about? Most of the rural enterprises that claim to be under this system are small companies under joint partnership. The others are irregular joint-stock enterprises. Rural enterprises that follow the textbook perfect cooperative system or joint-stock system are few and far between. For this reason, not just those rural enterprises that have not reformed their property rights should carry out such reform – those already passing themselves off as "joint-stock cooperative" enterprises should also undertake this reform in earnest, so as to standardize their operational system. They may either be transformed into cooperatives or joint-stock firms, or, in the light of their property rights situations, become private firms under either single ownership or partnership.

The term "joint-stock cooperative system" is somewhat off the mark. The cooperative system and the joint-stock system entail different organizational forms of corporate assets. An enterprise may or may not choose either system. It is impossible for a firm to adopt both at the same time, or combine them in one. Nevertheless, the "joint-stock cooperative system" catches the fancy of many a rural enterprise out of three probable considerations.

First, concern over being dubbed "capitalist," a term that may cause some raised eyebrows in socialist China. Out of the belief that the cooperative system is socialist and the joint-stock system capitalist, some enterprises choose to call themselves a "joint-stock cooperative enterprise" when regrouping or transforming themselves to measure up to the requirements of the joint-stock system. They do this to avoid unnecessary controversy and enhance their sense of security even though the name bears little meaning for a joint-stock company. Such concern is uncalled for today. The joint-stock system is, if anything, an organizational form of corporate assets. It is therefore contentious to call it either socialist or capitalist. The joint-stock system can stand on its own. There is no need to pass it off under the ill fitting title of "joint-stock cooperative system."

Second, the belief that the adjective "cooperative" can help attract government policy incentives. This again is unnecessary. Government policy incentives may be granted in two ways. Firstly, an enterprise that meets national or local policy requirements for industrial restructuring naturally qualifies for such incentives whether or not its name contains the word "cooperative." It is the industrial nature of the enterprise's investment and production that counts. Secondly, cooperative enterprises deserve certain policy incentives in compliance with relevant national and local legislation. An enterprise must be regrouped or transformed under the cooperative system to qualify for such incentives. It won't do to add "cooperative" to the name of an enterprise that is not really a cooperative one. If a "joint-stock cooperative" is truly cooperative, why don't they simply call themselves "cooperative"? It is useless to gild the lily.

Third, mistaking the "joint-stock cooperative" system for a corporate property organizational form with Chinese characteristics, which is different from both the cooperative system and the joint-stock system. It so happens that some enterprises have divided their stock into "collective shares" and "corporate shares." Believing that this division does not accord with the standard joint-stock system, and that "collective shares" and "corporate shares" smack of the cooperative system, they have renamed themselves "joint-stock cooperative enterprises." It also happened that some people – on the ground that the cooperative system allows investors to withdraw their shares but the joint-stock system does not, and that in a cooperative enterprise under the "one man, one vote" decision-making system, votes are decided by the number of stock shares – have coined the term "joint-stock cooperative" system in the hope of incorporating the strengths of both systems, so that old investors can withdraw their shares while new investors, individuals and legal entities included, can be attracted. They assert this "joint-stock cooperative system" is distinctively Chinese. This way of thinking, however, is misleading. For their tremendous role in Chinese economic development, rural enterprises are "distinctively Chinese" enough. There is absolutely no need to concoct an ill-fitting joint-stock or cooperative system. Such irregular systems, if allowed to exist, can only hold back the growth of rural enterprises.

VI

Property rights reform is under way among rural enterprises. The rise of the "joint-stock cooperative" rural enterprises are a nascent phenomenon no matter how you look at them. They deserve help and guidance to meet established business norms. They should not be discriminated against, still less rebuked or disbanded. Their rise is spontaneous to a large extent. Rural government officials and local farmers have embraced them with great gusto. Some of these enterprises, though looking somewhat outlandish, are the brainchild of local people. If the rise and development of rural enterprises had played a positive role in the development of China in the 1980s, part

of that contribution came from the "joint-stock cooperatives." If, with their presence and growth, rural enterprises are a powerful onslaught on central planning, the contributions of "joint-stock cooperative" rural enterprises cannot be denied. Practice proves that in comparison with the "orthodox" enterprises which are collective in name but centralized in deed, the "joint-stock cooperative" rural enterprises may well qualify as "heterodoxy." However, to unshackle the national economy from central planning, we would do better to have more of such "heterodoxy." Property rights reform should be carried out variously in light of specific circumstances, and different measures are called for to institutionalize the property rights configuration of rural enterprises. Such reform should also be allowed to go at different speeds. The general trend is that the cooperative system will be the target model for property rights reform in small rural enterprises, and the joint-stock system for this reform in large and medium-sized rural enterprises. Having made this point previously, I will not labor it further.

Joint-stock rural enterprises need not be listed on the stock market. Under the joint-stock system, only a few companies eventually become listed. Someday, however, some rural enterprises may qualify for it, a likelihood that should never be excluded. Most joint-stock rural enterprises, however, may be converted into limited liability companies, which I believe is a property organizational form universally applicable for rural enterprises. A certain number of them may be transformed into limited liability companies with internal stock shares. It should be noted that the joint-stock system cannot be divided into "urban enterprise joint-stock system" and "rural enterprise joint-stock system," nor can it be split into "joint-stock system for regrouped state enterprises" or "joint-stock system for regrouped rural enterprises." The joint-stock system applies to all manner of shareholding companies.

Some enterprises, out of one consideration or another, choose to stay with the name "joint-stock cooperative enterprise." What is to be done about this? In this case, impetuosity gets us nowhere. The goal of

property rights reform is to prevent the government from interfering in business management, to define property rights, and delegate enterprises with autonomy to make business decisions and handle their own gains and losses. A rural enterprise may still be known as a "joint-stock cooperative enterprise" provided it has reached the goals of property rights reform, adopted effective business operational mechanisms, and has already been organized and operated under a standard joint-stock or cooperative system. Someday, it may awaken to the need to change its name to "joint-stock enterprise" or "cooperative enterprise."

The "joint-stock cooperative system" is a transitional corporate property organization form. The "rural enterprise" is transitional, too, and many firms have stuck to this name since its debut for two reasons: first, to differentiate them from enterprises under the dominant central planning, such as state enterprises and large urban collectives; and second, to take into consideration the fact that they are located in villages and towns, with their workforce coming mainly from among local villagers. What will become of these "rural enterprises" in the future? Will there be any more "urban enterprises" in contrast with "rural enterprises"? Can "rural enterprises" be established only in villages or towns, and can their workforce come only from local villages? If, in these early days, it is necessary to use the term "rural enterprise" to highlight their differences in business operational mechanisms from those under central planning and their identity as "above-norm" commodity producers, is there any need to differentiate "above-norm" commodity producers from "planned" commodity producers in a future market economic environment? As mentioned in the foregoing, enterprises are enterprises, joint-stock enterprises are joint-stock enterprises. There is absolutely no need to divide them into "urban" and "rural" enterprises, still less "urban" and "rural" joint-stock enterprises. "Rural enterprise," as a transitional name, will disappear at last, and so will "rural joint-stock enterprise."

This, however, will not happen anytime soon. Returning to reality, we should pursue joint-stock reform among rural enterprises

and devise proper ways and means to establish and operate them. Moreover, to repeat once again, even though the notion of "joint-stock cooperative system" is inaccurate, and the establishment and operation of such enterprises can be very difficult, we may as well let such a title stay, considering the fact that it has been widely accepted by rural officials and farmers. The use of the name "joint-stock cooperative" system, or simply the "joint-stock system," represents a departure from the status quo. In property rights reform, instead of haggling over names endlessly, we should set our eyes on the essence of things. If an enterprise is traveling down the road of property rights reform, it will not reach its goal in just a single leap. A more realistic approach is to go step by step toward the final destination.

— *Study & Exploration* bimonthly, issue No. 3, 1994

[1] Large urban collective, a term dating back to the Big Leap Forward of 1958, referring to firms in which capital is owned collectively while workers are accorded the same wages and welfare benefits as state enterprise employees. (*Translator*)

收入分配的合理性与协调 (1994)

究竟什么是收入的公平分配？收入分配的合理是不是比收入分配的公平更为合适？这是收入分配理论中的一个重要问题。我的观点是：收入分配的公平是说不清楚的，而且容易导致平均主义分配方式的复归，因此“收入公平分配”的提法不如“收入合理分配”的提法。用“收入分配合理”一词作为“收入分配公平”的替代语也许更为恰当。

那么，究竟什么是收入的合理分配呢？让我们从收入分配合理性的两种含义谈起。

一、收入分配合理性的两种含义

收入分配的合理性有两种含义：一是指收入本身是否合理；二是指人与人之间的收入差距是否合理。两种含义虽然有密切联系，但并不一样。比如说，甲、乙二人都作为生产要素供给者参加了市场活动，某甲得到 n 元，某乙得到 m 元。收入分配合理的第一种含义是指，某甲得到 n 元，某乙得到 m 元，这是否合理？他们应当得到比 n 元、 m 元更多的收入呢，还是只应得到少于 n 元、 m 元的收入？如果说他们得到的收入应当高于 n 元或 m 元，那么高多少是合理的？如果说应当低于 n 元或 m 元，那么低多少是合理的？这就是第一种意义上的收入合理问题。再说，假定某甲得到 n 元，某乙得到 m 元，那么 n 元与 m 元之间的差距究竟多大为合理，否则就是不合理？社会上不只是某甲、某乙两人，而是有众多的生产要素供给者、市场参与者，他们之间的收入是有差距的。可以在众多的生产要素供给者、市场参与者中，按照收入状况划分为若干组。这样就便于通过对组与组之间收入差距的研究，进而说明社会收入分配的合理与否。这是第二种意义上的收入合理问题。

第一种意义上的收入合理问题与第二种意义上的收入合理问题有联系，也有区别。对第一种意义上的收入合理问题的研究，应成为研究第

二种意义上的收入合理问题的基础。比如说，如果某甲得到 n 元收入具有合理性，某乙得到 m 元收入也具有合理性，那么某甲与某乙的收入差距（ n 与 m 的差距）可以被认为是合理的。但是，如果某甲得到的 n 元的收入是不合理的，那么不管某乙得到的 m 元的收入是否合理，都难以认为某甲与某乙的收入差距（ n 与 m 的差距）具有合理性。反之，如果某乙得到的 m 元收入是不合理的，那么不管某甲得到的 n 元收入是否合理，也都难以认为某甲与某乙的收入差距（ n 与 m 的差距）具有合理性。

也许有人会提出：以前，在计划经济体制下，尽管人们的收入水平都很低，但彼此之间的收入差距不大，所以这仍应当被看成是收入分配的协调，即使是低收入条件下的收入分配的协调。能不能这样看问题呢？只要我们懂得了收入分配合理性的两种含义，这个问题就不言自明了。要知道，在计划经济体制下，在平均主义分配方式占支配地位的条件下，人们的收入都低于他们作为生产要素供给者本应得到的收入。既然彼此的收入都不合理，那么他们之间的收入差距也就不具有合理性。收入分配不合理（包括第一种意义上的收入分配不合理和第二种意义上的收入分配不合理），那还怎么谈得上收入分配的协调呢？

二、收入分配协调的含义

下面，让我们在弄清楚收入分配合理性两种含义的基础上，再就收入分配协调的含义进行阐释。

收入分配协调是以第一种意义上的收入合理分配和第二种意义上的收入合理分配为前提的。这就是如前面已指出的，没有第一种意义上的收入合理分配，第二种意义上的收入合理分配就无从谈起。而如果没有这两种意义上的收入合理分配，收入分配协调也就没有可能性。因此，我们不可能脱离收入分配的合理性来讨论收入分配的协调。

前面还指出，低收入水平上的收入分配协调，不可能是真正的收入分配协调，而是一种虚假的、真相被掩盖了的、所谓的“收入分配协调”。对这个问题的认识，必须同对平均主义分配方式的认识联系在一起。在平均主义分配方式之下，效率低，生产力水平低，收入水平也低。尽管彼此之间的收入差距不大，但不能认为这时已经接近了收入分配协调。收入分配协调，只有在按效益分配条件下，生产要素供给者各自得到了合理的收入，而彼此之间的收入差距也是合理的时候，才能实现。在普遍低收入条件下，无论怎样进行分配，也不可能做到收入分

配的协调。

在人们谈到收入分配协调还是不协调的时候，通常既指个人收入分配的协调，又指地区收入分配的协调。后者是从另一个角度提出的收入分配协调的含义。我们应当看到，个人收入分配的协调问题尽管也会遇到一些困难，但相对于地区收入分配协调问题而言，仍然比较容易解决。这是因为，个人收入分配协调与否同个人收入分配是否合理直接有关。只要把个人收入分配是否合理问题弄清楚了（虽然这也有一定的难度，关于这一点，下面还要展开讨论），那么个人收入分配协调与否也就较易于作出判断。然而，地区收入分配协调与否的判断却要困难得多。理由是：

第一，个人收入分配的合理性是以个人作为生产要素供给者按生产要素供给的效益取得收入为标准的，但地区收入分配的合理性却很难按照同样的标准来处理。要知道，个人收入是指个人提供生产要素所得到的收入。因为只有这样，才能说明这种收入是否合理。但地区收入的含义却不明确。它可能是指地区的国民生产总值和国民收入。如果地区收入是指这些，那么就难以说明它们是否合理，从而地区收入的合理性就缺乏判断的依据。假定把地区收入理解为地区的各个生产要素供给者个人提供生产要素所得到的平均收入，那么这种平均收入同样缺乏判断其合理与否的依据。因为平均收入掩盖了各个不同的生产要素供给者的效益的差别，从而掩盖了各个不同的生产要素供给者的收入的合理性。既然地区收入的合理性缺乏依据，那么上述第一种意义上的收入分配合理与否就判断不了，于是对于地区收入分配的协调与否也是无法判断的。

第二，上述第二种意义上的收入合理分配（即收入分配差距的合理），是以第一种意义上的收入合理分配为前提的。对于个人收入分配合理与否的判断是如此，对于地区收入分配合理与否的判断也应如此。然而，正如前面所指出的，上述第一种意义上的收入合理分配对于地区收入分配是不适用的。既然如此，地区之间收入分配是否合理也就无法判断。人们至多只能说沿海地区的收入与内陆地区的收入差距过大，应当缩小这种收入差距；但却不能判断究竟两个地区之间多大的收入差距才是合理的差距，因为缺乏判断的依据。

由此看来，虽然地区收入分配的合理性和收入分配差距的合理性问题都可以从理论上进行深入的探讨，但在考察收入分配协调问题时，还是以考察个人收入分配协调为宜。至于地区收入分配协调的判断问题，则不妨作为进一步探讨的理论课题，留待今后去研究、解决。当然，这

也并不妨碍我们笼统地使用“促进地区收入分配协调”这样的概念，这主要是指要避免地区收入差距过大而言。

再说，在考察效率与公平的顺序排列时，把个人作为生产要素供给者来对待，要比把地区作为生产要素供给区域来对待，更为清晰。因为效率是指资源的有效使用与有效配置；效率的变化，主要与生产要素供给者所提供的生产要素的效率变化有关。而公平，是指机会均等条件下收入分配的协调。这也只适用于对个人之间收入分配及其差距的考察，而不适用于对地区之间收入分配及其差距的考察，因为地区收入合理与否，以及地区之间收入差距合理与否的判断标准无法确定。

三、经济意义上与社会意义上收入分配差距合理性的区别

尽管我们不得不把收入分配合理性问题和收入分配协调问题的讨论集中到个人收入分配方面来，但是我们必须承认，在这方面还有一个难题有待于分析。这就是前面已经指出的，究竟什么是个人收入分配的合理差距，以及经济意义上的收入分配差距的合理性与社会意义上的收入分配差距的合理性为什么不完全一致。

从经济上说，假定生产要素供给者都是在同一条起跑线上参与市场经济活动的，竞争的结果使他们的收入有一定的差距，这种收入分配差距是机会均等条件下按效益分配原则起作用的产物。因此，经济意义上的收入分配差距的合理性存在的条件有二：一是生产要素供给者的机会均等，他们之间参与市场经济活动的出发点是相同的；二是生产要素供给者按效益分配原则取得各自的收入。不言而喻，经济意义上收入分配的不合理差距，或者来自生产要素供给者之间机会的不均等，即他们在参与市场经济活动时并非站在同一条起跑线上；或者来自生产要素供给者并非都按效益分配原则取得收入；或者两种情况兼而有之。单纯从经济上进行分析，只要收入分配差距来自上述两个原因（或其中任何一个原因），那么不管收入分配差距是大还是小，都是收入分配的不合理差距，都是收入分配不协调的表现。于是都要政府进行第二次分配来予以协调。换言之，从经济上说，只要收入分配是机会均等条件下生产要素供给者参与市场经济活动的结果，并且各个生产要素供给者都按照效益分配原则取得了收入，那么不管收入分配差距是大还是小，都属于收入的合理分配，也就是收入分配协调的表现。

社会意义上的收入分配差距合理或不合理的界定，比经济意义上的收入分配差距合理或不合理的界定困难得多。为什么这么说？可以从以下两方面来说明：

一方面，在判断经济意义上的收入分配差距合理与否时，是严格地按照是否在机会均等条件下参与市场经济活动和生产要素供给者是否根据按效益分配原则取得了各自的收入来得出结论。而在判断社会意义上的收入分配差距合理与否时，却找不到像判断经济意义上收入分配差距合理与否那样严格的标准。如果采取同判断经济意义上的收入分配差距合理与否的相同的标准，岂不是等于说社会意义上收入分配差距合理与否就是经济意义上收入分配差距合理与否？那样一来，又有什么必要把社会意义上收入分配差距的合理性问题单列出来呢？看来，社会意义上的收入分配差距合理与否的判断标准不能仅限于机会均等条件下的对市场经济活动的参与和生产要素供给者按效益取得收入这样两项，而必须另外寻找。但这个问题却不易解决。

另一方面，经济意义上收入分配的差距，只要是合理的差距，那么不管差距多大，在经济上所反映出来的结果将是效率的增长、生产力的发展、人均收入水平的提高。于是可以认为，经济意义上收入分配合理差距的存在将带来积极的后果。这一积极的后果在近期内就可以被观察到。然而，社会意义上收入分配的差距，如果差距偏大，却会导致社会的不安定，不管这种差距在经济意义上是否合理。加之，由于社会意义上收入分配差距偏大而引起的社会不安定，不一定是近期内就可以被观察到的，这往往需要经过一段时间。问题越积越多，矛盾越来越尖锐时，才会爆发出来。这就表明：要从所产生的后果方面来判断社会意义上收入分配差距的合理性，同样不是一件容易的事情。

既然经济意义上与社会意义上收入分配差距的合理性有上述区别，而社会意义上的收入分配合理性的界定要远远难于经济意义上的收入分配合理性的界定。那么我们不禁要问：是否有必要在界定经济意义上的收入分配差距的合理性之外，再去界定社会意义上的收入分配差距的合理性呢？应当说，这种必要性是存在的。经济意义上收入分配差距合理了，如果从社会意义上说收入分配差距也合理，那当然是最理想不过的。但在实际生活中，却很可能发生这样的情况：一种收入分配差距，从经济意义上说是合理的，而从社会意义上说，却不合理；或者，从经济意义上说是不合理的，而从社会意义上说，既可能也是不合理的，也可能反而是合理的。因此，即使对社会意义上收入分配差距的合理还是

不合理的界定远为困难，但在这里作一些探讨仍是需要的。探讨，有助于使我们距离这个难题的解决更近一些。

四、社会意义上收入分配差距合理与否的判断

前面已经提到，生产要素供给者参与市场经济活动的机会均等还是不均等，是判断经济意义上与社会意义上收入分配差距合理性的共同标准之一。生产要素供给者是不是按各自的效益取得收入，是判断经济意义上与社会意义上收入分配差距合理性的另一个共同标准。要判断经济意义上的收入分配差距合理与否，有这两个标准就够了。然而，要判断社会意义上的收入分配差距合理与否，单靠这两个标准还不够（尽管它们仍是不可缺少的），而有必要另外寻找。这个问题虽然难度很大，但还不至于完全没有办法。

社会意义上的收入分配差距的不合理，表现为收入分配差距的存在使得社会上产生了不安定，而社会的不安定又会导致经济发展受阻碍，导致效率的增长缓慢、停滞或下降，导致人均收入水平的降低或难以提高。社会意义上的收入分配差距的合理，则表现为：即使收入分配存在着某种差距，但社会上并未因此而产生不安定。于是经济可以持续向前发展，效率可以依然增长，而人均收入水平也可以照常逐步提高。这样，我们就可以把收入分配差距的存在是否引起社会的不安定看成是社会意义上收入分配差距合理与否的判断标准。初步看来，这个论点是可以站得住的。

但如果再仔细推敲一下，至少有三个问题有待于明确。这三个问题是：

第一，社会安定还是不安定的标志又是什么？经济意义上收入分配差距合理性所导致的经济发展、效率增长、人均收入水平提高，可以用统计指标来表示，可以计算，可以比较。社会意义上的收入分配差距合理性所导致的社会安定，或收入分配差距的不合理所导致的社会不安定，究竟用哪些指标来表示？如何计算？如何比较？

第二，正如前面已经指出的，社会意义上的收入分配差距合理还是不合理的后果表现为社会安定或社会不安定，这并不是短时期内所能观察到的。社会不安定有一个累积过程，有一个潜伏期。通常要等到问题尖锐的时候，才被人们观察到，但时间间隔是比较长的。这样就增加了

判断社会意义上收入分配差距合理与否的难度。主要的困难在于：如何衡量潜伏的社会不安定程度？如何才能避免把潜伏的社会不安定当成是社会安定，从而得出社会意义上收入分配差距合理的正确论断？

第三，社会不安定的原因是很多的，社会意义上的收入分配差距不合理只是原因之一。因此，究竟怎样才能判断社会意义上收入分配差距的不合理在社会不安定形成中的作用的的大小？社会不安定究竟能在多大程度上归因于社会意义上收入分配差距的不合理？特别是，在社会意义上收入分配差距合理的情况下，难道不会因其他原因而引起社会不安定吗？这些情况同样增加了判断社会意义上收入分配差距合理与否的难度。主要的困难在于：如何衡量社会意义上收入分配的合理差距在促进社会安定方面的作用，并把这种作用同促进社会安定的其他因素的作用区分开来？如何衡量社会意义上收入分配的不合理差距在导致社会不安定方面的作用，并把这种作用同导致社会不安定的其他因素的作用区分开来？

我们列举出以上三个问题，并不意味着由于这些困难的存在而不必再在这个领域内进行探讨了。而是说，正因为考虑到这些困难的存在，所以在这个领域内进行研究时不应当也不可能偏重于数量化的分析，而以比较粗线条式的研究为宜。具体地说，我们不妨以社会成员对自己的收入以及与他人的相比较的收入的满意度作为指标。社会成员对自己的收入的满意度和社会成员对于自己与他人相比较的收入的满意度是不同的，应当分别考察。

社会成员对自己的收入的满意度可以简称为个人绝对收入满意度。个人绝对收入满意度是指个人作为生产要素供给者对于自己提供生产要素所得到的收入同期望值的对应程度。如果个人作为生产要素供给者在提供一定量的生产要素的情况下所得到的收入同期望值达到了对应，个人就对自己的绝对收入感到满意。如果个人在这种情况下所得到的收入大于期望值，尽管二者并不对应，但由于收入是大于期望值的，所以仍应认为个人对自己的绝对收入感到满意。如果个人在这种情况下所得到的收入少于期望值，表明二者不对应，个人对自己的绝对收入就感到不满意。个人在这种情况下所得到的收入越是少于期望值，个人对自己的绝对收入的不满意程度就越大，或个人绝对收入满意度就越小。

社会成员对自己与对他人相比较的收入的满意度可以简称为个人相对收入满意度。个人相对收入满意度是指个人作为生产要素供给者对于自己提供生产要素所得到的收入在同他人因提供生产要素而得到的收入

的实际比率同期望比率的对应程度。如果这种实际的比率同期望的比率达到了对应，个人就对自己的相对收入感到满意。如果这种实际的比率大于期望的比率，尽管二者并不对应，但由于实际比率是大于期望比率的，所以仍应认为个人对自己的相对收入感到满意。如果这种实际的比率小于期望的比率，表明二者不对应，个人对自己的相对收入就感到不满意。实际比率越是小于期望比率，个人对自己的相对收入的不满意程度就越大，或个人相对收入满意度就越小。

社会是由众多成员所组成的。各个社会成员的个人绝对收入满意度不会一样，个人相对收入满意度也不会一样。在任何一种分配方式之下，社会成员的个人绝对收入满意度和个人相对收入满意度之间的差异总是存在的。但某一个社会成员的个人绝对收入满意度低或个人相对收入满意度低并不会造成社会的不安定，而只有在多数社会成员的个人绝对收入满意度低或个人相对收入满意度低的情况下，社会才会出现不安定。于是从理论上说，可以得到一定时点上的社会平均绝对收入满意度和社会平均相对收入满意度。当社会平均绝对收入满意度低到某一数值（临界值）以下时，社会将出现不安定。社会平均绝对收入满意度越是低于某一数值（临界值），社会的不安定程度就越大。当社会平均相对收入满意度低于某一数值（临界值）以下时，社会将出现不安定。社会平均相对收入满意度越是低于某一数值（临界值），社会的不安定程度就越大。

要知道，个人绝对收入满意度与个人相对收入满意度是有区别的。个人绝对收入满意度是个人相对收入满意度的基础。作为生产要素供给者的个人，如果个人绝对收入满意度较好，那么即使个人相对收入满意度较差，对社会不安定的影响也不会十分突出。如果个人绝对收入满意度较差，那么即使个人相对收入满意度较好，对社会不安定的影响也会较大。可以把个人收入满意度对社会不安定的影响的轻重程度按下列顺序排列：

1. 个人绝对收入满意度较好，个人相对收入满意度较好。
.....对社会不安定的影响最小
2. 个人绝对收入满意度较好，个人相对收入满意度较差。
.....对社会不安定的影响较小
3. 个人绝对收入满意度较差，个人相对收入满意度较好。

.....对社会不安定的影响较大

4. 个人绝对收入满意度较差, 个人相对收入满意度较差。

.....对社会不安定的影响最大

正如前面已经指出的, 社会成员的个人绝对收入满意度和个人相对收入满意度都应当以社会平均绝对收入满意度和社会平均相对收入满意度来表示。因此, 以上关于个人收入满意度对社会不安定的影响的轻重顺序排列也应以社会平均绝对收入满意度和社会平均相对收入满意度来表示。

考虑到在影响社会安定方面个人绝对收入满意度所起的作用要大于个人相对收入满意度所起的作用, 所以在把社会平均绝对收入满意度与社会平均相对收入满意度综合为一个社会平均收入满意度时, 社会平均绝对收入满意度所占的比重应当大一些, 社会平均相对收入满意度所占的比重应当小一些。这样就可以形成社会平均综合收入满意度, 并确定社会平均综合收入满意度的临界值。社会平均综合收入满意度及其临界值, 可以作为判断社会意义上收入分配差距合理与否的依据。

现在, 让我们把上面所讨论的作一概述。

A: 个人得到的收入;

B: 个人对收入的期望值;

C: 根据A与B而得出个人所得到的收入同期望值的对应程度, 又称为个人绝对收入满意度;

D: 个人得到的收入同他人得到的收入的实际比率;

E: 个人对自己得到的收入同他人得到的收入的期望比率;

F: 根据D与E而得出个人收入同他人收入的实际比率同期望比率的对应程度, 又称个人相对收入满意度;

G: 根据C而得出社会平均绝对收入满意度;

H: 社会平均绝对收入满意度的临界值;

I: 根据F而得出社会平均相对收入满意度;

J: 社会平均相对收入满意度的临界值;

K: 根据个人绝对收入满意度和个人相对收入满意度各自在影响社

会安定方面所起作用的大小，确定二者在影响社会安定方面各自所占的比重；

L：根据G、I、K而得出社会平均综合收入满意度；

M：社会平均综合收入满意度的临界值；

N：根据L与M来判断社会意义上收入分配差距的合理与否以及不合理程度。

五、对收入分配差距与社会不安定相互关系的进一步分析

前面在谈到以社会不安定作为判断社会意义上收入分配差距合理与否的依据时曾指出：社会不安定有一个累积过程，有一个潜伏期，通常要等到问题尖锐时才被人们观察到。造成社会不安定的原因较多，收入分配差距只是其中一个原因。既然如此，那么我们在考察这方面的问题时就有必要从社会平均综合收入满意度及其临界值的分析上再前进一步，对收入分配差距与社会不安定的相互关系作较为深入的研究。

先讨论社会不安定的累积问题。俗话说，冰冻三尺，非一日之寒。从社会不安定到社会的剧烈动荡的确有一个较长的累积过程。如果说人们对绝对收入的满意度的下降和对相对收入的满意度的下降都是逐步进行的话，那么一旦突破了临界值，问题很可能一下子尖锐起来。也许可以用这样的词句来形容，这就是，形势急转直下，一发不可收拾。在研究中，怎样对待这种情况呢？一个可能的解决方式是，把社会平均综合收入满意度的临界值分解为社会平均综合收入满意度临界值I和社会平均综合收入满意度临界值II。

社会平均综合收入满意度临界值I是指：当社会平均综合收入满意度低到这一数值（临界值I）以下时，社会将出现不安定。但这时，社会的不安定仍然是较轻的，或者带有局部性质。

社会平均综合收入满意度临界值II是指：社会平均综合收入满意度继续下降，当它低到这一数值（临界值II）以下时，社会状况将急剧恶化。社会将出现严重的不安定，或称为剧烈的动荡，而且往往带有全面动荡的性质。

于是，社会平均综合收入满意度临界值I与社会平均综合收入满意度

的临界值II之间的区域，是政府需要密切注意的范围。临界值I是路标。当社会平均综合收入满意度逐步下降而接近临界值I时，政府应当由此得到警告，设法缓和社会收入分配差距所产生的社会不满等问题，以免引起社会不安定。而临界值II则是另一个路标。如果社会平均综合收入满意度在降到临界值I之下时仍继续下降，那么尤其要引起政府的警惕。因为问题已经越积越多，矛盾已经越来越尖锐。一旦社会平均综合收入满意度再下降到临界值II以下时，社会的剧烈动荡将难以避免。社会平均综合收入满意度临界值分解为临界值I和临界值II，看来有助于进一步说明收入分配差距与社会不安定之间的相互关系。

至于收入分配差距在造成社会不安定方面的作用，以及收入分配差距作为社会不安定的原因之一同造成社会不安定的其他原因的关系，倒是一个真正的难题。的确，把社会不安定单纯归因于收入分配差距，是过于简单的。造成社会不安定的原因很多，而且这些原因也是相互影响的，所以很不容易把收入分配差距在造成社会不安定方面的作用大小从数量上加以确定。特别困难的是，收入分配差距在造成社会不安定方面的作用，同收入分配差距之间的关系是复杂的。比如说，如果收入分配差距较小，即使社会平均综合收入满意度并不高（指社会上多数成员不满意低收入条件下“吃大锅饭”的现状），但很可能只影响经济效率的增长，而不至于影响社会的安定。如果收入分配差距较大，但社会平均综合收入满意度并不很差（指社会上多数成员认为这种收入分配差距仍然是可以接受的），那么这不会对社会的安定有较大的不利影响。如果收入分配差距较大，而社会平均综合收入满意度又比较差，这就会对社会的安定产生较大的不利影响；并且，如果收入分配差距大到一定程度，社会平均综合收入满意度也下降到一定限界之下，那么这对社会安定所产生的不利影响就会大得多，甚至可以认为这时的社会不安定、社会动荡主要是由此引起的。

了解到收入分配差距同社会安定或社会不安定之间的复杂关系，我们就可以对这个问题采取如下的处理方式：

把收入分配差距和社会平均综合收入满意度作为两项指标。收入分配差距可以用基尼系数（Gini Coefficient）代替。基尼系数越小，越接近于收入的均等化；基尼系数越大，收入分配差距越大，即距离收入均等化越远。这样，收入分配差距同社会平均综合收入满意度之间的关系，可以用基尼系数同社会平均综合收入满意度的关系来代替。

由于基尼系数小的时候，不管社会平均综合收入满意度是高还是

低，社会安定都不会受到收入分配差距的较大影响，所以这种情况可以略去不讨论。

由于社会平均综合收入满意度较高时，不管基尼系数是大还是小，收入分配差距都不至于对社会安定产生较大的不利影响，所以这种情况也可以暂不讨论。

于是讨论的范围就可以限定为基尼系数大而社会平均综合收入满意度又低时的情况。可以把较大的基尼系数分为若干级。比如说，基尼系数多少为1级，基尼系数多少为2级、3级。1级高于2级，2级高于3级。基尼系数越大，级别越高。把较低的社会平均综合收入满意度也分为若干级。比如说，社会平均综合收入满意度多少为1级，社会平均综合收入满意度多少为2级、3级。同样地，1级高于2级，2级高于3级。社会平均综合收入满意度越低，级别越高。这样，可以把各级基尼系数同各级社会平均综合收入满意度组合在一起，根据不同的情况来判断收入分配差距同社会不安定之间的关系。一般说来，当基尼系数为1级，社会平均综合收入满意度为1级时，收入分配差距对社会安定产生的不利影响为最大。这时可以把收入分配差距看成是造成社会不安定、社会动荡的主要原因，造成社会不安定、社会动荡的其他原因相形之下退居于不重要的位置。而当基尼系数为3级，社会平均综合收入满意度为3级时，收入分配差距固然对社会安定产生了不利的影响，但这时的社会不安定也可能主要由其他因素所引起，至少由其他因素与收入分配差距共同引起。对于这种情况，目前是难以从数量上进行分析的。我们只可能通过对具体情况的具体研究来粗线条地加以说明。

小结

1. “收入分配公平”的提法是不清楚的，它容易导致平均主义分配方式的复归，所以不如改用“收入分配合理”这种提法。收入分配合理差距实际上是个人收入分配的合理差距。在这里，需要区分经济意义上的收入分配差距的合理性和社会意义上的收入分配差距的合理性。经济意义上收入分配的合理差距不一定等于社会意义上收入分配的合理差距。从社会安定的角度来看，在政府的收入调节中，不能不把社会意义上收入分配的合理差距问题考虑在内。

2. 要判断社会意义上的收入分配差距合理还是不合理，以及不合理程度究竟有多大，可以用社会平均综合收入满意度及其临界值来加以

衡量。为了使政府在这方面能够发挥更好的收入调节作用，可以把社会平均综合收入满意度临界值分解为临界值I和临界值II，并把它们作为两个路标，根据情况采取调节措施。

（原载《社会科学战线》，1994年第6期）

Rationality and proportionality in income distribution (1994)

What does an equitable income distribution entail? Is rationality a better benchmark than equity for income distribution? These are major questions pertinent to the theory of income distribution. My answer is that the term "equitable income distribution" is vague and smacks of a rehash of the old idea of egalitarianism, so the word "equitable" does not make as much sense as the word "rational" in this regard. This being the case, it is probably appropriate to replace "equitable income distribution" with "rational income distribution."

What kind of income distribution can be considered as being rational? Let us start this topic from the double meanings of rational income distribution.

I. Double meanings of rational income distribution

The term "rational income distribution" means two things: the rationality of income *per se*, and the rationality of income disparity among people. These two meanings, though closely related, are different. For instance, both Mr. A and Mr. B have taken part in market activity as production-factor suppliers with A earning n yuan and B making m yuan in return. The first meaning of rational income distribution poses the following questions: Is the distribution rational for A to make n yuan and for B to make m yuan? Should they be paid higher than n yuan and m yuan, or lower? If they should be paid higher than n yuan and m yuan respectively, how higher should it be for their income to be called rational? If they should be paid lower, how lower for it to be called rational? Such questions pertain to the first meaning of the term "income distribution rationality." The second meaning of the term poses the following questions: Supposing A earns

n yuan and B earns m yuan, how little should the disparity between n and m be for it to be called rational? How wide should the disparity between n and m be for it to be called irrational? Mr. A and Mr. B are of course not the only production-factor suppliers and market participants, and there are income gaps among them. We may divide all production-factor suppliers and market participants into groups according to their incomes, to make it convenient to study the meanings of income distribution rationality by looking into the income disparities among these groups in the light of the second meaning of rational income distribution, or "income distribution rationality."

There are both differences and correlations between the two meanings of income distribution rationality. Studies of the first meaning should serve as the basis for studies of the second meaning. If Mr. A's earning of n yuan is rational and Mr. B's earning of m yuan is also rational, then the income gap between A and B, or the income disparity between n and m may also be deemed as rational. However, if A's earning of n yuan is irrational, it is hard to believe that the income gap between them, or the income disparity between n and m is rational no matter how rational B's earning of m yuan may be; and vice versa.

People may argue that income distribution in China's recent past under central planning could still be regarded as being well coordinated because despite the meagerness of people's income, the income disparity among them was not so glaring. Does that argument hold water? The question can only be answered after we have understood the double meanings of income distribution rationality. We have to acknowledge that in those years under central planning, when income distribution was dominated by egalitarianism, everyone was underpaid as production-factor suppliers. Given that the earnings of all people were irrational, their income disparity was irrational as well. When income distribution is irrational in either meaning of income rationality, well coordinated income distribution is out of the question in principle.

II. What is meant by income distribution proportionality

Having clarified the double meanings of the rationality of income distribution in the previous section, let me explain what income distribution proportionality means.

Income distribution proportionality is based on both the first and second meanings of income distribution rationality. As was pointed out in the previous section, without the first meaning of income distribution rationality, there can be no income distribution rationality in its second meaning. Well proportioned income distribution is impossible without matching income distribution rationality's double meanings. This being the case, we cannot talk about income distribution proportionality in the absence of income distribution rationality.

It was also mentioned in the previous section that if income distribution is well-proportioned at a low income level for every market participant, it is proportionality in a false, disguised form. This point can be understood only from the perspective of egalitarian income distribution. Egalitarianism is associated with low efficiency, low productivity, and low income level. A seemingly moderate income disparity under egalitarianism should never be interpreted as evidence of near-perfect income distribution proportionality. Well-coordinated income distribution can only be realized when income is distributed according to people's production efficiency so that every production-factor supplier can receive a rational income. Only then can we say that income disparity among people is rational as well. When everybody's income is low regardless of productivity level, income distribution proportionality is an improbable proposition no matter how income is distributed.

Talking about whether income distribution is well-coordinated or not, people usually refer to the proportionality not only of income distribution among individuals, but also of income distribution among regions. Regional income distribution is another topic of income

distribution. We should see that although the effort to guarantee proportionality in income distribution among individuals may run up against some difficulties, it can still be handled with relative ease in comparison with the effort to achieve balanced regional income distribution. This is because whether income distribution among individuals is balanced or not is directly related to whether income distribution is rational or not. The evaluation of the rationality of income distribution among individuals can be relatively easy once the degree of income distribution rationality is measured (even though such measurement is somewhat difficult, a point that I will elaborate on later). By comparison, it is far more difficult to determine whether regional income distribution is well-coordinated or not for the following two reasons.

First, although individual income distribution rationality can be benchmarked by the amount of income individuals earn according to their production efficiency, such a benchmark does not apply to the rationality of regional income distribution. Individual income rationality means individuals earn on the basis of their productivity as production-factor suppliers. However, regional income distribution rationality is not well defined. Regional income may refer to a region's GNP and national income. If that is what regional income is all about, then it is hard to judge the rationality of regional GNP or regional income. If regional income equals the average income that individuals make as production-factor suppliers, it is still hard to decide whether it is rational or not, because the average income conceals the differences in efficiency between production-factor suppliers. Given the difficulties in evaluating regional income rationality in its first meaning, it is likewise impossible to judge whether regional income distribution is well coordinated or not.

Second, rationality of income distribution in its second meaning (i.e., rationality of income disparity) is based on income distribution rationality in its first meaning. This should be the case with both individual and regional income distribution rationality. Since income distribution rationality in its first meaning does not apply to regional

income distribution as described previously, there is no way to judge the rationality of regional income distribution. The most we can say is that the income disparity between coastal and inland regions is so glaring that something has to be done to reduce it. However, we cannot decide, due to the lack of empirical evidence, how little the disparity should be to put income distribution between the two regions on a rational footing.

Thus it can be said that even though the rationality of regional income distribution and of income disparity calls for in-depth theoretical study, it is better to focus on individual income distribution proportionality. We may as well leave regional income distribution proportionality for the future as a theoretical research topic. Of course, this does not mean we cannot use in general the term "promoting proportionality in regional income distribution," which is meant mainly to keep regional income disparity from growing out of control.

Efficiency or equality, which should come first? The answer will become clearer by treating individuals, rather than regions, as production-factor suppliers. This is because changes in efficiency – which is about effective use and allocation of resources – are relevant to the changes in the effectiveness of the production factors provided by suppliers. Equality – which refers to well-coordinated income distribution in the principle of equal opportunities – applies to individual income distribution and the income disparity arising from it, but not to regional income distribution and the income disparity resulting from that, because, as to income distribution rationality of a certain region or income disparity rationality among regions, there are no well defined criteria from which to make such a judgment.

III. Differences in economic and social senses of income disparity rationality

Although we cannot but set individual income distribution as the focus for our study of income distribution rationality and

proportionality, we must still answer the questions: What is on earth rational disparity in individual income distribution? And why does the economic sense of income disparity rationality not tally completely with its social sense?

From an economic perspective, let us imagine that production-factor suppliers are given the same opportunity to participate in market activity but end up with nonequal income. This inequality in income distribution is an outcome of distribution on the basis of production efficiency in compliance with the principle of equal opportunities. Therefore income disparity rationality in an economic sense can exist under two conditions: First, all production-factor suppliers are given equal opportunities so that they can join market activity from the same starting point; and second, these suppliers earn their income according to their production efficiency. Needless to say, irrational income disparity in an economic sense stems either from unequal opportunities (meaning they are not at the same starting point) or from failing to follow the principle of distribution according to efficiency, or from both. In a purely economic sense, income disparity stemming from either or both of the two factors is irrational, and is a manifestation of poorly coordinated income distribution, whether such a disparity is glaring or not. Such irrational income distribution should be remedied through redistribution by government. In other words, in an economic sense, as long as income distribution is the result of all production-factor suppliers having equal opportunities in market activity, with each supplier getting his pay in the principle of distributing according to efficiency, the income disparity, big or small, should be regarded as a sign of rational income distribution, or proportionate income distribution.

To define whether income disparity is rational or irrational in a social sense is more difficult than in an economic sense. Why? This can be answered in two ways.

On the one hand, to judge whether income disparity is economically rational or not, the conclusion should be strictly based on whether market activity opportunities are equal and whether

income is distributed among production-factor suppliers according to their production efficiency. Yet in judging the rationality of income disparity in a social sense, it is impossible to find a criterion as strict as that for income disparity rationality in an economic sense. If the criteria used to measure the rationality of income disparity in an economic sense are the same as those for the rationality of income disparity in a social sense, then income disparity rationality would be the same in both senses. If so, isn't it unnecessary to separate the economic sense of income disparity rationality from its social sense? It seems the criterion for judging income disparity rationality in a social sense should not be limited to whether participants have equal opportunities in market activity and whether the principle of distribution according to efficiency is followed when income is distributed among production-factor suppliers. A new criterion should be set, but it is not easy to find out exactly what it should be.

On the other hand, the results of rational income disparity in an economic sense will be eventually reflected economically in efficiency improvement, productivity growth, and per capita income rise no matter how great the disparity is. Thus it is safe to say that the presence of a rational income disparity in an economic sense can yield positive results which can be felt in the immediate future. However, if income disparity is too big in a social sense, it will cause social unrest whether it is economically rational or not. Moreover, social unrest caused by a large income disparity in a social sense cannot be felt immediately – it takes time for problems to crop up and conflicts to brew to the point where social turmoil breaks out. So it is not easy either to judge income disparity rationality from its aftermath in a social sense.

Given the differences between the economic and social senses of income disparity rationality, and the difficulty to define income distribution rationality in its social sense, we cannot but ask: Is it necessary to define such rationality in a social sense apart from defining it in an economic sense? We ought to say the necessity is warranted. If income disparity is rational economically, it would be

ideal if it is rational socially as well. However, things may turn out like this in reality: An income disparity deemed rational economically is irrational socially; whereas an income disparity deemed irrational economically may turn out to be irrational socially, or ironically rational socially. For this reason, it is necessary to explore income disparity rationality in its social sense despite the difficulties involved. The exploration may bring us closer to solving the problem.

IV. Income disparity rationality in a social sense

As mentioned above, whether opportunities are equal or not for all production-factor suppliers in the market is one of the criteria for assessing income disparity rationality in both economic and social senses. The other criterion is whether income is distributed according to efficiency. The two criteria are necessary conditions for income disparity to be economically rational. However, they are not sufficient conditions for judging an income disparity to be rational in the social sense. It is not easy to find the missing pieces, but we are not helpless either.

Irrational income distribution disparity, manifested in a social sense by income disparity among people, can lead to social instability. Social instability holds back economic development, and causes improvements in production efficiency to slow down, stagnate, or decline, thereby reducing the per capita income level, or inhibiting its growth. Therefore, we can say income distribution disparity is rational in its social sense if social stability is not affected by income disparity among people, if the economy continues to grow in a sustained way, if production efficiency grows as usual, and if per capita income keeps rising steadily. Thus whether or not income distribution disparity leads to social instability can be adopted as a third criterion for judging whether income disparity is rational or not. At least it is a sensible criterion at the current stage of Chinese economic development.

To scrutinize the issue further, at least three questions come to surface.

First, what is the signal for social stability or instability? The economic growth, efficiency, and per capita income resulting from rational income disparity in an economic sense can be reflected in statistical indicators that are at once computable and comparable. What statistical indicators should be adopted to signal social stability based on rational income distribution disparity in its social sense? How can those statistics be calculated and compared?

Second, as I have said previously, whether income gap rationality or irrationality has contributed to social stability or caused social instability cannot be determined overnight. It takes a brewing period before social instability becomes keenly felt, but that period can last for a long time, which makes it harder to judge if an income gap is socially rational or not. The catch is to find out how the degree of latent social instability can be measured. When judging if an income gap is socially rational or not, how can latent social instability not be mistaken for social stability?

Third, social instability can stem from many factors, and irrational income gap is just one of them. This gives rise to the question: How should the role of irrational income gap in causing social instability be determined in a social sense, and to what degree? In particular, when the income gap is found to be rational socially, can social instability not be caused by other factors? Both questions can make it more difficult to see if the income gap is socially rational or irrational. The secret lies, firstly, in determining how to measure, in a social sense, the role of rational income gap in promoting social stability and to separate this role from the other factors that are also contributing to social stability, and secondly, in discovering how to benchmark, socially, the role of irrational income gap in causing social instability and to separate it from the other factors that are also precipitating social unrest.

I do not list these three major questions to say that we need not to probe any further because of the aforementioned snags. It is precisely because of these problems that I believe we should not and cannot lean heavily on quantitative analysis in this field of study. Rather, we

had better adopt a rough-sketch type of approach. To be specific, we may use, as a benchmark, people's satisfaction with their own income and with a comparison of income with other members of society. As people's satisfaction differs in degree in both regards, the findings should be studied separately.

The degree of people's satisfaction with their income may be termed "an individual's absolute degree of income satisfaction." This term refers to the degree of correspondence between the income someone receives from the production factors he has supplied on the one hand, and the value of his expected income on the other. A production-factor supplier will be satisfied with his absolute income if what he earns meets his expectation. He will stay satisfied if his earning exceeds his expectation even if the two are not symmetrical. If he earns less than what he expected, he will be dissatisfied with the gap between reality and expectation. The more his actual earning falls below his expectation, the more dissatisfied he becomes, and the lower the degree of his absolute satisfaction is with his individual income.

The degree of a member of society's satisfaction with a comparison between his income and those of others can be abbreviated as the "degree of individual relative income satisfaction." This term denotes the degree of correspondence between the actual ratio of income gap between an individual and the others as production-factor suppliers and his expected ratio. He is satisfied with his relative income if the two ratios correspond with each other. He is even more satisfied if the actual ratio exceeds his expectations, even though the two factors do not correspond with each other. He is dissatisfied if the actual ratio falls below his expected ratio, that is, the two factors are ill-matched. The more the actual ratio falls short of his expected one, the more dissatisfied he becomes with his relative income, or the smaller the degree of his satisfaction is with his relative income.

Society consists of numerous members who differ in absolute or relative income satisfaction. No matter what the mode of income

distribution is, there is always a gap between the degrees of the members' absolute and relative income satisfaction. However, an individual's low satisfaction with his absolute or relative income is unlikely to cause social instability. Social instability takes place only when most members of society have registered a low degree of satisfaction over individual absolute or relative income. Theoretically speaking, society's average degree of satisfaction with absolute or relative income at a given moment in time can be pinpointed. Social instability happens only when this average degree of satisfaction with absolute income falls below a threshold point. The deeper it sinks below the threshold point, the greater the degree of social instability becomes. Social instability occurs when this average degree of satisfaction with relative income drops below a certain point. The more it dips below the threshold point, the greater the degree of social instability becomes.

It is worth noting that there is a difference between the degree of individual absolute income satisfaction and that of individual relative income satisfaction, with the former serving as the basis of the latter. If the degree of an individual's absolute income satisfaction is relatively high, his impact as a production-factor provider on social instability will be negligible even if his relative income satisfaction is low. If the degree of his absolute income satisfaction is low, his impact on social instability will grow even if the degree of his satisfaction with his relative income is high. The degrees of the impact of individual income satisfaction on social instability may be aligned in the following sequence:

- (1) A high degree of individual absolute income satisfaction alongside a high degree of individual relative income satisfaction, will have a minimum impact on social instability.

- (2) A high degree of individual absolute income satisfaction accompanied by a low degree of individual relative income satisfaction, will have a relatively small impact on social instability.

- (3) A low degree of individual absolute income satisfaction coupled with a high degree of individual relative income satisfaction,

will have a relatively big impact on social instability.

(4) A low degree of individual absolute income satisfaction together with a low degree of individual relative income satisfaction, will have a maximum impact on social instability.

As I have said previously, both the degree of individual absolute income satisfaction and that of individual relative income satisfaction should be indicated according to society's average degrees of absolute and relative income satisfaction. The above sequence of order in the degrees of impact of individual income satisfaction on social instability should also be expressed in the same way.

Considering that the impact of individual absolute income satisfaction on social stability is greater than individual relative income satisfaction, when combining society's degrees of average absolute and relative income satisfaction to derive society's average degree of income satisfaction, the former should take a larger portion than the latter. Thus a threshold value can be set for society's average degree of comprehensive income satisfaction. Society's average degree of comprehensive income satisfaction and its threshold value may be applied to back up judgment of income gap rationality in a social sense of the term.

Finally, a rundown of the above discussion:

A: individual income;

B: individual's expected income;

C: the degree of correspondence between A and B, known as the degree of individual absolute income satisfaction;

D: the actual ratio between one's income and someone else's income;

E: the expected ratio between one's income and someone else's income;

F: the degree of correspondence between D and E, known as the degree of individual relative income satisfaction.

G: the average degree of social satisfaction with absolute income as derived from C;

H: the threshold value of the average degree of social satisfaction with absolute income;

I: the average degree of social satisfaction with relative income as derived from F;

J: the threshold value of the average degree of social satisfaction with relative income;

K: based on the impact of the degree of individual absolute and relative income satisfaction on social stability, to determine the portions of both factors in their combined impact on social stability;

L: to derive from G, I, and K the average degree of social comprehensive income satisfaction;

M: the threshold value of the average degree of society's comprehensive income satisfaction;

N: based on L and M, to determine, in a social sense, the degree of income gap rationality or irrationality.

V. A further look at the relationship between income disparity and social instability

In my previous analysis, social instability is a criterion for income disparity rationality or irrationality. I have said that social instability requires a period of time to gather its momentum. Only when problems come to a head can social instability be keenly felt. Income disparity is only one of several factors that cause social instability. This being the case, we have to look deeper into the relationship between income disparity and social instability based on the previous study of the average degree of society's comprehensive income satisfaction and its threshold value.

First, consider the cumulative nature of social instability. As the old Chinese saying goes, "It takes more than one cold day for rivers to

freeze three feet deep." It takes a relatively long cumulative period for social instability to amount to social upheaval. When people's absolute or relative income satisfaction begins to decline, and once it progressively reaches its threshold value, the situation can turn grim in no time. Just as the old refrain puts it, "Things can take a sudden turn for the worse, and, if mishandled, can run out of control." A possible way to prevent this situation from happening is to break the threshold value of the average degree of society's comprehensive income satisfaction into Threshold Values I and II.

When the average degree of society's comprehensive income satisfaction dives below Threshold Value I, social instability will begin to be felt – meaning such instability is relatively mild or partial. Social instability deteriorates when the average degree of society's comprehensive income satisfaction falls further below Threshold Value II – meaning that it will soon turn into an overall social upheaval.

Thus the grey zone between Threshold Values I and II merits close government attention. Threshold Value I provides a warning sign. When the average degree of society's comprehensive income satisfaction approaches Threshold Value I, the government should be alerted and take action to avoid social upheaval by alleviating income disparity and relevant problems. If the decline in the average degree of society's comprehensive income satisfaction continues beyond Threshold Value I, the government should be further alarmed, because problems are boiling over and conflicts are intensifying. Social upheaval becomes unavoidable once the average degree of society's comprehensive income satisfaction plunges below Threshold Value II. So Threshold Value II is another warning sign. It seems to me that the establishment of Threshold Values I and II can help further clarify the relationship between income disparity and social instability.

The role of income disparity in precipitating social instability, coupled its relationship with other causes of social instability, is a difficult research topic. It is oversimplifying to attribute social instability solely to income disparity. Social instability can be caused

by a mixture of many factors that are affecting each other. This makes it hard to quantify the role of income disparity in causing social instability, not to mention the complex relationship between income disparity and its role in causing social instability. For instance, a small income disparity leads to low efficiency, which may result in a low average degree of society's comprehensive income satisfaction (such as in those low-income years when most members of society were disgruntled about the egalitarian practice of "everybody eating from the same big pot"), but it will have little impact on social stability. If income disparity is huge but the average degree of society's comprehensive income satisfaction is tolerable (meaning that most members of society find such an income disparity acceptable), it will not have a major impact on social stability. If income disparity is huge while the average degree of comprehensive social income satisfaction is low, its adverse impact on social instability can be felt; if the disparity grows to a certain degree and the average degree of society's comprehensive income satisfaction has also dropped below a certain threshold, the income disparity may lead to social unrest.

With the complex relationship between income disparity and social stability or instability in mind, we may handle the issue this way:

Let us take income disparity and the average degree of society's comprehensive income satisfaction as two indicators, and let income disparity be represented by the Gini Coefficient. The lower the Gini Coefficient, the smaller the disparity in income distribution. The higher the Gini Coefficient goes, the bigger the income disparity becomes, that is, the further it drifts away from equal income distribution. Thus the relationship between income disparity and the average degree of society's comprehensive income satisfaction can be replaced with the relationship between the Gini Coefficient and the average degree of society's comprehensive income satisfaction.

Whether the average degree of society's comprehensive income satisfaction is high or low, social stability will not be considerably affected by income disparity when the Gini Coefficient is low. Let us

therefore forget about this scenario for the time being.

When the average degree of society's comprehensive income satisfaction is high, income disparity will not grow to a point where it can adversely impact social stability whether the Gini Coefficient is high or low. Therefore this scenario can also be ignored as far as this study is concerned.

Thus our study is narrowed down to the scenario where the Gini Coefficient is high and society's average comprehensive income satisfaction is low. Let us set the Gini Coefficient at Levels 1, 2 and 3. The higher the Gini Coefficient, the lower its level. We may also divide society's average comprehensive income satisfaction into three tiers: Tiers 1, 2 and 3. The lower society's average comprehensive income satisfaction, the higher its tier. The three levels of the Gini Coefficient and the three tiers of society's average comprehensive income satisfaction can be paired to serve as benchmarks for judging the relationship between income disparity and social instability. Generally speaking, when the Gini Coefficient stands at Level 1, and society's average comprehensive income satisfaction at Tier 1, the adverse impact of income disparity on social stability is the highest, thereby pinpointing income disparity as the primary reason behind social instability or upheaval. When the Gini Coefficient stands at Level 3 with society's average comprehensive income satisfaction at Tier 3, social instability may be caused mainly by other factors, or a combination of factors that may or may not include income disparity, even though income disparity is also affecting social stability. Under these circumstances, it is difficult to quantify the impact of income disparity on social stability, but at least we can get a rough idea about it by studying individual cases.

VI. Conclusions

(1) "Equitable income distribution" is a vague notion that smacks of egalitarianism. "Rational income distribution" is a better term. In fact, rational income disparity denotes a reasonable gap in individual income distribution. However, it is necessary to distinguish the

economic sense of income disparity rationality from its social sense. A rational income disparity in an economic sense is not necessarily the same as it is in a social sense. In the context of social stability, the government is obliged to take the social sense of income disparity rationality into consideration when intervening in income distribution.

(2) To judge if income disparity is rational or irrational in a social sense, and to decide on the degree of such rationality or irrationality, two indicators can be employed – society's average comprehensive income satisfaction and its threshold value. To maximize the effect of government regulation of income distribution, we may benchmark society's average comprehensive income satisfaction with Threshold Values I and II. In that way the government may use them as warning signs in regulating the economy.

论财政政策与货币政策的配合使用 (1997)

一、市场不完善条件下货币政策作用的局限性

(一) 要结合经济增长来分析政策效应

货币政策与财政政策的配合，曾经是凯恩斯学派与货币学派长期争论的问题之一。根据后凯恩斯主流经济学的论述，在宏观经济调节时，除非在异常紧迫的状态中，“双紧”或“双松”都是力求避免的。需要作为政策配合所考虑和选择的是“松紧搭配”，包括松的财政政策与紧的货币政策的配合，或紧的财政政策与松的货币政策的配合。货币学派原则上并不反对货币政策与财政政策的配合，但认为财政政策本身有很大的局限性。例如在采取松的财政政策时，财政的扩张会挤出一部分私人消费与私人投资，从而财政政策不一定收到预期的效果；而在采取紧的财政政策时，经济增长率将会降低。这样，在财政支出减少的同时，财政收入也会相应地下降，从而不一定使财政政策达到预期的目标。因此货币政策的运用要比财政政策的运用更为有效，这是货币学派的基本政策主张。

凯恩斯学派在同货币学派关于政策的论战中，在货币政策与财政政策的配合问题上，进一步研究所得出的一个重要论点是，应当结合经济政策目标来讨论这种政策配合。具体地说，应当以是否有利于经济的稳定与持续增长来考察货币政策与财政政策配合的效应。

松的财政政策是支撑经济增长的，松的财政政策对国民生产总值的增长起着积极的作用。但这时是不是会挤出私人消费与私人投资呢？并不能一概而论。关键在于市场是否受限制，即市场能否随国民生产总值的增长而扩大。假定市场是一个不断扩大的市场，在经济增长过程中，松的财政政策同松的货币政策相配合，那么财政政策并不会挤出私人投资，也不会挤出私人消费。换言之，只有在松的财政政策同紧的货币政

策相配合时，才有可能发生所谓的“挤出效应”。货币学派的假设在这种情况下将有效。

然而，松的财政政策与松的货币政策配合使用的结果，必然是通货膨胀的加剧。这是“双松”政策所导致的格局。但这种格局被认为是可以避免的，主要是：一方面，使货币政策的放松比较适当；另一方面，通过经济增长和社会总供给增加，使通货膨胀有一定的限度。如果这种设想可以成立，那么需要探讨的问题将是：货币政策放松到何种程度，既可以避免由于银根放松而引起通货膨胀，而又不至于使财政支出的增加挤出私人消费和私人投资。这方面的研究尚有待深入。

无论是松的财政政策与紧的货币政策相配合，还是紧的财政政策与松的货币政策相配合，既涉及财政政策与货币政策效应强弱的比较问题，也涉及松的政策与紧的政策效应强弱的比较问题。如果不能对这些政策效应强弱的比较有所了解，那么就很难对不同政策配合使用的实际效应作出判断，从而难以对不同政策的配合方案作出选择。

（二）市场完善程度对政策效应的影响

以上有关凯恩斯学派与货币学派有关财政政策与货币政策配合问题的论述，对我们是有参考意义的。我们很难简单地作出判断，认为凯恩斯学派与货币学派之中哪一个正确，哪一个错误，因为这涉及经济增长与社会总供给增长的幅度问题。如果经济增长率过低，社会总供给增长太慢，由于财政支出会排挤私人支出，或者财政支出会同财政收入一起下降，所以松或紧的财政政策都可能起不了较大作用，从而也就谈不到财政政策与货币政策的配合。货币学派的分析这时也许是有道理的。否则，凯恩斯学派的分析似乎更有道理些。

但根据中国与一些发展中国家的经验来看，财政政策与货币政策的作用同市场的完善程度有关。具体地说，假定市场相当完善，那么无论是财政政策还是货币政策的效应，都可以比较充分地显示出来。相形之下，紧的财政政策在实行过程中所遇到的阻力要比紧的货币政策所遇到的阻力更大一些，从而其效应也就相应地受到一定的限制。

假定市场不够完善，比如说，资本市场、证券市场、外汇市场、产权交易市场等都不够完善，那么情况便有所不同。这时，货币政策在实行过程中所遇到的障碍可能大于财政政策，特别是紧的货币政策要比紧的财政政策所遇到的阻力更大一些，从而其效应也就相对地受到一定的

限制。理由在于：货币政策的作用是通过资本市场、证券市场、外汇市场、产权交易市场等而发挥的，不完善的市场使货币政策缺乏相应的传导机制或使货币政策的传导机制失灵，所以货币政策不易有效地发挥作用。

财政政策与货币政策不同，财政政策主要直接作用于商品市场。如果说市场不够完善，那么商品市场的不完善程度一般要小于其他市场，而资本市场、证券市场、外汇市场、产权交易市场的不完善程度一般要大于其他市场。目前中国的情形正是如此。因此，财政政策在目前的中国较易于发挥作用，其收效程度也比较高，尽管紧的财政政策仍会遇到不少阻力。

关于这一点，不妨以对经济增长的效应为例。由于财政政策对商品市场直接发生作用，并通过商品市场的伸缩消长而使国民生产总值发生变化，于是既有可能抑制经济增长率，又有可能刺激经济增长。即使商品市场也有不够完善之处，但财政政策的放松或抽紧，依然可以通过商品市场的变化而作用于国民生产总值，并最终反映于经济增长率的变化。货币政策则不然。只要资本市场、证券市场、外汇市场、产权交易市场等是不完善的，货币政策的作用所受限制较大，从而对经济增长率变化的影响也就不那么显著，或不那么直接。在中国，要促进经济增长，松的财政政策要比松的货币政策较为有效；而在加剧通货膨胀方面，松的财政政策所起的作用也要大一些。

松的政策与紧的政策效应，在市场不完善条件下是不对称的。一般说来，如果确定了银根松紧的标准，那么松的政策效应要大于紧的政策效应，货币政策在市场不完善条件下的松或紧所产生的影响尤其这样。这是因为，假定资本市场、证券市场、外汇市场、产权交易市场等都不完善，假定缺乏完善的货币政策传导机制，虽然货币政策的效应要受到某种程度的限制，但银根松紧的效应仍是不一样的。银根放松后，即使市场还不完善，但投资者总有可能从不同的渠道获得信贷，经济便会相应地活跃起来。而在银根由松变紧之后，无论是利率上升了还是存款准备金率提高了，市场的不完善仍会使得一部分投资者并不直接感到利率上升或存款准备金率提高的压力，仍然会按照预定的投资计划进行活动。这是因为，市场越不完善，借贷中的信息约束越大，竞争中的不公平程度也越大。于是一部分居于优越地位的投资者仍能获得信贷，照常投资。也许他们以后会逐渐感受到这种压力，但总的说来，货币政策抽紧后的政策效应对投资者是滞后的。

（三）市场不完善条件下的“松紧搭配”

由此涉及在市场不完善条件下的宏观经济调节的“松紧搭配”问题。这种条件下的“松紧搭配”同市场完善条件下的“松紧搭配”是有区别的。区别大体上有两点。

第一，在市场完善条件下，由于财政政策的效应与货币政策的效应都可以显现出来，尽管紧的财政政策要比紧的货币政策所遇到的阻力更大一些，但这并不妨碍在必要时既可以用松的财政政策同紧的货币政策配合，也可以用紧的财政政策同松的货币政策配合，从而都可以收到一定成效。然而，在市场不完善条件下，情况便有所不同。由于资本市场、证券市场、外汇市场、产权交易市场等要比商品市场更加不完善，而财政政策是直接作用于商品市场的，货币政策则要通过资本市场、证券市场、外汇市场、产权交易市场等发挥作用，所以在选择财政政策与货币政策配合时，为了达到宏观经济调节的目标，财政政策使用的效果比较明显。至于货币政策，除非加大力度，否则其作用受限制较大，所以不宜对它的效应寄以不切实际的希望。这正是市场不完善条件下宏观经济调节的一个特点。

第二，市场完善条件下，当实行紧的财政政策或紧的货币政策时，银根会随之抽紧，经济增长率会下降，通货膨胀率会受到抑制。而在实行松的财政政策或松的货币政策时，银根会随之放松，经济增长率会上升，失业率也会相应地下降。但这种情况只可能出现于市场完善时。如果市场不完善，那么宏观经济调节的效应不仅不能及时显现出来，甚至其结果可能遭到扭曲，产生预料之外的结果。这是因为，在各个市场中，资本市场、证券市场、外汇市场、产权交易市场等的不完善程度较大，货币政策的传导机制更有欠缺。如果准备以抑制通货膨胀作为政策调节目标，那么在实行紧的财政政策与松的货币政策相配合时，由于紧的财政政策易于发挥作用，经济很快地冷却下来，通货膨胀可以得到抑制。但为了使经济不至于冷却过度，不至于妨碍经济增长，配合以松的货币政策是必要的。然而由于市场的不完善和货币政策传导机制的欠缺，松的货币政策在紧的财政政策实行过程中难以发挥作用，达不到使经济仍然保持活跃的目的。结果，市场不完善条件下的紧的财政政策的效应较强和松的货币政策的效应较弱，从而有可能使经济冷却过度或使经济陷于停滞状态。所谓“刹车容易启动难”正表现于此。

与此相似的是，如果准备以促进经济增长作为政策调节目标，那么

在实行松的财政政策与紧的货币政策相配合时，由于松的财政政策易于发挥作用，经济受到财政支出扩张或税收减免的刺激而以较快的速度增长。但为了防止出现经济增长过程中的通货膨胀，配合以紧的货币政策是必要的。然而也正由于市场的不完善和货币政策传导机制的欠缺，紧的货币政策在松的财政政策实行过程中难以发挥作用，达不到避免经济增长率过高和通货膨胀过猛的目的。结果，市场不完善条件下的松的财政政策的效应较强和紧的货币政策的效应较弱，从而使得经济扩张过度，通货膨胀难以被抑制。

对市场不完善条件下财政政策与货币政策的配合使用所遇到的困难，同政策的“跛足”状态有关。即两种政策的效应一强一弱，使得调节过程中不易实现预定的目标。

这并不意味着在市场不完善条件下不可能配合使用财政政策和货币政策，而是指在配合使用这些政策时应当更多在政策强度上多加考虑。比如说，考虑到财政政策的效应强而货币政策的效应弱，于是就可以减轻财政政策的强度而加重货币政策的强度，以便这两种政策在实行过程中能较有效地发挥作用。

（四）一个重要结论：要注意“刹车容易启动难”

以上，对财政政策和货币政策的配合使用问题作了一些探讨，这对于当前的中国经济有什么意义呢？正如前面所说，市场不完善使得货币政策所受到的限制更大，也使得财政政策与货币政策的配合使用更难。因此，就现阶段的中国经济而言，需要注意的是以下两点：

1. 松的财政政策与松的货币政策的配合使用，以及紧的财政政策与紧的货币政策的配合使用，对目前的中国经济都不适当。因为这样一来，要么会使通货膨胀遏制不住，要么会把整个经济搞得过死。可以考虑的只能是：财政政策与货币政策一紧一松。而根据市场不完善条件下财政政策与货币政策各自效应的特点，最好是实行稍紧的财政政策与松动的货币政策相配合。

2. 市场不完善条件下，中国经济的显著特点之一是“刹车容易启动难”。宏观调节的效应的不对称性也表现于此。这是指：宏观调节抽紧的时候，效应会迅速反映出来，经济会很快趋于紧缩。而当宏观调节放松一些的时候，调节不易达到预期的效果；经济只可能缓慢地复苏，甚至要滞后相当长的一段时间，经济才会重新活跃。理由是：要经济活跃，

必须使企业与投资主体有盈利前景看好的信心，必须使广大消费者有预期收入上升的信心。这样才能使购买力旺盛，使市场繁荣。然而，信心的增强是一个累积的过程，并不是宏观调节一放松就能积累起人们对市场前景的信心的。加之，宏观调节的“跛足状态”（即财政政策作用大于货币政策作用的状态），使得调节遇到困难。假定在实行稍紧的财政政策的同时不使货币政策松动，经济启动的困难就更大。

结论是很清楚的：现阶段，中国的财政政策可以稍紧一些，而货币政策则应该松动一些，否则不易摆脱“刹车以后启动不了”的窘境。

二、货币政策非常规手段应当慎用

（一）货币政策三个基本手段的作用全都依存于市场完善程度

货币政策对资本市场、证券市场、外汇市场、产权交易市场等发生作用，并通过这些作用而影响国民生产总值的变化。如果以国民生产总值的变化作为最终目标的话，那么在这以前还有一系列中介目标。如果以通货膨胀率的变化和国民生产总值的变化作为双重最终目标，同样会有一系列中介目标存在。所以要研究货币政策对经济的作用，必须研究货币政策的传导机制，必须结合各种不同的货币政策手段的运用来考察货币政策对这些中介目标的影响，以及如何通过中介目标来影响最终目标。

利率是货币政策的中介目标之一。在市场完善条件下，中央银行运用再贴现政策来影响利率。当中央银行调整再贴现率时，将使得商业银行的借入资金成本发生变化，从而引起市场利率的调整，再使得投资者增加或减少对货币的需求。因此，货币供应量便是最重要的一个中介目标，它同利率水平这个中介目标一起影响着社会对货币的需求、社会总需求以及国民生产总值的变化。如果货币政策的传导机制有效，那么通过中央银行的再贴现政策可以作用于中介目标的实现，并对最终目标产生影响。然而这又同整个经济环境有关。假定市场不完善，再贴现作为货币政策的手段不可能像在市场完善时那样影响投资者对货币的需求，也不可能对货币供应量这一中介目标发挥有效的作用。除非再贴现政策的实行伴随着行政干预，否则货币供应量的增加或减少可能不受再贴现率变动的影响。

可以对再贴现率的作用再做些分析。如果想通过再贴现率的调整来影响市场的利率水平，那就需要有商业银行的充分竞争。并且假定商业银行完全按照市场竞争与选择规则给予客户贷款，而客户之间也存在着彼此公平竞争的关系，否则再贴现率调整对市场利率水平的影响也是不明显的。

存款准备金率的调整是另一个货币政策手段。这一手段之所以能发挥作用，是因为它的调整与使用可以影响商业银行的派生存款数额，约束商业银行的放款行为，从而影响货币供应量。在这里，货币供应量作为中介目标，可以通过中央银行存款准备金率的调整而实现。但是，除非存款准备金率很高，否则，存款准备金率作为一种货币政策手段尽管能起作用，却达不到防止金融危机的目的。此外，要让存款准备金率起作用，还需要有两个前提。一是商业银行应当以最大利润的取得作为自身的目标。如果商业银行尚不具备这样的条件，存款准备金率的调整、甚至存款准备金制度本身都不会产生多大的成效。这就同商业银行制度是否健全有关。二是中央银行的存款准备金率调整应当具有强制性而不应具有弹性，否则货币政策这一手段是难以达到影响货币供应量的目标的。由此看来，尽管存款准备金率调整并不是经常采取的一种货币政策手段，但它的传导机制是否有效仍然依赖于市场的完善程度。

至于中央银行的公开市场业务，它作为货币政策的又一手段，同样需要从经济环境上进行分析。相对于其他货币政策手段而言，公开市场业务所要求的市场条件更为严格。它不仅要求有完善的、发育健全的证券市场，而且要求有合理的市场利率和理性的投资者。公开市场业务的传导机制有欠缺，不仅可能使货币供应量这一中介目标的调节遇到困难，还可能使公开市场业务无法顺利开展，起不到货币政策手段的作用。

以上所说的再贴现率、存款准备金率和公开市场业务是货币政策的三个基本手段。它们的传导机制全都同市场完善与商业银行制度健全有关。市场条件不完善或商业银行制度不健全，必然使得这些政策传导机制有欠缺，甚至失效。

（二）非常规的信贷手段同样依存于市场是否完善

接着，再看看这三种货币政策手段以外的两种非常规政策手段，一是信贷规模控制或信贷配额制，二是再贴现限额与再贷款限额。前者是

商业银行在中央银行控制下所受到的贷款规模限制，后者被中央银行用来作为再贴现率调整的手段的补充。这两种手段一般都是在市场不完善或商业银行制度不健全的情况下被中央银行采用的。它们的传导机制各有特点。

信贷规模的大小是由中央银行根据对经济形势的判断而决定的。由于对经济形势判断的依据不一，观察问题的角度不同，以及对信贷规模效应的估计有差异，所以中央银行的信贷规模控制带有相当大程度的随意性。行政主管部门的意志在这里起着很大的作用。信贷规模受到控制，货币供应量便直接发生变化，它的效应的产生比较迅速。从这个意义上说，信贷规模控制这一手段的传导机制是有效的。但效应产生的迅速和传导机制的有效不等于效应一定有利于实现货币政策的最终目标。这主要因为，要促进经济的持续增长并使通货膨胀率保持在较低的水平，必须使资源配置不断优化。资源配置优化表明效率的增长。然而信贷规模控制的效应却是：尽管从短期来看货币供应量发生了政策决策部门所预期的变化，但只要从稍长的时间来看，这种带有行政主管部门意志的货币政策手段有损于资源的优化配置，结果不可避免地妨碍货币政策最终目标的实现。

中央银行的再贴现限额与再贷款限额作为货币政策的又一非常规手段，一般也是在市场不完善或商业银行制度不健全条件下被采用的。这主要是考虑再贴现率的调整所起的作用有限，所以要从数量上再予以限制。假定采取了再贴现限额这种做法，中央银行就有可能通过限额的增减而影响商业银行的贷款能力，进而影响货币供应量。同样的道理，中央银行也可以通过再贷款限额的增减达到同一目标。这种做法被认为有助于弥补再贷款利率调整的效力的不足。然而，无论是中央银行的再贴现限额还是再贷款限额，都是由行政主管部门随机制定的，带有较浓的主观色彩，同实际的货币供求状况不一定相符。因此对货币政策最终目标的实现究竟是有利还是不利，还难以确定。而另一方面，这些手段也会对资源优化配置产生损害，从而从较长时间来看，将会妨碍货币政策最终目标的实现。

（三）要慎重使用信贷规模控制等非常规手段

从货币政策传导机制的研究中，可以得出这样的结论：如果市场是完善的并且商业银行制度是健全的，那么传导机制可以有效地起作用。如果市场不完善，商业银行制度不健全，那么常规的货币政策手段不可

能使得货币政策的最终目标实现。而诸如信贷规模控制和再贴现限额、再贷款限额之类的非常规的货币政策手段，虽然其传导机制仍然可以有效，但从较长时间来看，却不利于资源优化配置，从而不利于货币政策最终目标的实现。

现在我们所要探讨的问题是，在经历过一段时间的经济紧缩之后，怎样才能使经济再度活跃起来？在上一节中已经指出，针对这种情况，实行稍紧的财政政策与松动的货币政策的配合，要优于松动的财政政策与稍紧的货币政策的配合，更优于财政政策与货币政策的“双紧”或“双松”。有关货币政策传导机制的分析，进一步证实了以上的结论是符合中国当前实际情况的。

我们承认，在市场不完善条件下，非常规的货币政策手段（包括信贷规模控制、再贴现限额、再贷款限额等）经常被使用，甚至存在着把非常规的货币政策手段视为常规的货币政策手段的趋势，似乎非如此不足以实现货币政策的最终目标。其实，这纯粹是一种误解。正如前面已谈过的，非常规的货币政策手段虽然能起一定作用，但对资源的优化配置并不有利；特别是它们带有浓厚的行政主管部门意志的色彩，从而同经济运行中的货币供求状况不一定相适应。

在经历过一段时间的经济紧缩之后，要使得经济再度活跃，应在实行稍紧的财政政策的同时，使货币政策松动些，而且力度也应当加大。在这种情况下，信贷规模控制等非常规手段的使用要慎重。这主要是因为：

1. 从经济紧缩走向经济再度活跃，同人们对市场前景的信心的恢复与增强有着密切的关系，而信心的增强是一个累积的过程。假定采用非常规的货币政策手段，无论它们趋向于放松还是趋向于抽紧，都给人们一种不确定的感觉。既然行政主管部门能“放”，它们无疑也能“收”。“放”与“收”都无规律可循，都在很大程度上凭借非常规手段使用者的意志，那么人们的信心依然是不足的。在这种情况下，倒不如不使用或少使用非常规的货币政策手段，宁肯采取常规的货币政策手段，这对于信心的增强和累积反而有利些。虽然常规手段会因市场不完善而使其作用受限制，但力度加大一些，仍可弥补。

2. 由于非常规的货币政策手段的使用往往给人们以错觉，给投资主体以误导，从而不利于资源的优化配置。因此，即使依靠放松了的货币政策来活跃经济，但资源配置难以优化，实际上起不到预期的实现货币

政策最终目标的作用。在经济紧缩一段时间以后，要使得经济再度活跃起来，并使这种活跃持久一些，就必须注意资源配置的优化，以便切实地按照市场需要来组合生产要素，提高资源利用效率。就这一点而论，使用非常规的货币政策手段是不如常规的货币政策手段的。至于常规手段因市场不完善而受到的限制，那就必须依靠加大力度来弥补。

3. 要松动货币政策并且松动的力度要大一点，应当以商业银行按贷款的可偿还性和贷款对象的资金使用效率发放贷款为前提，否则不良债务将增加，对经济的活跃也没有好处。那么，怎样才能防止松动之后不良债务的增加呢？是运用常规性货币政策手段更易于做到这一点，还是运用非常规的货币政策手段更易于做到这一点？显然，非常规的货币政策手段在使用中的随意性很大，行政主管机构干预的色彩很强，从而更不易防止不良债务的增加，更不易收到松动货币政策的预期效果。

三、关于货币政策效力的递减

（一）为什么货币政策的效力会递减

在研究货币政策在客观经济调节中的地位与作用时，涉及货币政策的效力递减问题。货币政策效力递减，是指货币政策在实行一段时间之后，它对经济增长与货币稳定这一最终目标的实现而言，所发生的积极影响会逐渐减弱，而其对经济的消极影响却会逐渐增大。

货币政策效力的递减可能是普遍性的，即不论是在市场完善和商业银行制度健全的条件下，还是在市场不完善和商业银行制度不健全的条件下，都会出现货币政策效力递减的情况。当然，在后一种条件下，货币政策效力的递减更加明显，也更加严重。

货币政策效力递减的主要原因在于：受到货币政策的作用的对象，包括商业银行与其他金融机构，以及社会上的投资者，是理性的行为人。他们对于中央银行所采取的货币政策会作出理性的反应。即使市场是完善的，商业银行制度也是健全的，但只要商业银行与其他金融机构以及社会上的投资者所考虑的是本身利益的最大化，他们就会根据经济形势的变化与政策的变化，拟定自己的对策。这些对策可能使得某一项货币政策手段的效力减少，也可能迫使中央银行重新考虑政策的效应，对政策进行调整。这种情况在市场不完善和商业银行制度不健全条件下无疑会更突出。

货币政策效力递减还同货币政策传导机制本身的局限性有一定的关系。货币政策是通过中介目标而作用于最终目标的。然而经济总是处于不断的结构调整之中，这种结构调整将对货币需求量提出新的要求。也就是说，货币供应量与对货币的需求量之间的关系要随着不断的结构调整发生变化。任何一种货币政策手段，都把着重点放在货币供应量的变化方面，从而相应地忽略了结构调整对货币需求量提出的新要求。实际上，这意味着中央银行通过货币政策的实行，要让货币需求量来适应货币供应量，而不是让货币供应量去适应货币需求量。货币供应量的变化是货币政策的中介目标，对货币的需求量的变化则没有被视为货币政策的中介目标。或者说，中央银行的货币政策都直接作用于货币供应量，并通过货币供应量的变化间接地影响对货币的需求。因此，这些货币政策并没有直接作用于对货币需求量的传导机制。正由于货币政策传导机制有上述局限性，所以在货币政策实行过程中，经济中同货币需求有关的投资者必然设法通过不同渠道来满足自己的货币需求或影响对货币的需求量，而这是货币政策的制定者力所不及的。这样，货币政策的效力递减，即使在市场完善和商业银行制度健全的条件下，也是难以避免的。因为货币政策最终目标的实现从货币的角度来看，不仅依赖货币供应量的变动，而且依赖对货币的需求量的变动。只有货币的供给与需求两方面协调一致，才能使货币政策对最终目标的实现发生有效的作用。

（二）市场不完善条件下货币政策效力的递减

至于在市场不完善和商业银行制度不健全的条件下货币政策效力的递减，除了上述这些原因之外，还有另一些原因。后者也许比前者更为重要。

另一些原因是：

第一，在市场不完善和商业银行制度不健全的条件下，中央银行习惯于把信贷规模控制、再贴现限额、再贷款限额等作为货币政策手段。但这些货币政策手段的制定与执行带有很大的行政管理色彩。中央银行制定了这种规模与限额后，无法根据经济情况的变化而予以调整。结果，这些货币政策手段成为脱离实际的僵硬的政策手段，达不到预定的调节目标。不仅如此，在具体操作过程中，由于这些货币政策手段是依靠行政方式来推行的，往往使商业银行和其他金融机构对中央银行的做法采取公开的或不公开的抵制，从而使得政策的效力减弱。

第二，在市场不完善和商业银行制度不健全的条件下，中央银行对整个经济中的货币数量的控制肯定是有限的。市场越不完善，商业银行制度越不健全，投资者就越有可能从中央银行控制以外的领域取得货币资金。与此相似的是，在市场不完善和商业银行制度不健全的条件下，中央银行越是想通过货币政策手段来控制货币数量，投资者就越想摆脱中央银行的控制范围，设法到中央银行控制力所达不到的领域内去寻求货币资金，其结果必然是货币政策的效力下降。

第三，在市场不完善和商业银行制度不健全的条件下，中央银行的活动以及商业银行的活动都可能受到各级政府的行政干扰，包括要求给予更多的贷款，甚至要求向银行透支。这些来自行政方面的干扰必然使货币政策难以实现预定的目标，使货币政策的效力减弱。而要摆脱这些行政干扰，除了应当健全商业银行制度和完善市场而外，还需要使中央银行制度本身健全起来，其中包括使财政部与中央银行之间的关系正常化，以及地方政府同中央银行分支行之间关系的正常化等等。

（三）从货币政策效力的递减看货币政策松动以及力度加大的必要性

现在让我们回到经济紧缩之后财政政策与货币政策配合使用这个问题上来。既然我们已经懂得了货币政策效力的递减是不可避免的，以及市场不完善条件下货币政策效力的递减更是必然的现象，那么我们完全有理由认为，要让紧缩之后的经济再度活跃起来，有必要采取稍紧的财政政策与松动的货币政策的配合，而货币政策松动的力度应当大一些。下面，从三个方面来进行论述。

1. 由于受到货币政策作用的对象——包括商业银行与其他金融机构，以及社会上的投资者——是理性的行为人，他们根据形势变化与政策变化而采取的对策会使货币政策的效力递减。因此，在放松了银根的条件下，如果不适当加大放松的力度，很可能使货币政策起不到应有的作用。有理性行为的投资者总是根据以往的经验与政府的做法采取相应的对策，特别是在经历过一段时间的经济紧缩之后，他们尤其不敢轻易地采取行动，总会打一点埋伏，留一手，以免再度使自己在投资中陷于不利状态。只有货币政策放松的力度加大一些，才能在一定程度上抵消或缓解货币政策效力的递减，使货币政策的预期目标得以实现。

2. 正如以上已经指出的，在经济紧缩之后走向经济活跃的过程

中，人们对市场前景和投资前景的信心的恢复与增强十分重要，而信心的增强又是一个累积的过程。因此，在政府实行稍紧的财政政策与松动的货币政策相配合的办法来推进经济活跃时，为了防止松动的货币政策的效力递减，货币政策松动的力度应当加大一些。这样才有利于人们对市场前景和投资前景的信心的增强与信心的累积。信心的充足与不足，通常表现于“可买可不买的买”与“可买可不买的不买”的不同。尽管只是一字之差，但对市场活跃程度的影响却是不可低估的。假定货币政策仍然从紧，人们将倾向于“可买可不买的不买”，市场活跃无望。货币政策稍松动一些，但力度不够，这种倾向依然不会改变。只有货币政策松动的力度大一些，人们信心增加了，转而采取“可买可不买的买”的做法，经济的兴旺与市场的活跃才会出现。

3. 要知道，单凭股市的看好是不足以使经济紧缩之后转入再度活跃的局面。相反地，股市一枝独秀还可能是经济尚未活跃的反映。因为其他行业的投资前景不乐观，投资渠道又窄，于是大量资金从其他投资领域流进了股市。加之，在其他行业的投资前景尚未看好的情况下，股市的上扬未免显得基础不扎实。这样，我们就应当设法启动其他行业，至少是某些能支撑经济活跃的几个行业，而在政策配合使用方面，需要让货币政策松动的力度加大一些。这实际上强调了结构性货币政策的重要性，即并非不顾行业的结构、投资的结构而让货币政策的松动无序，而是有选择地加大货币政策松动的力度，使某些能支撑经济活跃的行业先复苏，先兴旺，带动相关行业一起发展。对这些行业的货币政策松动力度大一些，将促进有效供给的增长，而不至于导致通货膨胀的加剧。有效供给增长才是名副其实的经济增长。此外，还应当注意到，现阶段的经济增长中不是没有水分的。如果说经济中确实存在着泡沫的话，那么经济增长中的水分就是最大的泡沫。要设法消除这种泡沫，那就必须消除无效供给。趋向于松动的结构性货币政策，只有力度加大一些，才能做到这一点。

总之，经济紧缩以后，要使经济转入兴旺活跃状态，根据中国的实际情况，目前我们不但需要采取稍紧的财政政策与松动的货币政策相结合，而且货币政策松动的力度要加大一些。同时，我们应当谨慎使用非常规的货币政策手段，更多地使用常规的货币政策手段。这就是《论财政政策与货币政策的配合使用》一文的思想。

（本文曾摘要发表于《亚太经济时报》

1997年5月29日、6月5日、6月12日）

Meshing fiscal policy with monetary policy (1997)

I. Limitations of fiscal policy in an incomplete market

i. Policy effectiveness in relation to economic growth

The interaction between fiscal and monetary policies was a much debated issue between Keynesians and Monetarists. According to post-Keynesian mainstream economics, in macroeconomic regulation the government should, except in times of crisis, avoid adopting fiscal and monetary policies that are tight or loose at the same time. A better choice is to pair tight fiscal policy with loose monetary policy, or loose fiscal policy with tight monetary policy. Monetarists, in principle, are not opposed to the interaction between fiscal and monetary policies, but they maintain that fiscal policy has great limitations. For example, a loose fiscal policy may not achieve the expected goals because fiscal expansion tends to partially "crowd out" private consumption and private investment, but if fiscal policy is tight, it cuts into the economic growth rate, resulting in fiscal expenditure cutbacks that invariably bring down fiscal revenue, thereby diverting the fiscal policy from its prescribed goals. Consequently, they believe that monetary policy is more effective than fiscal policy. Such is the basic policy preference of Monetarists.

In a policy debate with Monetarists, Keynesians further argue that the coordination between fiscal and monetary policies should be discussed in combination with economic policy goals. To be specific, they argue that it is necessary to observe the effects of the coordination between these two policies from the perspective of whether it is conducive to economic stability and sustainable growth.

A loose fiscal policy is supportive of economic growth and plays a

positive part in GNP growth. But can it "crowd out" private consumption and private investment? Sweeping generalizations should be avoided in answering that question. The key to the answer lies in whether the market is restrained or not, that is, whether the market can expand in time with GNP growth. If the market expands constantly, a loose fiscal policy in interaction with an equally loose monetary policy in the course of economic growth will squeeze out neither private consumption nor private investment. To put it another way, the "crowding out" effect can happen only when a loose fiscal policy interacts with a tight monetary policy. Only in that scenario can the Monetarist hypothesis make sense.

Nevertheless, to pair a loose fiscal policy with a loose monetary policy is bound to aggravate inflation. But this consequence can be forestalled if, on the one hand, the monetary policy is loosened only to a certain extent, and on the other, inflation is kept within bounds by boosting economic growth and aggregate supply. If this condition prevails, it broaches the topic of to what extent should monetary policy be loosened to avoid inflation resulting from increased money supply without allowing increased fiscal expenditure to suppress private consumption and private investment. Research on this topic has yet to be fully completed.

Whether the pairing is between a loose fiscal policy and a tight monetary policy or between a tight fiscal policy and a loose monetary policy, it calls for a comparison of effectiveness between the two pairings, as well as that between a tight policy and a loose one. Without such a comparison it is hard to decide how the two should be paired.

ii. Impact of market completeness on policy effectiveness

The above summary of Keynesian and Monetarist viewpoints about coordinating fiscal and monetary policies makes a valuable reference. It is hard to judge which school is correct, because it involves the margin of economic growth and the margin of growth in

aggregate supply. If the economic growth rate is too low while aggregate supply grows too slowly, neither fiscal policy nor monetary policy can work whether they are tight or loose, because fiscal expenditure will crowd out private expenditure or decline along with financial revenue. In that way, coordination between fiscal and monetary policies is out of the question. The analysis of monetarists may be warranted in this case. Otherwise, the Keynesian position may sound even more reasonable.

However, the experience of China and that of some other developing nations indicate that the effectiveness of fiscal and monetary policies is associated with the degree of market completeness. To be specific, both fiscal and monetary policies work most effectively if the market is fairly complete. By comparison, a tight fiscal policy tends to meet more impediments than a tight monetary policy in the course of enforcement, and, as a result, its effectiveness will be more or less curtailed.

The situation will be different if the markets – capital market, securities market, foreign exchange market, property rights market, and so on – are less than complete. In this scenario, monetary policy may come across more obstacles in the course of implementation than fiscal policy, and its effectiveness may be limited to a larger extent. By the same token, a tight monetary policy may face more hindrance than a tight fiscal policy. This is because monetary policy works through the capital market, securities market, foreign exchange market, property rights market and so on, whose incompleteness can deprive the monetary policy of its transmission mechanism or make its transmission mechanism less effective.

Fiscal policy differs from monetary policy in that it impacts the commodity market directly. If the general market is incomplete, the commodity market is usually less incomplete than the other markets, while the capital, securities, foreign exchange and property rights markets tend to be most incomplete. This is exactly true of the Chinese experience, where fiscal policy works relatively more effectively even though a tight fiscal policy may still encounter a lot of

obstructions.

This point may be illustrated with the effect of fiscal policy on economic growth. Because fiscal policy has a direct bearing on the commodity market and can change GNP through the extension and contraction, or ebb and flow of that market, it can either restrain or stimulate the rate of economic growth. Even if the commodity market is incomplete, fiscal policy can still act on GNP through corresponding changes in that market, which is ultimately indicated in changes of economic growth rate. This is something monetary policy cannot do, as its impact on the economic growth rate can be considerably lessened – and therefore cannot be as pronounced and direct as the impact of fiscal policy – as long as the capital, securities, foreign exchange and property rights markets remain incomplete. In China, a loosened-up fiscal policy works better than a loosened-up monetary policy in stimulating economic growth, but conversely, it is also more likely to play a larger part in aggravating inflation.

The effects of a loose policy and a tight policy are asymmetrical in an incomplete market. Given the same money market tightness benchmark, a relaxed policy is more effective than a tight policy. This is particularly true of monetary policy in an incomplete market. This is because – under the assumption that the capital, securities, foreign exchange and property rights markets are incomplete while the monetary policy lacks a transmission mechanism – the impact of a tight money market is different than that of a loose one even though the effect of monetary policy is restricted to a certain extent. When the money market is loosened up, investors can always obtain credit from different channels, and the economy will be animated correspondingly even if the market remains incomplete. When the loose money market is tightened up, however, some investors will still act on prescribed plans, because market incompleteness has made them oblivious to the pressure of a rising interest rate or a rising reserve requirement ratio. This is because the more incomplete the market is and the bigger the informational restraints are, the more unfair competition becomes. As a result, some privileged investors can

still obtain credit and make investment. They may gradually feel the pressure, but generally speaking, the effect of a tightened-up monetary policy on them always comes belatedly.

iii. Pairings of loose and tight policies in an incomplete market

This gives rise to the issue of how to pair a loose policy with a tight one in macroeconomic regulation of an incomplete market. Such pairings are different from those in a complete market in two ways.

Firstly, in a complete market, the effects of both fiscal and monetary policies are keenly felt. Even though a tight fiscal policy tends to hit more snags than a tight monetary policy, it works reasonably well, when and where necessary, to coordinate a loose fiscal policy with a tight monetary policy, or to pair a tight fiscal policy with a loose monetary policy. Yet, things are different in an incomplete market where the capital, securities, foreign exchange and property rights markets are most incomplete, through which monetary policy works. So fiscal policy is more effective than monetary policy. To meet the goal of macroeconomic regulation, fiscal policy is preferred over monetary policy, whose role can be very limited unless robustly enforced. Therefore, it is impractical to count on monetary policy in this regard. Such is one of the salient features of macroeconomic regulation under conditions of an incomplete market.

Secondly, a tight fiscal or monetary policy will strain money supply, bring down the economic growth rate, and curtail the inflation rate, whereas a relaxed fiscal or monetary policy will loosen up money supply, boost economic growth, and reduce unemployment. However, all this can happen only in a complete market. In an incomplete market, macroeconomic regulation will be slow to take effect, and worse, the results might be unexpectedly distorted. This is because the securities, foreign exchange and property rights markets are more incomplete than other markets, and therefore the transmission mechanism of monetary policy becomes even more flawed. If curtailing inflation is the goal of government policy regulation, the

adoption of a tight fiscal policy can quickly cool down the economy and reduce inflation because this policy works especially well in this field when it is tightened up. However, the tight fiscal policy needs to be paired with a loose monetary policy if we are to prevent the economy from being cooled to such an extent as to thwart economic growth. Furthermore, because of the incompleteness of the market, and the flaws in monetary policy's transmission mechanism, a loosened monetary policy cannot work properly in the course of enforcing a tight fiscal policy, thereby defeating the purpose of maintaining the economy's momentum. As a result, with the tight fiscal policy having a strong effect and the loose monetary policy having a weak effect under incomplete market conditions, the economy is likely to be over cooled or even bogged down in stagnation. That echoes the saying, "It is easier to stop a car than rev it up."

Similarly, when raising economic growth is the goal of government policy regulation, a relaxed fiscal policy can be adopted in interaction with a tight monetary policy because this is where the relaxed fiscal policy works particularly well. Stimulated by expanded fiscal expenditure or tax reduction or exemption, the economy achieves rapid growth, but it is necessary for the relaxed fiscal policy to be accompanied by a tight monetary policy to curb inflation in this process of accelerated economic growth. However, the incompleteness of the market and the flaws in its own transmission mechanism prevent the tight monetary policy from working properly in the course of enforcing the relaxed fiscal policy, thereby failing to achieve the goal of keeping economic growth and inflation from running too high. Thus, under incomplete market conditions, the strong effects of the relaxed fiscal policy, coupled with the weak effects of the tight monetary policy, can result in excessive economic expansion, and make it hard to contain hyperinflation.

Therefore, the troubles met in the coordinated application of fiscal and monetary policies in an incomplete market are attributed to the "limping status" of both policies. In other words, the pairing of an

effective policy with a less effective one makes it hard to achieve the goals.

This, however, does not preclude the combined use of fiscal policy and monetary policy in an incomplete market. Rather, it means that the forcefulness of both policies should be taken into account when pairing them up. For instance, given the strong effect of fiscal policy and the weak effect of monetary policy, we can implement the latter with more impetus than the former, so as to maximize the outcome of the combination.

iv. Conclusion: It is easier to stop a car than to rev it up again

In the previous chapters I have made a tentative study of the coordinated adoption of fiscal and monetary policies. What does this mean for the Chinese economy in the present stage of development? As I have stated in the foregoing, the effectiveness of monetary policy is considerably restrained in an incomplete market, which makes it even harder to be coordinated with fiscal policy. For this reason, I would like to draw attention to the following two points:

First, in the current stage of economic development in this nation, it is inappropriate to adopt a relaxed fiscal policy alongside a relaxed monetary policy, or a tight fiscal policy together with a tight monetary policy, because the former tends to lead to runaway inflation and the latter a stifled economy. The only option is to couple a tight fiscal policy with a relaxed monetary policy, or vice versa. Given the different attributes of the effects of the fiscal and monetary policies under incomplete market conditions, I would suggest a relatively tight fiscal policy alongside a relaxed monetary policy.

Second, under incomplete market conditions, the Chinese economy is typical of the saying, "It is easier to stop a car than to rev it up again." It is also where the asymmetrical nature of the effects of macroeconomic regulation is most pronounced. That is to say, when macroeconomic regulation tightens up, its effect is quickly felt and the

economy retrenches as a result. By contrast, if macroeconomic regulation slackens only slightly, it can hardly serve the purpose, because the economy can only revive slowly or stay stagnant for a considerable time before it comes back to its own. Why? Because the economy can be dynamic, the purchasing power stays strong and the market thrives only when businesses and investors are optimistic about the prospects of good profits and consumers are confident in anticipation of higher income. Nevertheless, it takes time to boost optimism and confidence. Expansionary policies cannot make people sanguine about market prospects right away, while the "limping state" in which fiscal policy outplays monetary policy can land macroeconomic regulation in an impasse. It will be even harder to rev up the economy with a tight fiscal policy in the absence of a relaxed monetary policy.

Hence the foregone conclusion: At the present stage of development, China can only slightly tighten up its fiscal policy while loosening up its monetary policy a little. Otherwise, the economy can never be delivered from the dilemma in which "it is easier to stop the car than to rev it up again."

II. Be prudent with unconventional monetary policy tools

i. Three basic monetary policy tools predicated on market completeness

Monetary policy impacts GNP through its effects on the capital, securities, foreign exchange and property rights markets. If changing GNP is the policy's ultimate goal, a series of intermediary goals are needed. If changing inflation and GNP are the dual ultimate goals, they cannot be fulfilled before the intermediary goals are attained. Therefore, in our research on the impact of monetary policy on the economy, we should study this policy's transmission mechanism, and observe, through its different tools, the policy's impact on the intermediary goals, for the purpose of finding the ways and means

with which to attain the ultimate goals through these intermediary ones.

Interest rate is one of the intermediary goals of monetary policy. Under complete market conditions, the central bank applies a rediscount policy to influence the interest rate. When the rediscount rate is readjusted, it will change commercial banks' cost of borrowed funds, thereby precipitating readjustments in the interest rate on the market, and compelling investors to raise or reduce their monetary demand. Money supply thus becomes the most important of all intermediary goals that, alongside the interest rate, influences society's monetary demand, aggregate demand, and GNP. If the monetary policy's transmission mechanism is effective, it can exert its impact, through the central bank's rediscount policy, to attain both the intermediate goals and the ultimate goals. This, however, also has something to do with the economic environment as a whole. If the market is incomplete, rediscount policy cannot work as a monetary policy step on money demand the way it does in a complete market, nor can it work effectively for the attainment of another intermediary goal, the volume of money flow. Unless the rediscount policy is executed with government intervention, changing the rediscount rate cannot work on the increases or reductions in money flow.

We may take a further look at the impact of the rediscount rate. For the changing rate to exert a desired influence on interest rate, there need be full competition among commercial banks that are supposed to grant loans to clients strictly in line with the norms of market competition and selection, while the clients are likewise expected to compete on an equal footing. Otherwise, the impact of rediscount rate readjustments on interest rate will be much confined.

Adjusting reserve requirement ratio is another monetary policy tool to influence commercial banks' derived deposit, restrain their lending behavior, and ultimately affect money supply. Here, another intermediary goal – the volume of money supply – can be attained through adjusting the central bank's reserve requirement ratio. This, however, can materialize only when this ratio stays at a high level.

Otherwise, even though the reserve requirement ratio can work as a monetary policy tool, it cannot serve the purpose of forestalling any financial crisis. Furthermore, the reserve requirement ratio cannot function as a policy tool without two preconditions. For one thing, commercial banks should set maximum profits as their goal, for without such a goal, the effectiveness of readjustments in the reserve requirement ratio and of the reserve requirement system itself will be greatly blunted. This precondition is hinged on the soundness of the commercial banking system. For another, central bank's adjustment of the reserve requirement ratio should be compulsory rather than elastic; otherwise it could defeat the purpose of this monetary policy tool to intervene in money supply. Although the adjustment of reserve requirement ratio is not a frequent monetary policy tool, the effectiveness of its transmission mechanism still rests on the degree of market completion.

The central bank's open market operation is yet another monetary policy tool that should also be observed from an economic environment perspective. In comparison with other monetary policy tools, open market operation calls for more stringent market conditions – a complete and mature securities market over and above a rational market interest rate and sensible investors. Pitfalls in the transmission mechanism of open market operation can not only make it hard to achieve the intermediary goal of adjusting money supply but also frustrate open market operation as a monetary policy tool.

The rediscount rate, the reserve requirement ratio, and open market operation discussed here are three essential monetary policy tools. Their transmission mechanisms are, without exception, associated with the soundness of the market and the commercial banking system. They invariably become crippled or totally ineffective under incomplete market conditions or a flawed commercial banking system.

ii. Unconventional policy tools also depend on market completeness

Now a look at two unconventional policy tools besides the three aforementioned monetary policy tools: (1) credit scale control or credit rationing; and (2) rediscount quotas and relending quotas. The central bank uses the former to control the lending scale of commercial banks, and the latter as a supplement to rediscount rate readjustments. Both are adopted under incomplete market conditions or under a flawed commercial banking system, but each uses a different transmission mechanism.

The central bank decides credit scale on the basis of its judgments of the economic situation. Differences in the grounds and perspectives for such judgment, and errors in evaluating credit scale effectiveness invariably lead to considerable arbitrariness in the central bank's credit scale control. The will of the government plays a big role therein as well. Controlled credit scale can change the money supply volume directly and rapidly, and in that sense, the transmission mechanism of the credit scale control policy is effective. However, prompt response and an effective transmission mechanism are not necessarily conducive to the attainment of the monetary policy's ultimate goal. This is mainly because resource allocation must be optimized constantly if economic growth is to be sustained and inflation is to remain low. Optimized resource allocation indicates improved efficiency. However, the effectiveness of credit scale control is a different story. The problem with credit scale control is that money supply may change the way policymakers want in the short run, but in the long run, with policymakers' will imposed on it, this monetary policy tool is detrimental to optimizing resource allocation, and will inevitably derail the monetary policy's ultimate goal.

Rediscount and relending quotas are adopted as another unconventional policy tool to make up for the limitations of rediscount rate readjustments. Rediscount quotas may enable the central bank to manipulate commercial banks' money-lending capacities by increasing or decreasing such quotas, and starting from there to further control overall money supply. The same purpose can be achieved by increasing or decreasing the relending quotas.

However, the central bank's rediscount quotas and relending quotas, being arbitrarily decided by the government, are so subjective that they do not necessarily fit the reality of money supply. Therefore, whether such quotas are beneficial or detrimental to the realization of the monetary policy's ultimate goal is open to question. On the other hand, these unconventional tools may impair the optimization of resource allocation, and, in the long run, will hold back the attainment of the ultimate goal of the monetary policy.

iii. Using credit scale control and other unconventional measures with prudence

From our study of monetary policy's transmission mechanisms we may conclude that if the market is complete and the commercial banking system sound, these transmission mechanisms may work effectively. If the market is incomplete and the commercial banking system flawed, it is impossible for conventional monetary policy tools to achieve expected results. As to such unconventional monetary policy tools as credit scale control, rediscount quotas and relending quotas, although their transmission mechanisms may remain effective in such a scenario, they are, in the long run, detrimental to the optimization of resource allocation and the attainment of the monetary policy's ultimate goal.

The question at hand to be answered is: What is to be done to reactivate the economy after a period of economic retrenchment? As is noted in the previous section, the adoption of a relatively tight fiscal policy in coordination with a loosened monetary policy under these circumstances is better than the pairing of a loosened fiscal policy with a tightened monetary policy, and even better than coupling fiscal and monetary policies that are both rigid or both relaxed. Our analysis of monetary policy's transmission mechanisms is further proof that this conclusion tallies with the reality of our nation.

Unconventional monetary policy tools – credit scale control, rediscount quotas, and relending quotas included – are often resorted to under incomplete market conditions. Worse, the trend is to regard

these unconventional measures as conventional ones, as if the ultimate goal of the monetary policy can never be attained without doing so. In fact, this is sheer misunderstanding. Just as is discussed in the foregoing, despite being somewhat effective, these unconventional measures are harmful to optimizing resource allocation, and, corrupted by government will, cannot satisfactorily fit the money supply situation in economic operation.

To rejuvenate the economy after a period of retrenchment, it is imperative to loosen up the monetary policy more forcefully along with a relatively tight fiscal policy. Thus prudence must be applied when employing such unconventional policy measures as credit scale control, and for three reasons:

First, the transition from economic entrenchment to economic revival hinges on restoring and enhancing public confidence in market prospects, but confidence can be built up only through a cumulative process. The adoption of unconventional monetary policy tools can engender nothing but uncertainty whether they are relaxed or rigid. If the government can employ relaxed measures, it can also choose rigid ones. In either case there are no norms to go by, because things are at the mercy of those who adopt such measures. The result can be the same: People feel their confidence draining away. That being the case, little or no use should be made of unconventional measures. We would rather adopt conventional monetary policy tools that are sure to help boost people's confidence. Although incomplete market conditions may somewhat tarnish such measures' effectiveness, that can be remedied with redoubled enforcement efforts.

Second, because unconventional monetary policy tools are often misleading to investors, and thus of great disservice to optimizing resource allocation even if a relaxed monetary policy has been adopted to activate the economy, the ultimate goal still cannot be attained due to the failure of these tools to optimize resource allocation. To rejuvenate the economy and keep it primed after a period of retrenchment, it is really important to focus on optimizing resource allocation so that production factors can be grouped and

resource use efficiency increased according to market demand. In this regard, unconventional monetary policy measures compare unfavorably with conventional ones. It must be pointed out that, the restraints imposed on conventional measures by an incomplete market can always be overcome through redoubled implementation efforts.

Third, monetary policy can be loosened up a little more than usual, but this should be done on condition that commercial banks issue loans only according to the redeemability of such loans and the borrowers' fund use efficiency. Otherwise bad debts will pile up, and economic vitality will suffer. What, then, is to be done to avoid the accumulation of debts under a relaxed monetary policy? What kind of monetary policy measures – conventional or unconventional – should be employed in this regard? Obviously, unconventional monetary policy measures are susceptible to arbitrariness and government intervention, making it hard to curtail bad debts, let alone achieve the anticipated results of the relaxed monetary policy.

III. The eclipse of monetary policy's effectiveness

i. What makes monetary policy increasingly less effective

The eclipse of monetary policy's effectiveness becomes an issue when our study comes to the position and impact on objective economic regulation of such policy. This refers to the fact that after a monetary policy has been executed for some time, its positive impact on attaining the ultimate goals of economic growth and monetary stability will ebb steadily while its negative impact on the economy will increase.

The waning of a monetary policy's effectiveness may be a universal occurrence. It happens whether the market and commercial banking system are flawless or not. Naturally, the decline in policy effectiveness becomes more serious when the market is incomplete and the commercial banking system faulty.

The decreasing effectiveness of monetary policy is attributed mainly to the fact that market participants – commercial banks, other monetary institutions, and nongovernmental investors – are sensible economic agents that react rationally to the monetary policy adopted by the central bank. Even if the market is complete and the commercial banking system healthy, these agents will take countermeasures against the changing economic landscape and policy if their overriding thought is to maximize their own interests. Such countermeasures may cause the effectiveness of a certain monetary policy measure to decrease correspondingly, or force the central bank to reconsider its policy's effectiveness and readjust it. This phenomenon is undoubtedly more pronounced under incomplete market conditions and a flawed commercial banking system.

Monetary policy's waning effectiveness has also something to do with the limitations of its transmission mechanisms. The policy attains the ultimate goal through intermediary goals. However, the economy is in a state of constant restructuring that constantly updates money demand. That is to say, the relationship between money supply and demand always changes in pace with economic restructuring. The monetary policy tools taken are, without exception, focused on changing money supply, to the neglect of the new money demand out of economic restructuring. As a matter of fact, this means the central bank's monetary policy should be designed to adapt such demand to money supply, not the other way around. Changing the money supply is an intermediary goal of monetary policy; changing the demand for money is not. To put it another way, the monetary policy of the central bank impacts directly on money supply, and indirectly on money demand by changing money supply. Thus it can be said that the monetary policy does not have a transmission mechanism that directly impacts money demand. Precisely because of this missing point in the transmission mechanism, investors in the chain of money demand inevitably seek to meet their demand for money or influence the aggregate demand for money through other channels, which are beyond the reach of policymakers. Thus the steady decline in the monetary policy's effectiveness becomes inevitable even if the market

is complete and the commercial banking system perfect. The achievement of this policy's ultimate goal, observed from a monetary point of view, is predicated on changes not only in money supply but also in money demand. Only by coordinating such supply and demand can a monetary policy be effective in the attainment of the ultimate goal.

ii. The eclipse of monetary policy's effectiveness under incomplete market conditions

The unstoppable ebb of a monetary policy's effectiveness under incomplete market conditions and an imperfect commercial banking system is also ascribed to the following causes that are perhaps more important than the aforementioned ones.

First, in an incomplete market and under a flawed commercial banking system, the central bank habitually resorts to unconventional monetary policy tools like credit scale control, rediscount quotas, and relending quotas. However, because the design and use of such tools smack of government intervention, the central bank is actually not in a position to make adjustments relevant to the changing economy. As a result, these tools become rigid policy measures that can only defeat the purposes. Moreover, because these policy measures are usually introduced and backed by the administration, their effectiveness is invariably whittled down because they are rejected, openly or covertly, by commercial banks and other monetary institutions.

Second, under incomplete market conditions and an unhealthy commercial banking system, the central bank's quantitative monetary control over the entire economy is limited. The more incomplete the market and the commercial banking system are, the more likely that firms and investors choose to obtain money beyond the central bank's control. Similarly, under the same conditions, the more the central bank tightens up its quantitative money control, the more firms and investors will try to dodge such control and seek money in areas beyond the reach of the central bank, resulting in a reduction in the effectiveness of the monetary policy.

Third, under incomplete market conditions and a flawed commercial banking system, the activity of the central bank and commercial banks may be interfered with by government at all levels that demand, including the demand for more loans and – in extreme cases – bank overdrafts. This manner of government intervention inevitably cuts deeply into the monetary policy's effectiveness and makes it difficult to reach its prescribed goals. To unshackle them from such intervention, not only should the commercial banking system and the market be straightened out, but the central banking system itself should be rectified as well. This calls for normalizing the relationship between the Ministry of Finance and the Central Bank, and between local governments and the Central Bank's local branches.

iii. Monetary policy needs to be more loosened and forceful – judging from its eclipsed effectiveness

Now let us return to the issue of coordinating fiscal and monetary policies in the post-retrenchment years. Now that we have seen that the eclipse of a monetary policy's effectiveness is unavoidable and even more so under incomplete market conditions, we have every reason to believe that, to reactivate the economy in the wake of the retrenchment, it is necessary to adopt a slightly tightened up fiscal policy in coordination with a monetary policy that is loosened up more forcefully. Such a necessity is justified from three aspects:

First, the countermeasures taken by those under the impact of a monetary policy – commercial banks, other monetary institutions and nongovernmental investors – against the changing situation brought about by that policy can keep eroding its effectiveness. As a result, the monetary policy may not work as it should on a relaxed money market if it is not loosened up with appropriate forcefulness. Sensible investors always take countermeasures according to experience and government behavior, and are especially cautious in action after going through the retrenchment years. They will tend to hold back and bide their time, lest an ill-advised investment move put them at a disadvantage. This being the case, the monetary policy has to be

relaxed a little more vigorously if its effectiveness is to stop its decline, and if its prescribed goals are to be achieved.

Second, as illustrated above, to rebuild and enhance public confidence in market and investment prospects is vital to post-retrenchment economic revival. Because this calls for a cumulative process, to loosen up the monetary policy more forcefully in coordination with a relatively tight fiscal policy is a sensible recourse for the government to prevent the monetary policy's effectiveness from diminishing endlessly and to boost people's confidence in market and investment prospects. Whether or not a consumer chooses to buy something he can do without is a conventional benchmark of his confidence or the lack of it. The consumer may make that decision on the spur of the moment, but its impact on the market cannot be underestimated. If the monetary policy is tight, people tend not to buy things they can dispense with, and thus the hope for a revived market is dashed. That tendency will remain unchanged if the monetary policy is not loosened up enough. People will not be confident enough to buy commodities in the gray zone between necessity and nonnecessity, and the economy and market will not come back to their own unless the monetary policy is loosened up adequately.

Third, it should be noted that a booming stock market alone is not enough to put the economy back on track right after a period of retrenchment. On the contrary, if the stock market is the only thing that is thriving, it may be evidence that the economy is still in a quandary, as dim investment prospects in many other fields are channeling large sums of money into the stock market. Furthermore, a bustling stock market may most likely be built on a flimsy foundation when investment prospects are grim in other fields. Under these circumstances, we should go out of our way to boost the other investment fields, at least those industries that can bolster up the economy. In conjunction with this, the monetary policy must be loosened up more emphatically to give precedence to the indispensability of its structural nature. That is to say, the policy must not be loosened up in a disorderly fashion and regardless of the

industrial and investment structures. Rather, it should be designed, in the first place, to revive selected industries that can bring the economy to life and cause a chain reaction in other industries. To loosen up the monetary policy a little more liberally for these industries helps increase effective supply to the extent where inflation will not be aggravated. Growth in effective supply means true economic growth. In addition, we have got to realize that economic growth at the present stage is not without bubbles. Of all the bubbles foaming in the economy, those in economic growth are the most obvious. To get rid of such bubbles, ineffective supply must be eradicated. This can be done by liberalizing the structural monetary policy a little more.

All in all, to shift the economy back on boom conditions in these post retrenchment years, we should not only coordinate a relatively tightened fiscal policy with a relaxed monetary policy, but also step up our effort to loosen up the latter. In the meantime, we should apply unconventional monetary policy measures with prudence, and make more use of conventional monetary policy measures. Such is the keynote of this thesis, entitled "Meshing fiscal policy with monetary policy."

— Carried in excerpts in *Asia Pacific Economic Times*, May 29, June 5
and June 12, 1997

论效率的双重基础 (1998年)

一、在效率问题的研究中必须考虑人的因素

在市场经济条件下，效率是受市场调节的。利益的驱动就是市场调节起作用的表现。每一个资源投入主体为了取得利益，必须根据市场上生产要素的供求状况与价格水平来组合生产要素，提高效率。因此，在市场经济中，效率背后的机制实际上就是利益机制或市场机制，资源投入主体的利益最大化就是他所追求的目标。这样，利益驱动与目标吸引在效率问题上是统一的。

假定在市场调节之外还有政府调节，那么在效率的背后必定存在着政府调节的影响，目标的吸引主要是政府调节起作用的表现。政府有自己的目标，政府目标不是单一的，而是多元的。政府为了使自己的目标得以实现，就需要通过各种调节手段对资源投入主体发生影响，使他们在资源投入领域的选择上与资源投入方式的选择上作出符合政府目标的选择，从而影响效率的变动。

由于市场调节与政府调节是共同起作用的，所以高效率或低效率的产生实际上受到市场调节与政府调节的共同影响。但对这个问题的分析不应到此为止，我们还需要作深入一层的探讨。这是因为，在市场上进行活动的是各个交易人，一个交易人就是一个资源投入主体。对市场进行调节的是政府，政府自身也是资源投入主体。受到政府调节的是市场上的交易人，他们作为资源投入主体，既要考虑自己的利益，也要考虑政府采取的调节手段对自己利益的影响。于是就出现了另外的问题：资源投入主体是怎样考虑的呢？他们的行为受哪些因素影响呢？效率除了受到市场调节与政府调节以外，是不是还受其他力量的影响呢？

让我们先以一个企业为例。一个企业内部的关系可以分为人与物之间的关系和人与人之间的关系。人与物之间的关系主要反映为生产资料使用者与生产资料之间的关系。企业的生产资料状况和平均每个劳动者

所使用的生产资料数量的多少，基本上反映了这个企业的技术水平，技术水平的高低影响着效率的高低。从人与人之间的关系来看，问题要比人与物之间的关系复杂些。可以把企业内部的人与人之间的关系分为若干种，例如，企业领导层同一般职工之间的关系，企业领导层内部的合作共事关系，企业领导层与各级管理人员之间的关系，各级管理人员内部的合作共事关系，一般职工相互之间的关系等等。这些人际关系中，有的协调，有的不那么协调，还有的完全不协调。有些人际关系在这种情况下比较协调，在另一种情况下却不协调。人际关系的协调程度影响着效率的高低，而且对效率的影响同技术水平对效率的影响是不一样的。如果技术水平低，企业通过增加投入，或增添新设备、修建新厂房，或进行职工培训、鼓励职工钻研技术，就可以大幅度提高技术水平，达到效率增长的要求。但如果企业内部人际关系不协调，增加投入能有多大成效？难道效率会因此而大幅度提高？

再从企业从业人员（包括各级管理人员与工人）的角度来看，在一定的技术水平之下，人的因素被摆到了显著的位置，企业的效率取决于人的因素所发挥的作用。在人的因素中，职工的工作时间、每个人已达到的文化技术等级、每个人在自己的工作岗位上的责任明确程度都是已知的。但在人的因素中，还有一些未知数。例如，职工的努力程度就是未知的，因为每个人在工作中究竟使出了多大的劲，不易确定。又如，每个人都有一定的惰性，惰性的影响小，积极性、创造性发挥得充分；反之，惰性的影响大，职工的积极性、创造性的发挥就受到阻碍。职工自身能在多大程度上克服惰性，也是一个未知数。再如，如果职工个人的目标同企业目标是协调的，效率将会增长；反之，职工个人目标同企业目标不协调，效率将会下降。但职工个人目标同企业目标究竟在何种程度上协调或不协调，同样是未知的。这些未知因素的存在对企业效率的影响，是值得研究的课题，也是市场调节或政府调节都难以解决的难点。

由此可见，对效率的研究有必要在市场调节与政府调节以外展开。这并不意味着市场调节与政府调节对效率的增减不重要，这只是表明市场调节与政府调节在影响效率方面有局限性，特别是在分析效率的源泉方面有局限性。比如说，在企业内部人与人之间关系的研究中，在与人的工作努力程度、人的惰性等有关若干未知因素对效率的影响的研究中，都需要深入到更深的层次。这就是说，道德力量在许多方面对人的行为发生作用，进而影响效率。什么是效率的真正源泉？效率的真正源

泉在于人的作用的充分发挥、人的积极性与创造性的充分发挥；而要做到这一点，道德力量的作用不可忽视。在道德力量作用之下，人的作用充分发挥了，人的积极性与创造性充分发挥了，效率将会大大提高。

应当指出的是，上述分析是以技术水平既定作为前提的。技术水平的高低，从人与物之间的关系的角度来看，关系到效率的大小。比如有两个国家、两个地区或两个企业。如果一个国家、地区、企业的技术水平高出另一个国家、地区、企业很多，那么道德力量对效率发生作用后所产生的后果就难以进行比较。因此，只有把技术水平作为既定，道德力量对效率的作用才能准确地显示出来，这样的对比才有意义。

二、效率来自凝聚力：团体的凝聚力和社会的凝聚力

前面已经指出，在一定的技术水平的条件下，效率的真正源泉在于人的积极性、创造性的充分发挥。而要充分发挥人的积极性、创造性，必须有合理的经济运行机制，必须做到人际关系的协调。

凝聚力的大小是人际关系是否协调或协调到何种程度的体现。凝聚力基本上分为两类：一是团体的凝聚力，二是社会的凝聚力。团体的凝聚力以团体内部人际关系的协调为条件，社会的凝聚力则以社会中人际关系的协调为条件。凝聚力产生效率：团体的凝聚力产生团体的效率，社会的凝聚力产生社会的效率。

这里所说的团体，包括了企业、事业单位、社区、社团、村、家庭等等。团体有大有小，但各有各的凝聚力。团体的组织有松有紧，紧密不等于有较大的凝聚力，松散也不等于缺少凝聚力。团体组织的松散或紧密，是从组织形式上说的；团体有没有凝聚力或凝聚力有多大，则同团体与成员之间协调与否、成员与成员之间协调与否有直接的关系。比如说，某个社团有严密的组织，但成员彼此之间可能勾心斗角，难以形成一股力量；或者成员对社团的领导层离心离德，存在着强烈的离心倾向，那么不管社团的组织形式多么严密，照样没有凝聚力。反之，某个社团尽管组织形式上是比较松散的，但成员之间的关系协调，成员同社团的领导层的关系协调，成员们为社团的发展齐心协力，这样的社团不仅有凝聚力，而且凝聚力还可能是很强的。

企业是由企业工作人员组成的一个团体。企业的凝聚力是团体的凝聚力中的一种。企业文化建设有助于企业凝聚力的形成。一个企业，如

果有较大的凝聚力，不仅能够促使企业效率不断提高，而且在企业遇到困难时，能够使企业克服困难，闯过难关。关于这一点，人们一般是不会产生疑问的。

需要深入探讨的问题是：社会的凝聚力如何形成？团体的凝聚力同社会的凝聚力之间存在什么样的关系？怎样正确处理这两种凝聚力之间的关系，以便既有团体的凝聚力，又有社会的凝聚力？

社会的凝聚力是指社会成员们能够团结一致，各尽所能来实现共同的目标。最显著的例子就是一个国家、一个民族在反侵略战争时期或遇到严重自然灾害时期社会成员所表现出来的齐心协力、艰苦奋斗与自我牺牲的精神。社会的这种凝聚力带来社会的高效率，会出现许多奇迹。即使在正常的情况下，如果社会上人际关系协调，社会凝聚力强，那么也会出现社会协调的环境，同样有利于效率的增长。

至于团体凝聚力与社会凝聚力之间的关系，应当认为，二者之间可能存在着相互促进的关系，也可能存在着相互制约的关系，关键在于团体的性质与团体的目标是什么样的。社会上有各种各样的团体，性质互异，目标互异。假定某个团体是政治性的组织并具有分离主义政治倾向，它的目标是要求改变现状，从一个国家分离出去。那么，这样的团体内部越有凝聚力，对社会越不利，社会的凝聚力越会受到损害。当然，这是极端的例子，我们可以把这一类团体作为特例，略去不谈。在一般情况下，团体的目标同社会的目标是相容的，也是可以协调一致的。因此，团体的凝聚力与社会的凝聚力通常有着相互促进的作用。这里仍以企业为例。

在市场经济中，企业作为自主经营、自负盈亏的商品生产者，有自己的目标，而首要的目标就是争取实现最大利益。企业之间存在着竞争的关系。为了使自己在竞争中取胜，企业不断调整生产和经营方向，也不断改进管理，增加内部凝聚力。正当竞争、合法条件下的竞争，是处理企业之间关系的前提。在这一前提下，企业之间有着共同的利益，这就是：社会越稳定，经济越繁荣，企业越能受益。一个企业的兴旺并不是必定以另一个企业的衰败为条件的。

在社会稳定与经济繁荣的大环境中，企业都有发展的机遇，并且都能实现这一愿望。从现实生活中可以看到，即使这样的大环境中，也总有一些企业由于生产经营不善，或投资决策失误，或适应不了技术迅速变化的形势，发生生产收缩、企业倒闭或被其他企业兼并等情况。但

这是正常的，这只不过是资源重新组合的反映。只要资源的重新组合能给国民经济带来效率的增长，为投资者创造新的机遇，那么某些企业收缩、倒闭或被兼并不会损害企业界的共同利益。

团体的凝聚力同社会的凝聚力是两种不同类型的凝聚力。团体的凝聚力能否同社会的凝聚力统一起来，或者说，团体凝聚力的加强能否促进社会凝聚力的加强，同作为促进团体凝聚力的重要因素的文化建设（如企业文化建设、社区文化建设、校园文化建设等）的内容与成效有密切关系。不妨仍以企业为例。在一个企业中，假定企业文化不仅强调企业自身的目标，而且同样强调社会的目标；不仅关注企业自身的利益和本企业职工的利益，而且也关注公共的利益；不仅致力于企业精神的培育，而且也致力于优良的社会风尚的培育。这样，企业文化建设的成就既表现于企业凝聚力的加强，也表现于社会凝聚力的加强，企业凝聚力与社会凝聚力是一致的。这正体现了成功的企业文化建设的社会功能与社会价值。反之，假定一个企业单纯着重企业自身利益与本企业职工利益的追求而忽略了企业文化建设的社会功能与社会价值，那么，尽管企业的凝聚力也有可能在某种程度上加强，但却无法使企业的凝聚力同社会的凝聚力协调一致，也无法使企业凝聚力的加强带来加强社会凝聚力的结果。在分析效率源泉问题时，我们不当忽视这一点。

如果再作进一步的分析，那么可以了解到，国民财富的增加、社会的经济繁荣和文化教育事业的发展是联系在一起的。一个经济繁荣、文化教育事业发达的社会，将更有条件来进行文化建设，促进社会凝聚力与团体凝聚力共同加强。道德调节作用在促进社会凝聚力与团体凝聚力共同加强方面表现得尤为明显，道德调节的这种作用是市场调节或政府调节无法替代的。这是因为，只有运用道德力量，才能使团体的成员认识到团体目标的实现从根本上说是同社会目标一致的，个人的利益、团体的利益从根本上说是同公共利益一致的。于是团体的成员就会从内心认同社会目标，其结果将是既增强了团体的凝聚力，又增强了社会的凝聚力。团体的效率与社会的效率将在道德力量的影响下不断提高。

由此可以得出下述结论：以往在效率源泉问题的研究中，通常只着重经济因素与技术因素而忽略非经济因素与非技术因素，只注意利益的影响而不注意社会责任感与公共目标的作用，只强调物的价值实现而忽视人的价值实现。在这种传统的思想与方法的指引下，实际上研究不了效率变动的深层次问题，也揭示不了效率的真正源泉还在于人的作用以及人与人之间的关系，而不仅仅在于物的作用以及人与物之间的关系。

团体凝聚力产生团体的效率，社会凝聚力产生社会的效率。在这种情况下，效率的产生与提高的原因不应当到市场机制中去寻找，也不应当到政府的调节行为中去寻找，而只能到道德力量及其对人的影响中去寻找。

三、超常规的效率是怎样产生的

效率具有物质基础，这是人们所公认的。一定的生产设备和原材料，一定的技术条件和具有一定技术水平的工作者，以及一定的社会基础设施（如交通运输设施、通讯设施、供水供热设施、能源供应设施等），构成一定的效率的物质基础。效率的物质基础的重要性已经得到了公认。不设法改善效率的物质基础，效率的提高会遇到障碍。

但是，效率是不是仅有一个基础，即物质基础呢？是不是只要具有效率的物质基础，效率就必定增长呢？从以上的论述中已经可以清楚地了解到，单有效率物质基础是不足以充分说明效率增减的原因的。我们必须讨论效率的另一个基础，即道德基础。生产设备和原材料由人来使用，技术条件的发挥同人的素质有关，也同人的积极性、创造性有关。即以作为效率的物质基础的组成部分之一的具有一定技术水平的工作者来说，这些工作者是活生生的人，而不是机器人。他们有思想，有主张，有感情，也有目标。对待生活，他们可能持这种或那种态度；对待工作，他们可能热情，也可能冷漠。加之，他们一个个都不是孤立的人，他们同其他人交往，构成各种各样的人际关系，而这些关系的协调程度是不一样的。这一切成为效率的另一个基础，可以称之为效率的道德基础。

效率的物质基础和道德基础是并存的。单单用物质基础或道德基础都解释不了效率的增长或下降。两家企业，假定物质技术条件完全相同，生产出来的产品也相同，并且都被消费者所需要，但为什么其中一家企业的效率高而另一家企业的效率低？效率的道德基础的比较分析将会提供答案。

因此，正确的说法应当是：效率具有双重基础，即物质基础与道德基础。

在任何时代，小到一个家庭、一家企业、一座村庄，大到整个社会、整个国家，都需要有一种精神上的凝聚力、一种以道德规范为准则

的行为引导、一种伦理观念。这些同科学技术是可以并行不悖的，而且也互不干扰。在处理人际关系时，凡是科学技术无能为力之处，就需要有道德力量来调整。人际关系融洽了，个人的积极性、创造性发挥了，效率自然会增长。这表明效率确实有自己的道德基础。

效率有双重基础，已如上述。接着要讨论的是：效率的物质基础是变化的。因为经济发展了，技术进步了，工艺改进了，使用生产资料的工作者的知识也更新了，效率的物质基础肯定发生变化，而且这种变化是不间断的。那么，效率的道德基础是不是也这样呢？难道会有一成不变的道德原则作为效率的道德基础吗？再如，既然效率具有物质基础与道德基础这样两个基础，物质基础是不断变化的，难道效率的道德基础就不会随之变化吗？如果说效率的道德基础是变化的，那么这种变化是主动的变化还是适应性的变化？所谓主动的变化，是指构成效率的道德基础的那些道德规范、行为守则、评价标准等等自身发生了变化，从而导致了效率的道德基础的变化。所谓适应性的变化，是指适应于效率的物质基础的变化而引起的效率的道德基础的变化。当然，主动变化与适应性变化有时是很难分开的。效率的道德基础的变化可能既有主动变化，又有适应性变化，二者往往交织在一起。

接着，让我们考察这样一个问题：超常规的效率究竟来自何处？物质基础通常提供的是常规效率，道德基础则不仅保证常规效率的产生，而且还能提供超常规效率。

历史上移民社会的超常规效率，一直是学术界感兴趣的课题。在中国，中原战乱期间，流民纷纷南下，在广东、福建一带披荆斩棘，排水造田，改变了当地荒芜的面貌。在西欧，从12世纪起，移民们就开始在尼德兰北部从事垦荒，兴修水利，发展农牧业。这些移民所表现出来的高效率，是超常规的。工具简陋，人力单薄，环境艰苦，为什么会涌现超常规的效率呢？在移民迁移过程中，甚至在移民社会形成后的较长时期内，既没有市场调节，也没有政府调节。那么，是什么力量使他们产生如此大的热情，提供如此高的效率呢？这就不能不归因于道德力量的作用、凝聚力的作用、人的创造性的作用。也许可以下这样一个结论：从历史上看，这些移民都是在超常规的客观条件下以超常规的主观力量来完成拓荒任务的，甚至移民们的社会组织也是超常规的。这些可以被看成是人类历史上的一种奇迹。如果没有相应的道德基础，就不可能有超常规的移民社会组织，也不可能有超常规的个人主观力量，从而也就不可能有超常规的效率。

超常规的效率涌现向人们充分显示：效率增长是有潜力的。效率增长潜力的发挥，主要依靠效率的道德基础的存在，依靠道德力量的作用。除了前面提到的以移民社会为例以外，还可以列举一些例证。例如，反侵略战争时期人们种种奋不顾身的行为，在抗御重大自然灾害袭击时人们作出的种种努力，甚至在为了团体（小至一个家庭、一个家族，大至一个宗教组织、一个民族或国家）的目标的实现或团体尊严、荣誉的维护方面，都可以看到道德力量、信念、信仰在激发人们的意志与能力中的作用。超常规的效率正是这样产生的。那么，效率的物质基础是不是也能为效率的超常规作出贡献呢？当然，效率的任何增长总是离不开物质条件的。例如，移民拓荒过程中，无论人的积极性多么大，总需要有一定的生产资料；抗御重大自然灾害时，也需要有一定的物质条件。但要知道，假定没有道德力量、信念、信仰等等在这些场合发生巨大的作用，依靠物质条件，人们仍然只能产生常规的效率，而不可能产生超常规的效率。不仅如此，还可以认为，假定缺少效率的道德基础，即使有效率的物质基础，完全有可能出现不充分的效率、低效率，甚至负效率。

在学术界曾经长期引起争论的所谓效率标准与道德标准之间的冲突问题，通过对超常规效率的分析，这个问题实际上已经得到了解决。所谓效率标准与道德标准之间的冲突，通常是指：对一种经济行为，究竟如何判断，有两个标准。一是效率标准，即以效率是增长还是下降作为标准，效率增长是善，效率下降是恶；二是道德标准，即以伦理上的是非作为标准，符合伦理原则的是善，违背伦理原则的是恶。这两种标准在许多场合是不一致的，因为效率的增长很可能不符合伦理原则，而符合伦理原则的却引起效率的下降。这是一个由来已久的老问题，它之所以难以解决，主要在于伦理上的是非究竟是从什么角度来判断的。

效率标准是经济学的标准，效率判断也是经济学中的判断，而道德标准和道德判断都不是经济学的研究对象或研究任务。但是，当问题涉及道德标准同效率标准之间的关系，以及涉及道德判断同效率判断是否一致时，这些问题便进入了经济学的讨论范围。我在所著《社会主义政治经济学》中，曾对这些问题做过如下的论述：“经济行为的道德判断必须和实践检验统一起来，否则经济中的伦理原则也就会变得难以捉摸……我们可以用‘劳动者的最大利益’作为经济行为的伦理标准。也就是说，凡是符合‘劳动者的最大利益’的，就是‘是’或‘善’；不符合‘劳动者的最大利益’的，就是‘非’或‘恶’。”^[1] 这是可以用来协调效率标准和道德

标准的方法之一。如果采取这种方法，也许可以作为某些经济行为评价的依据。

但不管怎么说，在另一些经济行为的评价中，效率标准和道德标准的冲突仍有可能出现。这也是至今使经济学研究者感到困惑的事情。然而，单就超常规效率的产生来看，我们不难发现，效率标准和道德标准实际上已经一致了。超常规效率的产生，本身就已经表明效率的大大提高，所以效率标准在这里是完全适用的。而超常规效率是怎样产生的呢？正如前面已分析的，这与道德因素的作用直接有关。没有道德因素的作用，在移民社会中，在反侵略战争期间，在重大自然灾害来临时，是会产生超常规的效率的。因此，用道德标准来衡量，可以说明超常规效率的产生在符合效率标准的同时也符合道德标准。

四、效率增长潜力的发挥

在谈到效率的道德基础时，还有一个问题需要作进一步的探讨。这就是：是个人越有自主性，效率的增长潜力越大呢？还是个人的自主性越少，个人越是从属于某个团体、某个组织，甚至从属于整个社会，效率的增长潜力越大？

为什么会提出这个问题？这与效率的道德基础有关。在生产资料的技术性质与生产的客观条件为既定的前提下，在个人作为生产者、工作者的文化技术水平已知时，如果个人有较大的自主性，那也就会有较大的积极性和创造精神，从而效率增长的潜力较大。这就是说，经济中自主的生产者、工作者越多，经济就越具有活力，经济增长的能力就越强，效率增长的潜力就越容易发挥出来。所以，不能认为生产者、工作者的自主性越大对经济越不利。但从另一个角度来看，既然效率的源泉也在于人际关系的协调，在于人同团体或社会的适应，那么在个人从属于某个团体、某个组织，甚至从属于整个社会时，人际关系协调的可能性、人同团体或社会相适应的可能性也就越大。这岂不是表明效率增长的潜力越大吗？

其实，上述问题并不是不易弄清楚的。个人的自主性与个人对某个团体、组织、甚至社会的从属，可以相容并存；不能作出必然非此即彼、必须二者择一的结论。效率的道德基础，既包括了人的积极性、创造性的发挥，也包括了人际关系的协调与适应。只强调前一方面而忽视后一方面；或者，只强调后一方面而忽视前一方面，都是不对的。不能

设想在个人从属于某个团体、组织、甚至社会的同时，个人又缺乏自主性、积极性与创造性的情况下，效率会持续地、而不是暂时地增长。也不能设想在个人虽有较大的自主性，而人际关系不协调、不适应的现象却不断加剧的情况下，效率会持续增长。因此，合理的情况应当是：既有个人的自主性，又有人际关系的协调与适应，二者不可偏废。个人对某个团体、组织、甚至社会的从属，与团体、组织、社会对个人的尊重，是并存的。这种并存保证了效率的不断增长。换言之，个人对团体、组织、社会的从属应当是发自内心的，而不是强加的、被迫的；而要人际关系保持协调，人与人之间应当在各自自重的基础上相互尊重。

现实中的情况正是如此。一个人生活在社会中，他必然是社会的成员。一个人在社会中总会参加一定的团体、组织。家庭是最小的团体，一个人总属于某个家庭。如果他是职工，他会在一家企业中工作，也许他还加入工会。如果他是农民，他所在的那个村，或许有村民自治组织。如果他是城市居民，他从属于他所在的那个社区、街道。如果他是私营企业主或个体工商户，那么他有自己的协会之类的组织。总之，他既是社会的成员，又是某个团体、组织中的一员。为此，他必须尽可能地处理好人际关系，以求得相互协调，彼此适应。但与此同时，作为一个人，他有自己的愿望，自己的要求，自己待人处世的原则。他必须有自主性，然后才有积极性与创造性。换言之，他是有活力的。一个人的自主性，是他处理好人际关系的前提，也是他同团体、组织、社会协调与适应的前提。假定他连一点自主性都没有，纯粹被当作一种工具被别人所使唤、支配，他没有活力，没有生气，处理好人际关系又有什么意义？人际关系的协调、适应等等又何从谈起？这不正说明个人的自主性同人际关系的协调相比，应处于首位吗？

进一步说，社会上有无数个个人，一个团体、组织中有若干个个人。如果这些个人都有自主性，都有活力，都能发挥积极性、创造性，也都能够按自己的目标进行活动并力求同社会的目标、团体的目标相协调、相适应，那么人际关系必定处理得更好，效率的增长会更快，幅度更大。这不正是社会或团体所希望实现的吗？

以上的分析告诉我们，效率的道德基础是客观存在的。但效率的增长既有可能是现实的，也有可能是潜在的，效率增长的潜力不一定能充分发挥出来。要发挥这种潜力，一要靠对人的自主性的尊重，以便人的积极性、创造性能得到发挥；二要靠人际关系的协调，靠人同团体、组织、社会的适应。

The dual foundations of efficiency (1998)

I. The human factor in efficiency studies

In a market economy efficiency is regulated by market, as economic activity is driven by interests. To gain interest, every resource investor must group his production factors in light of supply and demand and prices, and raise his efficiency. Therefore, the mechanism behind efficiency in the market economy is none other than the interest mechanism, or market mechanism, and the investor's goal is to maximize his interest. Thus motivation for interest and the lure of goals are unified insofar as efficiency is concerned.

Where there is government regulation besides market regulation, there will be the impact of government regulation on efficiency. The lure of goals is by and large a manifestation of such impact. Government has its own goals which are multiple rather than single. To meet its goals, the government needs to influence resource investors by way of regulatory means, and compel them to choose investment fields and forms of investment in line with government goals. Efficiency is affected as a result.

Because market regulation works hand in hand with government regulation, efficiency, whether high or low, is under their combined influence. Our study of this issue, however, should not stop just here. We need to probe deeper into it, because those engaged in market activity are individual traders, each being a resource investor. Market participants are subject to government regulation, with the government itself as a resource investor. Market participants as resource investors, are concerned with both their own interests and the impact of government regulatory steps on their interests. This raises the questions: What is on the minds of resource investors? What

factors are affecting their behaviors? Apart from market and government regulation, are there any other factors?

Take, for example, any normal firm. The relations in such a firm fall into two categories: relationships between people and materials, and interpersonal relationships. The relationship between people and materials finds expression mainly in the relationship between the means of production and those who use them. The condition and average quantity of the means of production per worker are basic indicators of a firm's technological level, which in turn determines its efficiency level. The interpersonal relationship is a lot more complicated than the former. It can be broken up into a number of relations such as the relation between the firm's leadership and workers, between members of the leadership, between the leadership and the managerial body, between members of the managerial body and between workers. Some of these interpersonal relations are congenial, others are not. Some interpersonal relations are agreeable under one condition, but disagreeable under another. The agreeability of these interpersonal relations impacts efficiency in ways different from the impact of technology. If the technological level is low, it may be upgraded as a *sine qua non* for efficiency growth by increasing investment, adding new equipment, constructing new factory buildings, putting workers through training, or encouraging them to hone their skills with an increase in efficiency as a result. If interpersonal relations are disagreeable, can reinvestment be effective? How can it send efficiency skyrocketing?

Supposing the technological level of a company is fixed, the human factor – managers and workers included – will become so prominent as to determine the efficiency level. In this human factor, every employee's work hours, cultural attainment and skill adeptness, and how well-defined his work post responsibility is, are observable factors, but there are also unobservable factors. For one thing, people's diligence level is elusive, for it is hard to tell exactly how hardworking every one is. For another, employees are under the effect of a certain level of inertia. Those who are less affected by it are more motivated

and aggressive in work; those affected more by it are lethargic. To what extent they can overcome inertia is another unknown factor. Moreover, efficiency grows when employees' goals match their firm's goals, and drops when their goals are at odds with each other, but whether or not these two kinds of goals match each other and to what extent are anyone's guess. The impact of these unobservable factors on firm efficiency merits careful study, for it is a hard nut to crack for both market and government regulation.

Therefore the study of efficiency needs to go beyond the scope of market and government regulation. This is not to say that market regulation and government regulation mean little to the rise and fall of efficiency. It only shows the limits of their impact, limits that, in particular, can affect our analysis of the sources of efficiency. For instance, in our research on a firm's interpersonal relationships, the impact of unobservable factors such as diligence and inertia on employees should be probed. This shows that work ethics affect human behavior and go on to affect efficiency in many ways. What is the true source of efficiency? It is the human factor. Efficiency hinges on people's motivation and innovativeness, so work ethics should never be overlooked. Efficiency improves greatly when full scope is given to people's potentials, and when they are highly motivated and innovative under the influence of work ethics.

It should be noted that the above analysis is predicated on a given technological level. Technological level, judged from the perspective of the relationship between people and the means of production, is relevant to efficiency level. If the technological level of a country, region, or firm is a lot higher than that of another country, region, or firm, it makes comparing the impact of work ethics very difficult. Only by accurately reading the impact of work ethics on efficiency at a given technological level can such comparison make sense.

II. Efficiency stems from organizational and social cohesion

As illustrated in the previous chapter, the source of efficiency at a given technological level lies in people's motivation and innovativeness. To make the most of such motivation and innovativeness, it is essential to develop rational economic operational mechanisms and agreeable interpersonal relationships.

The cohesion parameter of the agreeability of interpersonal relationship falls into two categories: cohesion of an organization, and cohesion of society. The cohesion of an organization or society hinges on the agreeability of its interpersonal relationships. Cohesion generates efficiency. Organizational cohesion delivers efficiency inside an organization, and social cohesion endows efficiency on society.

The organization in this context refers in general to businesses, institutions, communities, clubs, villages, households and others. Organizations may vary in size, but each has its own cohesion. Organizations may be structurally loose or tight. Tight structure is not synonymous with high cohesion, while loose structure does not always mean a lack of cohesion. The structural looseness or tightness of an organization is irrelevant to cohesion or the lack of it, which is directly relevant to the agreeability of the relationship between the organization and its members and between its members. If the members of an organization are given to scheming against each other or are in discord with their leaders, this organization will be devoid of cohesion no matter how close-knit its organizational structure is. By contrast, if members of a community are in an amicable relationship with one another and with their leaders and work with one mind to make progress, such a community will enjoy cohesion, and a strong cohesion at that, even if it is loosely organized.

A firm consists of workers and managers. Its cohesion is one of many kinds of organizational cohesion. To foster corporate culture helps cultivate corporate cohesion. With strong cohesion, a firm can not only improve its efficiency steadily but also overcome difficulties and tide over adversities. There is no doubt about it.

Some questions come to mind at this point of this study: How does society's cohesion come about? What is the relationship between

organizational cohesion and social cohesion? How should such a relationship be handled to achieve both organizational and social cohesion?

Social cohesion is the force that rallies members of society together as one to achieve common goals. There is no lack of outstanding examples in this regard, such as the concerted effort, hard work, and self-sacrifices of people rallying against foreign invaders or natural disasters. Under such unusual circumstances, this kind of cohesion can generate high social efficiency and work wonders. Under normal circumstances, a society with harmonious interpersonal relationship and strong cohesion invariably enjoys an agreeable social environment that is a boon to the growth of efficiency.

As to the relationship between organizational cohesion and social cohesion, they may either promote or circumscribe each other, depending on what the organization's nature and goals are. There are all sorts of organizations in society that differ in nature and pursue different goals. If separatism is a political organization's overriding call, then the more cohesive it is, the more destructive it becomes to society. Of course this is an extreme example that can be excluded from my discussion. Generally speaking, an organization and society can get along if they have compatible goals, and consequently the cohesion of the organization and that of society are complementary. Below let me take firms for example again.

In a market economy, maximization of interest is the primary goal of firms that function as commodity producers making their own business decisions and being accountable for their profits and losses. To meet that goal, they must beat competition by constantly adjusting their production and business directions, improving their management and enhancing their internal cohesion. Competition on a level playing field is essential to the proper handling of the relationship between firms, in which their shared interest lies in the belief that the more stable society is and the more the economy thrives, the better off the firms become. The rise of one firm does not necessarily mean the downfall of another.

In an environment of social stability and economic prosperity, every firm has the opportunity to grow and convert their good intentions into reality. However, even in such a friendly environment there are still firms that have to downscale production, go bankrupt, or be annexed due to decision-making errors or failure to keep pace with technological development. These occurrences are a normal reflection of the regrouping of resources. As long as such regrouping proves salubrious to efficiency of the economy as a whole and brings new opportunities to investors, the common interest of the business world will not be hurt by the aforementioned production cuts, bankruptcies, or mergers.

Organizational cohesion and social cohesion, however, are not the same thing. Whether the former can be unified with the latter, or whether enhanced organizational cohesion can strengthen social cohesion, is determined by the substance and efficacy of advancement in culture – corporate culture, community culture, campus culture, etc. – as a major element in the promotion of organizational cohesion. Let us take the firm again. If a firm's corporate culture emphasizes not only its own goals but also the goals of society, attaches importance not only to its own benefits, but to the benefits of the society as a whole, and aims not only at cultivating its own corporate spirit but also at fostering fine social mores, the achievement of such a corporate culture will be reflected in the improved cohesion of both the firm and society. The unification of corporate and social cohesion precisely embodies the social function and value of a sound corporate culture. Conversely, if a firm is bent on pursuing its own corporate and workforce interests at the expense of its corporate culture's social function and value, it will have no way of coordinating its cohesion with that of society, nor can its improved corporate cohesion result in improved social cohesion. This point should not be overlooked when analyzing the sources of efficiency.

A more nuanced understanding of the issue enables us to see that growth in national wealth is connected with society's economic prosperity and development in culture and education. A prosperous

society with advanced culture and education is better endowed to promote cultural development and coordinate its own cohesion with organizational cohesion. Moral values also play an outstanding role in enhancing social and organizational cohesion, a role that cannot be superseded by market or government regulation. This is because only moral values can demonstrate to members of organizations that their own organizations' goals are in line with those of society and that the interests of individuals and organizations are, fundamentally speaking, compatible with the interests of society. That realization enables them to identify themselves completely with society's goals, thereby bolstering both organizational and social cohesion. Both organizational and social cohesion can be steadily enhanced under the impact of moral force.

Hence my conclusion: In the past, researchers of the source of efficiency have often stressed economic and technological factors to the neglect of noneconomic and nontechnological factors, emphasized the impact of interests at the expense of public goals and a sense of social responsibility, and reiterated material values regardless of human values. Under the sway of such outdated ideological and methodological approaches, researchers could neither probe into the deep-seated issue concerning changes in efficiency, nor explain that the human factor and interpersonal relations – rather than the material factor and the relationship between people and materials – are the true fountainhead for efficiency. Organizational cohesion generates organizational efficiency, and social cohesion brings forth social efficiency. This being the case, the source of efficiency and its enhancement lies not in market mechanisms or government interventional behavior, but in the force of morality and its impact on people.

III. Where super efficiency comes from

It is generally acknowledged that efficiency rests on a material foundation. Such a foundation encompasses production equipment, raw materials, technological conditions, workers with a certain level

of technical proficiency, and social infrastructure (including means of communications and transportation, telecommunications facilities, water and heat and energy utilities). The importance of the material foundation is common knowledge. Efficiency suffers when the material foundation stops improving itself.

Does efficiency have only one foundation, the material foundation? Is it true that where there is a material foundation, there will be growing efficiency? As noted previously, a material foundation alone is not enough to account for the ebb and flow in efficiency. Due consideration must be given to the other foundation – the moral foundation. Manufacturing equipment and raw materials are used by people. The efficacy of technology cannot operate without man's proficiency, motivation and creativity. In other words, workers with a certain level of proficiency are an integral part of the material foundation of efficiency. However, workers are not robots. They are human beings who think, feel, and pursue ideas and goals. They may take one attitude or another towards life, and be either devoted to or uncaring about work. In addition, they are not isolated, but interact with one another to form all sorts of interpersonal relations with varying degrees of coordination. All this constitutes the other foundation for efficiency, the moral foundation.

The material and moral foundations of efficiency exist alongside each other. Neither of them can stand alone to account for a rise or fall in efficiency. Let us imagine that two firms have the same material and technological conditions and make the same product needed by consumers: How is it that one firm is more efficient than the other? The answer can be found by comparing the differences in the moral foundation of their efficiency.

Thus it makes sense to say that efficiency has dual foundations, material and moral.

Organizations – as small as families, companies or villages or as large as communities or nations – cannot survive without spiritual cohesion, norms of conduct, and moral values in the same way as they cannot dispense with science and technology. In handling

interpersonal relations, morality comes to assist when and where science and technology are helpless. Once interpersonal relations are finely tuned, once full scope is given to people's initiative and creativity, efficiency grows as a matter of course. This shows that efficiency does indeed have a moral foundation.

Efficiency's material foundation changes constantly with economic growth, technological advancement, and the renewal of knowledge on the part of those who use the means of production. Moreover, its changes are unstoppable. Does efficiency's moral foundation ever stop changing itself? Is there any unalterable moral principle that forms this foundation? Given that the material foundation is ever-changing, can the moral foundation stay intact alongside it? If the answer is in the positive, does the moral foundation ever change on its own or only in unison with circumstances? If it changes on its own, this refers to changes in moral values, rules of conduct, and evaluation criteria themselves. If it changes in unison with circumstances, this means that the moral foundation can adapt itself to the material foundation. However, it is difficult to distinguish between these two kinds of changes, which, in fact, are often intertwined with each other.

Now consider this question: Where does super efficiency come from? While the material foundation usually offers conventional efficiency, the moral foundation not only ensures conventional efficiency but also provides super efficiency.

The super efficiency of the immigrant societies of yore has been a topic of perennial academic interest. During the millennium-long war and turmoil following the demise of the Han dynasty (206 BC-220 AD), immigrants from central China hacked their way through brambles and throngs and settled in what are today's Guangdong and Fujian provinces, where they dredged rivers and converted barren land into fertile farmland. Beginning from the 12th century, immigrants into the western European region now known as the Netherlands reclaimed the land, built water conservancy projects and developed farming and animal husbandry. What these immigrants

embodied was precisely a kind of super efficiency. How did they achieve such efficiency with medieval tools and limited manpower in harsh environments? There was neither market force nor government intervention during the process of immigration and the rise of the immigrant society, so what had motivated these people to toil with such high efficiency? This can only be attributed to the magical forces of morality, cohesion, and creativity. We may as well say that given the historical circumstances, these immigrants performed pioneering feats with extraordinary strength under extraordinary conditions. Even their social organizations were extraordinary. These factors combined to work miracles in human history. In the absence of a commensurate moral foundation, there could not have been such extraordinary immigrant social organizations, the immigrants could not have mustered such extraordinary strength as individuals, and such super efficiency would have been out of the question.

The achievement of super efficiency fully testifies to what potential efficiency growth can do. Such potentials can be tapped by relying on the moral foundation of efficiency. Examples in this regard are aplenty, besides the aforementioned immigrant societies. The role of morality, confidence and faith in stimulating human willpower and abilities can be seen in people's death-defying behaviors in resistance against foreign invaders, in combating natural disasters, and even in the effort of members of an organization – as small as a family or clan and as large as a nation or region – in attaining their goals or in safeguarding dignity and honor. Super efficiency arises precisely from among these people. Can the material foundation also contribute to the rise of super efficiency? Efficiency can certainly not do without its material condition. For instance, our forefathers would not have accomplished their pioneering cause without certain means of production in their possession no matter how motivated they were. We cannot combat natural adversities empty-handed. However, without the tremendous impact of morality and faith under these circumstances, material conditions can only yield mediocre efficiency. We must admit to ourselves that in the absence of a moral foundation, our efficiency may still be inadequate, low or even negative despite

the provision of an efficient material foundation.

The longstanding controversy about the conflict between the efficiency standard and the moral standard is settled through our analysis of super efficiency. The conflict between these two standards is about judging economic behavior with two criteria. One is a standard of efficiency, meaning that an economic behavior is good when it boosts efficiency, and bad when it reduces efficiency. The other is a standard of morality: Efficiency is good if it accords with the moral principle and evil if it violates it. These two standards are often in discord because rising efficiency may run counter to the moral principle, whereas efficiency that accords with the moral principle may fall. This longstanding issue cannot be settled mainly because of uncertainty about which standard to use in judging the moral good or evil of efficiency.

The efficiency standard is an issue in economics, and so is efficiency judgment. However, neither the moral standard nor moral judgment is a subject or research task for any economists. Both belong in the realm of economics where and when an economic issue touches upon the relationship between moral standard and efficiency standard, and the need arises to determine whether or not a moral judgment corresponds with an efficiency judgment. In my *Socialist Political Economics* I put it this way, "The moral judgment of economic behavior should be tested in practice, otherwise the moral principle for the economy could become elusive.... We may as well regard 'maximum workforce interests' as the moral standard for economic behavior. That is to say, an economic behavior is sound when it complies with 'maximum workforce interests', and is evil when it does not."^[2] This approach to coordinating efficiency and moral standards may serve to support my judgment of certain economic behaviors.

After all, the conflict between efficiency and moral standards may still occur in evaluating some other economic behaviors, to the bewilderment of the economists of today. However, the emergence of super efficiency testifies to the accord between both standards. Extraordinary efficiency itself is evidence of an impressive boost in

efficiency, and therefore, the efficiency standard is entirely applicable here. How, then, does super efficiency come about? It is directly related to the role of morality, as I have stated before. Without morality, super efficiency would have been out of the question in an immigrant society or in combating foreign invaders or major natural catastrophes. Thus super efficiency that measures up to the efficiency standard is also up to the moral standard.

IV. Tapping potentials in efficiency growth

The mention of the moral foundation for efficiency brings the following question to mind: Under which condition is the potential greater for efficiency growth – the more the initiative is taken into the hands of individuals, or the less the initiative is taken into the hands of individuals while the more closely individuals are attached to their organization or society?

Why should I raise such a question? It has something to do with the moral foundation of efficiency. Given the technical nature of the means of production, given objective production conditions, and provided the cultural and technical proficiency of individuals as producers is fixed, individuals with more freedom of choice may become highly motivated and innovative, and thus have greater potential for efficiency improvement. That is to say, the larger the number is producers and workers with freedom of choice in economic activity, the more dynamic the economy becomes, the better the economy's capacity for growth is, and the easier the potentials of efficiency growth are to be tapped. Therefore, it is wrong to believe that the more autonomy is allowed for producers and workers, the more detrimental it is to the economy. On the other hand, however, given that the source of efficiency also lies in harmonious interpersonal relations and in people's compatibility with their organizations or society, it is more likely to coordinate these relations and enable individuals to adapt themselves to their organizations and society if they are subordinate to those organizations or society as a whole. Does this also point to greater potential for efficiency growth?

As a matter of fact, this question is not unanswerable. Individual autonomy and subordination to a particular organization or society can be mutually compatible instead of mutually exclusive. The moral foundation for efficiency entails not just making the most of people's enthusiasm and creativity; it also involves coordinating and harmonizing interpersonal relations. It is senseless to emphasize the former to the neglect of the latter, or vice versa. Nor can we believe that efficiency can grow continuously rather than temporarily when individuals are deprived of autonomy and lack enthusiasm and creativity as members of a particular organization or society, or when individuals enjoy a lot of autonomy while interpersonal relations are growing increasingly more inordinate and incompatible. Thus it is ideal to have both individual autonomy and coordinated and compatible interpersonal relations, with neither aspect neglected. This being the case, there should be individuals subordinate to organizations and society on the one side, and organizations and society holding individuals in due respect on the other – the coexistence of both conditions can keep efficiency growing steadily. In other words, individuals' subordination to organizations and society should be genuine and voluntary. Instead of being imposed upon them, their subordination should be conditioned by coordinated interpersonal relations and mutual respect, but at the same time, individuals should also conduct themselves with dignity and self-respect.

That should be the way it is in reality. People living in society are inevitably its members. A member of society invariably participates in certain organizations or institutions. The family is the smallest cell of society, and everyone belongs to a particular family. If a man is a worker, he works in a factory, where he may also be a trade union member. If he is a farmer, he may become a member of a villagers' self-governing organization, if such an organization ever exists. If he is an urban dweller, he belongs to the local community or neighborhood. If he is a private or self-employed business owner, he must belong to a certain association in which he handles interpersonal relations the best he can in order to live and work in harmony with fellow

members. Meanwhile, as an individual, he should have his own wishes and demands, follow his own principles in dealing with people and daily life, and take the initiative into his own hands to stay motivated and innovative. In all, he should be a dynamic human being. Self-dependence is the prerequisite for someone to be in good interpersonal relations and get along with his organization and society. Good personal and interpersonal relations can mean nothing, and there will be no coordination and compatibility to speak of, if people are deprived of self-dependence and personal initiative. Doesn't this mean that personal initiative should be put in the first place in comparison with harmonious interpersonal relationships?

Society consists of numerous individuals, and an organization or institution comprises a certain number of individuals. If these individuals enjoy self-dependence, are motivated, energetic, and innovative, and have the latitude to pursue their own goals while adapting themselves to organizational and social goals, interpersonal relations can be better handled, and efficiency can grow faster and by bigger margins. Isn't this exactly what society and organizations hope for?

Based on the above study, we know that the moral foundation of efficiency is an objective reality, but efficiency growth may either be real or potential, and the potential in efficiency growth is not necessarily tapped to capacity. To give full scope to such potential, we have to do two things: first, to respect people's self-dependence and give full scope to their motivation and innovativeness; and second, to coordinate interpersonal relations and adapt individuals to their organizations and society.

后记

一、生平简述

（一）求学（1955年以前）

厉以宁原籍江苏仪征，1930年11月22日出生于南京，是家中的长子。在他4岁那年，全家从南京迁到了上海；6岁时在距家不远的上海中西女中第二附小（现建襄小学）读书，从小就是一名勤奋好学的学生。

小学毕业后，他考进了上海南洋模范中学。太平洋战争爆发后，日军占领了上海租界，全家逃难到湖南沅陵。厉以宁转入由长沙迁到沅陵办学的雅礼中学。抗战胜利后不久，厉以宁回到南京，在南京金陵大学附中一直读到高中毕业。

在中学时代，厉以宁深受化学老师的影响，认为工业的落后是中国贫穷的根源，从而立下了实业救国的志向。1948年底，在烽火连天的战争中，厉以宁以优异成绩从高中毕业，并被保送进入金陵大学。一心想以实业报国的厉以宁选择了化学工程系。人民解放战争的胜利改变了厉以宁一生的命运。新中国的成立，使厉以宁对中国的前途和命运改变了看法，他对中国繁荣富强的希望之火重新点燃。厉以宁决定投身于新中国建设事业，在湖南参加了工作，在湖南沅陵教育用品消费合作社担任会计。

厉以宁学生时代 Li Yining in his school days

厉以宁在工作中发现自己的知识相当贫乏。因此，1951年，他毅然决定离职参加高考。1951年7月，厉以宁在长沙应试，8月底接到了北京大学的录取通知书，成为北京大学经济系的一名学生。

在北京大学学习期间，厉以宁忘我地学习，他十分珍惜这四年的学习时光。大学四年的八个寒暑假，他将全部时间都留在了北大图书馆，从未回过家。平时的正常学习时间里，他比其他同学更加勤奋。在别人刚刚起床、准备投入新一天的学习时，他往往已在晨曦里完成了大量而充实的阅读工作。课堂上的厉以宁，敏锐的目光一直紧紧地追随着授课老师，他往往能比别人更早、更透彻地理解老师的讲授，并提出一些颇有见地的问题。四年里的1000多个日日夜夜，厉以宁从未放松过学习。

博闻强记与发奋努力结出了丰硕的成果，年轻的厉以宁很快就在北大脱颖而出，成为众所瞩目的尖子学生。当时的北大经济系代理系主任陈振汉教授对他的评语是：“成绩优异，名列前茅”。1952年7月，刚刚完成一年学业的厉以宁就发表了题为《波兰经济的新面貌》的论文，翻

译了《赫尔岑和奥加略夫的经济观点》等专著。正所谓名师出高徒，厉以宁在大学时期的学习和研究，与当时北大经济系强大的师资力量密不可分。最早引导厉以宁钻研西方经济理论的是罗志如教授。他不仅在课堂上认真授课，而且在课下把英文书刊上的某些文章借给厉以宁阅读，使他眼界大开。陈岱孙教授毕业于美国哈佛大学，作为经济学说史研究者，他在潜移默化中影响着厉以宁。对厉以宁影响较大的老师还有胡代光、周炳琳、赵迺传、陈振汉和徐毓枏等教授。

（二）韬光养晦（1955-1980年）

1955年，厉以宁毕业留校任教。从1955年至1980年这一段时期，正是他潜心阅读、学习、思考和研究时期。20世纪50年代末至60年代初，厉以宁翻译了共约200多万字的经济学著作，还主办了30多期共100多万字的《国外经济学动态》，其中近90%的稿件是由厉以宁一人编写的。他还阅读了不少西方经济学专著，对凯恩斯、哈耶克、熊彼特和希克斯的学术思想非常熟悉。另外，他还是国内研究西方经济学非均衡理论的第一人。在如此深厚的理论基础的支撑下，厉以宁厚积薄发，于20世纪70年代末80年代初一跃成为中国学术界引人注目的中年学者。

在这25年的时期里，厉以宁的研究也多次被打断。1958年，在大跃进浪潮中，厉以宁随北大教师队伍来到京西地区，整整劳动了一年。1964年和1965年，厉以宁再次被迫放下书本，到农村参加四清运动；1964年秋到1965年夏，在湖北江陵农村；1965年秋到1966年6月初，即“文化大革命”开始，到北京朝阳区高碑店。1969年10月，厉以宁又跟随北大教师队伍到江西鲤鱼洲农场劳动，直到1972年才回到学校。但此后4年左右，厉以宁仍一再被派往农村，边劳动，边接受再教育。直到1976年11月初，也就是“四人帮”被粉碎后一个月，才在学校里安定下来。

厉以宁夫妇及女儿厉放在鲤鱼洲 With wife and daughter on Liyuzhou Farm

从1957年“反右”算起，到1976年为止，整整20年，厉以宁度过了心灵和肉体双重折磨的年代。他成熟了，是在不停的磨难中趋于成熟的。他上山下乡，亲历了国民经济遭受的严重破坏，目睹了广大农民的贫苦。他那颗充满理想主义信念的心受到了深深的震撼。他对传统社会主义模式的信念一次又一次遭到现实的无情打击，他不仅对这一传统模式产生怀疑，还进而从根本上予以否定。正是在这段时间里，厉以宁的经济观点发生了剧烈的变化，他决心自己去探寻一条研究社会主义经济的新路。

（三）大器晚成（1980年至今）

经过20多年的韬光养晦，厉以宁厚积而薄发，其经济学研究结出了累累硕果。从1979年起，他陆续向读者展示了自己对西方经济学20多年的研究成果，包括《论加尔布雷思的制度经济学说》、《现代西方经济学概论》、《宏观经济学的产生和发展》等一系列著作。这些著作在当时中国经济学学术界掀起了巨大的波浪。重返讲台之后，厉以宁马上成为北京大学最受欢迎的老师之一。他在校园里的课堂上，100人的教

室，每次都能挤满200多人。讲课期间，掌声雷动。很快地，厉以宁在全国范围内名气大增，成为众人瞩目的经济学大师。

厉以宁的学术成就与中国改革开放的历史大潮息息相关。1980年以前，中国实行计划经济，在改革开放后逐步向社会主义市场经济转变。如此庞大的经济体，其转型过程充满了未知和疑惑。厉以宁以其近30年对西方经济学的理论积淀，运用现代的经济理论，加上其对中国现实经济的深刻理解，提出了一系列的改革主张。由于他提出并推动了1980年代的“股份制改革”，而被称为“厉股份”。

在这个时期，厉以宁还一手创办了北京大学光华管理学院。光华管理学院前身是1985年北京大学的经济管理系和管理科学中心。1993年，厉以宁带领多名老师，在此基础上成立北京大学工商管理学院。1994年，在厉以宁的推动下，北京大学与光华教育基金会签定合作办学协议，工商管理学院改名为光华管理学院。管理学院自成立起，厉以宁长期担任院长，直至2005年。目前，光华管理学院已经成为中国最好的商学院之一。厉以宁还长期研究中国特有的“城乡二元结构”，推动民营经济的健康发展，关注中国的地区发展差异和帮助贫困地区的发展。

2010年，厉以宁已满80岁。自1980年以来，他30年来一直活跃于中国经济学学术界，是学生喜爱的老师，是受社会敬重的教授，也是对经济政策具有一定影响力的经济学家。关于他的学术思想和对中国经济改革开放的贡献，后文再做详细介绍，这里不再赘述。

（四）家庭生活

中国古代传说有一种鸟，叫鹣，雄有左翼，雌有右翼，比翼双飞。于是，人们也希望自己拥有相扶到永远的另一半，“鹣鹣情深”就成了人们对恩爱夫妻的赞美。厉以宁和他夫人何玉春，就是这样一对夫妻，患难与共，恩爱有加。

厉以宁和何玉春第一次相遇于20世纪40年代的湖南沅陵。1951年厉以宁考取了北京大学，1953年何玉春考取了华中工学院，两人天各一方。直至1957年2月，何玉春来京探亲，住在其兄何重义家中；厉以宁由北大来清华看望老同学何重义。两人不期而遇，从此结下一世情缘。

厉以宁何玉春结婚照 The wedding photo

1958年2月，正是农历除夕，厉以宁与何玉春喜结连理。新房就在北京海淀的三小间简陋平房，总面积不过20平方米。外祖母、母亲、弟弟都与他们住在一起。家具除了床以外，只有一张饭桌、四个板凳、一个碗柜、一个脸盆架。然而，简陋的小屋中却充溢着浓浓的甜蜜和欢笑。

两人结婚照颇具时代特点。厉以宁一身中山装，戴着眼镜，白净瘦削，显然一文静书生；何玉春穿着自织的花毛衣，两条长辫子挽上两边，一边扎一朵蝴蝶结，面带微笑。新婚后，他们在一起生活的时间很短，两人一个赴北京斋堂乡劳动，一个去辽宁鞍山上班。此后，在相当长的一段时间内，这对恩爱夫妻如同当时的许多家庭一样，不得不长期两地分居。直到1970年12月，夫妻分居终于熬到了头。经过长达十几年的两地相思苦煎熬之后，何玉春放弃了一切能放弃的（户口、专业、工作等），来到了江西鲤鱼洲，与厉以宁开始了一次真正不再分开的相聚。

到2010年，厉以宁、何玉春已相偕相伴走过了52个春秋。他们的女儿厉放已获得澳大利亚莫纳什大学博士学位，儿子厉伟自北京大学化学系毕业后，就南下广东创业。此时，厉以宁夫妇的幸福生活不仅体现在

儿女长大成人，更体现在事业上的携手共进。在改革开放这个大舞台上，厉以宁充分施展着自己的才华，名气盛大；但在他耀眼的光环后面，是夫人何玉春默默无闻的奉献。何玉春所学并非经济学，她是电气专业的高级工程师，但她却是厉以宁经济学专著的第一读者。厉以宁说：“她在阅读书稿时感到哪里还不够简明，还不易被人们看懂，我就修改，直到她满意为止。所以读者读完我的书，如果感觉到符合深入浅出的要求，那么夫人的功劳占一半。”

二、学术成就

（一）经济史研究

1. 概述

经济史研究，在厉以宁的学术研究中占有重要的位置。1962年，厉以宁第一次登上北大讲坛，讲授的就是外国经济史。在他后来几十年的学术生涯中，包括近30年着力研究中国经济体制改革的理论与实践问题期间，他都从未间断过对经济史、尤其是西方经济史的研究。在一定程度上可以说，厉以宁在经济学方面的建树，也来源于他在经济史方面的功力。《二十世纪的英国经济——“英国病”研究》、《资本主义的起源：比较经济史研究》以及《罗马—拜占庭经济史》等著作，都是厉以宁在经济史方面的集大成之作。

2. 《二十世纪的英国经济——“英国病”研究》

《二十世纪的英国经济——“英国病”研究》出版于1982年，是厉以宁早期经济学学习研究的结晶，也是他学术生涯的一个界碑。

20世纪大英帝国的衰落是世界史上最引人注目的话题之一。在西方一些著作中，学者们往往把大英帝国的衰落与其“世界工厂”地位的丧失等同起来。但是厉以宁对此并不完全认同。他认为，“世界工厂”地位的丧失虽然可以解释英国在世界上相对地位的下降，却解释不了为什么其经济本身陷入停停走走的状态。对于“英国病”，厉以宁给出了自己的诊断。那就是：世界工厂地位的丧失，殖民扩张的结束给国内经济带来的后果，福利国家政策所引起的问题和传统精神对经济的消极作用。在这本书中，厉以宁对英国二十世纪的社会、政治、经济和意识形态进行了综合的考察，得出了不同于前人的结论。这本书，既是中国当代经济学

家撰写的第一部关于20世纪的西方国家的经济史，也是第一部国内学者对英国政府宏观政策进行经济分析的著作。

2002年厉以宁全家合影照 A 2002 picture of all members of the Li family

3. 《资本主义的起源：比较经济史研究》

2003年由商务印书馆出版的《资本主义的起源：比较经济史研究》，从策划到完稿用了二十年的时间，是厉以宁在经济史方面的呕心沥血之作。在二十年的时间中，厉以宁不断地探索、思考和完善资本主义起源的理论体系，并结合他参与中国经济改革设计的经验，最终悟出了破解资本主义起源这道历史难题的全新思路。

按照起源的不同，厉以宁将资本主义划分为原生型资本主义和非原生型的资本主义。前者是指在本国或本地区的封建社会解体的过程中，由于内部因素的作用产生和发展起来的资本主义。西欧国家大体上属于这一类型。后者是指某种外力冲击了本国或本地区的封建社会，动摇了其统治基础，削弱了其统治力量，在封建社会解体过程中产生和发展起来的资本主义。日本和其他亚洲、非洲、拉丁美洲的一些后发资本主义国家即属于这一类型。那么，为什么资本主义能在一些国家的封建社会

内部产生、发展并最终确立下来，而在其他国家却需要外力的冲击才能确立呢？厉以宁认为，这与封建社会的不同体制有关。封建社会可以划分为刚性体制和弹性体制。在刚性体制下，社会等级制和身份制严格，社会流动不易。在弹性体制下，封建统治者未采用严格的等级制和身份制，容许纵向的和横向的社会流动；权力结构可以发生变化，权力的行使方式也灵活多样，以确保封建制度的存在和延续。在刚性体制下，由于权力结构固定，权力行使方式僵化，所以各权力之间容易出现空隙，便于体制外异己力量滋生长成；再发展壮大形成体制外的权力中心，与体制内的权力中心发生冲突，最终导致封建社会的崩溃和资本主义社会的诞生。而弹性体制下的封建制度，应变能力很强，遇到危机可以自我调整，不易产生体制外的异己力量，从而能够长期存活下来。

西欧封建社会的刚性体制看起来很坚硬、稳定，但实际上像脆弱的铁锅，经不起打击——农奴竭力想摆脱自己不自由的处境而向往城市，因为城市不但给卑贱者提供生存之路，而且提供了可以摆脱对封建主的人生依附关系和争取到平等地位的机会。社会体制越是限制社会的流动，卑贱者和等级低下的人，就越想摆脱这种限制。改变的最直接途径就是反抗。随着社会的发展，城市中聚集的人越来越多，城市的力量越来越大，形成了反对封建主的力量，最终造成了西欧封建社会的覆亡。

此书还对中国弹性的封建体制和非原生型资本主义的产生给出了生动而独到的分析。在整本书中，厉以宁关于制度调整的分析方法不但可以给资本主义的起源一个令人信服的解释，而且可以用来分析资本主义和社会主义的制度调整问题。可以说，它不仅分析了资本主义的起源，而且最终能提炼出社会制度转型和变迁的普遍规律。

4. 《罗马—拜占庭经济史》

《罗马—拜占庭经济史》（上、下编）是厉以宁出版于2006年的一部重要经济史学著作，是厉以宁多年来研究罗马、拜占庭经济史心得的积累，也是一部见解独到、思想深邃的重要史学著作。此书共分上下两编，上编为“从共和到帝制”，时间跨度大约为700多年，即从公元前3世纪罗马共和国盛期到公元476年西罗马帝国灭亡。下编为“东方与西方之间”，时间跨度将近1000年，即从公元476年西罗马帝国灭亡到1461年拜占庭帝国全境被奥斯曼帝国征服。全书时间跨度两千年，纵横数千公里，从不列颠直到阿拉伯海，描述了围绕着地中海东西部的广阔历史画卷，对罗马共和国盛期到拜占庭帝国灭亡期间的社会经济变迁做了论述。在这本书中，厉以宁针对罗马—拜占庭的历史提出了一系列自己的

观点。如，小土地所有者和大土地所有者之间的矛盾和斗争是贯穿罗马社会经济生活的主要线索；罗马共和国的兴盛和罗马帝国的兴盛所依靠的是乡村自耕农和城市工商业者的支持；罗马的帝制并不是古代东方国家的帝制的搬用。罗马帝制初期类似于军事独裁制，同时又保存了罗马共和制的一些因素。只是到了后来才吸收了越来越多的东方专制制度的内容和仪式，形成一种准东方的或半东方的帝制。

西罗马帝国的灭亡是一个影响深远的历史事件。对这一事件的原因，厉以宁既不同意“阶级斗争论”，也不同意“民族斗争论”，更不同意“罗马人素质退化论”。他认为，“任何大国在未经自我毁灭之前是不会为他国所征服的。”西罗马帝国的灭亡要从它自身寻找原因：罗马共和国和罗马帝国的兴盛所依靠的都是乡村中自耕农和城市工商业者的支持，兵源充足、府库充实、经济繁荣、社会基本稳定。但是，安东尼王朝结束以后，长时期内自耕农和工商业者备受打击、剥夺，相继沦于破产、逃亡的困境。兵源枯竭了，府库空虚了，经济萧条了，社会动荡不安，西罗马帝国自己摧毁了赖以生存的社会基础——社会的中产阶级。所以等待它的只有覆亡。

厉以宁认为，近1000年后拜占庭帝国的灭亡则重演了西罗马帝国灭亡的悲剧：拜占庭帝国毁坏了自己赖以生存的基础，即乡村中的小土地所有者和城市中的工商业者，兵源和税源都枯竭了。兵源枯竭后，只能由外族的雇佣兵来充当军队的主力。为了供养这批外族的雇佣兵，又只能加重赋税，迫使城市中的工商业者继续破产、被捕或逃亡，税源就更加枯竭了。

《资本主义的起源》和《罗马—拜占庭经济史》这两部经济史巨著说明，厉以宁对于经济史方面的学术研究，数十年保持了一种高度的热情。正是由于有这种热情，再加上他高超的洞察力，厉以宁才能够在经济史研究方面取得如此巨大的成就。

（二）转型经济学研究

1. 概述

厉以宁关于中国经济转型与经济发展理论的集中体现，是他关于转型经济学的观点。以两类经济非均衡的理论为基础，厉以宁对中国经济的转型问题做了深入的研究，并提出了三个重要的观点。第一，产权改革比价格改革更重要；第二，失业问题比通货膨胀问题更令人担心；第

三，经济增长分析比货币流量分析更有用。在他的转型经济学研究中，厉以宁还系统分析了经济转型过程中的政府调节、社会协调发展以及观念更新等许多重要的问题。

2. 《非均衡的中国经济》

在《非均衡的中国经济》一书中，厉以宁深入阐述了非均衡理论，又以非均衡理论为基础，分析了中国的经济现状，继而提出了中国经济改革的方略。

在西方非均衡理论的基础上，厉以宁将经济中的非均衡区分为两类。第一类经济非均衡是指：市场不完善、价格不灵活、超额需求或超额供给都存在、需求约束或供给约束也都存在，但参加市场活动的微观经济单位是自主经营、自负盈亏的独立商品生产者，它们有投资机会和经营方式的自由选择权，自行承担投资风险和经营风险。第二类非均衡是指：市场不完善、价格不灵活、超额需求和超额供给都存在、需求约束或供给约束也都存在，但参加市场活动的微观经济单位并非自主经营、自负盈亏的独立商品生产者，缺乏自由选择投资机会和经营方式的自主权，也不自行承担投资风险和经营风险。微观经济单位没有摆脱行政机构附属物的地位。厉以宁认为，资本主义经济中所出现的非均衡属于第一类，而社会主义经济中的企业由于没有摆脱行政机构附属物的地位，因此属于第二类非均衡。因此，中国的经济体制改革应当以所有制改革，即产权改革为主线，使企业从缺乏活力转为具有活力，转为自主经营和自负盈亏，以便使中国经济由第二类非均衡状态过渡到第一类非均衡状态；然后继续完善市场，使中国经济由第一类非均衡状态逐渐向均衡状态靠拢。

厉以宁有关中国经济改革主线的论述，通过股份制改革重新构造微观经济基础的论述，以股份制为主要形式的新公有制的论述，以及有关资本市场的论述，都是从他的两类非均衡理论出发的。

3. 双覆盖论：社会主义计划与市场

在1986年出版的《社会主义政治经济学》一书中，厉以宁系统阐述了他的两次调节论：一种调节是微观经济调节机制，实质上就是市场机制的调节；一种调节是宏观经济调节机制，实质上就是政府对宏观经济的调节。厉以宁指出，政府的经济调节对于消除由宏观、微观经济的不协调而引起的总量和结构失衡，有重大的意义。它能够保证国民经济的正常运行，使经济和社会发展达到预定目标。厉以宁将并存着的市场机

制和政府调节称为社会主义经济中的二元机制，市场调节是第一次调节，政府调节是第二次调节，即高层次的调节。政府对资源配置进行调节的结果，必然使政府调节的作用通过市场供求关系的相应变化而在全社会经济的各个方面表现出来。从这个意义上讲，政府调节是覆盖于全社会的，而且政府调节对全社会的覆盖是一种再覆盖，即覆盖于市场调节之上的覆盖。作为第一次调节的市场调节是对社会经济的第一次覆盖，作为第二次调节的政府调节对社会经济的覆盖是第二次覆盖，也是第二个层次的覆盖。这就是厉以宁由早期的“第二次调节论”、“两次调节论”逐步演变而成的“双覆盖论”。

4. 股份制：所有制改革的目标模式

自20世纪80年代以来，中国经济学界对中国的经济体制改革一直存在两种思路：“价格改革主线论”和“企业改革主线论”。厉以宁是后一种改革思路的坚定支持者。他认为，中国经济的非均衡属于第二类非均衡。在这种经济中，市场调节取得成效的两个条件——完善的市场环境和有活力的微观经济单位——都不具备，根本问题在于微观层面，即企业没有摆脱行政机构附属的地位。这一分析充分说明了经济体制改革、尤其是激发企业活力的改革，对经济发展具有迫切的意义。中国建设现代市场经济体制的核心问题，是产权制度的重新构造与市场主体行为的规范化。

厉以宁进而认为，进行企业制度的重新构造、明确财产关系的根本出路在于对企业实行所有权与经营权分离的股份制，并在此基础上完善所有制改革。他指出，所有制改革不是将公有制改为私有制，而是突破传统的全民所有制形式，把传统的公有制改造成为新型的公有制。他认为，20世纪80年代中国农村经济体制改革给人们的最大启示是：农村活力的源泉来自所有制改革，即家庭联产承包责任制的推广。城市的所有制改革则需要以建立更多的股份制企业为基础，以重新构造经济运行的微观基础。

（三）经济伦理与道德力量

1. 概述

厉以宁一直坚持认为，人的研究，是经济学研究的最高层次。离开了对人的研究、对生活质量的研究，经济学会变得没有意义。对经济伦理与道德力量的研究，则是厉以宁经济学人本理论的重要组成部分。

2. 经济伦理问题的探讨

经济学的伦理问题，一直是厉以宁关注的一个重要课题。他在这方面研究心得的集中体现，是出版于1995年的《经济学的伦理问题》一书。在这本书中，厉以宁从社会伦理的角度，讨论了中国由传统计划经济体制向社会主义市场经济体制转轨的过程中经济社会的一些焦点问题，如效率与公平的关系问题、产权交易的问题、失业与通货膨胀、个人消费问题、个人投资问题、经济增长的代价、合理的经济增长率等。厉以宁采用规范经济学的方法，把共同富裕作为社会主义发展的根本性目标，以劳动者的最大利益作为评价经济社会中是非善恶的标准，从伦理和道德的角度，提出了很多精辟的观点。

3. 道德力量在经济中的作用

厉以宁经过长期的思考，认为经济学是研究资源配置及其机制的科学。市场调节和政府调节是两种不同的资源配置方式。此外，还存在第三种调节方式，那就是习惯和道德调节。习惯和道德调节是市场调节与政府调节出现以前唯一起调节作用的经济调节方式，也是市场力量与政府力量达不到的领域内唯一起调节作用的经济调节方式。因此，在中国经济改革与发展中，有必要对市场调节与政府调节以外的道德调节进行研究，并加强道德调节的作用。

在此基础上，厉以宁还研究了效率的基础问题。他认为，效率有两个基础，一个是物质技术基础，一个是道德基础。物质技术基础通常提供的是常规效率，道德基础则不仅保证常规效率的产生，而且还提供超常规效率。效率增长潜力的发挥，主要依靠效率的道德基础的存在，依靠道德力量的作用。

（四）教育经济学

1978年，厉以宁在《社会科学战线》上发表《技术教育与资本主义工业化》一文。从那时起，厉以宁一直将教育经济学作为自己的研究重点。在随后的一系列学术论文的基础上，厉以宁在1984年出版了《教育经济学》一书。该书提出了许多富有开创性的学术观点，是“中国当代第一部教育经济学专著”。

厉以宁阐明了教育在中国经济增长以及经济和社会发展中的作用，阐明了智力投资的经济效果的含义、指标的选择和提高智力投资经济效果的途径。他对教育投资促进劳动生产率的机理进行了全面的剖析，揭

示了教育投资和劳动生产率之间的关系。他指出，教育或智力投资的经济效果可以分为宏观经济效果和微观经济效果，并分别讨论了效果的可计量性。厉以宁还研究了知识转化滞后以及毕业生发展潜力等问题。

三、社会贡献

（一）推动股份制改革

自1986年开始，中国经济学界对中国未来经济体制改革一直存在两种不同的思路。后来人们把两种不同主张分别称为“价格改革主线论”和“企业改革主线论”。厉以宁一直是后一主张的代表。1984年以来，价格改革先行、放开物价曾经成为影响国策的指导思想，但两种主张的争论一直没有停止过。

与“价格改革主线论”者将价格改革放在首位不同，厉以宁认为，在设计中国经济体制改革的总体思路时应该把企业制度的改革放在首位。他的理由是：商品价格以生产要素价格为基础，生产要素价格又以所有权为基础，所以价格说到底市场当事人之间转让所有权的交易条件。没有有效的所有权结构，就不可能有对企业和消费者有效的财产权力关系的约束，也就不可能有真正合理的价格体系。而且我国是短缺经济，存在较多的数量配额的情况下，价格和价格水平的调整对经济恢复均衡的作用是微乎其微的。中国的企业不具有真正商品生产者法人的自由度，放开价格只能加剧短缺条件下的经济混乱，而不能收到二战后西德和日本价格改革带来的效果。因此，厉以宁提出，改革的首要任务是用八年左右时间明确企业产权关系，实现企业的公司化。应把企业经营机制的改革与企业产权关系的改革联系起来，把非规范化的承包与规范化的产权改革联系起来。在八年的时间里，企业改革的重点应逐渐由承包制向股份制过渡，由低层次的经营机制与产权关系的改革向高层次的经营机制与产权关系的改革过渡。

厉以宁的主张随后被采纳，波澜壮阔的股份制改革在全中国推行。1993年11月，中共十四届三中全会通过了《中共中央关于建立社会主义市场经济体制若干问题的决定》，明确指出，我国国有企业的改革方向是建立“适应市场经济和社会化大生产要求的、产权清晰、权责明确、政企分开和管理科学”的现代企业制度，要求通过建立现代企业制度，使企业成为自主经营、自负盈亏、自我发展、自我约束的法人实体和市场竞

争主体。按照厉以宁的思路，中国国企改革逐步明确建立现代企业制度的目标，国有企业战略性改组与国有经济布局调整稳步推进，资本市场从无到有持续健康发展。可以说，中国过去30年取得的经济奇迹，与选择股份制改革的道路是密不可分的。作为“股份制改革”理论的倡导者和实践者，厉以宁对中国股份制改革作出了巨大贡献，被公众以及媒体尊称为“厉股份”。

（二）促进民营经济发展

民营经济这个概念是中国改革开放过程中的一大创造，它包括个体工商户和私营企业在内，但又限于个体工商户和私营企业。自改革开放以来，民营经济从无到有，从小到大，至今已经成为国民经济最重要的力量。

然而，民营经济的发展并不是一帆风顺，尤其是政策方面的问题。各省市根据实践，把民营经济发展的政策问题反映上来，从而引起了全国政协的高度重视。2003年下半年，全国政协经济委员会成立了非公有制经济专题组，厉以宁任专题组组长。专题组到辽宁、广东两省的一些城市进行调研，还在吉林、河北、江苏、浙江、福建等省召开了调研会、座谈会。调研前和调研期间，厉以宁收集到很多民营企业家的反映，表示他们在发展中遇到了一些障碍。厉以宁经过调研发现民营企业家反映的情况是存在的。比如准入限制，民营企业进入的领域还不如外商；政府在融资、税收、土地使用、对外贸易等方面，对民营企业都有不公平的地方；舆论环境对民营经济也不好等等。

2003年年底，以厉以宁为组长的调研组形成了一份报告，经全国政协经济委员会讨论后，由全国政协报送国务院。温家宝总理很重视，在2004年2月作了批示。批示指出：要落实中共十六届三中全会精神，促进非公有制经济发展，似应有一个通盘考虑，着手研究一些重大的政策性问题，最好能够形成一个指导性文件。温家宝让国务院研究室和发改委牵头起草文件。在文件起草过程中，初稿曾拿到全国政协经济委员会讨论，厉以宁和委员会提了一些修改意见。最终，文件在2005年2月出台。2005年2月24日，国务院下发了《关于鼓励支持和引导个体私营等非公有制经济发展的若干意见》（民间称之为“非公经济36条”）。从此，中国民营经济的发展进入了一个新的阶段。“非公经济36条”被社会上认为“是改革开放以来中国最全面、最系统的一部关于促进非公有制经济发展的政策性文件”，其发布实施是中国非公经济发展的一项突破。厉

以宁也因为其推动“非公经济36条”的巨大贡献，被媒体称为“厉民营”。

（三）帮助贫困地区

贫困是人类社会面临的最严峻挑战之一，消除贫困是当今世界共同的课题。中国目前的绝对贫困人口数量仍然庞大。由于对中国1960和1970年代贫困的亲身体验，厉以宁对中国贫困地区的发展倾注了许多心血，不仅持续研究如何促进贫困地区的发展，而且身体力行地以时间、精力和物质支持贫困地区的发展。

厉以宁在贫困地区考察 Visiting an impoverished village

——2005年11月，发起成立了北京大学贫困地区发展研究院，并出任院长；

——2006年3-4月，组织五个调研组，分赴贵州省毕节县、湖南省怀化县和攸县、甘肃省定西县、北京门头沟五种类型的贫困地区进行实地调查；

——2006年5月，发起举办了首届中国贫困地区可持续发展战略论坛（在天津召开）；

——2008年9月，举办了第二届中国贫困地区可持续发展战略论坛（在贵州毕节召开）；

——2004年7月，将日本福冈亚洲文化奖奖金300万日元（合人民币20.05万元）全部捐出，在贵州毕节地区毕节市捐建宗琳小学；

——2006年10月，出资40余万元，在湖南省沅陵县二酉苗族自治县捐建宗琳学校；

——2008年12月，由厉以宁夫人何玉春作画、厉以宁题词，举行义卖，两次共卖得126万元；其中100万元用于山区贫困农民老年白内障治疗，26万元用作捐建山区农村图书室。

……

以上这份纪录并不完整，但已足以展现厉以宁对贫困地区、对弱势群体、对欠发达地区的热忱与奉献。

2004年3月，厉以宁出任中央智力支边小组毕节实验区专家顾问组组长，并为毕节的干部做了脱贫致富的第一次培训。从那时开始，厉以宁开始了扶贫解困的深入实践。此后，他每年去一次贵州毕节，并在当地组织培训讲座。

当前正值我国即将进入第十二个五年规划时期，这是我国根除贫困的关键时期。厉以宁定位了两条研究思路。一方面进行实地考察案例研究，以某一特定地区或者特定群体为对象，提出有针对性的缓解贫困的方案；一方面进行政策理论研究，以扶贫政策本身为研究对象，通过历史数据考察既有政策的实施效果，提出改进方向，使之具有可持续的效果。这就是厉以宁在中国发展的关键时期又一次发出的声音。

四、诗人与经济学家

（一）双重身份

厉以宁不但在经济学研究方面成就卓越，而且在诗词创作方面也有独到的建树。厉以宁从1947年读高中时便开始填词，至今50多年，从未间断。即使在“文化大革命”期间，只要有感触，他就会情不自禁地用诗词写下自己的所思所想。诗词不但以特殊的方式承担了厉以宁对社会、对历史、对经济发展的思考，而且也显示了厉以宁在人文方面的修养。这种修养看似和经济学研究没有关系，但实际上显示了厉以宁丰沛的想象力和敏锐的感受力。他能成为学问大家，与此是密不可分的。

厉以宁的诗作清新自然，丝毫没有矫饰做作之态。他曾在一首七绝中表示，诗词是感情和思想的自然流露，奉命作诗，是不会有好作品的。厉以宁就是怀着这样纯朴的想法在写诗。厉以宁的诗词总是充溢着真情实感，反映的也都是他对现实的观察，很多诗都具有浓郁的感情，并且蕴藏着他的经济学思想以及深刻的人生哲理。

（二）诗词中的经济思想

厉以宁几十年来所写的数百首诗词，绝大多数都是谈个人的生活经历、家庭亲情、师生和同学之谊，以及所到之处的自然风光或人文景观。但是，如果仔细品味，会发现某些诗词也反映了他的经济思想，或者说，他的经济思想也能在这些诗词中有意无意地流露出来。如同上文提到的，厉以宁非常重视道德力量在经济发展中的作用，他有一些诗词，就是反映这个思想的。

1998年，厉以宁在福建龙岩市考察时写下的一首诗，以客家人发展的历史为例，说明了道德调节在社会发展中的作用。客家人的祖先原在中原，历朝动乱时期，以家族为单位陆续南迁到了南方，在蛮荒之地恶劣的自然环境中扎下根来。福建省龙岩市约有一万多座客家的土楼，每座土楼中都有几百户客家人共同生活在一起。厉以宁认为，移民社会之所以能有这种超常的效率，恰恰是由于道德调节的作用。

1980年4-5月，厉以宁参加了中共中央书记处研究室和国家劳动总局联合召开的劳动工资座谈会，讨论经济体制改革问题。在会议期间，厉以宁写了一首七绝，反映了他对经济体制改革的看法。厉以宁曾提出许多关于改革的建议，某些建议在开始时不能被人们所理解，甚至遭到批评。但他始终坚信陈规陋习是迟早要改变的，人不应该计较荣辱得失，而是要让时间来检验一切，让后人评价自己的功过是非。

1981年，改革开放之初，厉以宁到成都参加外国经济学说史研究会首届年会，并到青城山一游。青城山是道教名山，洞穴甚多，都是历代道士炼丹之处。厉以宁在这里填了一首《鹧鸪天》。这首词由古代中国道士的炼丹传统生发开来，说明要想悟道、得到真理，并不能依赖神丹仙药，而往往在于是非一念之间。在这首词中，厉以宁还引申到了治国的理念：改革需要渐进，处理社会问题则重在疏导。在当时的形势下，厉以宁用诗词语言表达了自己的想法：要用“看不见的手”来调节经济，进行社会资源的配置。市场活跃了，人民生活水平提高了，社会自然就

安定了。

厉以宁的题词 An inscription of Li Yining

(三) 诗词中的人生哲理

厉以宁1963年游览北京的潭柘寺时曾写过一首诗，这首诗受到了很多人的喜爱。在这首诗中，厉以宁以潭柘寺中的龙潭水作比喻，指出一个人如果有足够的修养，便可以抵挡外界的干扰。这在中国的传统文化中，也被视为一种重要的修养和智慧。在现实中，我们对于客观的把握常常无能为力，但我们可以通过自身修养来提高适应客观环境的能力。风动不动我把握不了，但我可以心不动。天热不热我无可奈何，但我可以心静自然凉。这是人生的一种境界。

厉以宁在“文革”期间，和周围的许多人一样，被批斗、抄家、长期从事体力劳动，正常的研究工作无法进行。但他总是能抵挡外界的干扰，无论是经济学研究，还是诗词创作，都从未中断。改革开放以来，厉以宁担任的社会职务越来越多，工作日益繁重，社会活动也异常频繁；但他依然能笔耕不辍，不断有新的观点和新的著作问世。这种旺盛的创造力，和他心灵的沉静是分不开的。

厉以宁在题词 Writing a calligraphic inscription

1988年，厉以宁到湖南桃源考察，写了一首咏诗，其中蕴含了深刻的哲理。桃花源在中国古代人的想象中，是一方远离乱世干扰、人人享受平静幸福生活的净土，寄托了饱受战乱之苦的人们一种美好的愿望。厉以宁在这首诗中提到，这种美好的愿望只能是一种愿望，世界上并不存在真正的“世外桃源”。但是，人们的心中却可以有这样一片美好的乐土，只要人心胸宽广、豁达、乐观，便可以随时享受桃源的怡然之美。这就是“心宽无处不桃源”。

哲学的思考是最终极的思考。从这个意义上来说，厉以宁不仅是一位造诣深厚的经济学家，也是一个洞悉世间百态的哲人。

Postscript: a profile of Li Yining

I. Biographical sketch

i. Education (before 1955)

A native of Yizheng, Jiangsu province, Li Yining was born the eldest son of a family in Nanjing on November 22, 1930. When he was four, his family moved to Shanghai. Two years later, he went to the Second Elementary School Affiliated to the McTyeire School (the predecessor of the present-day Jianxiang Primary School), where he began his education as a hardworking student.

Upon graduation from elementary school, he enrolled in the Nan Yang Model High School of Shanghai. When the Japanese army sacked the city's foreign concessions after the Pacific War (1941-1945) broke out, his family fled to Yuanling, Hunan province, where Li resumed his studies in the Yali High School that had just been relocated from Changsha to avoid the war and turmoil. Shortly after the V-day of the War of Resistance against Japan (1937-1945), he returned to Nanjing to complete his high school education in the Affiliated High School of Nanking University.

Under the influence of a high school chemistry teacher, Li Yining set his mind on saving the country through industrialization, believing the root of its poverty lay in its industrial backwardness. Toward the end of 1948, while the War of Liberation (1945-1949) was still raging, Li became one of the students to be exempt from qualification exams on account of his outstanding high school academic records, and admitted to Nanking University. To live out his dream of national salvation, he chose the Department of Chemical Engineering, but victory in the war changed his plans. The founding of the People's

Republic reshaped Li's outlook on China's destiny, and rekindled his hope for national prosperity and strength. Resolved to join in the construction of a new China, he preferred work over college. Thus he became an accountant with the School Stationery and Supplies Cooperative of Yuanling, Hunan province.

In his work Li found himself in dire need of knowledge. Therefore, he quit his job to prepare for college. He sat the college entrance examinations in Changsha in July 1951, and was enrolled in the Department of Economics of Peking University a month later.

Li studied every possible moment during his college days. The eight summer and winter vacations in the four years saw him absorbed in his studies in the university library. On weekdays, he worked harder than others. Usually he had already finished his morning reading by the time his classmates began to get up; in class, he was quick to learn and able to raise insightful questions. That was the way he passed his 1,000 or so university days.

Li's wide learning, retentive memory and unflagging diligence soon shone through, and he became a top student in Peking University. As Professor Chen Zhenhan, acting dean of the Department of Economics, put it in his comment on Li Yining, "Test scores exceptionally high; definitely among the best." In July 1952, barely a year had passed since he entered college, but Li already published his essay "The new face of the Polish economy," and translated *Economic Perspectives of Herzen and Ogarev*, among other works. As the old saying goes, "A great teacher produces a brilliant student." Li owed his achievement largely to the top-notch faculty members of the Department of Economics of Peking University. Professor Luo Zhiru, the first teacher to usher Li into the study of Western economic theory, not only taught him knowledge in class, but also lent him articles copied from English books or periodicals to broaden his vision after class. A Harvard University graduate, Professor Chen Daisun's influence on him as an economics historian was at once subtle and deep. Professors Hu Daiguang, Zhou Binglin, Zhao Naichuan, Chen Zhenhan, and Xu Yuzhan also influenced Li academically in their

respective ways.

ii. Getting through difficult times (1955-1980)

Li Yining joined the Peking University faculty upon graduation in 1955. During the 1955-1980 period, he plunged himself in reading, studying, contemplation and research. From the late 1950s to the early 1960s, the economic works he translated topped two million words, and the 30 issues of the *Foreign Economic Trends* journal he edited amounted to over one million words, 90% of which were compiled by himself. An avid reader of Western works on economics, Li could reel off the academic thoughts of John Maynard Keynes, Friedrich August Hayek, Alois Schumpeter, and John Richard Hicks. He was also the first Chinese economist to delve into the Western theory on economic disequilibrium. Having gained a solid theoretical grounding through years of unremitting study, Li was able to come to the fore as an outstanding middle-aged scholar in Chinese academic circles at the turn of the 1970s.

Li's researches, however, were interrupted repeatedly in this 25-year period of his academic career. During the Great Leap Forward^[1] of 1958, he did manual labor for a full year in west Beijing along with his colleagues. During the 1964-1965 period, 2he was forced to put down his books to join the "Four Clean-ups" Movement^[2] in two places in rural China: Jiangling, Hubei province, from autumn 1964 to spring 1965; and Gaobeidian in Beijing's Chaoyang district from autumn 1965 to early June 1966, when the Cultural Revolution started. In October 1969, Li and other Peking University faculty members went to the Liyuzhou Farm in Jiangxi province, where he worked as a farmer until he returned to the university in 1972. In the four years that followed, Li was frequently dispatched to rural areas, where he did farm work while being "reeducated" by local farmers. It was not until early November 1976, or one month after the gang of four was incarcerated, that he was finally able to settle down in his university.

For two whole decades from the start of the struggle against the

"bourgeois Rightists" in 1957 to the demise of the Cultural Revolution in 1976, Li Yining had his fill of physical and psychological trauma. The continuous trials and tribulations, however, made a mature man out of him. The grave damage done to the national economy by political movements, coupled with the poverty that reigned over the rural population, shocked his idealistic heart to the core, and smashed his belief in the traditional mode of socialism. His economic views changed dramatically, prompting him to seek a new road for the socialist economy.

iii. A great mind matures late (from 1980 onward)

Li Yining's twenty or so years of indefatigable toil in economics finally began to come to full fruition. From 1979 on, he had come up with a constant stream of research results. His *On Galbraith's Institutional Economics*, *A Concise Introduction to Modern Western Economics*, *The Rise and Development of Macroeconomics*, and other works on Western economics caused quite a stir in domestic economic circles the moment they came off the press. He became one of the most acclaimed teachers in Peking University shortly after his return to the lectern. His 100-seat classroom was often packed with twice as many students, and his lectures were invariably interrupted repeatedly by warm applause. His reputation spread in no time, and he eventually gained national attention as a preeminent economist.

Li Yining's academic accomplishments have everything to do with China's historic reform and opening up efforts. China was a planned economy before 1980, but has been in transition to a socialist market economy since the adoption of the policy of reform and opening up to the outside world. The transformation of such a gigantic economy is without doubt filled with uncharted dangers and fraught with uncertainties. Applying modern economic theories distilled from his near three decades of theoretical studies in Western economics, he set forth a series of reform proposals. As the initiator of the "joint-stock reform" that swept across China in the 1980s, he has since been fondly nicknamed "Li the Shareholding Guru."

In 1993, Li Yining masterminded the establishment of the Peking University Business School by merging the Department of Economics and Management and the Center of Management Science that had been established in 1985. In 1994, the Business School was renamed Guanghua School of Management after Peking University concluded, with Li as the driving force behind it, an agreement on cooperative school management with the Kwang-Hua Education Foundation of Hong Kong. Li served as the dean till 2005. Today, Guanghua is one of the best business colleges in China. A solicitous educator, Li has long been studying the peculiarly Chinese "urban-rural dual structure." He does his utmost to promote the healthy development of the private sectors of the national economy. Being attentive to the regional disparity in development, he renders great support for the development of less developed regions.

Li Yining turned 80 in 2010. For the last three decades, he has been preeminent amongst the Chinese economics academia. Loved by his students as a teacher, and held in high esteem by the public as a scholar, he is also an economist whose influence on the nation's economic policies is keenly felt. His academic thoughts and contributions to China's reform and opening up endeavors will be elaborated in a later chapter.

iv. Family life

In Chinese mythology, there was *jian*, a one-winged lovebird. The male sported a left wing, and the female a right one. They were always flying in pairs. This couple of lovebirds is therefore likened to the union of a doting husband and his loving wife. Li and his wife, He Yuchun, are exactly such a couple who have shared weal and woe for more than five decades in conjugal bliss.

Li Yining and He Yuchun came to know each other in Yuanling, Hunan province, in the 1940s, but were not able to see each other after he went to study in Peking University in 1951 and she enrolled in the Huazhong Institute of Technology at Wuhan in 1953. It was not until February 1957 that he saw her again when he called on He

Zhongyi, a former classmate who happened to be her elder brother, and whom she was visiting during a family reunion. That chance encounter kindled love between them, and before long they were talking about marriage.

They tied the knot on the lunar New Year's Eve in 1958 in a three-roomed bungalow in Haidian district, Beijing. The bridal chamber is a less than 20-square-meter property that they shared with his maternal grandmother, mother and younger brother. A few beds, a dining table, four chairs, a cupboard, and a washstand were all they had in the house. The family, nevertheless, was brimming with love and merriness.

Their wedding photo is characteristic of the era they lived in. Li, slim and bespectacled, neat and clean, is a typical intellectual dressed in a Sun Yet-sen suit. His wife, wearing a long plait tied up in a single loop with a bowknot on either side of her head, smiles meekly in a patterned woolen sweater she had knitted for herself. After a brief honeymoon the newlyweds were separated. He did manual labor in Zhaitang township, Beijing, while she became a commuter in Anshan, an industrial city in the northeastern province of Liaoning. For quite a long time, the couple lived apart like so many other families at the time. In December 1970, she gave up her job and career to join him at Liyuzhou, Jiangxi province, where he was working and being reeducated with local farmers. They have since never been apart from each other.

By 2010, they had spent 52 years together as husband and wife. Their daughter, Li Fang, graduated from Monash University, Australia, with a doctor's degree. Li Wei, their son, runs his own business in Guangdong province after graduating from the Department of Chemistry of Peking University. But the Lis' happiness does not stop at the successes of their son and daughter. The era of reform and opening up gave full scope to Li Yining's talent and academic prowess, and his reputation soared as a result. In the shadow of his luminous aura stands his wife, making quiet contributions to his career. He Yuchun is a senior electrical engineer by profession, but she willingly

serves as the first reader of her husband's works on economics. Li Yining said of his wife, "Whenever she spots any part of my writing that isn't succinct, lucid or readable enough, she'll demand a rewriting. I won't stop amending it until she is satisfied. If readers find my books not too difficult to read, half the credit is due my wife."

II. Academic achievements i. Research in economic history

i) General introduction Economic history figures prominently in Li Yining's academic studies. His first teaching assignment in Peking University in 1962 was on international economic history. In his academic career, including the last three decades that he has dedicated to the theory and practice of economic restructuring in China, he has never stopped his research in economic history, Western economic history in particular. In a sense, Li's accomplishment in economics is rooted in his scholarship in economic history. *British Economy in the 20th Century: A Study of the "British Disease"*, *The Rise of Capitalism: A Study of Comparative Economic History* and *Roman-Byzantine Economic History*, to name just a few, are crystallizations of his wisdom and hard work in economic history.

ii) *British Economy in the 20th Century: A Study of the "British Disease"* Published in 1982, this book was a product of Li Yining's early research on economic history, as well as a milestone in his academic career.

The fall of the British Empire in the 20th century is a topic of heated debate in world history. While Western scholars tend to ascribe the decline of the empire to the loss of its position as a "world factory," Li is of the opinion that such a loss might be responsible for Britain's diminishing world status, but is not enough to account for its tottering economy per se. On the "British Disease," Li gives his own diagnosis:

It was caused by a combination of factors that included the loss of

that country's position as a world factory, the aftermath of its colonial expansion, the flaws of a welfare state, and the negative influence of conservatism on the economy. Through a comprehensive survey of the social, political, economic and mental landscape of twentieth-century Britain, Li arrives at a conclusion that is worlds apart from his predecessors. The first book on the economic history of twentieth-century Western countries by a contemporary Chinese economist, *British Economy in the 20th Century: A Study of the "British Disease"* is also the first study of the macroeconomic policies of the British government by a Chinese scholar.

iii) The Rise of Capitalism: A Study of Comparative Economic History *The Rise of Capitalism: A Study of Comparative Economic History* (Commercial Press, Beijing, 2003) is Professor Li's brainchild from two decades of painstaking labor on economic history. By unremittingly exploring and contemplating the theoretical system concerning the genesis of capitalism, and by drawing on his own experience in helping draw the blueprints for the economic restructuring in China, he eventually discovered an entirely new approach to this historical question.

In the book, Li Yining divides capitalism into two types, homegrown and transplanted. The homegrown type of capitalism arose and developed in a country or region under the impact of internal factors during the disintegration of feudalism; and most West European countries belong in this category. The transplanted type of capitalism evolved during the collapse of the feudal society of a country or region under the onslaught of external forces that shook its foundation and weakened its rule; Japan and other capitalist "latecomers" in Asia, Africa, and Latin America are of this type. Why, then, could capitalism grow and establish itself from within feudal society in some countries while in other countries capitalism had to be midwived by external forces? Li Yining believes that it had something to do with whether the institution of a feudal society was rigid or flexible. In a feudal society with a rigid institution, the social hierarchical and identification systems were ossified, making social

mobility very difficult. In a feudal society with a flexible institution, the ruler forsook stringent hierarchical and identification systems, tolerated lateral and vertical social mobility, and favored changes in power structure and flexibility in power enforcement – thereby ensuring the survival and continuity of the feudal society. The ossified power structure and enforcement in a rigid feudal society were riddled with loopholes that gave rise to dissidence. When such dissidence grew into a power center outside the feudal institution, its conflict with the established power center would eventually cause the collapse of feudalism and the birth of capitalism. By contrast, a feudal society with elastic institutions could last for a long time because it was highly maneuverable and adjustable in emergency, leaving little room for the rise of anti-establishment forces.

The rigid institution of West European feudal society looked solid and stable on the surface, but in reality it was like a worn-out cast-iron wok, too fragile to withstand any blow. The serfs, desperate for freedom, were drawn to the cities, where there were not only hopes for survival but also opportunities for the underprivileged to end their status as appendages to feudal lords and become equal members of society. The more the feudal social institution restricted social mobility, the more resolved the humble and underprivileged became to unshackle themselves from such restriction. A direct course of action for them was to rise up in arms against the serf-owners. The larger the urban population grew, the greater the cities' strength against serf-owners became. Thus feudalism in West Europe was doomed.

The Rise of Capitalism also provides vivid and original analyses of the elastic feudal system and the birth of transplanted capitalism in China. Permeating the entire book is the author's analytical approach to institutional readjustment, an approach that not only gives a convincing explanation of the origin of capitalism, but also applies to institutional adjustments under both capitalism and socialism. While dissecting the genesis of capitalism, Li Yining also derives the universal norms governing transition and changes in social systems.

iv) Roman-Byzantine Economic History A crystallization of Li Yining's years of hard work on the economic history of the Roman Republic and Byzantium, the two-volume *Roman-Byzantine Economic History* (Commercial Press, Beijing, 2006) is another major work on economic history marked by unique perspectives and profound opinions. Volume One of the book, *From the Republic to the Empire*, covers a time span of over 700 years from the heyday of the Roman Republic in the 3rd century BC to the demise of the Western Roman Empire in 476 AD. Volume Two, *Between the Oriental and the Occidental*, encompasses nearly 1,000 years from the fall of the Western Roman Empire in 476 AD to the Ottoman Empire's complete conquest of the Byzantine Empire in 1461 AD. The entire book provides a broad historical panorama of the region that stretches for thousands of miles from Britain to the Arabian Sea via the Mediterranean, and recaptures two thousand years of socioeconomic vicissitudes from the zenith of the Roman Republic to the collapse of the Byzantine Empire. In this book, Li Yining takes a series of original viewpoints on Roman-Byzantine history. For instance, he believes that the conflicts and struggles between small and big land-owners were a major factor that affected Roman society's socioeconomic life, and that the prosperity of the Roman Republic and the Roman Empire hinged on the support of yeomen in rural areas and industrialists and merchants in urban areas. He maintains that the imperial system of the Roman Empire was not transplanted from Oriental countries – it was akin to a military autocracy that retained some remnants of the Roman republican system in the early years of the empire, and absorbed more and more elements and rites of Oriental dictatorship to evolve into a quasi- or semi-Oriental imperial system.

The fall of the Western Roman Empire is a historical event of far-reaching significance. In his cause-and-effect analysis, Li Yining disagrees with those who attribute it to "class struggle" or "ethnic strife," and rejects the opinion that it was caused by the "deteriorating Roman character." "A big power, whatever it is, cannot be conquered unless it has gone through a process of self-destruction," he believes. The causes of the fall of the Western Roman Empire should be

uncovered from within itself: The prosperity of both the Roman Republic and the Roman Empire stemmed from the support of the rural yeomen and the urban industrialists, who provided both the Republic and the Empire with an ample supply of conscripts, a full state treasury, a booming economy, and basic social stability. However, all this changed with the demise of the Antonine Dynasty (96-192 AD). The long years of repression and deprivation that followed pushed the yeomen, industrialists, and businessmen to bankruptcy and sent them into exile. The supply of conscripts dried up, and so did the state treasury. The economy slumped, and society was in chaos. In this way, the Western Roman Empire ruined the middle class, the very social foundation it relied on for existence. At this point, what awaited the Western Roman Empire was nothing but downfall.

Li maintains that the fall of the Byzantine Empire was a replay of the tragedy of the Western Roman Empire. The Byzantine Empire did exactly what the Romans had done nearly a millennium before, tearing down the very foundation for its survival in rural small land-owners and urban industrialists and merchants, and thus losing its sources of military manpower and tax revenue. After running out of local conscripts, the empire had no alternative but to man its main military force with mercenaries. To maintain these mercenaries, it had to levy more taxes, which drove more and more urban industrialists and merchants into bankruptcy, prison, or exile. The tax revenue shrank further as a result.

Both *The Rise of Capitalism* and *Roman-Byzantine Economic History* display Li Yining's persistent passion for economic history studies over the years. This passion, coupled with a penetrating insight, is the reason why he has been able to accomplish so much in this field of academic pursuit.

ii. Study of transitional economics

i) An overview Li Yining's theory of economic transition and development in China derives from his interpretation of transitional

economics. By probing deeply into issues pertinent to the Chinese economy in transition on the basis of the theory of two categories of economic disequilibrium, he comes up with three important viewpoints: First, ownership reform is more important than price reform; second, unemployment is more worrisome than inflation; third, analyzing economic growth is more useful than analyzing money flow. In his study of transitional economics, he also looks systematically into such major issues in the course of economic transition as government regulation, coordinated social development, and conceptual upgrading.

ii) The Chinese Economy in Disequilibrium In *The Chinese Economy in Disequilibrium* (Encyclopedia of China Publishing House, Beijing, 2009), Li Yining elaborates the disequilibrium theory in depth, and, basing himself on this theory, studies the current situation with the Chinese economy and goes on to propose his strategy for Chinese economic reform.

Based on Western disequilibrium theories, he divides disequilibrium in an economy into two categories. Economic disequilibrium of the first category is characterized by an incomplete market, inflexible prices, the presence of both excess demand and excess supply, and of restraints on both demand and supply, while the microeconomic agents in the market are independent commodity producers that make their own business decisions, are responsible for their own gains and losses, have the freedom to choose investment opportunities and modes of management, and bear investment and business risks on their own. Economic disequilibrium in the second category is characterized by an incomplete market and inflexible prices, the presence of both excess demand and supply and of restraints on both demand and supply. It is also marked by a market filled with microeconomic agents that, instead of being independent commodity producers making their own business decisions and taking responsibility for their own gains and losses, neither have the freedom to choose investment opportunities and management modes nor bear investment and management risks on their own. In a word, these

microeconomic agents have not quit their status as government subsidiaries. Li believes that disequilibrium in a capitalist economy belongs in the first category, while disequilibrium in a socialist economy belongs in the second category because its firms are yet to end their status as government subsidiaries. For this reason, economic restructuring in China should be focused on ownership reform, that is, reform of property rights relationships. That means to energize slumping firms and enable them to make their own business decisions and take responsibility for their gains and losses. Only in this way can the Chinese economy accomplish the transition from the second category of disequilibrium to the first category, and, by continuing to improve the market mechanism, move gradually on to equilibrium.

Li Yining's theory of two categories of economic disequilibrium constitutes the starting point for his pronouncements on a series of Chinese economic issues, such as what the focus should be for economic restructuring, reconstructing the nation's microeconomic foundation through joint-stock reform, shareholding as a major form of new public ownership, and the capital market.

iii) Double-coverage theory: socialist planning and the market In *Socialist Political Economics* (Commercial Press, Beijing, 1986), Li Yining gives a systematic illustration of his double-regulation theory: on the one hand, microeconomic regulation, which, in essence, is regulation by market; and on the other, macroeconomic regulation, which, in essence, is regulation by governmental macroeconomic mechanisms. He points out that government regulation of the economy means a great deal for the eradication of disequilibrium in economic aggregates and structure caused by dissonance between micro- and macro-economies, because it can set the national economy in orbit and guarantee the fulfillment of prescribed socioeconomic development goals. Li regards market and government as the "dual mechanisms" for the socialist economy. According to him, the socialist market should be regulated, first, by the market itself, and second, at a higher level, by the government. When the government mechanism works on resource allocation, its impact invariably manifests itself in

all aspects of social and economic lives through the changes in the relationship between supply and demand on the market. In that sense, government regulation works atop market regulation on the whole society. In other words, the market is subject to two layers of regulation: the market mechanism as the first layer, and government mechanism the second. Such is Li Yining's "double coverage" theory, derived from the "second regulation" and "dual regulation" theories he founded in the early stage of his academic career.

iv) Shareholding: the target mode for ownership reform Since the 1980s Chinese economic circles had been divided on which should take the center stage of economic restructuring – price reform or corporate reform. Li Yining, a staunch supporter of the latter, believes that the Chinese economy is in the second category of disequilibrium on the ground that neither of the two prerequisites for market regulation to become effective – a relatively complete market and energetic microeconomic agents – is available in the economy, and that the fundamental problem lies at the microeconomic level, where firms have yet to quit their status as government subsidiaries. His analysis drives home the urgent significance of economic restructuring, in particular the reform to invigorate firms, for economic development. Indeed, restructuring the property rights system and standardizing the behavior of market participants are pivotal to the building of a modern market economy in this country.

Li further asserts that the fundamental strategy in restructuring the corporate system and defining the property rights relationship is to introduce the shareholding system that separates ownership and management in firms, and on this basis, to bring the ownership structure to near perfection. He points out that, rather than replacing public ownership with private ownership, ownership reform is meant to break through traditional state ownership and transform it into a new type of public ownership. In his view, the greatest inspiration from the rural economic restructuring in the 1980s was that the vitality of the rural economy hinged on ownership reform, in which a household contract responsibility system linking remuneration with

output was introduced. Ownership reform in cities calls for the emergence of more shareholding firms, so as to restructure the microeconomic foundation for the operation of the national economy.

iii. Economic ethics and the power of morality

i) An overview Li Yining insists all along that the study of people represents the supreme level of economic research, and that economics is meaningless without studying human beings and the quality of human life. Economic ethics and the power of morality are part and parcel of his humanity-oriented economic theory.

ii) Exploring the issue of economic ethics Ethics in economics has always commanded Li Yining's attention as a major research topic. His achievements in this field of study find concentrated expression in his *Ethics in Economics* (SDX Joint Publishing Company, Beijing, 1995). In this book, he proceeds from social ethics to dwell on some essential socioeconomic issues that have occurred during China's transition from traditional central planning to a socialist market economy. These include the relationship between efficiency and equity, transactions in property rights, unemployment and inflation, consumption and investment by individuals, the cost of economic growth, and rational economic growth rate. By adopting normative economic approaches, setting common prosperity as the ultimate goal of socialist development, and regarding workers' maximum interests as the benchmark for truth and falsehood and good and evil in the socioeconomic realm, *Ethics in Economics* provides an array of incisive viewpoints from the perspective of ethics and morality.

iii) The role of moral power in the economy Through many years of contemplation, Li Yining arrives at the conclusion that economics is a discipline of resource allocation and its mechanisms, and that market regulation and government regulation are two different mechanisms for resource allocation. Besides these, he says, there is a third mechanism: custom and morality, which combine to be the only regulatory mechanism for resource allocation prior to the advent of market and government mechanisms, and is still the only mechanism

that can work in areas beyond the reach of market and government. Therefore, it is necessary to study morality as a regulation mechanism apart from market and government mechanisms, and emphasize the role of morality in regulating resource allocation.

On that basis Li has also studied what constitutes the foundations for efficiency. To him, efficiency rests on dual foundations – first, materials and technology, and second, morality. While the material and technological foundation guarantees conventional efficiency, morality not only ensures conventional efficiency but also provides extraordinary efficiency. The potentials for higher efficiency can be tapped mainly by relying on efficiency's moral foundation and on the role of moral force.

iv) Educational economics Li Yining published his paper "Technology education and capitalist industrialization: a study of the rise of technological power in Western Europe and America" in the *Social Sciences Front* journal, issue No. 4, 1978. Since then, educational economics has become another main field in his researches. Based on a series of papers that he had written on that subject, he published the book *Educational Economics* (Beijing Publishing House, Beijing, 1984). With its wealth of ground-breaking academic findings, it was hailed as "the first exclusive work on educational economics in contemporary China."

In *Educational Economics*, Li spells out the role of education in economic growth and socioeconomic development in China, what is entailed in the economic returns of intellectual investment, benchmark options, and approaches to enhancing the economic returns of such investment. His all-around dissection of the mechanisms by which investment in education boosts labor productivity brings to light the relationship between education investment and labor productivity. In this book he points out that the economic returns of educational or intellectual investment are both macroeconomic and microeconomic, and follows up with a discussion on the quantifiability of each category of returns. Moreover, the book also covers such issues as the time-lag in the commercialization of

technological knowledge, and the potentials in the development of school graduates.

III. Social contributions

i. Promoting the shareholding system

Reference has already been made to the division, from 1986 onward, in Chinese economic circles between two opinions on what should take the lead in the nation's economic restructuring, price reform or corporate reform. Li Yining is a proponent of corporate reform. Although price reform, or price decentralization, has dominated national policy decision-making since 1984, the controversy remains unresolved to this day.

Unlike those who put price reform above anything else, Li Yining believes that precedence should be given to corporate reform when shaping the general principle for economic restructuring. His reason: Because commodity prices are based on the prices of production factors, which are in turn predicated on ownership, prices are ultimately the prerequisites of transactions for ownership between market participants. Without an efficient ownership structure, there will be no effective restraints on the property rights relationship between firms and consumers, still less a truly reasonable price system. In addition, in the presence of large numbers of quotas in a shortage economy like ours, the impact of price regulation on the restoration of economic equilibrium is negligible. Chinese firms are yet to become free legal entities of commodity producers in the true sense of the term. To decentralize prices can only exacerbate economic disorder when there are shortages in various fields, and fail to achieve what postwar West Germany and Japan did in price reform. So Li Yining proposes that before anything else, the property rights relationships should be straightened out and firms demutualized over a period of about eight years. During this period, it is necessary to link the reform of corporate management mechanisms with the reform of

the property rights relationship and to link nonstandard contractual management with standard property rights reform. In this eight-year span, the weight of corporate reform should be gradually shifted from a contractual system to a shareholding system, and from low-level management mechanisms and property rights relationships to high-level ones.

His proposal was adopted, and shareholding reform came under way all over the land. The *Decision of the Party Central Committee on Issues Concerning the Establishment of a Socialist Market Economic Structure*, adopted at the Third Plenary Session of the Fourteenth Party Central Committee in November 1993, sets the goal for the transformation of state firms to establish a modern corporate system that "conforms to the requirements of the market economy and large-scale production, with well-defined property rights, rights and responsibilities, separates government and management, and is under scientific management." The document also sets the requirement to turn firms, through the establishment of such a modern corporate system, into legal entities and market competitors that make their own business decisions, bear the responsibility for their own gains and losses, seek their own development, and regulate themselves. Following Li Yining's thoughts, the goal of the reform of state-owned firms to establish a modern corporate system has been gradually clarified, the strategic regrouping of state-owned firms and the restructuring of the state sector of the national economy have been making steady headway, and a capital market has started from scratch to achieve healthy and sustained development. It can be said that China's economic miracle over the past three decades has everything to do with the decision to introduce the shareholding system. As an advocate and practitioner of the theory on this system, Li has made no small contribution to the nation's economic reforms. Hence his nickname, in Chinese, "Li the Shareholding Guru."

ii. Promoting a nonpublic economy

Coined during the reform and opening-up process, the concept of "nonpublic economy" encompasses self-employed industrial and commercial businesses and private firms, but is not limited to these entities. Since the adoption of the policy of reform and opening up to the outside world in 1978, the nonpublic economy has started from nothing and grown into the foremost sector of the national economy.

The development of the nonpublic economy, however, is not without its problems, those concerning state policy in particular. Reports on these policy-associated problems came flooding in from various provinces and municipalities, and eventually came to the attention of the National Committee of the Chinese People's Political Consultative Conference. In the latter half of 2003, the CPPCC Economic Committee set up a panel for a survey of the nonpublic economy. Li Yining, who had already received complaints from many entrepreneurs about the snags they had encountered in developing the nonpublic economy, was appointed as head of the panel. From the facts collected by a series of surveys and discussion meetings in Liaoning, Guangdong, Jilin, Hebei, Jiangsu, Zhejiang, and Fujian provinces, he was able to see that the problems were real. For example, nonpublic firms were allowed a much narrower business access than foreign investors, and were held back by government discrimination in financing, tax, land use, and foreign trade. Public opinion was prejudiced against them as well.

Toward the end of 2003, the CPPCC Economic Committee submitted a survey report by Li Yining's panel to the State Council. It drew the attention of Premier Wen Jiabao, who instructed in February 2004 that, in order to comply with the spirit of the Third Plenary Session of the Sixteenth Party Central Committee and promote the nonpublic economy, it was necessary to take the overall situation into consideration and draft a document to provide guidelines on relevant policy issues. The premier entrusted the State Council Research Office and the State Development and Reform Commission to take the lead in drafting the document. The draft was discussed at meetings of the Economic Committee, and amended by taking the suggestions of Li

Yining and other members into consideration. On February 24, 2005, the State Council promulgated the *Opinions on Encouraging, Supporting and Guiding the Development of the Nonpublic Economy*, known as *36 Regulations on the Nonpublic Economy*. The promulgation of the document ushered the nonpublic economy in China into a new period of development. The *36 Regulations* is hailed as a "comprehensive and systematic policy document for promoting the nonpublic sectors." Its implementation marks a breakthrough in the development of this sector of the national economy. For his immense contributions to the *36 Regulations*, Li Yining has been dubbed, in Chinese, "Li the Nonpublic Economist."

iii. Helping impoverished areas

Poverty is one of the sternest challenges confronting humanity. Eradication of poverty has become a global concern. In China, a huge part of the population still lives in absolute poverty. With his personal experience of such poverty in the 1960s and 1970s, Li Yining has made painstaking efforts for the development of the nation's less developed regions. While persisting in exploring ways and means to hasten economic growth in these regions, he has also devoted personal time, energy and wealth to the effort of improving the lot of his countrymen there.

- November 2005. He became dean of the Peking University Institute of Poverty Research that he initiated.
- March-April 2006. He organized five investigative teams on fact-finding tours in five types of poverty-stricken areas – Bijie county in Guizhou province, Huaihua and Youxian counties in Hunan province, Dingxi county in Gansu province, and Mentougou district of Beijing.
- May 2006. He initiated the first session of the China Forum on Strategies for Sustainable Development of Less Developed Areas in Tianjin.
- September 2008. He chaired the second session of the China

Forum on Strategies for Sustainable Development of Less Developed Areas in Bijie county, Guizhou province.

- July 2004. He donated his 3-million-yen (equivalent to 200,500 yuan) Fukuoka Asian Culture Prize to Bijie, Guizhou, for the construction of the Zonglin Primary School.
- October 2006. He donated over 400,000 yuan to the Eryou Miao Autonomous Township, Yuanling county, Hunan province, for the construction of another Zonglin Primary School.
- December 2008. He collected 1.26 million yuan from two charity auctions of the paintings of his wife He Yuchun with his own inscriptions, donating one million yuan for the medical treatment of senior cataract patients in impoverished mountain areas, and 260,000 yuan for the construction of libraries in those areas.

This incomplete record is enough to bear out Li Yining's devotion and contribution to underprivileged people and underdeveloped areas.

In March 2004, Li Yining ran his first training class for government officials in Bijie, Guizhou, shortly after he was appointed to head a panel of experts and advisors for the Bijie Experimental Area under the Central Task Force for Intellectual Support of Peripheral Regions. Since then he has made it an annual routine to visit the experimental area and train local officials.

China today is on the threshold of the Twelfth Five-Year Plan Period (2011-2015), which is pivotal to the nation's poverty eradication efforts. Li Yining has adopted a two-fold research approach accordingly: first, case studies on specific areas or groups of people, which will help him make specific poverty alleviation proposals; second, policy theory studies that enable him to observe the actual effects of national aid-the-poor policies, and, on this basis, to make improvement proposals that will help these policies achieve enduring effects. That is the way Li Yining makes his voice heard once again when national development enters a crucial period.

IV. Li Yining the poet

i. Double identity

Li Yining is not just a towering figure in economics. He is an accomplished poet as well. He has been composing lyric poems for the last 50 or more years since his senior middle school days. Even the chaos of the Cultural Revolution could not prevent him from jotting down his thoughts and feelings in verse whenever the mood hit him. Poetry is instrumental in voicing his musings on society, history and economic development; it also showcases his profound attainment in the humanities. Seemingly irrelevant to economic research, this attainment actually reflects his prolific imagination and incisive acumen, without which he would not have become the erudite scholar he is today.

Li Yining's verse is lucid and natural, without the least affectation. In one of his seven-character quatrains, he says poetry is the natural revelation of his innermost feelings and thoughts, and that you will never come up with good poems if you are doing someone's bidding. It is this crystal-clear frame of mind that enables him to imbue his verse with genuine passion, economic insight, philosophical wisdom, and penetrating observations of reality.

ii. Expressing economic thoughts in verse

Most of the hundreds of poems he has written over the decades are about personal experience, family life, teacher-student emotional ties, and camaraderie between school friends. Some of them portray scenes and sights, and places of historical and humanistic interest. Upon a closer perusal, however, his economic thoughts are discernible between the lines of some of his poems. In other words, his ruminations on economics often reveal themselves consciously or unconsciously in his verse.

In a poem written during a 1998 inspection tour of Longyan,

Fujian province, he cites Hakka history to drive home the role of morality in economic development, a role that he has always cherished in his academic studies. In ancient times, clan after clan of the Hakkas' ancestors fled the war and turmoil of central China, and settled down in south China despite its harsh natural environment. The land of what is the present-day city of Longyan, is clustered with more than ten thousand dwelling complexes, in which several hundred Hakka people lived under the same roof. According to Li Yining, the extraordinary efficiency of such an immigrant society was made possible precisely because of the regulatory role of morality.

Attending a round-table conference on labor, wage and economic restructuring co-sponsored by the Research Office of the Secretariat of the Party Central Committee and the State Labor Bureau in April and May 1980, Li Yining composed a seven-character quatrain to voice his opinions about economic restructuring. At the time, he was under fire for some of his reform proposals that people found unacceptable. Convinced that outmoded conventions and customs would give way sooner or later, in that poem he indicates that one should not haggle over personal honor or disgrace, gains or losses, and that a person's merits and demerits should be left to the judgment of time and posterity.

In 1981, when the reform and opening-up policy was still in its infancy, Li Yining attended the first annual meeting of the Society of History of Foreign Economic Thoughts in Chengdu, Sichuan province. That gave him the opportunity to visit the nearby Qingcheng Mountain, a famous Taoist domain studded with caves in which Taoist priests of yore practiced alchemy. Inspired by the mountain's ancient Taoist alchemical tradition, he improvised a lyric poem to the tune of *Partridge Sky*, in which he says that immortality and truth can be attained not with wonder drugs but often in a flash of inspired thought. Extending that idea to the philosophy of state governance, he argues that reform should advance progressively and social problems can be addressed only through patient persuasion and proper guidance. With the current situation in mind, he suggests in this poem

that the economy should be regulated, and social resources allocated, with an "invisible hand." According to him, only when the market is activated can people's living standards be raised and social stability achieved.

iii. Versifying a philosophy of life

In 1963, Li Yining acquired quite a following with a poem he wrote on a tour of the Tanzhe Temple in Beijing. In it he likens a person's peace of mind to the tranquil water in that temple's Dragon Pool, indicating that one can resist the interference of the outside world if he has done enough in self-edification. In traditional Chinese culture, such self-edification is deemed a major part of one's character and wisdom. According to the poet, we may not be able to control the environment around us, but we can adapt to it through self-cultivation. "Whether the wind moves or not is beyond my control," Li says, "but my mind can remain in peace come what may. By the same token, whether it is hot or not is beyond us, but we can stay cool as long as we maintain a peaceful frame of mind. Such is the state of mind we can strive for."

During the Cultural Revolution, Li Yining, like so many people around him, was denounced and manhandled at public meetings, his house was ransacked, and his research work interrupted by long years of physical labor. Nevertheless, he could always overcome these disturbances, and keep his economic studies and poetic composition going uninterrupted. In these reform and opening-up years, he has taken up more and more public positions, which has vastly increased his workload and social activities. But he never gives up writing, and his new ideas and books come in a constant stream. His exuberant creativity is intimately associated with his tranquil mindset.

Visiting Taoyuan county in Hunan province on a fact-finding tour in 1988, he composed a profoundly philosophical poem on the name of the county meaning "peach blossom spring." In the imagination of our ancestors, the Peach-blossom Spring is the Chinese translation of Shangri-la, where people are free from the chaos of the mundane

world and live in peace and bliss. In that poem Li points out that the Peach-blossom Spring is a utopian ideal, but it is possible to carve out such a wonderland in our heart. We can be bathed in the serenity of this wonderland anytime we want it, provided we stay magnanimous and optimistic. As one line in Li Yining's poem goes, "For those who are open-minded, the Peach-blossom Spring is everywhere."

Philosophical meditation is the ultimate way of thinking. In this sense, Li Yining, the accomplished economist, is also a philosopher with a penetrating eye. (*Translated by Peng Lin, Ren Xiaomei and Zhong Zhilan*)

“博雅双语名家名作”出版说明

1840年鸦片战争以降，在深重的民族危机面前，中华民族精英“放眼世界”，向世界寻求古老中国走向现代、走向世界的灵丹妙药，涌现出一大批中国主题的经典著述。我们今天阅读这些中文著述的时候，仍然深为字里行间所蕴藏的缜密的考据、深刻的学理、世界的视野和济世的情怀所感动，但往往会忽略：这些著述最初是用英文写就，我们耳熟能详的中文文本是原初英文文本的译本，这些英文作品在海外学术界和文化界同样享有崇高的声誉。

比如，林语堂的*My Country and My People*（《吾国与吾民》）以幽默风趣的笔调和睿智流畅的语言，将中国人的道德精神、生活情趣和中国社会文化的方方面面娓娓道来，在美国引起巨大反响——林语堂也以其中国主题系列作品赢得世界文坛的尊重，并获得诺贝尔文学奖的提名。再比如，梁思成在抗战的烽火中写就的英文版《图像中国建筑史》文稿（*A Pictorial History of Chinese Architecture*），经其挚友费慰梅女士（Wilma C. Fairbank）等人多年的奔走和努力，于1984年由麻省理工学院出版社（MIT Press）出版，并获得美国出版联合会颁发的“专业暨学术书籍金奖”。又比如，1939年，费孝通在伦敦政治经济学院的博士论文以*Peasant Life in China—A Field Study of Country Life in the Yangtze Valley*为名在英国劳特利奇书局（Routledge）出版，后以《江村经济》作为中译本书名——《江村经济》使得靠桑蚕为生的“开弦弓村”获得了世界性的声誉，成为国际社会学界研究中国农村的首选之地。

此外，一些中国主题的经典人文社科作品经海外汉学家和中国学者的如椽译笔，在英语世界也深受读者喜爱。比如，艾恺（Guy S. Alitto）将他1980年用中文访问梁漱溟的《这个世界会好吗——梁漱溟晚年口述》一书译成英文（*Has Man a Future? —Dialogues with the Last Confucian*），备受海内外读者关注；此类作品还有徐中约英译的梁启超著作《清代学术概论》（*Intellectual Trends in the Ch'ing Period*）、狄百瑞（W. T. de Bary）英译的黄宗羲著作《明夷待访录》（*Waiting for the Dawn: A Plan for the Prince*），等等。

有鉴于此，外研社人文社科出版分社推出“博雅双语名家名作”系列。

博雅，乃是该系列的出版立意。博雅教育（Liberal Education）早在古希腊时代就得以提倡，旨在培养具有广博知识和优雅气质的人，提高人文素质，培养健康人格，中国儒家六艺“礼、乐、射、御、书、数”亦有此功用。

双语，乃是该系列的出版形式。英汉双语对照的形式，既同时满足了英语学习者和汉语学习者通过阅读中国主题博雅读物提高英语和汉语

能力的需求，又以中英双语思维、构架和写作的形式予后世学人以启迪——维特根斯坦有云：“语言的边界，乃是世界的边界”，诚哉斯言。

名家，乃是该系列的作者群体。涵盖文学、史学、哲学、政治学、经济学、考古学、人类学、建筑学等领域，皆海内外名家一时之选。

名作，乃是该系列的入选标准。系列中的各部作品都是经过时间的积淀、市场的检验和读者的鉴别而呈现的经典，正如卡尔维诺对“经典”的定义：经典并非你正在读的书，而是你正在重读的书。

胡适在《新思潮的意义》（1919年12月1日，《新青年》第7卷第1号）一文中提出了“研究问题、输入学理、整理国故、再造文明”的范式。秉着“记载人类文明、沟通世界文化”的出版理念，我们推出“博雅双语名家名作”系列，既希望能够在中国人创作的和以中国为主题的博雅英文文献领域“整理国故”，亦希望在和平发展、改革开放的新时代为“再造文明”、为“向世界说明中国”略尽绵薄之力。

外语教学与研究出版社

人文社科出版分社

序

李济先生曾于1957年在华盛顿大学出版社出版了*The Beginnings of Chinese Civilization*一书，在海内外引起广泛的反响，十余年内共印了五版。外研社全新推出的这本《中国文明的开始》（英汉对照）在该书的基础上，增选了几篇相关主题的重要文章，其中既有关于考古学、人类学研究的发现，也有对学术范式、人才培养的思考，旨在从不同角度展现李济先生的主要学术思想及其发展脉络。

李济先生的著作在国内外已有数个版本流传，但此番乃是首次以英汉双语的形式呈现。对人文社科领域英汉双语著作的提倡，据我所知，最早可追溯到剑桥大学历史系的蒲立本教授。他感到要研究中国历史，需要学习并熟悉关于中国语言的知识。受他的启发，费正清等人提出了“中国的思想和制度”这一研究计划。李济于上世纪60年代初期接触到该方案时，就建议这个“时髦的计划”应当在严格的人类学基础上进行。李济建议，要更好地研究中国历史，应该采取一套他名之为“心理学+双语研读制+人类学”的方法。而能够善用这种研究方法的人无非两类：一类是“学会用中国话和中国文字去思考，必须能用中国语言客观地内省自己的思维过程，并用他同样熟悉的另一种语言把这一过程记录下来”的外国学者，另一类是“以中国话为母语……又受到完善的科学方法的训练，并且外国语也学得很好”的中国学者。由此看来，外研社人文社科分社以英汉双语形式出版李济先生的作品，可谓对其学术主张的一种很好的回应。

本书所选篇目大多曾刊载于海内外颇具影响力的学刊上。前三篇选文原为李济先生于1955年在美国华盛顿大学所作的三次演讲的手稿，介绍了震惊世界的“使殷商文化由传说变为信史”的河南安阳殷墟发掘。《考古学》（"Archaeology"）选自陈衡哲主编的《中国文化论集》（*Symposium on Chinese Culture*）。《山西南部汾河流域考古调查》（"Archaeological Survey of the Fêng River Valley, Southern Shansi, China"）原文刊载于《史密森研究院各科论文集刊》（*Smithsonian Miscellaneous Collections*），此次调查拉开了中国人自己主持科学考古发掘工作的序幕，具有相当的史料价值。在此需要特别提及的是，《中国的若干人类学问题》（"Some Anthropological Problems of China"）一文首先于1922年发表在巴尔的摩的《中国留学生月刊》（*The Chinese Students Monthly*）上，并在美国科学促进协会年会上宣读；经作者修改后，于次年再度发表于《哈佛研究生杂志》（*Harvard Graduate Magazine*），在学界引起轰动，并为英国哲学家罗素所引用。鉴于此修订版已为笔者译为中文并发表于《中国现代学术经典·李济卷》上，为更完整地展现李济先生对此议题的思考，本书选用了最原初的版本，以供读者参照比较。《再论中国的若干人类学问题》（"Some Anthropological Problems of China: Reconsidered"）最初发表于1962

年的《国际亚洲历史学家学会第二届双年会会议记录》(*Second Biennial Conference Proceedings, International Association of Historians of Asia*)上。《中国人的种族历史》("Racial History of the Chinese People")是李济先生于台北所作的一次演讲，手稿于1969年发表于《中国社社刊》(*Journal of the China Society*)。

参与本书翻译工作的多是考古学、人类学等相关领域的专家学者，他们的劳动是此双语版得以呈现的前提。已故的地质学界前辈袁复礼教授、李济先生弟子夏鼐教授、张光直教授和人类学家杨希枚教授等对译文的审校和订正工作提供了大力帮助。本书的编者和相关负责人对所有的原文和译文都进行了细致的核实与修订。在此向他们一并表示诚挚的感谢。我相信，以一丝不苟的态度来翻译、编辑和出版李济先生的作品，是对先生最好的追忆和纪念。

Preface Li Chi: 1896-1979

After almost sixty years, first as the father and later as the dean of Chinese archaeology, Li Chi has left indelible contributions to the science of humankind and of history, and his thinking still dominates his discipline in China.

Born in Hupei, Li Chi grew up at home and in Peking at a time when the old country, forced by encounters with the West, was taking its initial steps on the long road to modernization. Then, as now, bright young students were sent to Western countries to learn their scientific secrets. After his graduation from the elite Tsinghua Academy, Li Chi was sent to the United States, where he studied psychology and sociology at Clark University in Worcester, Massachusetts, and then anthropology at Harvard. According to an interview with Wilma Fairbank in 1977, Li Chi said that he went to Clark because a psychology teacher at Tsinghua, a Dr. Wolcott, had told him that Clark was the place to be for psychology. While at Clark, Li Chi developed the habit of spending every Saturday morning browsing in the open shelves of the library. There he happened upon anthropology books and was fascinated by this subject, of which he had had no previous knowledge. At Harvard, where he earned a doctorate in 1923, Li Chi studied with Hooton, Tozzer, and Dixon, and from these three mentors he learned, respectively, physical anthropology, archaeology, and ethnology, all of which he made use of, both in his doctoral dissertation (1928) and in his subsequent sixty-year career in China.

From 1923, when he returned to China, to 1928, Li Chi was the typical university professor-cum-research scholar in the American mold. He taught at Nan-k'ai University in Tientsin (1923-1925) and then at his alma mater Tsinghua Academy's new Graduate Research Institute (1925-1928). From 1925 to 1926 he undertook the excavation of a Neolithic Yang-shao culture site at Hsi-yin-ts'un in Hsia Hsien, southern Shansi, under the joint auspices of the Tsinghua Institute and the Freer Gallery of Art, Washington D. C., becoming the first Chinese scholar to dig an archaeological site.

The year 1928 was a turning point in Li Chi's life, and it was a turning point in Chinese archaeology and historiography as well. To appreciate fully the significance of events surrounding Li Chi beginning in 1928 we must go back some thirty years, to 1899, one

year before the Boxers and the Allied Invasion which wrought Imperial China's ultimate humiliation in the face of the industrial and military might of the West. In that year oracle bone inscriptions of the Shang (or Yin) Dynasty (1766-1122 B.C.) came to the attention of ancient historians for the first time since the dynasty's fall three thousand years previously, and during the next thirty years Shang scholars within and outside of China became fascinated by this new historiographic source material and launched extensive efforts to track down the bones floating on the antiquities market. Before long, the scholars became aware that these inscribed bones had come from Yin Hsü, the ruins of the Yin Dynasty, long known to be on the banks of the river Huan, near the modern city of An-yang, in northern Honan.

前言 怀念李济（1896～1979）

近六十年的岁月里，首先作为中国考古学之父、随后又作为中国考古学掌门人的李济，为人文科学和历史科学作出了不可磨灭的贡献。在中国，他的学术思想至今仍在他的研究领域占据支配地位。

李济在湖北出生，在老家和北京成长，他的少年时期正处于这个古老国家在与西方接触的压力下迈开通向现代化漫长道路的最初步伐的时候。就跟现在一样，当时一批批颇有才华的青年学生被送往西方各国去学习它们的科学奥秘。从著名的清华学校毕业后，李济被送到美国麻省伍斯特市的克拉克大学攻读心理学和社会学，接着又到哈佛去学习人类学。据李济在1977年跟费正清的夫人费慰梅女士的一次谈话中说，他之所以去克拉克大学，是因为清华的一位心理学老师华尔考博士跟他说，要学心理学，就要去克拉克。在克拉克时期，李济养成了一个习惯：每个星期六的上午他都去图书馆开架阅览室，尽情浏览各种书刊。在这种啃青草式的阅读中，他偶然地接触到自己不曾了解的人类学的书籍，立刻就被这门学问吸引住了。李济于1923年获得哈佛大学博士学位。在那里，他跟从虎滕、托策和狄克森三位老师分别学习了体质人类学、考古学和人种学；这三门学问在他的博士论文写作（1928年出版）和之后六十年的学术生涯中全都派上了用场。

从1923年回国到1928年，李济一直担任着一种典型的美国式的大学教授兼研究学者的工作。他先后在天津南开大学（1923年～1925年）和母校清华大学新成立的国学研究院任教（1925年～1928年）。1925年到1926年他负责主持了在山西南部夏县西阴村一处新石器时代仰韶文化遗址的发掘。这次发掘是由清华的国学研究院和美国华盛顿特区的弗利尔美术馆联合举办的。李济因此成为第一位挖掘考古遗址的中国学者。

1928这一年是李济一生中的转捩点，也是中国考古学和历史学的转捩点。为了充分认识从1928年开始李济所经历事件的重要意义，需要再上溯到近三十年前的1899年，即义和团事件和八国联军入侵的前一年；八国联军的入侵使中华帝国在西方强大的工业实力和军事威力面前蒙受了奇耻大辱。也就是在这一年，商（或殷）代（公元前1766年～公元前1122年）^[1]的甲骨文在王朝灭亡近三千年之后，首次引起了古史学者们的关注。在此后的三十年里，中国和国外的研究商史的学者们都被这一新的史料来源迷住了，他们大规模地追踪古董市场上流通的这类骨片的出土源头。没过多久，这些学者就察觉到契刻甲骨来自殷墟，即长久以来为人们所知晓的位于河南北部洹水岸边、现代安阳所在地附近的殷王朝废墟。

In 1928, the Nationalists succeeded in their Northern Expedition and founded a new regime in Nanking. A new national academy of

sciences—Academia Sinica—was established, and under it there was a National Research Institute of History and Philology. The institute's director, Fu Ssu-nien, who had studied historiography and philology in Germany, decided at once on two projects, among others, for the new institute to launch—to establish a department of archaeology as a new instrument to investigate Chinese history; and to carry out an excavation at Yin Hsü as the department's first field project. For both, Fu needed a senior archaeologist trained in the Western tradition of field investigations, and Li Chi was a logical choice for both department chairman and excavation project director. From then on, Li Chi's career became inextricably linked with the An-yang excavations, which, under Academia Sinica, lasted for fifteen field seasons, until the middle of 1937.

It is known to only a very few people now that when Fu was looking for a suitable scholar to head the new archaeology department—thus choosing, in effect, the national leader of archaeology—he had recommended to him not one, but two strong candidates, the other being Ma Heng (1881-1955), a highly respected scholar of the traditional antiquarian mold, later to become chairman of the Research Section of Archaeology of Peking University and director of the Palace Museum. It would be interesting to speculate what Chinese archaeology would be like now had Ma Heng been Fu's final choice, for the An-yang excavations of 1928-1937 and Li Chi's direction of them were to shape Chinese archaeology for the next half century.

国民党人在1928年取得了北伐的胜利，在南京建立了新的政府。一个新型的全国性的科学研究机构——中央研究院——成立了，研究院内设立了一个国立的历史语言研究所。所长傅斯年曾在德国学习历史学和语言学，他立即为新成立的研究所立下了两个项目：（一）成立一个考古组，作为研究中国历史的新工具；（二）发掘殷墟，作为考古组的第一个田野工作项目。为实现这两件事，傅亟需一位受过西方田野调查传统训练的有资历的考古学家；组主任和发掘项目主持人这二者的必然选择结果，都落在李济身上。从这时开始，李济的学术生涯就和安阳的发掘再也分不开了。中央研究院所领导的这一发掘工作一直持续了十五个工作季，直到1937年年中。

如今只有为数很少的人知道，当傅寻找一位合适的学者来领导这个新成立的考古组——这实际意味着挑选一位全国性的考古事业的领导者——时，受到推荐的不是一位、而是两位有力的候选人。这另一位是马衡（1881年~1955年）。马是一位备受尊敬的传统古文物研究学者，后来是北京大学考古研究室主任和故宫博物院的院长。不妨设想一下：如果马衡当年成了傅最后选中的人，中国的考古学现在会是一个什么样子？因为1928年至1937年的安阳发掘和李济对安阳发掘的领导，对下半个世纪的中国考古学的发展起了决定性的影响。

First of all, the An-yang excavations established the status of the Shang civilization at the head of the ancient history of China as the first civilization in the whole eastern half of Asia with written documents. Shang is the linchpin that ties together the vast recorded history of China with the increasing body of information about prehistoric China. But our knowledge of the Shang has to a great extent been shaped by Li Chi. He organized the search at An-yang for archaeological sites. He applied Western archaeological methods and concepts. He recruited colleagues and students and trained them in these methods and concepts at An-yang. Among these younger scholars were all the leading archaeologists active in China in the last thirty years, including Hsia Nai, director of the Institute of Archaeology, the Chinese Academy of Social Sciences, and Kao Ch'ü-hsun, until summer 1981 director of the Institute of History and Philology in Taiwan. Li Chi also set both the tone and the priorities of the study of the An-yang finds, and his methodology—above all ceramic and bronze vessel nomenclature and typology—still dominates the whole field of archaeology in China. In his own research he set a high standard of scientific excellence, which his successors struggle to measure up to in their own works. He was also both a patriot, jealously guarding China's cultural treasures against foreign pilferage, and an internationalist eager to adopt the best techniques and ideas the West had to offer and to view and conceptualize about China in the world setting. Many of his successors have succeeded in being one or the other, but few have equaled his tenacity and vision to be both.

The Sino-Japanese War that broke out in July 1937 virtually put an end to further archaeological fieldwork of significance being carried out by Li Chi's department, and after 1949 he went to Taiwan. From 1937 until his death in 1979, Li Chi spent much of his time dealing with the care, transportation, study, and publication of the An-yang material excavated during the 1928-1937 interval. Although the war-caused instability of institute life and the deaths and departures of many of the An-yang archaeologists had adversely affected Li Chi's plans for the Shang treasure, by the time of his death he had seen the publication of the bulk of the material, which he summarized in his last book *Anyang* (1977). The whole report is not out, but the adverse factors were beyond Li Chi's control, and he did everything he could have done, for which we are truly grateful. I have a strong feeling that the reason Li Chi declined repeated offers of university posts in the United States, to which some of his *Academia Sinica* colleagues immigrated during and after the war, was primarily because he felt he had to stay in China to see the Anyang studies through.

首先，安阳的发掘确立了商文明在中国古代史上为首的地位，它是整个东亚地区第一个有文字记载的文明。商代是把浩瀚的中国史籍记载和日益增长的史前中国信息体联结起来的一个纽带。然而我们关于商代的知识很大程度上仍是由李济给我们塑造的。他组织了在安阳的考古探寻。他使用了西方的考古方法和观念。他招募了众多的同事和学生，并在安阳的实地工作中用这些方法和观念培养他们。这些年轻的学者中包括近三十年活跃在考古界的所有重要人物，包括夏鼐——中国社会科学院考古研究所的所长，包括高去寻——直至1981年夏天高一直在台湾任历史语言研究所所长。李济为安阳出土器物的研究定下总基调，并确立了研究的主次性，他的整套研究方法——尤其是陶器和青铜器的命名和类型学方法——一直还在整个中国考古学界处于支配地位。在他本人的研究工作中，他树立了一种高要求的科学标准——他的后继者们都努力在自己的工作中以之为榜样。他既是一个认真守护中国的文化珍品、防范外国盗窃者侵犯的爱国者，又是一个渴望接受西方所可能提供的最佳技术和观念、渴望在世界背景下观察和构想中国的国际主义者。他的后继者中有许多人能做到这两者中的一个方面，但几乎无人能像他那样有韧性和眼光同时做到两个方面。

1937年7月爆发的抗日战争事实上结束了李济的考古组所进行的进一步重要田野考古工作；1949年以后，李济去了台湾。李济从1937年直到1979年逝世，花去大部分时间用于保管、运送、研究和出版1928年至1937年期间安阳出土的资料。虽然因战争而造成的研究生活的不稳定，以及参加安阳工作的考古学家中有些人故去、有些人离去，给李济管理商代遗宝的计划造成不利的影响，但到他去世前，他看到在他的最后一部著作《安阳》（1977年英文版）中概述到的很大一部分资料都已经出版了。完整的报告并没有出来，但是不利的因素已非李济所能控制的了；他已经做到他力所能及的一切，对此我们表示衷心的感谢。我强烈地意识到，李济一生之所以一再拒绝美国一些大学提供职位的邀请、没有像他的一些同事那样在战中或战后移民过去，最根本的原因是，他感到自己必须留在国内，看到安阳研究的全过程。

Outside his An-yang work, Li Chi was engaged in many other significant scholar activities, first during the war in the Southwest and, after 1949, in Taiwan. Among them we may name the following. In 1934 he was appointed to head the Central Museum, and from then on he was an ardent espouser of historical museums as organs of excavation, research, and education. This ideal has been put into practice extensively throughout China during the last thirty years. In 1949 he founded the Department of Archaeology and Anthropology at the Taiwan University in Taipei, the first university program in China to train professional archaeologists. In the early 1960s he was instrumental in the organization, under Academia Sinica, of a committee on the ancient history of China to launch the preparation of a multiauthored, interdisciplinary volume on ancient Chinese history, the first such effort in Chinese historiography. By the time of

his death the first drafts of this volume were beginning to appear.

I first met Li Chi in the fall of 1950, when I was admitted to his new department at Taiwan University. For the next twenty-nine years he was my teacher, mentor, critic, role model, and academic conscience. I was always conscious, of course, that Li Chi was a great historical figure, who had given archaeology in China its present shape. But above all he meant just one thing to me—he embodied the highest scientific standard that could be achieved in the study of Chinese history and archaeology. He had a single-minded devotion to scientific scholarship in China and by his own word and deed set a forbidding model for his followers to aspire to. His death is a gigantic loss for all true scholars of the world.

K. C. Chang

19 November 1981

除了安阳的发掘和研究外，李济还从事了其他许多重要的学术活动，最早是在抗战时期的大西南，1949年以后在台湾。这里仅列举其中的几项：1934年他被任命为中央博物院的筹备主任，从此以后，他成为了一名主张历史博物馆应是发掘、研究兼教育的机构的热心拥护者。他的这一理想在近三十年里已在中国得到广泛的实现。1949年他在台北的台湾大学创办了考古人类学系，第一次在中国把培养专业考古学家列入大学计划之内。20世纪60年代初期，他在促成“中央研究院”成立中国古史委员会，着手编写一部多著者、跨学科的中国古史中起到关键作用，此举开中国史学编著之先河。到李济去世时，该书的初稿已开始问世。

我第一次见到李济是在1950年秋季进入台大他创办的新系的时候。这以后的29年里，他是我的老师、导师、批评者、行为榜样和学术良心。当然，我时常感到，李济是一位伟大的历史人物，他塑造了今天中国的考古学；但对于我来说，他最主要的价值就在于他体现了在中国历史和考古学研究中所能达到的最高科学标准。他对在中国建立科学的学术事业怀有一种纯挚的热忱，并用自己的言行树立了一个令他的后继者渴望达到而又难以企及的榜样。他的过世是世界上一切真正学人的一大损失。

张光直

[1] 历学界对商代的起始年代尚有争议。一说商代始于公元前1600年，亡于公元前1046年。——编者注

I Digging Up China Past

More than forty years ago, when I was first admitted to the middle school, I used to feel extremely happy to know that I was born in a country whose history had already lasted 5,000 years. I say 5,000 years because it was actually the figure given to the youthful mind of my generation. The Sumerian civilization and the Egyptian civilization, we were told, might have started earlier; but they were also dead long ago. The Hindus, too, enjoy a long tradition, but their men of learning, till recently, never seemed to think it worth while to put their tradition on written records. So when all these things have been considered, China is certainly the oldest country still existing on this earth, and possesses the longest—and this is important—continuous written history of all the nations. This was my understanding of China's past before the time of the Chinese Revolution.

After the revolution, things began to change. There was a time when the reformers of China were skeptical about everything recorded in and about the past, including history itself.^[1] The Renaissance movement in the early twentieth century was essentially a rationalist movement, more or less akin in spirit to that of the classicists of the seventeenth century. Their slogan, "Show your proof," though destructive in nature, did bring about a more critical spirit in the study of ancient China. Thus, if one wants to pay excessive tribute to the Golden Age of Yao and Shun, well, Show your proof; if one wishes to talk about the engineering miracles of the Great Yü of the third millennium B.C., proofs must also be given. What must be remembered in this connection is that written records alone were no longer accepted as valid proofs.

This proof-seeking movement created a great deal of havoc with the traditional learning and revolutionized the method of classical studies. Modern archaeology in China was born in this atmosphere.^[2]

The task of a modern archaeologist in China, however, is not limited to the search for proofs in order to reinstate the glories that were China's past. His more important mission is rather to answer a set of new questions conceived in the light of modern science but only dimly perceived by historians of bygone generations. The questions so raised are of two different categories but are closely interwoven with each other: the one is concerned with the origin and the formation of

the Chinese people, and the other with the nature and the building of Chinese civilization.

壹 挖掘中国的历史

四十多年以前，我初入中学读书，当我知道自己生于一个有五千年悠久历史的国度里时，常觉欢欣莫似。我说五千年，是因为灌输于我那一代年轻人心目中的，恰是这个数字。据说苏美尔人和埃及人的文化可能起源更早，但是那些文化消逝得也早。印度人也有一段很长的文化传统，但是，印度的学人似乎从不认为有必要将他们的传统记载下来，这一观点直到最近才有所转变。所以，如果将以上这些因素都考虑在内，中国无疑是依然存在于地球上的最古老的国家。她有着世界上最悠久的——这一点很重要——延绵不断的历史记录。这就是辛亥革命前我对中国过去的理解。

辛亥革命以后，情况开始转变。有一个时期，中国的革新者对过去的记载和关于过去的记载全都发生怀疑，也怀疑历史本身。^[3]20世纪初中国的“文艺复兴”运动，本质上是一场理性运动，其精神多少与17世纪的古典主义相仿。他们的口号“拿证据来”在本质上虽然具有破坏性，但对中国古代研究的确带来了更多批判的精神。因此，如果你想颂赞尧舜的盛世，好吧，拿出你的证据来；如果你想谈论公元前两千多年大禹在工程上的伟绩，也得拿出证据来。我们得先记住，在这种怀疑的精神之下，单纯的文字记载已不复被认为是有效的佐证了。

这种找寻证据的运动给传统的治学方法以重创，但同时却给古典研究的方法带来了革命性的改变。中国的现代考古学就是在这一种环境之下产生的。^[4]

然而，现代中国考古学家的工作，不仅限于找寻证据以重现中国过去的光辉，其更重要的责任却是回答以前历史家只是隐约感知到的、而在近代科学影响下酝酿出的一些新问题。这些问题分为两类，但两者却息息相关：其一是有关中华民族的起源及其形成，其二是有关中国文明的性质及其形成。

So the new historians have been continually asking: Who were the earliest Chinese and in what manner was the Chinese civilization developed? I shall make an attempt to answer the above two questions in a general way and on the basis of modern archaeological discoveries. Let me take up the racial history of the Chinese people first.

The earliest examples of *Homo sapiens* discovered in the Chinese area are still those from the Upper Cave of Chou-kou-tien, first found in 1933 and briefly described in a preliminary report by Franz Weidenreich in 1939.^[5] The skeletal remains from this cave show a curious combination of several specimens. According to Weidenreich's

descriptions, the three best preserved skulls represent "three different racial elements...to be classified as primitive Mongoloid, Melanesoid and Eskimoid...." [6] What is amazing to many an anthropologist who studied these data is the great possibility that these three individuals might have belonged to only one family, if there was at that time a family organization. Weidenreich's paper aroused some very interesting speculations in many quarters. One of the queries stimulated by this discovery was about the possible relation of the Upper Cave skeletons to the formation of the Chinese people in historical times. According to Weidenreich's idea, if the ancestors of the modern Chinese were already existent 20,000 years ago, [7] they were certainly not represented in the Upper Cave of Chou-kou-tien. The concluding paragraph of his interesting paper published in the *Bulletin of the Natural History Society of Peking* includes the following remarks:

As to the origin of the Chinese—in so far as it is permissible to use this designation in determining a race—the discovery of Chou-kou-tien population failed to shed any light. Even so, one cannot conclude that the Chinese did not already exist during the Upper Palaeolithic time because there is evidence that Melanesian and Eskimoid types were in existence at that time. It is possible that the Chou-kou-tien family belonged to a migrating tribe foreign to the country and that the actual settlers who attacked and exterminated them were the real representatives of that Chinese race.... [8]

Professor E. A. Hooton, while agreeing with Weidenreich's major diagnosis, expressed his dissension on one point. He believed that the Old Man of the Upper Cave, whom Weidenreich classified as primitive Mongoloid, "... looks like a primitive European White, with more than a dash of the archaic Australoid features and can be duplicated almost exactly in the skulls of modern Ainu...." [9]

因此新的史学家常问：谁是最早的中国人？中国文明又是怎样发展起来的？我想试着以近代考古学的发现为基础，概括性地回答以上两个问题。让我先谈一谈中国人的种族历史。

在中国地区所发现的智人（指有分辨能力的人属动物，通常译为“智人”；笔者惯用半意译、半音译的“有辨的荷谟”。——译注）的例子，仍然以1933年周口店首次发现的山顶洞人为最早，对此魏敦瑞在其1939年写的一篇初步报告中有简要描述。 [10] 山顶洞所遗的头骨是一个包含多种样本的奇怪组合。据魏氏所述，其中保存最完整的三具头骨代表了“三种不同的种族成分.....分别为原始的蒙古人种、美拉尼西亚人种及爱斯基摩人种.....”。 [11] 让许多研究这些数据的人类学者感到惊异的是，这三具头骨分属的三个人非常可能是一个家庭的三个成员——如果那时有所谓家庭组织存在的话。魏氏的论文在很多方面引起了非常有趣

的揣测。其中之一是山顶洞人之骨骼和中华民族在历史过程中的形成的可能关系。据魏氏的观点，如果现代中国人的祖先在两万年以前业已存在的话，^[12]他们绝不可能以周口店的山顶洞人为代表。他在《北京博物学会会志》上发表的这篇颇为有趣的论文的结论中有如此的叙述：

说到中国人（如果允许以这个名词作人种名称的话）的起源，周口店所发现的骨骼无法给予我们任何启示。虽然如此，任何人都不能因为美拉尼西亚人种和爱斯基摩人种在上期旧石器时代已有存在的证据了，就断言中国人在此时期尚未存在。也许周口店那一家人是别处移居来的，被原住在该地的人所攻击消灭了。这些原住人才是中国人的真正代表.....^[13]

虎藤教授大致赞同魏敦瑞的意见，但同时陈述他自己一个不同的观点。他以为被魏氏归为原始蒙古人种的山顶洞老人，“.....看来类似具有些许古代澳洲人种特征的原始欧洲白人，并且其头骨几乎与近代的阿依努人的头骨完全相同.....”^[14]

Professor Hooton's remark is the more interesting because it serves to link the discovery of the Upper Cave not only with modern anthropology of the Far Eastern region but also with some curious tales transmitted from early China.

Among the strange tales told in the *Mountain and Sea Classics*, there is one story about a Hairy People in Book 17.^[15] This book is devoted to the folklore of the northeastern region of the Ancient East, covering approximately the territory of modern Manchuria, eastern Siberia, and the islands of Sakhalin and Japan. The description of the *Mao-min* of this region, that is, the Hairy People, includes some statements about both their physical appearance and their food habits. An explanatory note attached to the term *Mao-min* by a fourth-century commentator says that the faces and bodies of these people were all covered with hair.^[16] It is obvious that both the author of *Shan-hai-ching* (that is, the *Mountain and Sea Classics*) and its commentator must have been more or less familiar with the appearance of the *Mao-min*, as their descriptions of these people almost exactly fit the modern Ainu, still surviving in the northern part of Japan.

Even more significant than this interesting tale about the *Mao-min* is a statement occurring in the chapter on antiphrenology of Hsün-tzū, the great Confucian philosopher of the third century B.C. In his scathing criticism of the practice of, and the superstitious beliefs in, phrenology, Hsün-tzū said: "In Hung Yao's physical appearance, no skin is visible on his bodily surface...," meaning that the strange appearance of Hung Yao did in no way check his eminent career.^[17]

Hung Yao, as is well known to students of ancient Chinese history, was one of the ten most prominent ministers who composed

the brain trust in the court of the founders of the Chou dynasty.^[18] If his face was all covered with hair, it would be by no means too speculative to take him as one of the kinsmen of the Ainu's ancestors or, perhaps, a descendant of the Old Man of the Chou-kou-tien Upper Cave, if one were inclined to accept the opinions of the late Professor Hooton. Since the Ainu have been classified as one of the Palaeo-Asiatic peoples, the assumption is certainly well justified that they played an important role in the formation of the Chinese people in the protohistorical period. But evidently they were in a small minority, as in the time of Hsün-tzū their hairiness was already considered more or less unusual.

虎藤教授的看法很有意思，他不但把山顶洞的发现与远东地区的现代人类学联系了起来，而且也把这一发现和古代中国神话传说连贯在一起。

在《山海经》讲述的那些奇异的传说中，第十七卷内有一段关于“毛民”的故事。^[19]这一卷专门叙述古代东方东北地区的民情风俗，其所及的区域约为现在的中国东北、东西伯利亚、萨哈林岛（库页岛）及日本一带。有关这一地区“毛民”的叙述涉及了他们的形体特征和饮食习惯。公元4世纪的注释家解释“毛民”，说他们脸部和全身上下都长满了毛。^[20]显然《山海经》的作者和它的注释者都多少熟稔“毛民”的外表，因为他们的描述与现在仍然生活在日本北部的近代阿依努人的外貌几乎完全相符。

比以上所述更重要的是公元前3世纪的伟大儒家思想家荀子在《非相篇》里的一段陈述。荀子无情地批评面相之术，反对人们对于面相的迷信。他说“闾天之状，面不见肤，……”意思是说，即以闾天那样奇异的长相，也无碍他的丰功伟绩。^[21]

学习中国古代史的人都知道，闾天是组成周朝创始者智囊团的十大功臣之一。^[22]如果他的脸部生满了毛发，那么我们基本可以肯定他是阿依努人祖先的近亲，或接受已故虎藤教授的观点，认为他是周口店山顶洞老人的后裔。因为阿依努族已被认为是古亚语族之一，所以完全有理由推断他们在史前中华民族的形成过程中扮演了重要的角色。但是显然他们是一个很小的少数民族，因为在荀子时代他们多毛的外貌已被认为多少有些不寻常了。

As to the Melanesian elements, it is also interesting to speculate as to when they became "exterminated" by representatives of the Chinese, as Dr. Weidenreich has put it. We know almost for certain that there were still Negrito survivals in South China as late as the ninth century A.D.,^[23] and perhaps even later, a fact that tends, indirectly at least, to confirm what the French archaeologists found in the prehistorical sites of Indo-China, the presence of pre-Melanesian skulls. On ancient Chinese bronzes, one occasionally finds, among their profuse decorative patterns, the casting of the human face

realistically done; the Melanesian appearance is by no means rare. The most illuminating example is from the Sumitomo's collection,^[24] a *yu* wine vase cast in the form of a tiger embracing a child; the face of the child shows a decidedly Negroid countenance with which the designer of this bronze must have been intimately acquainted. A big bronze tetrapod, weighing many hundred pounds, was dug out during World War II by a group of peasants in the neighborhood of the ancient capital of the Shang dynasty. This, too, shows, on the two standing lugs above the rim, a decorative pattern consisting of a human head, Negroid in appearance, placed between the heads of two tigers standing on their hind legs and arranged antithetically (Fig. 1). Other instances of this kind need not be repeated.

But down to the close of the Neolithic time in North China, the people who dominated this area were Mongoloid and, according to the study of Davidson Black, "conformed to a type essentially similar to that represented by the present-day Northern Chinese...." Three years later Black again said, in the concluding chapter of his study on the Kansu and Honan Aëneolithic skulls:

(1) Ink rubbing of the decorative pattern on the standing lug above the rim of a tetrapod discovered in the neighborhood of Hou-chia-chuang 侯家庄附近出土之后母

...As a result of the foregoing investigations into the group measurements and form relations of the Honan and Kansu prehistoric crania in comparison with recent North China material, it would seem to be established beyond any reasonable doubt that the prehistoric populations represented were essentially oriental in physical character.

Further, the resemblances between these prehistoric and recent North China populations would appear to be such that the term "proto-Chinese" may with some propriety be applied to the former.^[25]

至于美拉尼西亚人种成分，推测他们在何时为典型的中国人“消灭”（像魏氏所说）也是一件十分有意思的事情。我们几乎可以确认，直到9世纪或更晚一些，华南地区仍有小黑人种存在；^[26]这一事实，至少间接地证实了法国考古学家们在印度支那史前遗址所发现的前美拉尼西亚人种的人头骨。在古代中国青铜器的繁复花纹中，我们有时会发现非常逼真的人面像，而其中不乏美拉尼西亚人的人面相。住友收藏的一支卣是说明这一事实的最好例子。^[27]这支卣的形状是一只老虎抱着一个孩子，孩子的面貌与小黑人的面貌绝肖，这一面貌想来为此青铜器的设计人所熟稔。二战期间，一群农人在安阳附近掘出一四足鼎，重达几百磅。此一铜鼎之二立耳，饰以一个人头和两个虎头的图案：虎之后足挺立，小黑人的人头像夹在两个虎头中间。两只老虎相对而立（图1）。类似的例子不必一一枚举。

但是到了新石器时代末期，华北一带占多数的是蒙古人种。据步达生研究，这些人“在本质上和今日华北中国人的类型相符.....”。三年之后，步达生在有关甘肃及河南铜石并用时代的头骨研究一文的最后一章再次说道：

.....由以上对河南及甘肃史前人头盖骨的集体量度及型式关系研究的结果，并与今日华北所获之资料比较，史前居民在形体特征上说实质上是东方的已无甚疑义。

再者，因为史前居民与今日华北居民的类似，所谓“中国原人”一词，亦可适用于前者。^[28]

It is to be observed that from the time of the Old Man of the Upper Cave of Chou-kou-tien to the Late Neolithic of North China, the time interval is more than 10,000 years. Modern archaeology has not yet been able to supply any material for a study regarding the emergence of the proto-Chinese or to fill up the gap with an evolutionary series of the Mongolian race from the primitive Mongoloid to the formation of the Chinese people in historical time, except for the find of a single tooth of Upper Palaeolithic time in the Ordos region,^[29] discovered by Licent and Teilhard de Chardin, and described by Davidson Black as a "shovel-shaped upper incisor."

This isolated find, on account of its unique morphological

character, has aroused a great deal of interest among both anthropologists and historians. It is doubly significant because on the one hand this morphological feature seems to be related to *Sinanthropus pekinensis*, according to Franz Weidenreich, and on the other hand to the modern Chinese. Weidenreich's study on the "Dentition of *Sinanthropus Pekinensis*" devoted fully two pages to discussing the problem of shovel-shaped incisors in recent mankind and made the following remarks:

As to the occurrences of these types in recent mankind, the essential point is not that they may be found to a certain extent in all races in a minor percentage, but that they occur in special races up to almost 100 per cent; as, for instance, in Eskimo and Chinese, at least as far as the lateral incisors are concerned; and the same percentage must be taken to be characteristic for *Sinanthropus*...^[30]

It is not my purpose to discuss any possible relation between the *Sinanthropus* and the Mongoloid or the Chinese. But it is important to note that Professor Weidenreich's statement about the frequency of the shovel-shaped incisors among the Chinese has recently been confirmed by an examination of the incisor teeth of freshmen of the Taiwan University.^[31] Among 803 male freshman students examined in 1952, more than 90 per cent possessed shovel-shaped upper incisors; the same was true of 121 female freshmen. In both sexes the incisors of less than 1 per cent showed a non-shovel-shaped appearance.

In addition to the above confirmatory evidence it is to be further noted that Davidson Black, in his note on the Ordos tooth, made use of a number of the upper lateral incisors recovered from the Aëneolithic sites in North China for comparative study. He said that in all these specimens, whether Early Bronze and Copper Age or modern North China, we are dealing with well-formed incisor teeth, conforming in all essentials and most details to a type aptly described by Hrdlička as shovel-shaped.

需要注意的是，由周口店的山顶洞老人时期到华北的新石器时代的晚期，其间约有一万年以上。近代的考古学家尚未能提供任何材料借以研究中国原人的出现，也未能提供任何资料来说明原始蒙古人种如何经过一系列革命性的种族演进进化成中国人的这一历史进程，以填补这一空白。唯一的例外是桑志华和德日进在河套地区发现的一枚旧石器时期上期的人齿，^[32]步达生称之为“箕形上门齿”。

这枚孤零零人齿的发现，由于其独特的形态学特征引起了考古学家和历史学家的极大兴趣。它的双重意义在于，以形态学的特征来看，一方面它似与中国猿人北京种有关——据魏敦瑞的观点；另一方面又与现代的中国人相似。魏氏在《中国猿人北京种的牙齿》一文中，用了整整

两页来讨论近代人类的箕形门齿，他这样写道：

关于这类门齿在近代人类出现的例子，主要的不是我们可以在所有的种族中找到一小部分例证，而是在某些种族中这类门齿所发生的比例几乎是百分之百。例如，爱斯基摩人和中国人，至少边门齿是如此的。这样的百分比也必须视为中国猿人的特征.....[33]

我的目的不是讨论中国猿人与蒙古人种或是中国人的可能关系。不过应该注意到，魏氏关于中国人箕形上门齿出现频率的论断，最近在一次对台湾大学新生的体质调查中得到了证实。[34]1952年对803位男性大学新生的调查中，有90%以上具有箕形上门齿，121位女性大学新生的情形亦复如此。无论男生和女生，仅有不足1%的具有非箕形上门齿。

除了上述确凿的例证之外，还应进一步注意到，步达生曾在他有关河套人齿的笔记中，将在华北铜石并用时期遗址中所发现的侧上门齿用于比较研究。他说，不论是由青铜时代早期或是近代华北所得的标本，我们研究的都是形成完好的上门齿，它们在本质上和诸多细节上都与赫得利奇卡氏所谓的箕形相吻合。

Thus modern archaeology and modern anthropology have jointly established a case that in Eastern Asia the evolution of Hominidae, from the time of early Pleistocene down to the modern age, is accompanied at different stages by a persistent morphological characterization: the invariable presence of the shovel-shaped upper incisor teeth. It is a phenomenon quite peculiar to this region, which so far has found no parallel anywhere else (Fig. 2).

There seems to be little question that the origin of the ancestors of the Chinese is tied up with the origin of the Mongoloid; and the Mongoloid race, on the evidence now available, must have evolved east of the Ural Mountains. With this background as a working hypothesis, we should be better prepared for an interpretation of early Chinese history.

I propose to start the discussion of early Chinese history with the Neolithic phase, as it is only at this stage that there is something definite to work upon.

It is well known that prehistorical researches in China started with the Swedish geologist, Dr. J. G. Andersson, who not only discovered the locality of Chou-kou-tien and the first trace of Peking Man but was also the first scientist to find the existence of a widely distributed prehistorical culture of the late Neolithic phase in North China. The interest shown in this discovery by archaeologists all the world over is mainly due to the possible relation this culture might have had with the West. This fascinating question, however, could hardly be settled at present on the basis of available data; so let us confine our discussion to the field of the Chinese area. [35]

In the last thirty years archaeologists have located the presence of the Painted Pottery culture along the major portion of the Yellow River Valley basin in North China, with, however, a marked exception in the province of Shantung. Its sphere of influence reached Manchuria in the east and Sinkiang in the west; its zone of concentration is located in the section of the Yellow River Valley between T'ung Kuan and Taihang Shan that divides the province of Honan from Shansi.

(2) Three examples of shovel-shaped incisor teeth from North China: a, Ordos tooth of presumably Pleistocene period; b, Sinanthropus teeth; c, upper frontal incisor of a Shang dynasty skull 华北箕形门齿三例：a. 更新世河套人齿；b. 中国猿人齿；c. 商代人头骨上门齿

由此近代考古学和人类学共同证实了一个事实，即：从更新世早期到现在，东亚区域的人科在其不同的演进阶段，有一个贯穿始终的形态学特征——箕形上门齿的存在。这一现象是这个区域所特有的，在别的区域尚未发现类似的情形（图2）。

中国人的祖先和蒙古人种有密切的关系似已不成问题了，而且以现有的证据而论，蒙古人种必然是起源于乌拉尔山脉东部。以此背景作为作业假说，我们对早期中国历史的解说就有了更好的基础。

我以为讨论早期的中国历史应自新石器时代开始，因为只有从这时期开始，我们才有信而可征的资料。

众所周知，中国史前的研究始自瑞典地质学家安特生博士。他发现了周口店的遗址、北京人的最早足迹，同时也最早发现了散布在华北一带颇广的新石器时代晚期的一种史前文化。全世界的考古学家对这发现感兴趣，主要是由于这文化可能与西方文化有些关系。这纵然是一个颇引人入胜的问题，然而以现有的资料为基础，仍不能得到定论。这样，还是让我们把讨论局限于中国地区吧。 [36]

近三十年来考古学家发现的彩陶文化都在华北黄河流域的主要地区，仅有的一个显著的例外是山东省。彩陶文化影响所及，东自东北、西迄新疆。其中心位于河南与山西交界的太行山和潼关之间的一段黄河流域。

It is precisely within this zone that the simplest type of painted pottery, in shape as well as in patterns of decoration, is located. [37]

Liang Ssu-yung, followed by G. D. Wu, was of the opinion that the painted pottery discovered by him at Hou-kang in Anyang represented the earliest stage—at any rate earlier than the Yangshao group. Wu went a step further and assigned definite dates to the Hou-kang Ocultures in his chronological table of Chinese prehistory.^[38] It seems to be quite definite that, as far as present knowledge goes, neither in the northwest from Kansu to Sinkiang nor in the northeast from Hopei to the Liaotung Peninsula has there been discovered, up to the present time, any painted pottery culture simpler and more primitive than that found in Hou-kang, located in the northernmost part of Honan province.

What is particularly baffling in regard to the distribution of the Yangshao culture is its complete absence in the province of Shantung. In spite of the many efforts made by a number of archaeologists to find Neolithic remains in this peninsula, no trace of painted pottery has ever been discovered there. Shantung is China's Holy Land, not merely for the reason that Confucius was born there; it was also, as many historians would testify, the cultural center of China in the first millennium B.C. And, what is even more important, it was most probably the homeland where the culture of the Shang dynasty had its early growth.

It was precisely in this province that another phase of the prehistorical culture of North China was discovered by the young archaeologist Wu Gin Ding (G. D. Wu) in 1930, just after he was graduated from the Tsing Hua Research Institute. This phase is known as the Lungshan culture after the name of the village near which the first and the type site is located. The most characteristic feature of this culture, as of the Yangshao remains, is its pottery; but unlike the Yangshao pottery the Lungshan ceramics are mostly monochrome, of which the most distinguished group is pure black, lustrous, and thin. Subsequently it was found that this culture also covered a wide area in eastern and northeastern China,^[39] extending northward to the Liaotung Peninsula^[40] and southward to the delta region of Hangchow Bay.^[41]

Following this discovery arose the chronological problem of the relative sequence of these two prehistorical cultures in North China as a whole. The basic work in the field that determined the time relation of these two cultures was carried out in the Anyang region by members of the Archaeological Section of the Academia Sinica. Here were discovered many sites in which three distinct types of cultural remains were found in successive deposition; they were: (1) the Painted Pottery culture, (2) the Black Pottery culture, and (3) the historical culture of the Shang dynasty, of which the white pottery has

received the most attention from antiquarians. [42]

考古学家们正是在这个区域发现了形制和花纹都极简单的彩陶。[43]梁思永以及之后的吴金鼎都认为梁氏在安阳后岗发现的彩陶是最早的——起码较仰韶村出土者为早。吴氏则更进一步，在其中国史前年代表中给予后岗文化以一明确之年代。[44]以目前所得的知识，大约足以肯定：不论西北从甘肃到新疆或东北由河北至辽东半岛，直到现在仍未发现有比在河南省最北端后岗的更原始、更简单的彩陶文化。

仰韶文化分布中的一个令人不解的问题，是在山东境内全无它的踪迹。尽管不少考古学家费了很多气力想在这半岛上寻找新石器时代的遗存，却从未发现彩陶的痕迹。山东是中国的圣地，不但是因为孔夫子诞生于斯，而且像很多历史家都证实的，它是公元前第一个千年内中国的文化中心。更重要的是，它很可能也是商文化发轫的所在。

恰好就在这个省，年轻的考古学家吴金鼎，刚从清华研究院毕业后，即于1930年发现另一阶段的华北史前文化。这阶段的文化被称为龙山文化，因在龙山镇附近首先发现此一典型之遗址而得名。此文化最鲜明之特征，也像仰韶遗存一样，表现在其陶器上。但龙山之陶器与仰韶的陶器不同，多为单色的。其中最显著的呈黑色，光亮，壁薄。其后，人们发现这一文化远及中国东部及东北部甚广地区，[45]北至辽东半岛，[46]南迄杭州湾三角地带。[47]

紧接着这发现所产生的问题是，如果把华北看作一个整体，那么这两个史前文化的年代孰先孰后呢？中央研究院考古组在安阳的基础田野工作，解决了这相互的年代关系问题。在安阳地区多处遗址中有三种文化遗物，并且有明显的分布层次，即：（1）彩陶文化，（2）黑陶文化，（3）商代的历史文化。其中商文化的白陶曾引起古物学家的很大注意。[48]

In the stratified area of the Hou-kang site, three types of relations of the three different types of cultures were observed: the superposition is either the Shang over the Yangshao, or the Shang over the Lungshan, or, thirdly, the Lungshan over the Yangshao. These orders have been found to exist wherever intact stratified cultural remains have been located. The reverse of such orders was not reported in any of the excavated areas within this region. So the sequence thus determined may be given as: the Painted Pottery culture as the earliest, followed by the Black Pottery culture, and then the historical Shang culture.

But it must be made clear at once: this established sequence has its geographical limitation.

Now about the earliest historical Chinese culture, the culture of the Shang dynasty. For quite some time it was thought that, from the latest phase of the Neolithic culture discovered in North China to the earliest phase of the historical remains discovered in Anyang, there

was a close and almost immediate succession. The cultural sequence established in Anyang and confirmed in a number of other places has been usually taken as a positive proof of the closeness in time of the Lungshan and the historical Shang cultures. But a more critical examination of their detailed contents, especially the pre-Shang and the Shang remains found in Hsiao-t'un, reveals the existence of a gap which might have been caused by interrupted development, a discontinuity which might be an indication of some time interval. [49]

What distinguished the historical remains of the Shang at Hsiao-t'un from the pre-Shang deposits found quite extensively in Anyang, including Hsiao-t'un, are the following six groups of cultural traits:

- (1) New development of ceramic industry
- (2) Employment of bronze to cast tools, weapons, and sacrificial vessels
- (3) The presence of a highly developed writing system
- (4) Chamber burials and human sacrifices
- (5) Use of chariots
- (6) Advanced stone carvings

None of the above six cultural traits could be linked, as far as is known, in even a remote way to the Yangshao and the Lungshan cultures. They also differ among themselves in the degree of the suddenness of their emergence from a total obscurity in the Neolithic time to the foreground of the historical scene. Of these six groups the ceramic craft especially needs some discussion. The nine types of pottery which occurred most frequently in the Shang (Yin) stratum were all novel as compared with the pottery forms of the black pottery in the bottom deposit underneath the Shang stratum (Fig. 3). The prevalent six types of the gritty and the black wares of the prehistorical period disappeared almost completely in the cultural stratum of the Shang period. The Shang potters discarded altogether the fine and delicate craft of producing the thin, lustrous, and beautifully turned black ware. They went on experimenting with some inventions of their own and introduced for the first time in the history of ceramic art the use of kaolin clay, with which they produced the famous white pottery. They also made the earliest attempt to cover the external surface of the stoneware with an extra coating of glaze. It is true that methods used by potters of the preceding periods were still continued in the Shang time to produce certain types of wares for daily use, but there was a distinct change in both the style and the method of production of the more refined articles. [50]

在后岗遗址的地层组织中，观察到三类这三种文化层的相互关系：商文化层在仰韶文化层的上面，或是商文化层在龙山文化层之上，或是第三类，龙山文化层在仰韶文化层的上面。在任何未被搅乱的地层中，都有这三类顺序之一的存在。而与之相反的顺序排列在此地区从未报告过。因之，我们可以确定这三个文化层的层次是：彩陶文化最早，其次是黑陶文化，再其次是商文化。

在这里必须说明的是：这样的顺序是有其地区局限性的。

现在让我谈一谈历史时期最早的中国文化——商文化。在很长一段时期内，人们都以为从华北一带所发现的新石器时代末期，到安阳出土的历史遗址所处的最早时期，二者在时间上相近，并且几乎是紧接着的。在安阳确认、并相继被其他各地所证实的文化层次，常被视为这种论断的有力证据：历史时期的商文化与龙山文化紧密相连。但是如果仔细考察其细节，尤其是考察小屯发现的商及前商遗物，我们可发现其间有一段缺口，这一缺口表明二者之间可能存在一定的间隔期。^[51]

小屯的商代历史遗迹与广泛分布在安阳地域（包括小屯）的前商遗迹的区别，主要体现在以下六个方面的文化特征：

- （1）制陶业的新发展；
- （2）使用青铜铸造工具、武器及祭器；
- （3）高度发展的文字体系的出现；
- （4）墓葬和人牲；
- （5）战车的使用；
- （6）先进的石刻。

以现有的知识而论，以上六种文化特征，没有一种能和仰韶或龙山文化拉上一点关系。它们在新石器时代杳无踪迹，而在此时却突现，这一突然性之程度在它们各自之间也有所不同。六种文化特征中的陶业需要专加探讨。殷商地层甚常发现的九种形制的陶器，全都与殷商地层下面的黑陶形制大异其趣（图3）。史前时期所盛行的六种夹砂的黑色陶器，在殷商文化层中几乎完全绝迹。商代陶工完全摒弃了制作质地轻薄而表面光泽的黑陶器皿所采用的精巧旋盘工艺。他们试以自己独创的方法，并且在制陶史上首先采用高岭土制造出著名的白陶。他们又首先尝试在粗陶器外层涂上一层透明光泽的釉。确实，在某些日常的器皿制作上，商代陶工仍然沿用前代的工艺，但是更为精致的物品，其风格与制作方法已有显著的改变。^[52]

Of the other five cultural elements which made their first appearance in the Shang dynasty, the writing system and the bronze may be discussed together. The general impression has been that these two cultural activities seem to have started almost simultaneously.

其他五种在商朝首次出现的文化成分中，文字体系和青铜器可一并讨论。一般印象是，这两种文化活动似乎是同时出现的。

(3) Pottery types from Hsiao-t'un: above, nine common types from the Shang stratum; below, six common types from the pre-Shang stratum 小屯出土陶器的形制：上方为殷商地层出土的九种普通形制；下方为先殷地层出土的六种普通形制

As I have tried to show in another connection, their simultaneity is more apparent than real; and both of them must have had an earlier development from which their Hsiao-t'un phase was evolved. Taking first the problem of the bronzes found in Hsiao-t'un, it is obvious to anyone who has examined this problem that an earlier background must be postulated in order to explain the stage of development which

the bronze of Hsiao-t'un attained. Among the Hsiao-t'un remains themselves, evidence was by no means lacking to show that the history of bronze foundry in this locality is divisible into two substages; and the earlier substage may lead back to a still more primitive phase.

The writing system of the Hsiao-t'un stage as found on the oracle bones, like the Hsiao-t'un bronzes, represents a development on a comparatively advanced level. It is of course a well-known fact that the Hsiao-t'un scripts are 1,600 to 1,800 years later than the earliest Sumerian writing; and in this time interval the idea of keeping some written records might have migrated from the valley of the Tigris and Euphrates to the valley of the Yellow River. Still this does not explain how such a highly complicated system as the earliest known Chinese writing, composed of more than 2,000 characters and totally unlike the cuneiform scripts in either form or structure, should have appeared all of a sudden on Chinese soil. It is to be remembered that in the middle of the second millennium B.C., east of the Ural Mountains and the Indian peninsula, North China was the only literate spot in the whole region bordering on the Pacific. Even the most earnest diffusionist must prove his thesis by gathering evidence in the intervening region between Mesopotamia and the northeastern China plain before any convincing arguments can be made to support the idea of complete borrowing. Personally, I am more inclined to believe that the birth of all great civilizations, in the past as well as the present, is due to cultural contact. But before we accept this as true of any particular civilization, no effort should be spared to collect all available data in order to examine in detail the process of actual growth. In China's past, only a small area has been properly investigated up to the present time, and, even in this area, the task is hardly half done. In fact, just when scientific data were being accumulated in the middle 1930's, the endeavor was brought to a sudden end by the Japanese invasion.

And now, after a lapse of almost twenty years since World War II started in the Far East, we are still dependent upon the materials collected in the brief span of nine years (1929-1937) when the Academia Sinica excavated in Anyang and its adjacent region. In many key areas, although there have been plenty of fruitful lootings, hardly any properly conducted archaeological excavations have taken place. There is scarcely any doubt that our urgent problem is still to look for new facts so that the sudden emergence of the bronze industry, as well as the writing system, may be explained on a more substantial basis.

我在别处曾提到过，这“同时”不过是一种表象而并非实际，而且两

者一定都已过了一段早期的发展历史，才演进到小屯这一阶段。先以小屯发现的铜器来说，任何研究过这个问题的人都知道，为了解释小屯铜器的发展阶段，必须假定一个更早的背景。而在小屯遗址本身也不乏证据，足以证明此地青铜铸造的历史可分成两个亚阶段，而由其中较早的阶段还可能追溯到一个更原始的阶段。

在甲骨上所找到的小屯阶段的文字体系，正如小屯的铜器一样，也呈现出一种相对进步的发展水平。众所周知，小屯的文字比最早的苏美尔文字约晚了1600年至1800年；在这一段时间里，保存书写记载的观念可能由底格里斯河和幼发拉底河流域传入了黄河流域。然而这仍不能解释这种高度复杂的、中国已知最早的文字体系——拥有两千多个单字、在形式和结构上与楔形文字无一相似之处——突然出现在中国土地上的原因。我们要记住，在公元前一千多年，在乌拉尔山和印度半岛以东，华北是整个太平洋沿岸区域唯一具有文字的所在。纵使是最执着的文化传播论者，也得在中国东北平原地区与美索不达米亚之间搜集证据，才能作出论断支持它们是完全舶来的观点。就我个人而言，我认为今日或过去所有伟大文明的发生都是文化接触的结果。但在接受此种理论适用于任一文明之前，我们必须不惜余力搜集资料来详细考察此文明实际成长过程。截至目前为止，中国仅有一小部分地域作过考察，而即使连这一小部分地区的工作也仅做了不到一半。事实是，在20世纪30年代中叶，当科学的资料正在积累时，日本的侵略使一切都归于停顿。

如今，在第二次世界大战在远东爆发二十年后的今日，我们仍需依靠自1929到1937这短短九年间中研院在安阳及其附近地区发掘所获的资料。而在很多重要的地区，目前尽管已经知道许多有价值的文物遗存，但是几乎不曾作过任何适当的考古发掘。毫无疑问，我们亟待解决的问题仍然是寻找新的证据，以便在更坚实的基础上对青铜业及文字体系的突然出现作出解释。

万家保 译

[1] The more important papers which reflect the spirit of this period were collected by Ku Chieh-kang in Ku-shih-pien (in Chinese), of which the first volume was published in 1926. Ku wrote a lengthy preface to this unique publication; it is mainly autobiographical, dealing with the development of his own interest in historical studies. A. W. Hummel, who translated this preface into English with the title *The Autobiography of a Chinese Historian*, said in the introductory remarks to his translation: "It is a critical résumé of all the currents of thought that have swept over China in the past thirty years." Hummel's translation was published in 1931 in the *Sinica Leidensia Series*.

[2] In the *Bulletin of the National Research Institute of History and Philology of the Academia Sinica* (in Chinese), Vol. I, No. 1 (1928), Fu Ssu-nien, the founder and the first director of the Institute, discussed in the publication notice of the bulletin the general background of historical researches in China and expounded the urgency and necessity of the adoption of a new method and a new approach for the continuous advancement of this branch of Chinese learning.

[3] 反映这时代精神更为重要的文献是顾颉刚所编的《古史辨》（中文），第一卷发行于1926年。顾氏在这文集前面，写了一篇自传性的长序，主要讲述他自己对历史研究兴趣的变迁。恒慕义把这序译成英文，并以《一个中国历史学家的自传》出版。恒氏

在他的译前评介中说：“这是一项对近三十年来中国流行思潮的批判摘要。”他的译本于1931年作为荷兰莱顿汉学丛书系列之一推出。

[4] 在《国立中央研究院历史语言研究所集刊》（中文）第一本第一分（1928）的创刊词中，史语所的创办人、第一任所长傅斯年讨论了中国历史研究的一般背景，并说明了为求中国史学的继续发展，探取新方法及新途径的急迫需要。

- [36] 安特生对他在中国主要的考古工作作了一个总结,并以《中国史前研究》为题撰写专著在《远东古物博物馆通报》第15册(斯德哥尔摩,1943)予以发表。
- [37] In "Researches into the Prehistory of the Chinese," Andersson expressed the opinion that "the problem of pottery painting in the Far East does not begin with Yangshao, but with the hanging triangle of Ch'i Chia P'ing," (p. 282; Pl. XXXVII, 2). Since 1943, however, the chronological position of the Ch'i Chia remains, as interpreted by Andersson, has been definitely proved to be untenable by the discovery of Hsia Nai ("New Discoveries of a Ch'i Chia Culture," *Chinese Journal of Archaeology* (in Chinese), III (1948), pp.116-117). It may be noted here that, as early as 1938, G. D. Wu already mentioned the fact that the specimen of the Houkang painted pottery, first described by Liang Ssu-yung, consisting of a few parallel vertical lines, is the simplest of its kind that has been discovered in the whole of North China including Ch'i Chia P'ing. See also note 20.

II Origin and Early Development

In the last thirty years field archaeology in China has uncovered the remains of the Shang dynasty, datable to the middle and the latter part of the second millennium B.C. It has been found that Chinese civilization as represented by these remains, located in the northernmost part of Honan province and north of the Yellow River, was very advanced and had already attained maturity, with a complete mastery of the technique of casting bronze, the possession of an independent writing system, and an efficient and complicated military and political organization; it was also characterized by an abundance of material well-being, a remarkable manifestation of a highly sophisticated decorative art, an exacting social system, and a theocratic religion dominated by an excessive devotion to ancestor worship. It was a civilization full of vitality and vigor; although not without elements of cruelty and monstrosity, it had nevertheless adequately prepared the ground for the coming of a humanistic philosophy that found its ablest exponents in Confucius and his school in the following Chou dynasty.

Is the civilization of the Shang dynasty homogeneous, autochthonous, and entirely independent of outside influence? My answer to this question is an emphatic no. Let me discuss it in some detail.

It is a well-known fact that, at the close of the Neolithic age, North China was divided into at least two cultural zones, with a possible third one which still needs further clarification by more archaeological evidence. In a paper which I read before the Eighth Pacific Science Congress in 1953, I pointed out the fact that during this period:

In the northwest and along the Sino-Mongolian border was the culture first developed by the Painted Pottery people, and most probably further elaborated by the Hsia, the first of the Chinese dynasties, which preceded the Shang. To this dynasty the earliest Chinese bronzes and bronze foundry were usually attributed both according to the historical narratives and the antiquarian's account. Most probably also, the people of this dynasty believed in and practiced totemism, in the light of some recent interpretations of certain folk literature that survived in the various compilations of the Chou philosophers.^[1] The center of the second tradition is to be

located near the Eastern Coast and was represented by the Black Pottery folk who survived in the historical time as the Eastern I, also known as the Squatting Barbarians in the early documents....

貳 中国文明的起源和早期的发展

在最近三十多年的中国田野考古工作中，考古工作者发现了商朝遗址。商朝的年代约当公元前第二个千年的中期至晚期。由这个坐落在河南省北端、黄河北岸的遗址所表现的来看，彼时中国文明不但相当进步，而且已臻成熟。它具备一套完整熟练的铸铜技术、独立发展的文字体系和一种复杂而有效率的军事和政治组织。这种文化还体现了富庶的物质生活、高度成熟的装饰艺术、严苛的社会组织和对祖先极度崇拜的神权政治。这是一种充满生机和活力的文明；虽然其间不免含有残酷和黠武的因素，但这个文化也为后来周朝的孔子及其学派所代表的人文主义哲学奠定了相当的基础。

商的文明是不是同质的、土著的、完全独立于外界影响之外的呢？我对这个问题的回答是断然否定的。现在让我详细加以解说。

众所周知，在新石器时代的末期，华北至少已分为两个文化地区。也许还有第三个地区，但尚需更多考古学的发掘方能予以证实。我在1953年第八届太平洋学术会议上宣读的一篇论文中曾经指出，在这一时期：

彩陶民族首先在西北与中蒙边界沿线地方发展其文化，这种文化很有可能为商朝以前的中国第一个王朝——夏朝——进一步予以发扬。根据历史记述和古物学家的看法，夏开中国青铜器及青铜铸造的先河。又根据最近一些对在周朝先哲浩淼著述中保留下来的民间文学的新解释，夏人很可能相信且已运用图腾。^[2]第二种文化传统的核心位于东部沿海一带，以黑陶民族为代表，亦即历史上的东夷，在早期的文献中被称之为“尸方”……

But the forerunners of the Shang dynasty could not, by any historical or archaeological evidence, be positively identified with either of the above traditions. The founders of the Shang dynasty were probably the earliest Chinese who developed the kneeling posture into a sitting habit, known later among the Japanese as *seiza*. Whether they learned this from the Egyptian scribes or developed it independently remains to be investigated. It seems to be pretty certain that at first the ancestors of the Shang dynasty conquered the Eastern I and absorbed some of their art tradition; in return, they also taught them a new technique of warfare, on the condition, of course, that they should fight under their leadership. With this newly trained army, the Shang conquered the Hsia further west, and subsequently learned from the Hsia whatever was worth their while learning. So the dynastic splendor of the Shang is the result of the coalescence of three distinct cultural traditions: the Eastern I, the western Hsia, and the

proto-Shang....^[3]

The foregoing statement was based mainly on the study of the decorative art of the Shang dynasty, especially the two fragments of human figures carved in stone, recovered respectively from the dwelling site of Hsiao-t'un and the cemetery site of Hou-chia-chuang (Fig. 4·1, Fig. 4·2), with additional confirmatory evidences from bone carvings and pottery decorations.

(4·1) Fragment of human figures in stone from Hou-chia-chuang 侯家庄出土的石雕人

(4.2) Fragment of human figures in stone from Hsiao-t'un 小屯出土的石雕人像残片

The economic conditions of the three types of community in the Aëneolithic and protohistorical periods—the Yangshao, that is, the Painted Pottery culture; the Lungshan, the Black Pottery culture; and the Hsiao-t'un, the Shang culture—are clearly reflected in the faunistic remains collected from these sites. The fauna of the Yangshao remains consist only of pigs, dogs, and cattle; neither sheep nor horses were found.^[4] In Ch'eng-tzu-yai,^[5] the type site of the Black Pottery culture, the list of the animal bones includes those of pigs, dogs, sheep, oxen, and horses. In both Yangshao and Ch'eng-tzu-yai, deer were also found; whether they were domesticated or not is not clear. On the whole, bones of wild animals were rare in both of the prehistorical sites. This is certainly an indication of a quiet sedentary life, devoted entirely to agriculture and the keeping of a few domesticated animals; if there was any game hunting, it was limited

to the hunting of a few deer.

但是无论是历史学证据或是考古学的证据，都不能证实商朝的祖先具有上述某一传统。商朝的创始者可能是最早将跪姿转为坐姿的中国人，日本人后来称之为“正坐”。这是从埃及学来的，还是自己发明的，还有待考察。不过，可以确定的是，商朝的祖先首先征服了东夷，吸取了他们的某些艺术传统，也教给他们一些战争新技术，当然前提是他们在商人的领导下作战。商人挟此新练之兵，西指克夏，又吸收了一部分他们认为值得学习的夏文化。所以商朝灿烂的文明是综合了东夷、西夏和原商三种不同的文化传统.....[6]

以上的叙述，主要是根据对商代装饰艺术、特别是对两块分别从小屯居住区及侯家庄墓葬区发掘出来的石雕人像残片（图4·1，图4·2）的研究得出的；这一说法在骨雕及陶饰中得到了进一步证实。

铜石并用时代与原史时期的三大群落——仰韶（彩陶文化）、龙山（黑陶文化）和小屯（商文化）——之经济环境，分别从这些遗址所收集的动物群之遗骸中清楚反映出来。仰韶遗址的动物群仅包括猪、狗和牛，并无羊或马。[7]典型的黑陶文化遗址城子崖，有猪、狗、羊、牛及马的兽骨遗存。[8]仰韶和城子崖两地还曾发现过鹿，至于鹿是驯养的还是野生的则不能确知。总体而言，野生动物的骨骼在这两处都很罕见。这样的情况确定地表现了一种平静的定居生活，以农耕和饲养家畜为主；即使有狩猎的话，也只限于狩猎。

But the faunistic assemblage from the Shang remains^[9] at Hsiao-t'un is much more remarkable, not only for its greater variety of domesticated animals—for it includes oxen and buffalo, sheep and goats, dogs and horses, and two varieties of pigs; but there is also an impressive list of wild animals, ranging from monkeys to whales, and comprising bears, tigers, leopards, tapirs, elephants, rhinoceroses, many varieties of deer, foxes, badgers, and so forth. The whole list of the mammalian collection, including both the wild and the domesticated group, numbers no fewer than twenty-nine species, according to the latest estimate of the eminent palaeontologists Dr. C. C. Young and the late Pierre Teilhard de Chardin.

The great abundance and variety of the faunistic remains from Hsiao-t'un,^[10] especially of the undomesticated group, may be taken as an unmistakable index to the life of a people given to wild game hunting. So it is obvious that the ruling house of the Shang dynasty must have been somewhat different, culturally at least, from the peasants of the Aëneolithic Yangshao and the Lungshan periods. This is confirmable not only by the obsequies of the members of the royal families but also by the oracle bone inscriptions. In *Archaeologia Sinica*, Number Two, IIB, 2908 (Fig. 5), there is on record the following inscription:

Divine on the day Wu-wu

Ku made the inquiry

We are going to chase at "Ch'iu"; any capture?

Hunting on this day, (we) actually captured:

Tigers, one;

Deer, forty;

Foxes, one hundred and sixty-four;

Hornless deer, one hundred and fifty-nine;

and so forth

由小屯的商朝遗址出土的动物群更加引人注目，[\[11\]](#)因为这其中不但有更多种类的家畜——包括了黄牛、水牛、绵羊、山羊、狗、马和两种猪，而且还有从猴到鲸的一系列野生动物，其中包括熊、虎、豹、獾、象、犀牛、许多类型的鹿、**玃**及獾等等。据著名古生物学家杨钟健博士和已故德日进神甫的最新估计，此地哺乳类动物——包括驯养的和野生的——合计共达29类之多。

(5) Ink rubbing of the inscribed plastron about King Wu-ting's captures in a hunting expedition at "Ch'iu" 武丁狩獵^魁腹甲殘片拓片

小屯出土的动物遗骨^[12]——尤其是野生动物遗骨——总量之丰富，种类之繁多，无疑可以显示此时人们对于狩猎的喜好。因之，显然商朝王室至少在文化上与铜石并用的仰韶和龙山时期的农民有所不同。这不同之处通过王室成员的葬礼和甲骨文都可得以确证。《中国考古报告集之二·小屯·乙编》中第2908号甲骨片（图5）刻有如下的文字：

戊午卜（在戊午那天卜卦）

谷贞（是名叫谷的人卜的）

我狩𪛗，禽？（我们去狩𪛗，能获得多少？）

之日狩，允禽，获：（这天我们实际猎到）

虎一；

鹿四十；

玃一百六十四；

麇一百五十九.....

Following the above records are some more inscriptions not yet decipherable. The inscription quoted is a sufficiently clear example that bears witness to the royal passion for hunting. This particular record is attributed by Professor Tung Tso-pin to the reign of Wu-ting of the fourteenth century B.C.^[13] In another inscription of the same period, it is recorded that two tigers were captured; the largest number of deer shot in one chase during this reign is 162.^[14]

Hunting records are frequently found in the oracle bone inscriptions; they were taken down from various periods and by different kings; so this passion for big game hunting was really a tribal habit shared in common by all the members of the royal house instead of being the idiosyncrasy of an individual king.

The royal passion for sports may be also testified to by the fact that, underneath the wooden chamber where the royal coffin was placed, there were always sacrificial pits in which large dogs accompanied by big adult human males were sacrificed. These men and dogs were the king's company in his lifetime; as they followed him in his moments of pleasure, so they accompanied him to another world (Fig. 6).

Thus it could not be considered as a mere coincidence that with the coming of Shang there was a sudden efflorescence of animal art. This art must have been developed with a whole tribal tradition behind it: the passion for hunting and also for keeping wild animals alive; then, at the death of the master, all followed him to eternity. Once correlated with this tradition, the animal art of this period becomes much more intelligible.

If the Shang culture was totally different from the Yangshao and not exactly the same as the Lungshan, the question naturally arises, where was this culture first developed? The question sounds complicated, so the answer requires a ramified search.

后面紧接着还有一些仍然不能解释的文字。不过这几行记载已足以清楚展示王室对于狩猎的热爱。董作宾教授将这片龟甲划归于公元前14世纪武丁在位时期。^[15]同时期的另一片甲骨上有猎得虎两只的记载；

武丁在位时曾有一举猎鹿162只之多的记载。 [16]

关于狩猎的记录频见于甲骨文中，涉及到不同时期的不同帝王。由此可见狩猎大型动物实为一种风靡整个王室的部落习惯，而非某位帝王个人的特殊癖好。

王室对于狩猎运动的热爱也可从安置王棺的木椁下面获得证明：那里总有埋葬牺牲用的坑穴，坑中有巨犬和高大的成年男人尸体。这些曾伴着帝王狩猎，他们在主人生前曾追随他欢享过愉快的狩猎时光，又陪伴主人到另一世界去（图6）。

因此，自商代以来动物艺术的突然兴盛不应被看作是一种巧合。这种艺术的发展背后必定有整个部落传统的支持：热爱狩猎和饲养野生动物，在主人死后将之一起送到极乐世界。只要与这一传统联系起来看，这时期的动物艺术就容易理解得多。

既然商文化和仰韶文化截然不同，又和龙山文化互异，那么随之而来的问题是：商文化是从哪儿来的？这个问题听起来很复杂，所以答案也须作多方面的探讨。

(6) Floor of the wooden chamber of HPKM: 1001, Hou-chia-chuang 侯家庄
HPKM:1001大墓之木椁地面遗迹

In my paper on the "Diverse Background of the Decorative Art of the Shang [Yin] Dynasty" which I have cited above, I tried to show that the animal art found on the Shang bronzes was most probably derived from wood carvings. The imprints left on the pounded earth in the royal tombs were originally the decorative parts of perishable

materials, made up mostly of leather, textiles, and wood (Fig. 7). Although the wooden chamber which housed the royal coffin has vanished with only minute fragments left here and there, still these are sufficient to prove that the inside of the chamber was originally decorated. So the existence of a wood-carving art is beyond dispute. [17] A study of the imprints on the pounded earth from the various tombs proves that the Chinese decorative art at this stage of its development was already a commingling of several traditions; a similar condition is also reflected in the bone and stone carvings. Among the sundry traditions, the one with an obvious Western affiliation usually attracts the attention of the archaeologists first. Several important examples under this category may be mentioned; of these the *fei-i* monster (Fig. 8), developed as a decorative pattern with one head, *t'ao-t'ie* fashion, and two intertwining bodies, may be taken as the first instance. This pattern was traced out on the top of the wooden chamber in HPKM: 1001 of the Hou-chia-chuang royal cemetery, and is certainly the earliest example of its kind in the art history of China. The pattern underwent an evolution in China and was transmitted in various versions in later times. It reappeared in the famous Wu Liang Tz'u's two incised human figures, [18] the lower parts of which are made up of two long tails intertwined with each other. But the earliest example of this pattern as found in the royal tomb was already more than a thousand years later than those discovered in the Middle and the Near East. So its ultimate origin must be traced to the Mesopotamian region; and it is quite likely that, like the gold-foiled handle from Gebel el Tarif of Egypt, decorated by two intertwining snakes, which Henri Frankfort thought was of Sumerian derivation, [19] the *fei-i* pattern of the Shang art was inspired from the same origin, modified to some extent to suit the Chinese tradition.

在上面曾引述的我的一篇名为《殷代装饰艺术的诸种背景》的论文中，我曾试图证明商朝铜器上所见的动物艺术非常可能是由木雕演变而来。在王室陵墓夯土上遗存的凹痕是原来的旧皮革、纺织品或木材等易腐坏材料制成的装饰部分（图7）。虽然安放帝王棺材的木椁已经消失，但是仅有的零星散布的碎片仍足以证明木椁内部最初曾刻意装饰过。所以木雕艺术的存在是无可争议的。 [20] 对不同墓葬中夯土印痕的研究证明，发展到这一阶段的中国装饰艺术已经综合了几种不同的传统；同样的情形也反映在骨雕和石雕上。在各种不同的传统之中，和西方有明显关联的通常首先引起考古学家的注意。这一类中有几个重要例子可以一提。其中，一个名为“肥遗”的怪兽图案（图8）可以作为一个首要的例证，她的头部形似饕餮，二身交结。这一图案是从侯家庄王陵 HPKM: 1001 大墓的椁顶模写下来的，这无疑是中国艺术史上此类图形的最早例子。这种图案在中国经过了若干演变，后以各种不同式样传世。在著名的武梁祠中，它以两个雕刻人形再现， [21] 其下半身是两条长长的扭在一起的尾巴。但是在殷代王陵中发现的首个此类图形，已比

中东和近东出现的晚了一千多年。所以，它最根本的源头定可追溯到美索不达米亚地区。亨利·法兰克福认为出土于埃及盖伯尔塔里夫的有双蛇交缠图案装饰的包金手把起源于苏美尔人，^[22]商朝艺术中的“肥遗”图案也很有可能是从同一起源中受到启发，只是经过了些许修正以适合中国的传统。

Another motif that appeared among the traces of the perishable wood-carving art is a pair of tigers, arranged antithetically with tails pointing toward the center and an animal face between the tigers near the top. The whole pattern was badly decayed and almost beyond recognition, but careful tracing work recovered it. The accuracy of the tracing was proved by the discovery of a similar pattern on a big bronze tetrapod recovered in a village very near to the royal cemetery (Fig. 9-1). This is evidently a degenerated version of the famous Hero and Beast motif, which also originated in Mesopotamia and was then transmitted to Egypt and later immortalized in the Mycenaean time by the famous Lion Gate.^[23]

(7) Drum and musical stone discovered together with remnants of their hanging frames in HPKM: 1217, Hou-chia-chuang 侯家庄HPKM:1217
大墓出土的皮鼓、石磬及其支架之遗迹

(8) *Fei-i* pattern traced from the remnants of a disintegrated wooden article in one of the big tombs of Hou-chia-chuang 侯家庄大墓残存木制品上的肥遗图案

It is clear that, as it appeared on the Chinese bronzes, the motif of the hero subduing the beasts had already undergone important changes. In place of the figure of the hero, the character *wang*, meaning the king, might appear; and the lions on both sides were replaced at first by tigers, and later by a pair of boars or even dogs. In some cases the hero was given an actual human figure but was also accompanied by an additional beast placed under the figure of the hero. In other cases some other character, not yet decipherable, was substituted for the pictorial character for the king. All these versions, which appeared as incised symbols on many bronzes, were, it seems to me, simply variations of the original Mesopotamian motif (Fig. 9).

另一种在易腐坏的木雕残迹中发现的母题是一对老虎的图形：两虎左右对称，虎尾直指中央，两虎之间靠近上方有一兽面。这个图案原已残碎得不堪辨认，但是经过精细描摹已得以复原。王室墓区临近村落发掘出的一只四足鼎上的一幅相似图形证明了此次复原的精确性（图9-1）。显然，这个图形是著名的“英雄与野兽”母题的一种变形，它亦起源于美索不达米亚，后流传到埃及，再后来又于希腊迈锡尼时期因著名的狮门而得以不朽。^[24]

正如中国铜器上的图案所表现的那样，这种英雄擒兽主题明显经历了若干重大改变。英雄像可能化成一个“王”字；两旁的狮子，先变成了一对老虎，后来则是一对公猪甚至一对狗。有时英雄也以真正的人形出现，但是还会有一只野兽在其下方。有时中间的象形文字“王”也会被另一个尚未辨识的字所替代。所有这些刻在铜器上的不同花样，在我看来，不过是美索不达米亚原母题的不同变体。（图9）

(9) 1, Ink rubbing of the decorative pattern on the standing lug above the rim of a tetrapod discovered in the neighborhood of Hou-chia-chuang; 2-12, bronze inscriptions from Jung Keng's *Chin-wen-pien* (*Inscriptions on Bronzes*) (2nd ed. rev. and enl.; Ch'ang-sha, 1939), supplementary chapter, p. 26. 1, 侯家庄附近出土之后母

The most interesting proof of China's contact with the West in the second millennium B.C. or even earlier comes from some pottery forms. The example I have in mind for illustration is a jar cover, in the shape of a flower pot, with a phallic-shaped handle standing upright in the center inside the pot. This type of cover, as made known by McKay and publicized by Gordon Childe,^[25] was also found in Jemdet Nasr and Mohenjo-daro. Comparing the pottery forms of the Shang period with those of the Middle East and the Near East regions, one may find a number of instances that exhibit close resemblances; but I take this one as the most indisputable example indicating cultural contact, as no imaginable reason could be conceived for the independent invention of covers so similar in structure in two different and widely separated parts of the world (Fig. 10).

All these evidences, however, show only the existence of some contact between the cultures of the Near East and the Far East. The nature of such contact could scarcely be inferred from the above evidences; it may have been a very remote one resulting in partial imitations, such as most of the instances cited actually were. The real foundation of the Shang culture was still in the Asiatic East, which also gave rise to and inspired the major art tradition of the whole Pacific basin. The source of this tradition is most probably to be found in the lost art of wood carving of China's past. I have dwelt elsewhere on the main features of this particular tradition in some detail; as they are so important in the present connection, let me cite some of the samples used for the illustration of this thesis.

中国在公元前第二个千年或更早时期和西方文明接触的最有趣的证据，是从陶器的形制上得到的。我想用以说明这一事实的例证是一件陶罐的盖子。这一件像花盆一样的盖子的中央有一根直立的阴茎状的柄。这样形状的盖子最初由麦偕氏所发现，经柴尔德氏介绍而为世人所知，^[26]同样的盖子也在杰姆德纳刹和莫汉久达鲁地方发现过。将商代陶器形制和近东、中东的加以比较，可以发现很多甚为相像的例子，但我以为这一个是说明文化接触最无可争议的例证。在相隔这样遥远而且互异的世界的两端，如果能各自独立发明出结构如此相似的器盖，其原因是难以想象的。（图10）

然而，上述的各种证据只能说明近东和远东之间存在文化接触。这种文化接触的性质甚难由上述例证推断——这也许只是一种引起部分模仿的遥远接触，像上述所举的多数例子实际上就是如此。商文化的真正基础仍在亚洲东部。这个地区孕育并且启发了整个太平洋地区的主要艺术传统，而这一传统很可能在失落的中国古代木雕艺术中找到源头。我曾在别处详细讨论过这种独特传统的主要特征。因为这些特征在这里也

很重要，让我引述几个例子来加以阐释。

(10) A type of jar cover found in Jemdet Nasr, Mohenjo-daro, and Hsiao-t'un. (The bottom one from *New Light on the Most Ancient East*, by V. Gordon Child [New York: Frederick A. Praeger Inc., 1952], p.132.) 小屯、莫汉久达鲁、杰姆德纳刹（从上至下）出土的陶盖比较图（最下方图示出自柴尔德：《远古东方之新曙光》【纽约：Frederick A. Praeger Inc., 1952】，132页）

The unique bone handle which I first uncovered in 1929 still remains the most important example of its kind that is nearly complete. The most remarkable features of this handle are the ornamental patterns (Fig. 11). It is about 15 cm. in length and almond-shaped crosswise, with a socket at the smaller end that

measures 16 mm. deep; the cross section of the socket, which is lentil-shaped, measures 16 mm. by 8 mm. at the maximum. The outside of this handle is completely carved from top to bottom, on both sides and in five units; three of the units are composed of *t'ao-t'ie* masks, each consisting of a pair of such masks joined at the back and facing opposite sides. These three units are separated from each other by two longer and slenderer units of *t'ao-t'ie* in profile, each with a body attached to the head. These five units of decorative patterns, essentially similar to one another, pile up on the handle with a vertical succession that reminds one of the arrangements of the animal heads carved on the totem poles found on the northwestern coast of Canada, except that the composition of the Hsiao-t'un handle seems to carry a more subtle rhythm.

我在1929年发现的一只几近完整的独特骨柄，至今仍是这类物品中最重要的一个例子。这只骨柄最引人注目的是它的装饰图案（图11）。骨柄长约150毫米，截面为杏眼形，在较细的一端有深16毫米的承口，此一扁豆形之承口最宽处面积为16毫米×8毫米。骨柄之表面由上至下正反两面通体皆刻以花纹，分成五个单位；其中三个单位分别以两饕餮面组成，两面相背而立，边缘相接，朝向相反的方向。这三个单位又被两个瘦长的、头体相连的饕餮纹单位两两相隔。这五个饰纹相类的单位，在骨柄上依次堆叠，使人联想到加拿大西北海岸刻有重叠兽首的图腾柱，只是这只小屯出土的骨柄构图更加精巧和谐。

(11) Patterns of carved decoration and sections of a bone handle from Hsiao-t'un 小屯雕花骨柄及其剖面

The decorative patterns and their arrangement described above suggest three principles which have been found to be basic in most Pacific arts; besides the piling up of similar designs in vertical succession, there are the junction of profiles of the animal body, split into two symmetrical halves on a curved surface or a flat one, and, in addition, a rigid symmetry and a regular rhythm. All these three principles found their fullest expression in the bronze works of Shang and later times and in many of the wood carvings of the Pacific region.^[27]

Let me give some more examples from the excavated bronzes of Anyang. Of this collection there are many square *yi* on record. Each of the square sides was cast like a flat piece of wooden plank (Fig. 12·1). All the sides are fully decorated with the head of an animal either with or without a body as the central motif, surrounded by some minor decorative patterns. The main theme on the *yi* illustrated is the treatment of the animal's head; it is an attempt to render a three-dimensional object on a two-dimensional background by cutting the head into two profiles and joining them together in a perfectly symmetrical arrangement. The effect is almost exactly the same as that of the house-front painting of the Kwakiutl, cited by Franz Boas in his work on Primitive Art.^[28] On the Chinese bronzes, such animal heads have been called *t'ao-t'ie*, but they evidently had more realistic names in earlier times, names more suggestive of the true nature of these animal representations.

(12-1) Square yi of the Shang dynasty from Hou-chia-chuang 侯家庄出土的商代方彝

(12-2) Square *yu* of the Shang dynasty from Hsiao-t'un 小屯出土的商代方卣

The square *yi* of the Shang time is almost always fully decorated. In one of my earlier papers^[29] I have tried to show that, as far as the shapes of the excavated bronzes from Hsiao-t'un are concerned, the

majority of these in the round-bodied group derived their origin from the pottery forms, while the angular type—both the square and the quadrangular bronzes—copied their forms as well as their patterns of decoration from some wooden prototypes. It was also pointed out in this paper that the angular type was always fully decorated (Fig. 12·1, Fig. 12·2), while the round type was fully covered only rarely, and more frequently left completely plain (Fig. 13·1, Fig. 13·2). An obvious inference from all these discoveries would be that the angular-bodied bronzes not only inherited the shapes of the wooden prototypes but also carried on the method and patterns of decoration of the wood carvers, while the round-bodied articles cast in bronze, shaped mainly after the ceramic tradition, acquired their ornaments much later.

以上描述的装饰图案及其构图使人想到太平洋艺术中所见的三点基本原则：除了相似图案的依次垂直堆叠以外，这种艺术还呈现出动物身体侧面图在平面或曲面上的对称拼接，以及严格的对称性和规律性。这三点原则都在商代及其以后的青铜器，以及太平洋区域的许多木雕图案上充分表现出来。^[30]

让我再举几个安阳出土的青铜器做例子。在这类藏品中有好几个有记录的方彝，其每一方面都像一块木板（图12·1）。每一面都完全饰以一个兽面或连体兽面为核心的母题，周围充以其他细小的饰纹。图版所示的方彝也以兽首为主题，它将兽首一分为二并将两面以相接的方式完全对称地平铺于一个平面上，试图以此在二维空间里展现三维物体。这种效果与博厄斯在《原始艺术》^[31]一书中引述的夸扣特尔人的房前绘画几乎完全一样。中国铜器上这种兽面，我们称作饕餮，不过其早期的名字显然更具现实性，更能代表这些动物图像的真实特性。

商代的方彝几乎都是满面纹饰。在我早期的一篇文章中^[32]，我曾试图证明，以小屯出土铜器的形制而论，圆形的铜器大部分都是由陶器演变而来，而方形——包括正方形的和长方的——铜器无论形制还是饰纹都是对木器的临摹。在这篇论文中，我还提出，方形的铜器通常都是满面饰纹（图12·1，图12·2），圆形的满面饰纹则很罕见，全素的更为常见（图13·1，图13·2）。从这些发现中可以明显地推断：方形铜器不但承继了木器的形制，而且沿袭了木雕的方法和饰纹样；圆形的铜器则主要承袭陶器传统，较晚的时候才开始模仿其装饰。

(13.1) *Ting* tripod from Hsiao-t'un 小屯出土的鼎

(13·2) *Ku* from Hsiao-t'un 小屯出土的觚

It may be further inferred that, as the members of the ruling house of Shang were probably all genuine lovers of wild game hunting, such habits were very likely nurtured in a forest environment, which would also be best fitted for the development of a wood-carving art. It is most interesting to compare the types of animal patterns on the bronzes with the hunting records in the oracle bone inscriptions. Tiger and deer motifs were constantly met with on the

chariot pieces as well as on the big bronzes; the tiger was frequently found on musical stones, inlaid and painted decorative pieces, of which the substances had disappeared long ago but whose impression had been left on the stamped earth. The abundance of deer is proved not only by the hunting records; it is even better testified to by their skeletal remains, quantitatively second only to the domesticated pigs among the remains of Hsiao-t'un. These animals, as we know, are essentially woodland creatures; wherever they roamed, their presence may be taken as an indication of some forested region not far off.

The dominance of the animal motifs, however, did not succeed in obliterating completely the geometrical arts which prevailed in North China before the Shang. Authentic Shang bronzes were sometimes covered exclusively with spirals or zigzags (Fig. 14, Fig. 15).

由商王室之爱好狩猎还可进一步推测，狩猎习惯很可能是在森林环境中养成的，而这样的环境也最适合木雕艺术的发展。把铜器上动物的图案和甲骨文上的狩猎记录加以比较，也是一件非常有趣的事。虎和鹿的母题经常在战车残片及大型铜器上出现；虎的图案也常常出现在簋上，目前所见的是有镶嵌和绘图的残片，虽然原物消失已久，但我们仍能从压土上找到图案的印迹。鹿之众多不但能从甲骨文的狩猎记录中窥见一斑，更在小屯出土的动物残骨中得到了印证——鹿骨的数目位列第二，仅次于家猪。我们都知道上述动物都是森林动物，不论它们在哪里游走，它们的出现意味着附近有森林地区存在。

然而，动物母题虽占有绝对优势，也没有完全取代商以前流行于华北的几何图案。真正的商代青铜器有时是完全以云纹或锯齿状纹为装饰的（图14，图15）。

The most important example that testifies to the survival of geometrical decoration in the Shang dynasty is a fragment of a stone human figure in a kneeling-sitting posture, fully dressed in robe and skirt; the border of the garment and the skirt and the cuff of the sleeve are all ornamented with a band composed of double chevrons and interlocked T-patterns (Fig. 4-1, Fig. 16a). All these patterns are incised in narrow lines, hardly wider than 1 mm.; most of the lines thus rendered are short and straight, and at each turning the incision usually starts anew. There is no continuous curvilinear line in the whole composition.

(14) *Tzu* decorated with spirals only 云纹装饰的觶

(15) *P'an* from Hou-chia-chuang with geometrical patterns 侯家庄出土的以几何图形装饰的盘

This kneeling-sitting posture, as distinguished from the squatting-sitting stone torso (Fig. 16b) discovered at Hsiao-t'un, is singularly significant in that it serves to link the daily habit of the ruling class of the Shang dynasty with the decorative art found at the closing phase of the Neolithic time, especially in the Black Pottery region. In the historical period, as we have noted, the indigenous inhabitants who inherited the old territory of the Black Pottery people on the eastern coast were known as the Eastern I, or the Squatting Barbarians. In other words, while the Shang people adopted the decorative art of the coastal culture to a limited extent, the native inhabitants of the coast had stuck to their old habit of squatting instead of aping the *seiza* posture of their conquerors.

(16) Human figures in stone from Anyang: a, d, from Hou-chia-chuang; b, from Hsiao-t'un; c, from Ssu-p'an-mo 殷墟石雕人像四种：a及d自侯家庄出土；b自小屯出土；c自四盘磨出土

The squatting torso from Hsiao-t'un, however, cannot be identified with the coastal culture, if we take the Black Pottery tradition as its main representative. Unlike the Hou-chia-chuang figure, it is entirely devoid of any sartorial covering, except perhaps an apron in the front below the waistline. All four limbs are covered by carved tattooing marks of disintegrated patterns reassembled around an eye design near the joints.

用以证明几何图案在商代仍然存在的最重要证据，是一座跪坐的服饰俱全的石像残片，它的衣边、裙边及袖口都饰以复山形及交错的“T”形花边（图4-1，图16a）。这些花纹都以宽不足1毫米的线条刻画而成，线条短而直，线条的弯折处，皆系另起一笔，整体鲜有曲线连接。

这尊与小屯出土的蹲踞半身石像（图16b）风格迥异的跪坐石像意义重大，因为它把商的统治阶级的日常习惯与新石器时代晚期、特别是在黑陶文化区域里的装饰艺术连接起来了。上面我们曾经提到过，历史上东部滨海的土著，即居住在以往黑陶文化区域的居民，我们称之为“东夷”，亦即“尸方”。换句话说，商人在一定程度上采用了沿海文化中的装饰艺术，但这些滨海土著居民仍执着于传统的蹲坐，并没有模仿他们的征服者改为“正坐”。

然而，如果我们将黑陶文化视为滨海文化的主要代表，小屯出土的

蹲踞石像并不能与此文化相同。与侯家庄出土者不同，这座小屯的石像除了在体前腰下着有一件腹兜外，全身赤裸。四肢皆刻以碎裂的文身图案，图案在关节处攒成一个目形纹饰。

Tattooing as a cultural trait survived among many indigenous tribes south of the Yangtze River in early China. The first century B.C. historian, Ssu-ma Ch'ien, made it known that the native people of Chekiang, whose culture the uncles of the founder of the Chou dynasty adopted, practiced tattooing.^[33] In the classic *Li Chi* there occurs this general statement: "The Easterners are called I; they let their hair loose, and tattoo their bodies."^[34] On the basis of this statement, it seems to be justifiable to identify the Hsiao-t'un torso with the squatting Eastern I; however, additional evidence is needed to show that the tattooing patterns found on the torso of Hsiao-t'un were evolved from a prehistorical prototype before such identification can be confirmed. The southern origin of this particular custom is probably indisputable, as many of the aboriginal tribes south of the Yangtze River are still tattooing their bodies.

This leads us to another aspect of the culture of the Shang dynasty as a whole. How large a portion of its total content may be considered as related to the south or of southern origin? Twenty years ago, I stated in the *Preliminary Reports of Excavations at Anyang* that the shouldered celts, tin ingots, rice, elephants, and buffalo were all apparently related to the south.^[35] As the matter stands now, and after twenty years of discussion and reflection, it seems proper that the case should be restated. Rice was cultivated in northern Honan as early as the Yangshao time; however, no domesticated buffalo were discovered contemporaneous with this cultivation.^[36] In the Shang time, on the other hand, according to recent interpretation of some passages in the oracle bone inscriptions, not only was there rice cultivation but the fields were actually ploughed, and the ploughs were drawn by domesticated buffalo.^[37] The character for rice was identified in the oracle bone inscriptions. In this connection it might be fitting to quote the authentic opinion of the authors of "On the Mammalian Remains from the Archaeological Site of Anyang." In a note at the end of their report, they said: "The discoveries from western Honan, northern Shantung, and eastern Szechwan support the idea that in Anyang, *Bubalus mephistopheles* represents an old indigenous type (artificially prolonged by domestication) rather than an imported foreign form."^[38] So it would seem that, although the rice cultivation may have originated in the south, it may have been improved and further developed in the Yellow River basin. The statistical study of the faunistic remains of Hsiao-t'un by C. C. Young shows that *Bubalus mephistopheles* is one of the three mammals that

ranked highest numerically in our collection, the individual specimens exceeding 1,000 in number.^[39] Yet buffalo were never used for sacrificial purposes; in the sacrificial pits, only *Bos exiguus* was found.

作为一种文化特色，文身曾存在于古代中国长江以南的许多土著部落中。公元前1世纪的历史学家司马迁曾记载周朝开国王叔们“观乡而顺宜”，效法浙江土著文身的风气。^[40]《礼记》中也有类似叙述：“东方曰夷，被发文身。”^[41]据此记载，似乎有理由认为小屯的石像为蹲踞的东夷；不过还需再找到证据证明小屯石像上文身的花纹是由史前的花纹原型演变而来，此一断语方能确立。文身之习俗源于南方，似无争辩之余地，因江南的土著至今仍有文身者。

以上讨论导引我们进入商整体文化的另一个方面：商文化当中究竟有多少与南方有关，或起源于南方？二十年前，我在《安阳发掘报告》中说：有肩石斧、锡铤、米、象和水牛都明显地和南方有关。^[42]照目前的情况来看，经过了二十年的讨论和辨疑之后，这一主张确有重申的必要。早在仰韶时期，在河南北部已有了稻米的耕种，但驯养的水牛却未在栽种水稻的同一时期发现过。^[43]另一方面，根据最近对甲骨文某些片段的解读，商人不但已开始种植稻米，而且懂得犁地，并且拖犁的就是驯养的水牛。^[44]“米”这个字在甲骨文中也确定了。在这里或适于引用《安阳殷墟之哺乳动物群》一文作者的真实观点。在文末一段注释中，作者说到：“豫西、鲁北及川东的发现，证实安阳的圣水牛代表一类古老的土生的品种（其体型通过驯养人为地被拉长），而非引进的。”^[45]因此，事实可能是，虽然稻米或源于南方，但却可能在黄河流域经过一番改良和培育。杨钟健先生对小屯动物遗骸的统计显示：圣水牛是我们发掘出土三种为数最多的哺乳类动物之一，其单体取样已逾千个。^[46]但水牛从未做牺牲品用，在祭礼坑中发现的只有牛。

The problem of the tin remains the same as twenty years ago; no new data can be added (Fig. 17). It may be emphasized once more that the very fact that this mineral was stored in ingot form is an indication of its being imported from some distance. The copper was evidently smelted right at the spot of the foundry near the site of Hsiao-t'un, as malachite ore was more than once discovered. This ore was apparently brought to the foundry without any preliminary reduction. If the tin was imported, the further question is whether it was imported from the south or from some other quarter. Old gazetteers reported the production of tin in North China within the radius of a few hundred kilometers of Anyang.^[47] Mining geologists are not totally prepared to accept such reports, but neither are they prepared to deny their accuracy altogether.

Elephants, like buffalo, might have been native Anyang beasts, too, at least in the Shang time. As for shouldered celts, they might have inspired certain types of bronze weapons of the Shang dynasty.

In addition to the 1933 list, one item of real significance should

be added, namely the tortoises whose plastrons were used for divinatory purposes. My colleague Professor Shih Chang-ju recently argued for an independent origin of plastromancy,^[48] as a contrast to the practice of scapulimancy of the Lungshan culture. Whether one agrees with him or not, the southern origin of *Testudo anyangensis* seems to be indisputable. If these shells were sent to the royal court as tributes from various vassal states, as abundantly proved in the oracle bone inscriptions and recently elucidated by Tung Tso-pin,^[49] it is a sure proof that the Shang Empire had a large slice of territory south of the Yangtze River, over which it might have exercised some political control.

(17) Tin ingots from Hsiao-t'un 小屯出土的锡锭

To sum up: my thesis is that the culture of the Shang dynasty is a very composite affair and represents a fusion of many cultural streams. The fundamental stratum upon which the Shang culture was built is rooted deep in the prehistorical past; the development of the rice culture and the whole complex attached to it illustrates the fact that the economic basis of the Shang Empire is typically Eastern

Asiatic and developed in *situ*, as shown by the various eminent workers in the field, such as Andersson, Teilhard de Chardin, and Young, and reaffirmed by the oracle bone inscriptions.

关于锡的问题仍和二十年前一样，并未发现新的资料（图17）。我们现在可以再予强调的是，此金属以锭的形式存在意味着系由外地运来。但是显然铜在小屯附近冶炼，因孔雀石之发现屡见不鲜。此种矿石显然未经预加工便运至铸造地。既然锡系外来，那么进一步的问题是：它是由南方运来，还是由其他地方运来的呢？旧方志记载，在华北地区，安阳方圆数百公里之内有锡矿存在。^[50]采矿地质学者未完全认可此种说法，亦未全予否认。

象和水牛一样，可能也是安阳土生动物之一，至少在商朝是如此。至于有肩石斧，则可能启发了商代某些类青铜武器的形制。

除了1933年论文中所论及的物品外，另有一件物品具有真正重要的意义，即占卜所用的龟甲。我的同事石璋如教授最近以为，不同于龙山文化的牛肩胛骨，龟甲有其独自の来源。^[51]不管同意或不同意他的说法，安阳土龟之来自南方似已无可辩驳。如果正如大量甲骨文所证，如董作宾先生最近所言，^[52]这些甲壳是由各诸侯国贡献给殷王室的，那么，这确实可以证明殷王朝在长江南岸有一大片可以实施政治控制的领地。

总结来说，我以为商的文化是一个多方面的综合体，代表了多种文化源流的交融。殷文化之基础深植于史前时期；稻米文化的发展及附着于此的文化综合体，说明了殷商帝国之经济基础是典型东亚型的，并且是在原地发展起来的。此一事实为许多卓越的田野工作者指出，如安特生、德日进及杨钟健等，又由甲骨文再次证实。

The ruling house of the Shang dynasty had a passion for big game; in the royal park at Hsiao-t'un, the collection certainly included tigers, elephants, monkeys, many species of deer, foxes, wolves, wild boars, and such rare animals as *Budorcas taxicolor lichii*. Their hunting territory must have covered a very large region including large tracts of heavily forested region and extending to places like eastern Mongolia and southern Manchuria. From these quarters, and also from the eastern seaboard, the ancestors of the Shang dynasty acquired some vague knowledge of foreign countries. The Shang people might have been the earliest Chinese to make extensive use of chariots both for hunting and for war purposes, although it was as yet impossible to prove that the Shang people were the first to introduce metals. But it is beyond any doubt that they improved the art and craft of the bronze-casting industry enormously; and the chief use they made of the alloy was to cast ceremonial vessels which were never equaled in any other parts of the world.

The basic problem concerning the genesis of the Shang culture

has to do with the still undiscovered pre-Shang phases of the evolution of the Chinese scripts. In this connection, it must be remembered that, so far, only a very small area of North China has been properly investigated; if other key areas could be studied as thoroughly as the valley of the Huan River, it would certainly be only a matter of time until such fundamental problems would be solved.

商王室酷爱猎狩大型猎物。小屯王家苑林中显然有虎、象、猴、各类的鹿、¹ 犴、狼、野猪以及诸如“李济氏扭角羚”类的稀有动物。他们的狩猎范围定然十分宽广，远及蒙古东部、东北南部，并且有大片密林。从这些地区和东部沿海一带，商人的祖先得到了一些关于外国的模糊知识。商人也许是最早在狩猎和战争中广泛利用战车的中国人，虽尚无法确定他们是否最早利用金属。不过他们极大地改进了青铜器铸造工艺和艺术，这一点无可置疑。商人应用青铜合金主要是为了制造礼器，此种礼器在世界各地罕有与其匹敌者。

商文化发生之基本问题，与至今仍未明了的前商时代中国文字的演变有密切的关系。在这方面，我们必须记住，截至目前为止，华北仅有小块地区得到了适当的调查。如果别的重要地区也像洹水流域一样得以系统的彻底研究，那么获致这一基本问题之最后答案，只不过是时间早晚而已。

[1] In the fifth year of Yin Kung of Lu (Duke Yin), Confucius noted the following event in Ch'un Ch'iu: "The duke reviewed a display of the fishermen at T'ang" (Ch'un Ts'ew, translated by James Legge in the Chinese Classics series, V, Part I [London, 1872], 19). In his translation of this entry, Legge followed the standard interpretation. The original meaning of this version has recently been discussed by Mr. Ch'en P'an, Research Fellow of the National Research Institute of History and Philology; Fu Ssu-nien, Director of the Institute at the time, wrote a lengthy supplementary note to this paper and advanced the interesting theory that the Chinese character 物, used in this connection and in many other ancient texts, really had the meaning that the term "totem" has in modern ethnology. Fu's paper has been republished in the Collected Papers of Fu Meng-chen (in Chinese), IV (Taipei, 1952), pp.236-240.

[2] 孔子在《春秋》中记载：鲁隐公五年，“公观鱼于棠”。（原文此处引用李雅各英译《中国经典》第5册，第1部[伦敦，1872]，19页。）李雅各在翻译该句时遵循的是标准的理解方式。史语所研究员陈槃先生最近曾讨论这句话的原意；史语所前所长傅斯年在陈氏的文后，写了一篇很长的跋，提出了一个非常有趣的理论，他认为“物”字在此处和其他若干古代典籍中确有现代民族学中“图腾”的意义。傅氏的文章收集在《傅孟真先生集》（中文）的第4卷（台北，1952），236~240页。

III The Bronze Age of China

The bronze age of China, as far as present knowledge goes, ranges from the middle of the second millennium B.C. to the middle of the first millennium B.C. Actually, of course, it lasted much more than one thousand years. But it is difficult to fix a definite date either for its beginning or for its end. In the past, students of Chinese bronzes were so completely charmed and dazzled by the splendor of the ritual vessels that they scarcely found any chance to ponder upon the possibility of a humbler history for these antiquities. But like every other craft and institution, the bronze industry of China never was a gift from heaven; it emerged gradually and developed step by step. At least, modern archaeology is proving this to be the case.

Stratigraphy

The most reliable set of data available for a scientific study of this problem is no doubt the collection of bronzes from the Anyang excavations. Of the various localities which were excavated in Anyang, two are the most important. They are the dwelling site of Hsiao-t'un and the cemetery site of Hou-chia-chuang. While it was from the dwelling site that practically all the written records on oracle bones were recovered,^[1] it was from the tombs that the significant collections of bronzes were made. During the Shang dynasty, the northwestern part of Hou-chia-chuang was used exclusively as a burial ground. In Hsiao-t'un, burials of a sacrificial type were also discovered; although not comparable in magnitude with the Hou-chia-chuang big tombs, they were evidently contemporaneous with them. From these burials, a number of important bronzes were also recovered. So the great majority of the bronzes from Hsiao-t'un and Hou-chia-chuang are tomb furniture, buried together with one or a number of persons. Only occasionally was a hoard of bronzes discovered in a storage pit. Such hoards constitute only a small fraction of the total collection; specimens from the storage pits are not only limited in number but are also limited in typology.

For a long while, the exact relation of the tomb bronzes to the inscribed oracle bones, uncovered mainly from the cultural stratum of the Shang dynasty, at Hsiao-t'un, remained an enigma to the fieldworkers in Anyang. In fact, although more than a thousand tombs in Hou-chia-chuang and Hsiao-t'un were opened by the Anyang

excavation party, none of them contained any inscribed oracle bones; a few inscribed bronzes discovered in the tombs, which seemed helpful for identification purposes, are again too meager for detailed investigation, as none of these inscriptions contains more than ten characters.^[2] Thus the inscribed oracle bones and the beautiful big bronze vessels, in the opinion of the field archaeologists at Anyang, were only indirectly and partially associated.

叁 中国的青铜时代

以目前所获的知识而言，中国的青铜时代约当公元前1500年至公元前500年之间。实际上青铜时代当然持续了远不止一千年，可是要确定它究竟起于何时、止于何时，是颇为困难的。以往研究中国青铜器的学者们完全迷醉于这些礼器的华丽，无暇去思考这些古物可能有着相对朴实的历史。但是中国的青铜业，如同任何的工艺及制度一样，不是天赐的；它是逐渐地生长起来，又一步一步发展下去的。至少现代的考古学证明正是如此。

地层

这一问题的科学研究所能依据的最可靠材料，无疑是安阳发掘出土的一批青铜器。在安阳很多被发掘的区域里，其中两个地区最关重要。其一是小屯的居住区，另一处是侯家庄的墓葬区；全部有字的甲骨都自居住区出土，^[3]而主要的青铜器则出自墓葬区。在商代，侯家庄西北部几乎全被作为墓地之用。在小屯亦间有发现具随葬物的墓穴，虽然在规模上不能与侯家庄大墓相比较，但二者显然是处于同一时期的。从这些墓葬中也发现了许多重要的青铜器。所以小屯及侯家庄出土的大部分青铜器都是随葬品，随一个或多个死者埋在墓里。仅仅偶然间可在地窖中发现青铜器，此类青铜器为数既少，形制亦不多。

很长的一段时间，随葬青铜器和小屯殷商文化层出土的有字甲骨这二者之间的确切关系究竟如何，使安阳发掘的工作者感到迷惘。安阳发掘团曾掘开一千多座小屯和侯家庄的墓，但其中从未发现有字甲骨。仅有的几件带铭文的青铜器，看上去有供鉴定用的价值，但是文字多者不超过十个字，也无法作详细的研究。^[4]所以，对安阳的考古家来说，有字的甲骨和优美硕大的青铜器间只有间接的、部分的关联。

This partial association was determined by a careful study of the content of one storage pit, E16, discovered at Hsiao-t'un in the fourth season of the Anyang expedition (1931).^[5] In this pit a large number of inscribed scapulae as well as plastrons, in addition to a small hoard of well-preserved bronze tools and weapons, were found together. As weapons and tools similar in type to this hoard were also found among the burial goods of Hsiao-t'un and Hou-chia-chuang, E16 has served as a strong connecting link which definitely proves the contemporaneity of the bronze with the oracle bone records.

This link, however, connects these two cultural traits in only a general way; it supplies no details as to how closely the different stages of bronze development are related to the various periods of

oracle bone inscriptions. It is fairly obvious that the industry of bronze foundry underwent a process of evolution during the time that the Shang dynasty had its capital at Hsiao-t'un. But by what criteria besides typology are these substages to be divided?

The answer to this question depends much, of course, upon our knowledge of the underground condition of the occupation site at Hsiao-t'un. The earliest settlers in this place were the prehistoric Black Pottery people, who lived in huts partly underground; besides pottery, they manufactured bone and stone implements, but they possessed no knowledge of bronze or copper. This cultural stratum at Hsiao-t'un was first worked out by the Anyang excavation party; they discovered further that on and directly above this cultural stratum were the deposits of the metal-using Shang people.^[6] This observation, however, is susceptible to two interpretations. It may be asked: Are the immediate successors of the Black Pottery culture at Hsiao-t'un the dynastic Shang people or their forerunners?

The establishment of Yin (namely, the locality at Hsiao-t'un) as the capital of the Shang Empire in the time of P'an Keng is an important historical event long familiar to students of antiquity and Chinese history; traditional chronology attributed its occurrence to the fifteenth year of P'an Keng's reign, which was approximately 1384 B.C.^[7] Modern archaeology is naturally concerned with the problem of whether Hsiao-t'un was a deserted village or a populous city when P'an Keng cast his eye on that place and made the momentous decision to establish there the royal seat of administration. Hsiao-t'un continued as the capital city until the end of the Shang dynasty—a period of 273 years, about seven years longer than the total reign of the Manchus.

这种部分的关联乃是在仔细研究1931年安阳第四次发掘中所见E16灰坑中的掩埋物后而确定的。^[8]在这灰坑里，有很多带字的牛脾骨、龟版和少量保存良好的青铜工具及武器。由于小屯及侯家庄墓葬中也发现了与此形制相似的武器和工具，因而E16灰坑成了一个证明青铜器与甲骨记录同期的有力环节。

然而，这个环节仅仅是大体上联结了这两组文化特征，并不能详细说明青铜文明发展的各阶段与甲骨文各时期有多么密切的关系。很明显的，青铜铸造业在商朝奠都小屯之后曾经历一番演变过程。但除了类型之外，还能根据哪些标准来把这些阶段细分出来呢？

这一问题的答案大部分当然要靠我们对小屯居住区地下情形的了解来解决。那里最早的居民是史前的黑陶文化居民。他们的茅舍一半在地面以下；他们除了制陶器以外，也曾做骨质和石质的用具，但是却未掌握任何青铜和铜的知识。这一小屯文化层首先由安阳发掘团发现。他们进一步发现此文化层和紧接其上的文化层的是应用青铜器的商文化层。

[9]这一现象可有两种解释，人们要问：小屯的黑陶文化紧接的后继者是殷人，还是殷人的先辈呢？

在盘庚时期商王朝奠都于殷（小屯区域），这一重要历史事件早为古物学者及中国历史学者所熟稔。传统的历书以为其发生于盘庚统治的第十五年，约相当公元前1384年。[10]现代考古学关心的自然是，当盘庚放眼于这片土地并决定以其作为王朝统治中心时，到底小屯是一个荒废的村落呢，还是一个人烟稠密的都市。其后小屯一直是商代首都，直到其衰亡——前后历时273年，比清代的统治时期尚多七年。

It has been assumed, on a very substantial basis, that P'an Keng's new era coincided with a series of novel architectural activities (Fig. 18·1, Fig. 18·2), which left abundant traces among the ruins of Yin-hsü. The new method of building introduced in this new era was the adoption of *pisé*, which the field archaeologists in Anyang call *hang-t'u*. It is a method that is still extensively employed in all parts of China, wherever the clay is of a kind that can be stamped.

(18·1) Building foundations of stamped earth, discovered at Hsiao-t'un: earth floor of a Shang dynasty house 小屯夯土建筑基址之商朝房屋的地板

(18-2) Building foundations of stamped earth, discovered at Hsiao-t'un: side view of the structure of the stamped earth, 20 layers in succession 小屯夯土建筑基址之夯土层次的侧视图，共计二十层

The underground deposit of Hsiao-t'un, when uncovered, exhibited extensive foundations built of pisé; around these foundations were located many sacrificial pits, in which were buried both human and animal victims, accompanied in a number of cases by bronzes, pottery, and articles of bone and jade. Underneath the pisé foundations were found many subterranean pits and caches and sometimes even the remains of dwelling floors, which were undoubtedly earlier than the overlying stratum built of *hang-t'u*. The artifacts excavated from the various pits in the substrata often show no appreciable difference from authentic Shang finds but are decidedly different when compared with the premetallic remains of the Black Pottery period.

我们有充分理由假定，在盘庚统治时期，曾有一系列新奇的建筑活动相伴而来（图18-1，图18-2）。这种建筑活动在殷墟留下了大量的痕迹。此时期新引入的建筑方法采用了捣实黏土，安阳考古家们称之为夯土。这种建筑方法如今仍为中国全境普遍施用，只须该地的黄土为适于锤培者。

当小屯的地下遗址被发掘时，遗址显露了散布甚广的夯筑基础，在此种基础周围遍布着许多祭祀坑，坑穴里面埋葬着殉葬的人和动物，常伴有青铜器、陶器、骨器及玉器等。在夯筑基础的下方，更发现许多地下的穴窖，有时还残留着一些居所的地面，这些无疑都比在上面的夯土层为早。在这较深的文化层坑穴中所发现的器物，往往与商朝的器物并无显著区别，但是与黑陶时期的前金属期遗存比较，则其不同甚为明

Thus, in many respects, the transition from the predynastic Shang period to the dynastic Shang period at Hsiao-t'un happened without any concurrent changes of the material culture. The question is further complicated by the fact that the *hang-t'u* remains were built in several different periods, so it frequently happened that early dynastic Shang pits might be overlaid by late dynastic Shang *hang-t'u* buildings. It is not my purpose here to disentangle these intricate relations between the pre-Shang and dynastic Shang underground conditions. Suffice it to say that differences actually existed and have been found. Professor Shih Chang-ju, field director of the last three seasons of Academia Sinica's archaeological expedition to Anyang, says:

The normal stratification under the surface soil of Hsiao-t'un is composed of subterranean pits, caches, or houses as the lower layer, overlaid by a stratum of *hang-t'u* foundations. There are many instances of this type; they are quite extensively distributed under the surface soil of the Hsiao-t'un site.^[11]

As to the time interval that separates the two strata, Shih is of the opinion that it is, as yet, not ascertainable. Shih is also of the opinion that, before this place was chosen as the capital city, it must have been already occupied by the pioneers of the Shang settlers for a considerable length of time. The culture of the dynastic period is profusely represented by abundant archaeological remains; in addition to many magnificent bronzes, whose date we shall discuss at length, there are the oracle bones, the chariots, wooden chamber burials, and many pieces of stone, jade, bone, and ivory carvings, and so forth. Most of these can be dated on a fairly accurate basis and assigned to the period from the reign of P'an Keng to the downfall of the Shang dynasty.

But the cultural remains do not seem to terminate at the same time as the fall of the Shang. What followed the Chou conquest of this ancient capital has also for a long time been a matter of speculation. According to available historical accounts, the capital must have been thoroughly sacked by the Chou soldiers after the last king of the Shang dynasty, King Chou, burned his palace and his own body.^[12] Ssu-ma Ch'ien put it on record that when Chi Tzū, the elder brother of King Chou, who surrendered and received a title from the new dynasty, revisited the old capital some years after the conquest, he found only beautiful crops of wheat or millet growing all over the ruins of the destroyed palaces and ancestral temples.^[13]

Archaeological excavations carried on both at Hou-chia-chuang and Hsiao-t'un have brought to light post-Shang burials as well as

evidences of post-Shang occupation, although to a greatly reduced extent. It is clear at any rate that Hsiao-t'un was abandoned gradually and converted to agricultural land only a part at a time.

如此看来，在很多方面，从前商迄于商代，小屯的物质文化方面并无任何相应的变更。而使得问题更为复杂的是：夯土的遗存是在不同时期形成的，所以商代早期的坑穴可能在晚期夯土建筑覆盖之下。而今我的目的不在清理前商与商代二者之间埋藏状况的复杂关系，只是说明差异的存在而且已为人发现就足够了。中央研究院最后三次田野考古发掘的主持人石璋如教授曾说：

小屯地面土层下的典型地层是，由地下的覆穴、窰窖、居室组成了较低的一层，这一层的上面是夯土基础层。这一类型的地层甚为普遍，其小屯的地下分布也很广泛。^[14]

这两地层相距的时间，据石氏称仍未能确定。石氏认为小屯在成为商的首都之前，早已为商的前驱者占据了相当长的一段时间。此王朝时期的文化，通过大量考古学遗迹充分表现出来：除了许多华美的青铜器（青铜器的年代我们将会详加讨论）以外，还有甲骨、车马器、木椁以及石器、玉器、骨器及象牙雕刻等等。这些器物多数可相当精确地判定为属于盘庚到商代覆没时期。

但是此文化的遗迹似乎并不随商代的衰亡而同时终止。周人占领了这一古都之后的情形如何，长期以来不甚了然。根据历史记载，继商的最后一个君主纣放火烧了皇宫并自焚以后，这个城市被周兵洗劫一空。^[15]《史记》记载说，那一位降周并受封的纣王之兄箕子^[16]，亡国数年后曾重临旧都，但见禾黍绿油油地生长在宫殿和宗庙的废墟上。^[17]

侯家庄和小屯的考古发掘，虽然也曾出土商以后的墓葬和居住的遗迹，然而数量锐减。很显然小屯逐渐被遗弃、变成农田。

Thus there have been discovered enough criteria by means of which the archaeological remains of Hsiao-t'un may be divided into four substages: (1) the premetallic substage of the Black Pottery culture; (2) the predynastic substage of the Shang culture; (3) the dynastic Shang culture; and (4) the post-Shang substage. The lines of division that mark the various substages are in most cases stratigraphically definite and chronologically under control. They may be arranged in tabular form as shown in Table 1.

Table 1 Cultural Stages of Hsiao-T'un Remains

Period	Characteristics
Black Pottery	(on the virgin soil)
Early Bronze	Below <i>hang-t'u</i>
Mid Bronze	B.C.
Late Bronze	II

The major portion of the bronze collection made at Hou-chia-chuang and Hsiao-t'un belongs to the *hang-t'u* period (Hsiao-t'un 3);

some pieces are assignable to Hsiao-t'un 2. A few pieces may be as late as Hsiao-t'un 4. Those which follow Hsiao-t'un 4 were the finds of the Western Chou dynasty and their sequels.

Analyses

Eight samples of Hsiao-t'un bronzes were analyzed in 1947 by the National Research Institute of Chemistry at the request of the Archaeological Section; the results are arranged in Table 2.

Table 2 Chemical Analyses of Bronze Specimens Excavated from Hsiao-t'un

Sample No.	Specimen
0001	Unidentified
0002	Unidentified
0003	Unidentified
0004	Unidentified
0005	Unidentified
0006	Unidentified

0008	Unidentified
0009	Unidentified
0010	Unidentified

由此，我们已经具备足够的标准，将小屯的考古遗物分为四个阶段：（1）前金属期的黑陶文化时期；（2）前商文化时期；（3）商代文化时期；（4）后商文化时期。上述各时期的分划大体都有明显的地层根据，年代亦多确定，可由表1显示。

表1 小屯遗址的文化层

地层测定
属商代晚期土之上)
属商代晚期前384年下
属商代晚期1384年~公元前1111年
属商代晚期II1年

侯家庄及小屯出土的大部分青铜器属夯土期（小屯三期），有些可归于小屯二期。少数可晚至小屯四期。晚于小屯四期的属西周或更晚时期。

分析

中央研究院化学所在1947年曾应考古组之请分析了八件青铜标本的成分，其结果详见表2。

属商代

The detailed percentages of the component minerals shown in Table 2 may be roughly divided into three groups: specimens 3 and 6, each with more than 90 per cent of the element copper, form one group; specimen 1, with a relatively large proportion of lead, forms a group by itself; then the remaining five specimens, each containing more than 10 per cent of the element tin, form the third group. The last group is comprised entirely of vessels of the ceremonial type, while groups 1 and 2 are specimens of tools and weapons. I have in my possession a series of analyses of the *ko* halbert of different periods; Table 3 shows the results of the various analyses. It is revealing to compare the chemical compositions of the *ko* halberts of the various periods. The increasing proportions of the tin and the lead elements in the later periods serve to indicate some significant change in the supply of these two minerals. In the Chou dynasty tremendous new activities might have prevailed in the search for new sources of these minerals, and, as a result, their supply might have been much more abundant to the people of northern Honan. The copper supply seems never to have worried the Bronze Age people of this area since the Shang dynasty. Old gazetteers recorded many copper mines in this region; a recent compilation of these records^[18] shows that, within a radius of 300 kilometers of Anyang, no fewer than nineteen copper mines were mentioned. The one at Yuan-chü, less than 300 kilometers from the ancient remains of the Shang capital, was still a great center for money coinage in the Northern Sung dynasty. The mineral specimens from this district, collected in 1948, were on exhibition in the Geological Survey in Nanking.

由表2详示各种金属在合金中所占百分比，这八件样品可大体分为三组：样品3和6的铜含量皆在90%以上，归为一组；样品1含铅较多，自成一组；其他的五件样品，含锡量皆在10%以上，构成第三组。第三组全部为礼器，一、二两组为工具和武器。我手边另有几项不同时期戈的分析，表3是这些分析得出的结果。我们可以比较不同时期戈的化学组成，得到一些启示。后期锡和铅两种成分的增加表明此时这两种矿物质的供给发生了重要变化。周朝可能大举进行过寻找这些矿物质的新来源的活动，结果使得河南北部的人们有了更充足的供给。自商代以来，此地青铜器时期的人们似从不忧虑铜的供给。旧的地方志记录了此地有许多铜矿，新近关于这些记录的一个汇编^[19]显示，在安阳方圆三百公里的范围内，至少有十九处铜矿存在。离殷墟不到三百公里一处称为垣曲的地方，截至北宋时仍然是一处大型铸币中心。1948年在垣曲采集的铜矿石标本曾在南京地质调查所展出。

□ HT. 1: Shang dynasty; HTs. 3, 4, 5: Western Chou dynasty; SPT. 7: Eastern Chou dynasty.

Such data as the above fit into the historical conditions of the Shang dynasty very well; otherwise, it would be difficult to explain the intense activity and the great output of the bronze products of this period. But the low proportions of the tin and lead found in the making of the *ko* halbert during the Shang dynasty cannot be satisfactorily explained by merely resorting to the interpretation that the supply of these raw materials was limited; as a matter of fact, these two minerals were quite generously provided in the casting of ceremonial vessels (see Table 2).

Moreover, the *ko* halbert is not the only type of specimen whose composition shows a low percentage of tin. The arrowhead and the knife handle, as analyzed in the above table, also contained a low proportion of this mineral. Thus it seems that, as early as the Shang time, there was already a distinct correlation between the type of product and the relative proportion of different minerals that entered into the composition of the alloy. On the basis of such distinctions found among the compositions of the alloys of different bronze articles, it is even justifiable to indulge to a certain extent in some speculation as to whether some of the products might have appeared earlier than others.

Evidence is not lacking to indicate that bronze knives dug out from pits underlying the pisé foundation might have been manufactured in an earlier period. The one mentioned in my article of 1948 (see note 12) is a case that illustrates the point. The pit in which this knife was found is YH379 and is located in the excavation unit C333. Directly above this pit was the *hang-t'u* stratum gamma 16. The convex-edged knife (Fig. 19-2) is unique among the Hsiao-t'un finds and does not seem to have reappeared in the *hang-t'u* period.

□ HT. 1 : 商朝 ; HTs.3 , 4 , 5 : 西周 ; SPT.7 : 东周。

以上的数据和商代历史环境甚为相符，否则就难以解释商代青铜器生产之繁荣及产品之丰富。但如果将商代青铜戈中铅与锡的低含量完全归因于铅与锡之供应量不足，这种解释并不能令人满意；事实上以礼器铸造来说，这两种金属的用量并不算少。（参见表2）

并且，戈并非仅有的低锡含量标本类型。如上表所示，箭头和刀柄的锡含量亦颇低。因此，似乎早在商代，物品的类型与其合金中所含矿物的成分比例之间已有明确之相互关系。根据青铜器物所用合金成分的不同，在一定范围内我们甚至可以推断器物出现的相对的早晚关系。

很多证据表明，夯筑基址下面的坑穴出土的青铜刀可能是在更早期制造的。我在1948年发表的一文中（参见注释12）所提到的那把青铜刀即为此例。这把刀发掘于小屯C333区的YH379灰坑，紧接其上的是γ16夯土层。这一只新月形的刀（图19-2）在小屯出土的文物中是独一无二的，夯土期中再没有发现。

While the pit YH379 might be of the Shang period, judging by its general contents, the possibility of the presence of some early survival in such a definitely stratified pit is certainly greater than in pits without so distinctive a position. Another distinctive attribute of this find is the method of its casting by a one-piece mold, with only one side in relief and the other side entirely flat. At a later period, namely the *hang-t'u* stage, symmetrical knives (Fig. 19-3-9) with similar reliefs on both sides were manufactured. To achieve this purpose, valve molds were undoubtedly used. Whether the method of using the internal molds was introduced at the same time it is difficult to say. In my article referred to above, I divided the nineteen specimens of bronze knives from Hsiao-t'un into three types according to the methods by which they were manufactured: (1) single-mold casting, articles with one side flat, two samples; (2) valve-mold casting, articles symmetrical on both sides, thirteen specimens; (3) multimold casting with the occasional employment of internal molds, four specimens (Fig. 19-8, 9). It is important to point out that all the nineteen specimens of the bronze knives from Hsiao-t'un were designed for daily use; in no case were they made for burial purposes, as is true of many of the Hou-chia-chuang knives (Fig. 20).

虽然YH379灰坑可能属于商代，根据其内容物可以判断，在这类有明确分层的灰坑埋藏有早期遗物的可能性远较那些层次不明的坑穴为大。这把刀的另一显著特征是它所采用的开范法铸造方式：刀的一面有浮雕的纹饰，另一面完全是平的。在晚些时候，即夯土期，制造的是两面纹饰相似对称的刀（图19-3~9），铸造这类青铜刀无疑要用两瓣范法，但是同时是否已应用了心型范法尚不能确定。在上面提到过的那篇文章中，我将小屯出土的十九件青铜刀，按其铸造方法分成三类，即：

(1) 开范法，刀子一面平，二件；(2) 双瓣范法，刀子两面对称，十三件；(3) 多瓣块范法，间用心型范法，四件(图19-8, 9)。须特予说明者，上述十九件出土于小屯的青铜刀都是日常用品，非为陪葬之用，而侯家庄多数铜刀则属此用(图20)。

(19) Types of bronze knives excavated from Hsiao-t'un and Hou-chia-chuang: 1, 2, one-sided flat knives; 3-7, symmetrical shapes, showing bivalve casting; 8, 9, hollowed handlers, indicating use of internal mold 小屯及侯家庄出土青铜刀的形制：

1, 2, 一面平的刀; 3~7, 两面对称的刀, 两瓣范铸成; 8, 9, 空柄, 示铸造时应用心型范

Molds

In this connection it may be fitting to say a few words about the molds excavated from Hsiao-t'un. The collection of these artifacts reached quite a respectable size after the fifteenth season in Anyang. Most of the better preserved pieces, that is, those with patterns still distinctly shown, are light gray in color, occasionally mixed with a light brownish hue, and they are more or less porous in composition. The back part of the mold is usually irregular, and the edges, if not broken, are tenoned or mortised in many cases. Many of these fragments are complete and have suffered no damage as far as external appearances are concerned, but no success has been achieved

in attempts to piece the individual fragments together into a complete unit originally used in the casting operation.

It is also remarkable that, while hundreds of clay molds were collected, not a single piece of stone mold was found. There are many pieces of stone carvings in the Academia Sinica collection, but none of them could have served as a model for these clay negatives. On the other hand, a number of clay models (Fig. 21) were discovered; they were evidently molded after the shape of the article in the process of being cast, and on them the molds that were to serve as negatives for direct casting were to be printed. On these models, decorative patterns in relief were worked out just as one finds them on the finished products in bronzes; in several cases, on the relieved parts, fine lines were drawn in red or black pigments (Fig. 21, upper right), which were evidently to be incised afterward. These half-finished models discovered at Hsiao-t'un throw a great deal of light on the early history of bronze casting.

铜范

在此，我想应当谈一谈小屯出土的铜范。到安阳第十五次发掘后，出土的铜范已聚集了相当大的数目。保存得比较好的铜范，也就是说花纹比较明显的，呈浅灰色，有时掺杂点浅褐色。铜范为多孔性的烧土制成，范的背面多呈不规则状。如果两侧完整，则多带有阴或阳榫。许多范块外表看来完整，没有受到任何破坏，但是考古工作人员始终未能将这些单个的范块重新拼成一个原来用以铸造的完整的范组。

值得一提的是，虽然发掘到数以百计的土范，却连一块石范都不曾见到。“中央研究院”存有很多石雕，但是没有一件石雕是用来做这些范的母模的。另一方面，我们发现一些泥制母模（图21），它们很显然是依欲铸造的铜器而制，范就由这些母模压制而成。这些母模上雕凿着突起花纹，同青铜制成品上的花纹相仿。有的母模在这些突起的花纹上绘有朱笔或墨笔的细线（图21，右上），显然是备雕刻用的。小屯发掘出的这种半成品母模，对了解早期的铸铜历史贡献颇大。

Most of the clay molds were well baked; some attained a degree of hardness almost comparable with that of stoneware. It is interesting to note that one of the hard-baked pieces was incised with a character (Fig. 22:2) not yet decipherable but obviously the name of a person whose property this mold might have been. As the character was incised on the back part of the mold, it could not have been intended for casting. So, if the incised character was for the purpose of identification, the object to be identified would be the mold itself rather than the article to be cast after this mold.

(21) Clay models for casting in bronze, all from Hsiao-t'un. Specimen upper right still retains traces of lines drawn in red pigment. 铸铜用的泥模，皆为小屯出土。右上方的一块，仍留有以红色涂料绘画的线条。

Several fragments for casting arrowheads were found (Fig. 22-5). They belong evidently to the valve type; no molds so simple that they might have been used for the open-hearth process were discovered. Inner molds were found in abundance—a definite indication that the foundry at Hsiao-t'un in the Shang time was a factory for the production of an advanced type of bronze. The factory was well supplied with plenty of malachite and prepared ingots of imported tin. Both these minerals were discovered during our excavations. [20]

Shapes

In my first study of the Hsiao-t'un bronzes, [21] I listed eighty-two specimens of the containers, including six covers, which were excavated from this site. Covers excepted, the seventy-six containers were divisible into five classes: round-bottomed, flat-based, ring-

footed, tripod, and tetrapod; these five classes were again divided into nineteen types. Tools and weapons were studied in my second article. [22] There are eighty-one specimens within this category besides arrowheads, and they are divided into four classes and fourteen types. Chariot parts, ornamental pieces, and articles of miscellaneous character which do not belong to the first two categories still remain unclassified, since most of them were parts of, or attached to, composite tools, weapons, or chariots. They will be discussed in relation to the things which they decorate or of which they constitute a part. Bronzes in the Hou-chia-chuang collection are amazingly similar to those from Hsiao-t'un, but they are richer in variety of forms, bigger in size, and better made. Owing to the highly dilapidated conditions in both sites, it is difficult to say whether the differences found so far are more apparent than real. About their contemporaneity there seems to be hardly any doubt.

多数土范皆经过焙烧，有些硬度几与石器相若。甚为有趣的是，有一块焙烧过土范刻有一个尚不能辨认的文字（图22·2），但显然是这一土范所有者的名字。此一文字刻在土范的背面，所以应该并非做铸造用。因之，如果此文字供做识别用，则被辨识者必是土范本身而非以此为模板制作的器物。

(22) Clay model used for casting bronzes, from Hsiao-t'un: 1, 4, clay negatives for socketed spear handles; 5, mold for casting arrowheads; 2, 3, 6, molds with signs 铸铜的泥范, 小屯出土: 1, 4, 铸矛柄的范; 5, 铸箭头的范; 2, 3, 6, 有记号的范

在铜范之中，有几块是铸造箭头用的（图22:5），属于双瓣范一类，用于开模铸法的简单铜范尚未发现。心型范发现颇多，证实了商代在小屯的铸铜场确是产制高级青铜器的工厂。同时这些铸铜场也有足够的孔雀石及外来锡锭供应，这些矿料皆曾由我们的考古队发掘出土。

形制

我在《记小屯出土之青铜器（上篇）》一文中，^[24]曾列举八十二件容器样本，其中六件为器盖，皆自小屯出土。除了器盖，我把七十六件容器分为五目：圜底目、平底目、圈足目、三足目及四足目。这五目复分为十九式。该文中篇所讨论的课题为工具及武器。^[25]除箭头外，共计有标本八十一件，分成四目十四式。车马器、饰物及不属于前二项之杂项铜器仍未予分类，因其多半为武器、工具或车马之零件或附属品。它们将在介绍其装饰的或附着的物品时一并加以讨论。侯家庄出土的铜器与小屯出土者极相似，唯其形制之变化较多，体型较大，铸造亦较考究。但这二地区皆经破坏，故这种表面的区别与实际上是否一致颇难断言，然两者属于同一时期则几无疑义。

Among the Hou-chia-chuang bronzes there were certain pieces (Fig. 23) that were never duplicated in the Hsiao-t'un collection; but the majority of the bronze forms are about the same, and many of the specimens from these two sites could be exchanged without being recognized. So, on the whole, it is safe to say that the two collections are the products of the same period, and that whatever marks the Hou-chia-chuang group off is mainly due to the custom that the best bronzes went to the royal tombs.^[26]

(23) *Ting* tripod with a big handle, from Hou-chia-chuang 侯家庄出土的具鬲鼎

The shapes of most of the containers found in Hsiao-t'un could be accounted for. The tetrapods, tripods, and ring-foots as well as the flat-based containers evidently derived their forms from the wooden and the pottery receptacles. Tools and weapons found their prototypes in implements made of bone, stone, or antlers. There are also a number of articles whose origins are obscure. One of the Hsiao-t'un flat-based specimens is a pan-shaped bronze, originally found in broken condition in YM331. Restored, it looks very much like a frying pan, with a big rim whose diameter measures 52 cm.^[27] It is undoubtedly the forerunner of the frying pan used by every Chinese housewife, but its origin is rather indefinite.

侯家庄出土的铜器中，确有几件（图23）是在小屯出土的铜器群中

找不到类似的。但是两地大部分的铜器形制都甚相似，纵将两处的样本相互调换，也不易分辨出来。所以大体来说，这两组铜器为同一时期之产物是可信的，而侯家庄的出土物的有所不同主要归因于通常最好的青铜器都要随葬在王墓这一习俗。^[28]

大多数小屯出土的容器，其形制皆有所本。四足目、三足目、圈足目及平底目的容器，显然由陶制或木制容器演变而成。工具和武器亦可在骨、石及角制品中找到它们的原型。也有数件器物，其原始形制仍模糊不清。小屯出土过一只平底目的样品，为平底盘形铜器。此一铜器于YM331墓出土，出土时已呈破损。经复原后，看来甚似一只平底锅，其口缘甚大，直径52厘米。^[29]它无疑是中国主妇家用的平底盘的前身，但其原始形制则不明。

If these two collections are taken as typical Shang dynasty bronzes and compared with the Hsin-ts'un collection of the Western Chou and the Shan-piao-chen collection of the Eastern Chou time, certain marked changes in the shapes of the containers are evident. In the post-Shang periods the tetrapod class almost completely disappeared while the tripod class persisted but had undergone a great number of structural modifications.^[30] The *ting* tripods of the Eastern Chou periods acquired covers, and the *hsien* steamer was cast in two pieces in the Eastern Chou. A number of new shapes made their appearance in the later periods, owing partly to changes of customs as well as to technical improvements. The best group of bronzes that may be taken to illustrate such changes are the *ko* halberts, which were found all through the Bronze Age of China and were represented by a large number of examples in all the above collections.

The *ko* halbert is a weapon used for more than one thousand years by the Chinese fighting force in the classical period. It is a typical Chinese invention and developed exclusively in China. In 1950, the *Bulletin of the Institute of History and Philology* published my article on "Typological Studies of the Bronze Kou-ping (Chinese Halberts) Excavated from Northern Honan, with a Classified and Illustrated List." In this article the development of *ko*, leading gradually from the stone prototype and bronze imitation, through the various intermediate stages to the ideal shape as laid down in the famous version of "K'ao Kung Chi," was traced.^[31] The specimens examined are 208 in number and belong to the following five collections:

Specimens

- (35) Hsiao-t'un
 - (32) Hou-chia-chuang
 - (37) Hsin-ts'un
 - (54) Shan-piao-chen ^[32]
 - (15) Liu-li-ko
-

The first two groups belong to the Shang dynasty; the Hsin-ts'un collection consists mainly of remains of the Western Chou time; while the fourth and the fifth groups represent the period of the Warring States. The typological characteristics of these three periods may be summarized in the following terms.

如果把小屯和侯家庄这两组铜器当作是典型的商代青铜器，用来与辛村的西周青铜器及山彪镇的东周青铜器相参证，我们会发现容器在形制上有明显的变化。商以后四足器几乎全部消失，三足器虽然继续存在，但在结构上有了很多的改进。^[33]东周的三足鼎已有了器盖，同一时期的甗则分铸作两件。同时在周的晚期，部分由于习俗的改变及技术的改良，许多新形制的铜器也出现了。说明这种变迁的最好例子是戈，戈在中国整个青铜器时代都有发现，上述各遗址中都有很多样品。

中国古代军队以戈为武器前后达千余年之久。戈是一种典型的中国的发明，并仅在中国境内得到发展。1950年《历史语言研究所集刊》中有我一篇《豫北出土青铜句兵分类图解》。在这一文中，我将戈由其石器的原始形态到青铜的仿制品、历经各种变化阶段演变成著名的《考工记》所载的理想形制这其中的发展轨迹探溯出来。^[34]计所检查样品达208件，分属下列五地出土：

前两组属商代；辛村出土者大部分为西周遗物；第四、五组属于战国时期。以上三期青铜戈形制的特征可综述如次：

鞞

35件 小屯

31件 侯家庄

67件 浚县辛村

59件 浚县山彪镇^[35]

16件 辉县琉璃阁

208件

(1) The *ko* of the Shang dynasty is of the simplest type (Fig. 24, Fig. 25); it is frequently composed of an elongated tongue-shaped blade made of jade or other hard stone of fine grain, which may be hafted into a T-shaped bronze sleeve (Fig. 25·7). A more primitive type of *ko* (Fig. 26·1-3), evidently of early survival and used exclusively for burials, is made completely of stone; it is merely an elongated blade, pointed at one end, and with the other end cut into a tang for hafting. All-bronze *ko* of this period were usually cast in imitation of the jade-with-bronze-sleeve type; the two projecting points on both edges of the socket were retained at the junction between the blade (*yuan*) and the hafting part (*nei*). These structural peculiarities were never found in the stone prototype.

(1) 商代的戈形制最为简单（图24，图25），通常包括一长条形舌状戈身，为玉或其他细纹理的硬石所制，楔于一T形青铜套内（图

25·7)。更原始的戈(图26·1~3)只做随葬用的,且显然是较早期的遗物,为全部石质;一端为一长尖刀,另一端为戈根以置入柄内。这一时期的全青铜戈都仿制玉身铜套戈的式样,在戈身的锋刃部分(援)与供置入柄内的部分(内)相接处,承口的两阑仍保留尖头形。这种结构特征在石制的戈中从未发现。

(24) Ko halberts from Hsiao-t'un 小屯出土的青铜戈

(25) *Ko* halberts from Hou-chia-chuang 侯家庄出土的青铜戈

(26) The earliest and latest types of the ko halbert: 1-3, stone *ko* from Hou-chia-chuang, Shang dynasty; 4, bronze *ko* from Ch'ang-sha, Chan-kuo period 最早和最晚时期戈的形制：1~3，商代侯家庄的石戈；4，战国时期长沙青铜戈

Stone *ko* were found in large numbers in both Hou-chia-chuang and Hsiao-t'un. It is interesting to note that in one of the Hou-chia-chuang royal tombs (HPKM: 1001), together with the underground guards buried in the sacrificial pits underneath the wooden chamber, there was found in each case a *ko* halbert. The one found in the central pit, evidently the resting place of the chief guard and much larger in size than the other pits (Fig. 6), is made entirely of stone; those found in the corner pits are all made of bronze. There is no doubt here that the weapon made of stone was given a more honored position chiefly for its greater antiquity.

侯家庄与小屯两地，石制戈形句兵皆有大量出土。有趣的是，在侯家庄的HPKM: 1001王墓里，在其木椁室下面陪葬卫士的每个坑穴里，各有一具戈。中央最大的坑穴，显然是卫士长葬身之处（图6），其中的戈是完全石制的；角落的坑穴中的戈则为铜制。无可置疑的是，石制的武器因其更古老而更受尊崇。

(2) In the Western Chou period, both the inventive genius of the founders and the innate qualities of the metallic substance began to assert themselves, and the results were expressed in the new types of *ko* halberts (Fig. 27) which were evolved from a more primitive form found in the preceding dynasty. In this period there is, for the first time, a definite sign of the development of *hu*, or necking, namely, a downward projection at the hafting section of the blade; it was, no doubt, a device invented by the foundry master to improve the efficiency of hafting. The continuous development of *hu*, mainly its projection downward, took place in this period. In the Hsin-ts'un collection the variation of this particular feature is most noticeable. As the different specimens show, a number of ingenious experiments were made for the purpose of increasing the efficiency of this weapon. There was an effort made, for instance, to combine the *ko* and the *mao* into one composite weapon, an experiment which did not achieve any success till several hundred years later (Fig. 28).

(2) 到了西周，因为铸工的创新能力及金属固有的性能的开发，出现了由商代原始形制演变而来的新形制的戈（图27）。这一时期最重要的形态变化是“胡”的产生，也就是刀根部分下展。此一变迁明显的是铸工在增强戈与戈柄连接方面所作的努力。“胡”的继续下伸发生在这一时期。辛村所出之戈头，此特征之变迁最为显著。由这些不同形态的戈头，我们可以看出改进此类武器效率所作的各种尝试。尝试之一是想把戈和矛的作用合并，成为一种综合的武器，然而此种尝试在数百年后方始成功（图28）。

(27) Ko halberts from Hsin-ts'un, Chün Hsien 浚县辛村出土的青铜戈

(28) Ink rubbing of the decorative pattern of a *chien* basin from Shan-piao-chen, Chi Hsien 汲县山彪镇出土战纹鉴拓片

(3) The typological development of the *ko* reached its zenith in the period of the Warring States (Fig. 29). The classical description of the standard type of *ko* (Fig. 26-4) provided by "K'ao Kung Chi" was a product of this period. In the *ko* of this period, not only was the hafting process perfected but ingenious use was also made of the originally useless *nei*. In the earlier time the *nei* had served only ornamental purposes, but it was now put to effective use by being provided with sharp points and edges or sometimes bent into hook-shaped cutters (Fig. 29-5, 10). A device was finally found, after a long series of experiments, to combine effectively the *ko* and the *mao*, namely, the halbert and the spearhead, into one effective weapon, the *chi* (Fig. 28), with which the State of Ch'in unified China for the first time. It was with this same weapon that the Emperor Han Wu-ti subdued his rivals in both Central and Eastern Asia.

These three typological stages are all well illustrated by the five collections mentioned above (Fig. 30). In the period of the Warring States, iron was already in use for making agricultural implements. At exactly what time bronze was fully replaced by iron in the manufacture of weapons is, archaeologically speaking, still uncertain. What is definite is that the evolution of the *ko* halbert must have taken nearly one thousand years before it reached its perfection, and its active service must have lasted more than a millennium before it was finally abandoned. The various stages of the typological development of this weapon have a chronological value which can hardly be equaled by any other group of artifacts of the Bronze Age. But to trace back to the earliest stage and the origin of this era, there is still a great deal of work that must be done. The data selected for the present survey were all collected by our own field workers from the northern part of Honan. There are many key areas equally important for archaeological purposes but totally unknown. Until these areas have been examined with scientific care, it would be rash indeed to postulate a definite theory about the origin of the Chinese Bronze Age.

(29) Ko halberts from Liu-li-kuo, Hui Hsien 辉县琉璃阁出土的青铜戈

(3) 战国时期，戈在形态上的演变达到顶点（图29）。经典文献《考工记》中描述的标准形态的戈（图26 · 4）就是这一时期的产物。这时期的戈，不但固着柄的方法已臻完善，而且一向没有什么作用的戈

柄部分（内）也很巧妙地加以利用。较早的时期，内只是用以装饰，而今则有了实际的用途：或制成锋尖，或弯作镰刀状（图29 · 5, 10）。经过一系列长期的试验，戈和矛终于综合成一件名为戟的有效武器（图28）。秦国之初次统一中国，汉武帝之征服中亚和东亚的敌人，所使用的都是这种武器。

这种武器形态演变的三个阶段，很清楚地由上述五处出土的戈形句兵表现出来（图30）。在战国时期，铁已被用来制造农具，不过究竟何时铁完全取代铜制造武器，考古学上仍无定论。我们能确定的是：戈的演变历时近一千年始臻于完美，而它用做武器以迄被放弃，其间定在一千年以上。这一武器在形态学上的演变所具有的年代学价值非青铜时代其他任何制品所能比拟。但是追溯其最早的发展形态以及此时期的缘起，仍有很多工作要做。这里所选用的资料，都是史语所实地工作人员在豫北得到的。还有很多具有同样考古意义的关键地区，但是尚不为人知。只有在对这些地区全都作了科学考察之后，才可能对中国青铜时代的起源提出一个审慎的理论假说。

[1] With the exception of a small lot of inscribed oracle bones discovered in the southern part of Hou-chia-chuang (See Tung Tso-pin, "On the Seven Complete Inscribed Tortoise Shells from the Excavation at Hou-chia-chuang, Anyang," T'ien-yeh-k'ao-ku-pao-kao [in Chinese], No. 1 (1936), pp. 91-165), and one piece found at the site of Hou-kang, all the inscribed oracle bones in the Academia Sinica collection were excavated from the dwelling site of Hsiao-t'un.

[2] Of the excavated bronzes from Hsiao-t'un and Hou-chia-chuang, only one piece bears an inscription of four characters; it is a big basin-shaped container, placed at one of the passages in one of the big tombs. The four characters read: *ch'* in (sleeping), *hsiao* (small), *shih* (chamber), and *yü* (basin).

[3] 除了一小部分有字甲骨在侯家庄南部发现 (参看董作宾:《安阳侯家庄出土之甲骨文字》, 载《田野考古报告》[中文], 第一册 [1936], 91~165页), 和一块在后岗遗址发现之外, “中央研究院”所藏的有字甲骨全都是从小屯居住区遗址发掘的。

[4] 小屯和侯家庄发掘的青铜器, 只有一件刻有四个字; 这只大盂是在一个大墓的墓道发现的。四个字是“寢、小、室、盂”。

[5] Storage Pit 16 was discovered and excavated in the fourth season at Hsiao-t'un in the spring of 1931; this pit was first found on April 10 of that year, and the excavation lasted nine days; the deposit reached a depth of 9.3 meters, somewhat beyond the present water level in the rainy season. The pit is circular in shape with a diameter of 1.7 meters at the upper rim. See for details Preliminary Reports of Excavations at Anyang (in Chinese), Part IV (1933), pp. 564-567.

[7] Recent discussions on the chronology of the Shang (Yin) dynasty have advanced much of our knowledge about its complicated nature, but the result, if there is any, is still far from being conclusive. I have in the tentative table of this paper chosen a more conservative estimate, as it seems to me that none of the half-dozen new dates proposed by the various schools is backed up by arguments either more substantial

or less defective than earlier calculations. One of the most serious attempts to build up a new chronology for this period is, no doubt, the one made by Professor Homer H. Dubs. In defense of his own interpretations of astronomical records preserved in ancient Chinese documents, he has recently criticized, rather fairly I should say, Tung Tso-pin's (Dung Dzo-pin, according to Dubs) chronology in these words: "It is dangerous to employ a Han Calendar for a period a thousand years earlier" ("The Date of the Shang Period," T'oung Pao, XL, Nos. 4-5 (1951), p.325). It is, therefore, most amazing to read in the same paper five pages further on, where the author discusses the problem of the beginning and end of "day," the following remarks: "Later Chinese practice, however, provides strong evidence [*italics mine*] that in the Shang period China used the Roman Day. Eclipse Record IV confirms that probability" (p. 330). The point is, as admitted by Professor Dubs himself, that Eclipse Record IV is also a defective document which contains at least one character, a key word for the interpretation of the whole record, still disputable as to its exact connotation. It is obvious that here Professor Dubs's superior knowledge of astronomy does not help him to settle this problem. When he goes back to the idea of referring to "later practice" as "strong evidence" to prove what might have been the case a thousand years or so earlier, or even a few hundred years earlier for that matter, he seems to be using exactly the same method which he had discredited in the earlier part of his paper. So, pending the arrival of a genuine scientific reconstruction of the Shang chronology, a more conservative date is certainly preferable for the simple reason that it would, at least, avoid much useless confusion.

[8] 1931年春小屯第四次发掘出现第16号灰坑，坑于该年4月10日被发现，发掘工作持续了9天。坑深达9.3米，稍高于现在雨季时的水位。坑呈圆形，上口直径为1.7米。详见《安阳发掘报告》（中文），第四册（1933），564~567页。

[10] 最近有关商殷年代的讨论，大大推进了我们对其复杂性质的认识。不过如果说有什么结论，仍为时尚早。我在这篇文章中初拟的年代表上，选择了一种较为保守的估计。因为，依我看来，由各学派提出的六种新的时间，其理论依据并不比前人的更充分或更完善。在诸多试图重新确立这一时期的年代的学者中，德效骞教授无疑是最为认真的一位。为了要卫护他自己对中国古文献中有关天文记载的解释，他批评了（我认为他的批评相当公正）董作宾所著的年表：“将汉代的历法应用到一千多年以前是危险的。”（《殷日》，载《通报》，40，4~5期（1951），325页）不过再往下读五页之后，德效骞讨论“日”的开始和终止时，他说，“中国后来的做法有力地证明了（着重号是我加的——作者注）商代采用的是罗马记日，第四次月食的记录也证实了这一可能”（330页）。德效骞自己也承认，问题是第四次月食记录也是一项有缺陷的文件，文件至少有一个关系整个记录解释的字，其确切的含义至今仍争论未决。显然，德效骞教授的卓越天文学知识对此问题也无能为力。于是他走回董作宾的老路子，拿“后来的做法”去“有力地证明”一千多年前或更早，或只几百年前的事。他用了他自己在文中所抨击的方法。所以，在以真正科学的方式重建殷历之前，我宁愿选择较保守的纪年方法，至少可以避免许多无谓的争论。

[26] The term "royal tombs," as far as I am aware, was first employed by Professor Paul Pelliot in his lecture at Harvard University on the occasion of its tercentenary celebration (see "The Royal Tombs of Anyang," in *Independence, Convergence and Borrowing in Institution, Thought and Art* [Cambridge, Mass.: Harvard University Press, 1937], pp. 265-272); the field archaeologist who worked in Hou-chia-chuang called them simply big tombs and small tombs. Liang Ssu-yung, Director of the Hou-chia-chuang excavations, labeled the map of this cemetery area as "Thousand Tombs Cemetery Area of Hou-chia-chuang." But there is much justification for Professor Pelliot's adoption of this descriptive term. Tomb HPKM: 1001, for instance, as surveyed, shows a total content of no less than 4,200 cubic meters; so, to dig the pit alone, it must have required no less than 4,200 day-labor units, if one labor unit at that time could have removed one cubic meter of dirt in a day; as the best of farm hands nowadays, with a much superior tool and better incentive, might occasionally be able to do. It is scarcely imaginable that in the neighborhood of the capital of the ruling dynasty any other group of people, aside from the royal clan, were in the position to command such wealth and power.

[27] See Li Chi, "Studies of Hsiao-t'un Bronzes, Part I," p. 68.

[28] 据我所知，“王墓群”一词是伯希和教授在哈佛大学三百年庆典演讲时首先使用的。（参看《安阳的王墓群》，《体制、思想和艺术的独立、汇合和借鉴》[剑桥：哈佛大学出版社，1937]，265~272页）。侯家庄田野考古家只称之为大墓群或小墓群。侯家庄发掘工作主持人梁思永，曾在这些墓区位置图上标识为“侯家庄千墓区”。但伯希和教授用王墓群这一形容词也颇适当。以HPKM: 1001墓为例，勘察显示整个土方不下于4200立方米，按1个劳动单位每天移走1平方米泥土计算，单掘一个这么大的坑，至少需要4200个日劳动单位；即使是今日最好的农人，配以更优越的工具、有更好的激励机制，也只是偶尔可以做到这一点。所以很难想象在都城邻近，除了王室之外，还有其他人能统御如此众多的人力和物力。

IV Archaeology

Antiquarian studies in China began to develop in the beginning of the Sung Dynasty (960-1126 A.D.). They enjoyed a glorious period for more than one hundred years, during which a solid foundation was laid for later development. The classical revival in the eighteenth and nineteenth centuries included a very strong current of antiquarian interest, which has been rightly considered as the direct descendant of Sung scholarship. Western science began to affect China seriously, only at the beginning of the twentieth century. So the concept of modern archaeology in China may be said to be developed from two entirely different, but mutually complementary traditions: on the one hand, it is related to that special branch of classical learning known as the Study of Metals and Stones; and on the other, to the field explorations and excavations, which were first developed in the science of geology and biology, and from which archaeology in the West has been gradually evolved. Such being the case, archaeology, therefore, unlike most other natural sciences which have come to China unprecedented, serves best to link together modern science and traditional Chinese learning. In order to make a proper estimate of what is being done at present and what can be achieved in the future, it is necessary that something should be known of China's antiquarian past.

Historical Background

In a paper published by the late Professor Wang Kwo-wei on "Archaeology in the Sung Dynasty,"^[1] he pointed out the distinct achievements by Sung scholars in archaeology, in several different fields. The more important of these are collecting, recording, and identifying. In all these their merits rank very high; some remain unsurpassed down to the present time. It is interesting to note that this is only part of the result of a broad intellectual movement of the Sung Dynasty, which yielded important achievements in many different spheres. The whole movement was characterized by a great deal of constructive effort; many of the monumental works on history, treasures of Chinese spiritual possessions, date from this period. While the interest in antiquities was no doubt a phase of the historical mentality of the time, it attained an independent development in the very beginning. Works on this subject left to us from this period are

strangely modern in many of their ideas.

肆 考古学

在中国，对古物的研究在宋朝（公元960年～公元1279年）^[2]初期就已经开始有所发展，当时曾经有百余年的鼎盛期，为以后的发展奠定了坚实的基础。18～19世纪古学的复兴包含了一股古物热的风潮，这股热潮被认为与宋学一脉相承，此种看法是正确的。西方科学开始对中国产生实在的影响，已是在20世纪初以后。因此，中国近代考古学的概念可以说是从两个截然不同而又相互补充的传统发展而来：一方面，它是从中国古典学问中的金石学这一特殊分支发展而来；另一方面，它又与地质学和生物学中首先发展起来的田野调查与地下发掘联系在一起，西方考古学正是从这些科学中逐渐发展出来。既然如此，那么，与大多数中国第一次接触到的自然科学不同，考古学极好地将西方近代科学和中国古典学问联系起来。要准确评价目前正在进行的工作和未来可达成的目标，有必要对中国古学研究的历史作一番了解。

历史背景

在已故王国维教授发表的《宋代之金石学》^[3]一文中，他指出宋代学者在金石研究多个方面取得了非凡成绩，尤其体现在搜集、著录和考订方面。他们在研究所及之领域均获得了极高的成就，有些至今尚无人能及。应该注意到，这只是宋代这场大的思想运动的部分结果，这场运动在许多不同领域都取得了重要成果。此次运动整体呈现出极具建设性的特点，许多史学巨著、精神财富都起源于那个时代。虽然对于古物的兴趣无疑只是宋代史学思想发展的一个阶段，但它从一开始就获得了独立的发展。这一时期留传下来的有关这一主题的著作，其中的许多观念都出人意料地具有近代特征。

It is true that there was neither historical nor comparative method, nor any attempt at a comprehensive system, but the effort aimed at accurate presentation and reproduction, and many of their identifications are quite praiseworthy. *K'ao Ku T'ou* and *Po Ku T'ou* published between the eleventh and twelfth centuries A.D. are more than a collector's handbook. In them a system was created for recording and reproducing antiquities, which, except for minor details due to improvements in modern printing, has been taken as a model of all treatises on antiques till the present day. It may not be possible to test the accuracy of their measurements or reproductions, but their aims at being accurate are more than obvious; and the ingenuity and correctness of most of their identifications have been confirmed by modern criticism. As printing was at that time already invented, so the vogue of collecting spread fast. What is more remarkable is that the

fashion of collecting was created and maintained chiefly by private individuals, in spite of the fact that the largest and the most well-known collection is an Imperial one. Thus Professor Wang says in his paper on "Archaeology in the Sung Dynasty":

Remarkable as was the Imperial collection, the fashion of collecting ancient objects, however, was created by private individuals. History records that Liu Ch'ang, when governor of Yung Hsing (present Hsianfu in Shansi), secured eleven objects of pre-Ch'in periods; and that Li Kung-lin, having a wide acquaintance with objects of antiquity and being skilful in judging them, showed such enthusiasm, that whenever he heard of an object of value, he would not hesitate in the least to pay a price of a thousand taels. Books such as Lü Ta-lin's *K'ao Ku T'ou*, Hsu K'ao Ku T'ou by an unknown author, Wang Fu-chai's *Chung Ting K'uan Shih*, and the appendices of the *Tsih Ku Lu* and *Chin Shih Lu*, very frequently record the names of the collectors underneath the descriptions of the objects. The collectors thus recorded numbered no less than several scores.... (p. 223)

The scope of those collections included mainly bronzes and jades, but coins and some kinds of stone work were sometimes also included. Although they concentrated most of their interest on inscriptions, it is the merit of the Sung archaeologists that they were able to see, in the antiques which they were collecting, important materials for studying ancient institutions. It was the common belief of the Sung antiquarians that it needed men versed in rituals to know the usage of antiques. Thus they made two great contributions towards the gradual building up of an antiquarian science in China: namely epigraphical study, and identification of forms, besides their persistent effort in collecting, reproducing, and circulating. In about one hundred years or so, they created a new science and perfected a new technique.

诚然，那时没有历史方法，没有比较方法，更没有试图创建一个综合体系，但他们追求准确描述和复制的努力以及他们的许多考订，都是颇值得称道的。11~12世纪出版的《考古图》和《博古图》绝不仅仅是一个收藏指南，其中创立了一个著录和复制古物的系统，除了因近代印刷技术的改进而造成的在少数细节上比较落后外，这一系统直到今天都是这方面论著的典范。也许无法检测其度量与复制的精确程度，但他们力求精确的目标是显而易见的；他们在辨识古物方面表现出的独创性和正确性已为近代批评界所印证。由于那时印刷术早已发明，因此，收藏古物之风传播极快。更令人惊叹的是，尽管最大最著名的收藏是皇室收藏，但收藏之风尚却主要是由个人开创并维持的。因此，王国维教授在其《宋代之金石学》一文中说：

.....宣和藏器之富，固自不足怪也。然宋人搜集古器之风，实自私家开之。刘敞知永兴军[今山西]，得先秦古器十有一物。李公麟博物精

鉴，闻一器捐千金不少靳。而《考古图》、无名氏《续考古图》、王复斋《钟鼎款识》以及《集古》、《金石》二录跋尾，往往于各器之下注明藏器之家，其人不下数十……（223页）

这些收藏的范围主要包括青铜器和玉器，不过，钱币和石器有时也在收藏之列。尽管宋代收藏家们的兴趣主要是在铭文上，但是，他们的可贵之处在于，他们能在其所收藏的古物之中看出研究古代制度的重要材料。宋代的古物研究者们普遍相信：了解古器物的用途需要熟谙礼法。因此，除了不断地收集、复制和传播古物之外，他们对中国古物学的逐步建立还作出了两方面的重大贡献，即铭文研究和款式识别。在一百年左右的时间里，他们开创了一门新科学，完善了一门新技术。

This new science, founded by a group of Northern Sung scholars, was ably continued even after the disastrous event of the Tsing K'ang era when the Golden Tartars raided the capital city at K'aifeng and made it a ruin. In fact it continued to the very end of the Sung Dynasty. Many notable treatises on antiques were produced in the later period.

Owing to this continued activity, the foundation of the new science was laid firmly; so even after a total lapse of almost five hundred years, it still retained enough vitality to give new strength to the classical revival in the Manchu Dynasty. "During the 150 years, from the middle of Chien Lung's reign to the present, marvellous progress has been made in the study of archaeology, ..." says Liang Ch'i-ch'ao in an address in honor of the visit of the Crown Prince of Sweden to China. "The number of books on archaeology is truly astonishing. I am familiar with at least 400 books which I consider as valuable contributions to this subject,"^[4] he continued. The works of this period, however, deviate very little from their Sung prototype; but they have attained greater accuracy, and are worked in greater detail. They are on the whole better epigraphists. Owing to the intensive interest in textual criticism of this period, antiquarian studies were much encouraged, as they offered so much new material, and were evidently helpful in the study and interpretation of ancient classics. Yüan Yüan, who edited the famous Huang Ch'ing Chin Chieh, is also the author of Chi Ku Chai Chung Ting I Ch'i K'uan Shih, one of the first treatises on bronze inscriptions written in this period. From Yüan Yüan's time on, a long list of scholarly antiquarians has followed, until it gradually merges into an intermediate stage when Western influence began to penetrate. The result of the contact of this influence with the old tradition is the birth of a new archaeology in modern China.

The great contribution of this period is the advancement of epigraphical studies, of which the Sung antiquarians made only a start. They also showed a more diversified interest, and produced

special treatises on bricks, tiles, seals, and other antiques of a given locality. It is only fair to say that at the end of the nineteenth century, traditional antiquarian science had already developed to such a stage that it was only a step from the standard of Modern Archaeology. Wu Ta-chêng's treatise on jade, and his study of early inscriptions, for instance, can stand comparison with any modern scientific treatise of a similar nature. It is an even bet whether or not traditional archaeology in China would have advanced to the modern stage even without Western influence! It is at any rate obvious that without such background archaeology would not have attracted so much interest in China at the present time.

由北宋学者建立的这门新科学，即使在遭遇靖康年间金人突袭、摧毁京城的灾难后，仍顽强地沿续了下来。事实上，它一直延续到宋朝末年。许多有关古物学方面的著名论著都是在宋朝后期完成的。

由于此种连续不断的努力，这一新兴科学的基础得以建立牢固；也正因为如此，即使在经过了近五百年后，它仍有足够的生命力给清朝古学的复兴以新的动力。“由乾隆中叶以后直至现在，一百五十年间，这种学问有很猛烈的进步”，梁启超在欢迎瑞典王储到访中国的致辞中说。他还继续说道：“关于考古学的著作，数目的增加实在可惊，据我所看见过，认为很有价值已经成书的，不下四百种。”^[5]这一时期的著作几乎没有偏离宋代的原型，不过更精确、更详细而已。从总体上看，他们更是更优秀的碑铭研究家。由于这一时期对于文本考据的浓厚兴趣，古物研究得到大力提倡，因为它们提供了如此多的新材料，对于研究和解释古代经典显然极有帮助。著名的《皇清经解》的编者阮元，同时也是《积古斋钟鼎彝器款识》的作者，后者是这一时期研究青铜器铭文的最早的专著之一。自阮元以后，涌现出了一大批学者型的古物学家，直到西方影响渗入中国，传统的金石学逐渐进入一个过渡性的中间阶段。古老传统与西方影响接触的结果催生了近代中国新的考古学。

这一时期的重大贡献在于铭文研究的进步。在这一领域，宋人只是开其端绪而已。此外，他们的兴趣也比宋人更为广泛，并撰写了有关砖、瓦、印玺及某些特定地区的其他古物的专门论著。公允地讲，到19世纪末，传统的古物学早已发展到了离近代考古科学仅有一步之遥的阶段。例如，吴大澂论玉器的专著及其对早期铭文的研究，可与任一同类性质的现代科学著作相媲美。即使没有西方的影响，中国传统的考古学是否也已发展到近代阶段，对此我们很难下结论。无论如何，若没有这样一个背景，考古学不会在中国引起如此多的兴趣，这是显而易见的。

An Intermediate Stage

Before we discuss recent works, it is worth while to note how Western explorations of Chinese antiques have reacted upon the classical school of China. In this connection, two great events need

special mentioning: one is the discoveries of the Tun Huang Manuscripts, and the other is the activity of the Geological Survey. I have no space here to relate in any detail the story leading to the discovery of the Tun Huang treasury. Those who are interested may be referred to the publications of Aurel Stein^[6] and Paul Pelliot^[7]. This discovery has influenced the classical school of China in recent years most profoundly, and it proves convincingly to the conservative Chinese learned world how much more fruitful is field exploration than mere book pursuit, even in classical study. This stage of reaction was brought forth by a very fortunate circumstance; that is, the Tun Huang manuscripts are both rich and variegated, and relate to a period immediately preceding the age of the earliest printed books. Some of the best minds of the last generation were occupied with the study of this new discovery; the results are almost revolutionary. A perusal of the works of Lo Chên-Yü and Wang Kuo-wei, two of the most eminent scholars, whose activity may be properly assigned to this stage, show, that what makes their achievements enduring is their opportunity to study these new materials.

Meanwhile some energetic minds began working along a different line, which was bound to exercise a healthful influence in the same direction and quicken the birth of a modern archaeology in China. I mean to refer to the activity of the Geological Survey of China. The survey was established for a definite purpose, which is being successfully fulfilled; besides, they have found enough energy to pay a great deal of attention to the Psychozoic period. This has resulted in a series of archaeological works culminating in the recent discovery of *Sinanthropus Pekinensis*. But the works that have a more immediate bearing on archaeology are those undertaken by J. G. Andersson, Swedish advisor to the Survey, in Manchuria, Honan, and Kansu, where he found an early Chinese culture totally unknown before, and whose relation to the traditional Chinese culture has aroused a great deal of speculation.^[8] An intense interest in early Chinese history has been stimulated by these discoveries. The younger generations are finally and totally convinced of the great possibilities of archaeological excavations; plans for such activity have begun to mature.

中间过渡阶段

在我们讨论近期工作之前，应当关注一下西方对中国古物的勘查是如何影响中国古典学派的。在此方面，有两件大事特别值得一提：一是敦煌卷子的发现，二是地质调查所的活动。因篇幅所限，此处不可能详叙敦煌宝藏发现的经过，对此感兴趣的读者可以参阅斯坦因^[9]和伯希和

[10]的著作。这一发现更深远地影响了近年来的中国古典学派，令人信服地向保守的中国学界证明：即使在古学研究领域，田野调查也比单纯的书本研究要有成效得多。这一时期的影响是由一个特别幸运的情况引发的，即：敦煌卷子既丰富又多样，恰恰又与最早的印刷本的书籍出现的前一个时代相联系。一些上一辈最优秀的思想家都潜心研读这些新发现的材料，其所得之结果几乎是革命性的。仔细研读罗振玉和王国维两位这一时期内研究最具代表性、最杰出学者的著作，就会发现正是这一研究新材料的机遇才使得其研究成果具有不朽价值。

同时，一批活跃的思想家开始沿着另一条路线开展工作，这必将在同一方向上对考古学产生健康的影响，并加速中国近现代考古学的诞生。此处指地质调查所的活动。该所的建立有其特定的目标，且该目标正在成功实现；同时，他们又有足够的余力对灵生代时期展开仔细研究。这导致了一系列考古学著作的问世，以最近北京人的发现达到了顶峰。不过，对考古学产生更为直接影响的，是地质调查所的瑞典籍顾问安特生在东北、河南、甘肃所开展的研究工作。在上述省区，安氏发现了一种此前完全不为人知的中国早期文化，此种早期文化与传统的中国文化的关系已经引起大量猜测。[11]这些发现引发了人们对于中国早期历史的强烈兴趣。年青一代终于完全相信考古发掘工作的巨大潜力，此类研究计划也已经开始成熟。

Recent Works

The confluence of traditional antiquarian studies and modern scientific method has necessitated a readjustment of viewpoints, and brought forth not only an improvement of technique, but also a complete review of all the historical problems. It must be said that such a process will take a long time to complete; what is being done at present is only the beginning of a new era.

From a purely archaeological viewpoint, as different from that of early antiquarians, there are certain problems never thought worth consideration by traditional historians, which have gained their importance through the development of natural sciences. When China is now viewed not as an isolated unit by itself, but merely a fragment of the total humanity, one finds that a great deal of materials, totally disregarded by early antiquarians, become extremely informative and historically significant. From this point of view China is an extremely rich field which has just begun to be explored.

Many of the institutions of higher learning like the Department of Chinese Studies of the Peking Government University, the Historical Museum, and the Tsing Hua Research Institute began to take up these new problems, and became interested in archaeological excavations in the last decade. Although it has not been possible to carry out all the

plans, sporadic work has been done from time to time, and some of it has been done meritoriously. However, it remains for the Institute of History and Philology, Academia Sinica, to be the first sponsor of serious archaeological excavations. The recent work undertaken by the Institute in Anyang^[12] deserves special mention for a variety of reasons; it is thoroughly modern in its planning; it is one of the key sites of North China; it has yielded abundant results; and above all, it has been of interest to both the early antiquarians and the modern archaeologists. So it may be taken as a typical example of recent work done in this field.

近期的研究工作

传统的古物学和近代科学方法的汇流，亟需观点上的调整。这不仅带来了技法上的改进，同时也引发了对所有历史问题的全面反思。必须指出的是，这样一个过程的完成需要很长时间，目前正在进行的工作不过是一个新时代的开端而已。

与早期的古物学不同，从纯粹考古学的角度来看，一些在传统的历史学家眼中从来不值得考虑的问题，由于自然科学的发展已经变得十分重要。现在，中国已不再被看作是一个自成一体的孤立个体，而只是整个人类世界的一部分，因此，我们发现，大量早期古物学家不屑一顾的材料如今成为了信息含量高、历史意义重大的材料。从这点来看，中国是一个有待探查的富饶田野。

许多高等学术机构，如国立京师大学校中文系、历史博物馆、清华国学研究院等，均已开始关注这些新问题，并在过去十年中对考古发掘工作产生了兴趣。尽管无法完成所有计划，但零星的工作还在不时进行，且其中不少是卓有成效的。然而，第一个出面主持真正的考古发掘的还得是中央研究院历史语言研究所。该所最近在安阳^[13]所进行的工作由于多方面的原因，值得特别关注：这项工作在计划方面，完全是现代化的；发掘地点是华北的关键遗址；发掘成果丰富；最重要的是，它同时吸引了早期的古物学家和现代的考古学家的兴趣。因此，它可以视为这一领域近期工作的典型事例。

This site first became known to the antiquarians in 1899, when some curio dealers brought some inscribed bones from this site to Peking, attracting the attention of Wang I-yung, a great scholar and statesman who immediately recognized their importance and began to collect them. He died in the Boxer's time the year following. His collection passed into the hands of Liu Tieh-yün, who was the first to make rubbings on these inscribed bones, and publish them in book form. Then it was followed by some periodical bone-rushes among the curio dealers, a great deal of serious work, and some very interesting episodes when these new materials were struggling for recognition.

During this period serious studies were made chiefly by Lo Chên-Yü, and Wang Kuo-wei, who deciphered about half of these newly discovered characters, thus laying the foundation of this new branch of palaeography. In the early period the work were carried on with a great deal of opposition from other quarters. Chang Ping-lin for instance, one of the greatest living Chinese scholars at the time, who is in certain sense radical in his political thought, but conservative in his literary ideas, considered these materials as forgeries. Nevertheless, studies were carried on and new inscribed bones were added to the market every day. The actual site was eventually ascertained. Lo Chên-Yü had the originality of visiting it himself but at that time he considered the site, so far as the inscribed bones were concerned, as already exhausted. All the while it never occurred to anybody that excavations might be fruitful.

The Institute of History and Philology was organized in 1928. In the very beginning, archaeological excavation has been taken as one of its regular enterprises. Anyang was chosen as the first site for work. In less than two years time three seasons' diggings have been done. Because of their importance the results achieved have received attention all the world over. It may be truly said that since this work started, modern archaeology has made a beginning in China.

Previous to the excavations of the Institute, our knowledge of the Anyang site was confined to the inscribed bones. It was also known that it was the capital city of the Shang Dynasty, and that many other things were found together with these bones. But the knowledge of the latter was so imperfect that scientifically speaking it was almost worthless. Meanwhile, the site was badly destroyed by the reckless plundering of curio dealers for almost thirty years. When the Institute first began to work, many thought it already too late. But through careful planning, methodical procedure, and detailed observations, the field work has been carried out with extraordinary success.

这一遗址的存在最早为古物学家所知是在1899年。当时，一些古董商人把从该遗址得到的刻字的甲骨拿到北京，引起当时的官员、大学者王懿荣的注意。王氏立即意识到其重要价值并开始收集。王于义和团事件的第二年逝世，他的收藏后来传入刘铁云手中。刘氏成为第一个制作甲骨文拓片、第一个以图书的形式出版这些内容的人。在刘之后，出现了一阵古董商人追逐甲骨的热潮，也有大量严肃的研究工作，还有这些新材料在争取承认的过程中的一些非常有趣的插曲。这一时期严肃的研究工作主要是由罗振玉和王国维完成的。他们解密了约一半的新发现的文字，从而为这门新的古文书学奠定了基础。初期，这一工作遇到了来自其他方面的反对。例如，当时中国在世的一位顶级学者章炳麟——从某种意义上说他的政治思想是激进的，但其文学观念却是保守的——他就认为这些材料都是伪造的。尽管如此，研究工作仍在继续，市场上

每天都有新甲骨流入。实际的出土遗址也最终确定了。罗振玉是第一个前往参观遗址的人。不过，那时他认为，就甲骨而论，那里已经早已挖掘殆尽。人们始终没有想到，对这一遗址进行发掘还会有丰富的收获。

1928年，历史语言研究所组建。在建立初期，考古发掘是其定期工作之一。安阳就是第一个选定的发掘地点。在不到两年的时间里，开展了三季的发掘工作。由于其重要性，发掘成果受到全世界的关注。我们真正可以这样说，自从这项工作开始之后，近代考古学在中国创生了。

在史语所开始发掘之前，我们对于安阳遗址的了解只限于甲骨文。我们还知道，安阳是商朝的都城，与这些甲骨一起出土的还有许多其他物品。但关于这些物品的知识并不完善，所以从科学的角度上讲，基本上毫无价值。同时，这一遗址经过古董商人三十年左右的肆意掠夺，已受到严重破坏。当史语所开始工作的时候，许多人都认为已经太晚了。但是，经过详细的筹划、系统的发掘和仔细的考察，田野工作取得了极大成功。

Among the many discoveries that have been made, some are of such fundamental importance that they deserve more detailed treatment. Through stratigraphical studies it has been possible to determine definitely the general character of the various associated finds. The nature of the deposit, the conditions that led to the final abandonment of the city, and the changes that have taken place after the abandonment have all become observed knowledge. It can now be categorically laid down that Hsiao-t'un Ts'un, where the diggings were carried out for three seasons, was once part of the capital city of the Shang Dynasty, sometime between 1400 and 1200 B.C., but it was deserted during the final collapse of the Dynasty. The place has never again been occupied as a city site.

The most important group of artifacts that have been taken out from the buried city are inscribed plastrons and scapulars that were used for the purpose of divination. On them are inscribed the queries made and answers given in consultation, in archaic characters, which are more primitive than the oldest inscriptions on bronzes previously known. They represent undoubtedly one of the early stages in the development of Chinese writing, from which the later ones have gradually been evolved. It has been possible after many years of patient work to trace, gradually, such development. More than eight hundred of these characters, about half of the total that have been discovered, can be definitely deciphered. The contents of these inscriptions are therefore quite readable and prove to be very rich.

The royal house of the Shang Dynasty were faithful observants of oracles. Judging by the great abundance of these bones and the contents of the inscriptions, it is quite definite that oracles regulated even the minute details of the conduct of the king. Whether it was an

act of performing a sacrifice, or taking a trip, going out hunting or fishing, inquiring about the weather, or sending out an expedition, the cracks of the bones must be consulted; answers were found in the signs of these cracks, which the king evidently had to obey. It is for this reason that the inscribed bones have been found in such great abundance and with content so rich that from them a great deal of the lost history of that period, political, social, economic, and religious, can be reconstructed.

在众多的发现之中，有一些具有重大的根本性意义，值得更进一步研究。通过地层研究，已能确定各种相互联系的发现的一般特性。沉积物的特性、致使这一都城最终荒废的条件及其以后所发生的变化，都已成为可以观察到的知识。现在我们可以断定，三季发掘工作的所在地小屯村，曾是商朝都城的一部分，持续时间约在公元前1500年至公元前1200年之间，但随着商王朝的最终崩溃被放弃。从此以后，此地再无城市兴建。

从这座被掩埋的城市里发掘出来的最重要的史前器物就是供占卜之用的刻有文字的龟甲和牛脾骨。甲骨上刻写着问卜及问卜所得之结果，用比先前已知的青铜器铭文更为古老的文字写成。毫无疑问，这些文字代表了中国文字发展的早期阶段，后来的文字就是由此逐渐演变而来。经过多年的潜心研究，此种演变的轨迹也可逐渐追寻。已有八百多个字——约为所发现的文字总数的一半——得以明确解读。因此，这些铭文的内容是可以读懂的，而且证明非常丰富。

商王室笃信占卜。从甲骨数量之多及所刻文字的内容可以断定，商王即使是微小细节的行为举动都要由卜辞来决定。无论是贡献牺牲，还是外出巡狩渔猎，无论是询问天气，还是派军远征，都要看甲骨上所现的裂纹。问卜的结果就在裂纹之中，商王显然必须遵守。正是因为这一原因，所发现的甲骨数量才会如此之大，内容才会如此丰富，那个时代已经消失的历史、政治、社会、经济和宗教才能得以重建。

Important as these inscribed bones are, the associated finds are no less so. Inasmuch as the time can be approximately defined, the material culture, as revealed in the artifacts contemporaneous with this period, can both substantiate the verbal statements on the bones and, to an even greater extent, supplement them. A great deal of our knowledge concerning the culture of this period depends almost entirely on such finds. For instance, it would be difficult to find out from the inscriptions whether the Shang people of this period were still in the stone age or had already begun to use metals; if they used metals, to what extent. The stone or metal objects themselves furnish the exact data. By means of careful stratigraphical study we know for certain now that the Shang people of this period had already mastered to a very advanced degree the secret of casting bronze. They made weapons, ceremonial vessels, and many ornaments of this metal, and

developed an extensive bronze industry right on the spot, as proved by the remains of moulds, bronze ore, and slags attached by copper rust. But at the same time, the copper and tin supply must have been somewhat limited, so a great number of utensils were still made both of bronze and stones, such as axes and knives, etc. That it is possible to show and prove that in this period people were using both stone and metals, is, I believe, a great contribution to our knowledge of early Chinese history, and at the same time furnishes new materials for students who are interested in the migrations of early cultures.

Ceramics, which are basic archaeological materials, have been found in great quantity. They consist of many fundamentally different types, easily proven to be an aggregation of different local productions, as is to be expected of a metropolitan culture. One of the amazing discoveries concerning this industry is its use of glaze, the beginning of which has been hitherto considered to be sometime in the Han Dynasty. In spite of its aggregative character, the ceramics on the whole share certain individual traits typical of this period. For instance they are all monochrome and decorated by incised lines, entirely different from the aëneolithic Yang-shao ceramics, which are polychrome and decorated by paintings. Survivals of Yang-shao wares were discovered on this site. This discovery is of some importance because it helps to determine the lower limit of the age of Yang-shao which has never been definitely fixed.

The finds also contain many decorative works of shell, stone, and bone, illustrating profusely the art of the period. The decorative elements on the whole are quite consonant with the traditional ideas relating to the art of the period, only proving to be more luxurious. When they are worked out, it will be possible to determine the relationship with the various surrounding centers that were contemporaneous with this culture.

这些刻有文字的甲骨固然重要，相关发现的重要性也同样不可忽视。由于可以大体确定这一文化所处的时期，同时期的史前器物所反映的物质文化，不仅可以证实甲骨上的文字内容，而且还能更进一步地补充这些文字内容。我们关于这一时期文化的许多认识几乎完全依赖于这些发现。例如，从甲骨文中，我们还难以确定：这一时期的商人是仍处于石器时代，还是已经开始使用金属；如果他们使用金属，到什么程度。石器或金属实物本身提供了这方面的确切资料。经过仔细的地层研究，我们现已确知，这一时期的商人已经掌握了相当先进的铸铜技术。他们用青铜来制造兵器、礼器和饰品，在当地发展起了庞大的青铜业，此点可由当地出土的铸模、铜矿以及带有铜锈的熔渣证明。但与此同时，铜、锡的供应必定有限，因此还有大量的器皿，如斧头和刀子等，都是用青铜和石头混合制造的。笔者认为，对这一时期人们可能既使用石器又使用金属这一事实的表现和佐证，大大增加了我们对于中国早期

历史的认识，同时也为对早期文化迁移有兴趣的学者提供了新的材料。

陶器——考古学的基本材料之一——已被大量发现。所发现的陶器包含许多迥异的类型，显然证明了这是不同产地陶器的汇聚，这正如人们预想中的大都市文化一样。关于这一行业的一项惊人发现是釉的使用。此前学界一直认为，釉的使用最早是在汉代。尽管这些陶器是从四面八方汇聚而来，但总体上都有这一时期陶器的几个典型特征。比如，它们都是单色的，刻有装饰线条，完全不同于仰韶新石器时代那种多色、绘饰的陶器。仰韶时期器皿的遗存也发现于这一遗址。这一发现的意义在于，它有助于确定此前一直未能确定的仰韶时期的时间下限。

出土物中还包括许多装饰性的贝壳、石、骨等，充分展示了这一时期的艺术。这些装饰性元素从总体上看与有关这一时期艺术的传统观念相符，只是更加丰富多彩。待这些元素得以确定，就有可能确定它们与同时期周边文化中心之间的关系。

These are only a few examples of the finds from this site; many are still in the hands of specialists whose opinions are being awaited as to their real significance. Even these few are sufficient to show the general nature of the contents and the importance that may be attached to them. From an archaeological viewpoint it is most fortunate that this site should have been chosen for the first serious work. When the materials are thoroughly studied they will help to clarify many difficult problems and serve as standard of definite value by which others may be compared and judged. In other words we have got a key site in North China, gradually worked out and found a guide to direct our search in the archaeological maze of the Yellow River Valley.

Future Prospect

The work of the Institute has already created a widespread interest in archaeological excavation in China. To follow up this work many plans have been made by various universities and museums to excavate early remains. It can be safely predicted therefore that as soon as the country is politically settled there will be a flourishing period of archaeological diggings. But from practical experience can we say anything about the archaeological prospects of this country?

I have been told that when Sir Flinders Petrie first went to Egypt in 1880 he was not at all encouraged by any of his senior workers; the fact was that Egypt seemed to many experts at that time to have been archaeologically exhausted. Fifty years have now passed since his first triangulation of the Pyramids in Gizeh, and many undreamed of discoveries have been made, one after another in this period; yet, to this day, Egyptology seems to be a field for young archaeologists just

as alluring as it was fifty years ago. China possesses an ancient tradition and is just beginning to be explored. Results of the recent works prove most substantially that the spade can work just as many wonders here as it did in other old countries. The forgotten history of China will certainly be written on materials to be recovered from this source, as has been the case with Mesopotamia, Egypt, Greece, and Rome.

以上只是有关这一遗址出土物的几个例子，更多的例子还在专家们的手里，其真正的重要性还有待专家的意见。不过，仅这几例已足以表明这些发现的一般性质及其可能具备的重要性。从考古学的角度来看，选择这一遗址作为第一个正式发掘点是十分幸运的。材料经过彻底研究后，会有助于澄清许多难题，并充当绝对价值标准，以资参照、判断。换言之，我们已经在华北地区发现了一个颇为关键的遗址，并逐渐摸索得出了一个指引我们在黄河流域考古谜宫探索的指南。

未来展望

史语所的工作已在中国引发了一阵广泛的考古发掘的热潮。紧接着这一工作之后，许多大学和博物馆制订计划，准备发掘早期遗址。因此，可以大胆预测，一旦国家政治上安定下来，马上会有一个繁忙的考古发掘期到来。不过，就实践经验而言，我们对于本国的考古前景可以说些什么呢？

有人曾经告诉笔者说，1880年派特力前往埃及时，没有一个前辈鼓励他；在那时的许多专家看来，从考古学意义上讲，埃及早已考之殆尽，无可再考。自他对吉萨的金字塔进行三角定位以来，已经五十年过去了。在这段时期里，许多前人连做梦都未想到过的发现却一个接一个出现了。直到今天为止，对于年轻的考古学家来说，埃及学仍像半个世纪前那样充满魅力。中国有着古老的传统，探索才刚刚开始。最近的工作结果充分证明，一把铁锹在其他古国可以发现奇迹，在中国同样可以发现奇迹。同美索不达米亚、埃及、希腊、罗马一样，有了这一源头所发掘出的资料，中国被遗忘的历史必将被重新书写。

[12] The Freer Gallery of Art, Smithsonian Institution, has been for many years, actively interested in archaeological works in China. The expense for the Anyang excavation for the year 1929 was equally shared by the Institute and the Freer Gallery of Art, with which the author was connected for five years, and to which he is glad to be able to acknowledge his indebtedness.

[13] 史密森研究所的弗利尔美术馆多年来一直积极关注中国考古研究。安阳考古发掘所用经费由清华国学研究院和弗利尔艺术博物馆平均分担。五年来，笔者参与此事，特此致谢。

V ArchAeological Survey of the Fêng River Valley, Southern Shansi, China

In the latter part of December, 1925, Mr. Bishop suggested that I undertake some work in the field. The idea immediately occurred to me that before the spade be brought out, a preliminary survey should be made, so it was agreed that I should go to the southern part of Shansi and investigate the archaeological possibilities along the Fêng River valley. The president of Tsing Hua College, Mr. Y. S. Tsao, kindly consented to cooperate. In his official capacity, he wrote to Governor Yen Hsi-san and successfully arranged for a permit for me to travel in southern Shansi. By a lucky coincidence also, the Geological Survey of China was on the point of sending Mr. P. L. Yüan to the same region for some field-work in geology. Mr. Yüan is a geologist of much experience, having travelled with Andersson in Kansu for two years and acquired a great deal of interest in prehistoric archaeology. So we arranged to travel together. Our start was somewhat delayed, and it was not until February 5, 1926, that we left Peking, just a week before the Chinese New Year.

We arrived at T'ai-yüan on the 7th, and spent the whole day of February 8th in making calls and purchasing equipment. When I left Peking, I brought a large number of letters of introduction to the Governor and the various officers of influence in Shansi. Among these was one written by Mr. Liang Ch'i-ch'ao, now senior professor of the Tsing Hua Research Institute. Similar to many other letters, this one explained the purpose of my visit and the necessity of archaeological work at present. The Governor, however, was too much occupied with matters of greater importance to see us; but we succeeded in having an interview with his secretary, who, on behalf of the Governor, promised us all the help we asked. These promises were well fulfilled later on.

We left T'ai-yüan on the 9th (Fig. 31) and, traversing what is geologically a *loess* area, arrived at Chieh-hsiu three days later. I was much impressed by the extensive use of arches that is noticeable from T'ai-yüan southward. It seems to be quite a peculiarity of Shansi architecture. The first series I saw was along the Chêng-t'ai road. All the way, in houses that were built on a grand scale, as well as in the small inns, we found such arches employed. Buildings of this type are known as *yao-fang*. Native scholars told me that they are warm in

winter and cool in summer, the style being derived from the early cave-dwellings. At present, we still find all the transitional stages from the *loess* cave type to the most complicated *yao-fang* represented in this region.

伍 山西南部汾河流域考古调查^[1]

1925年12月下旬，毕士博先生（即卡尔·怀顶·毕晓普，美国弗利尔艺术馆的专员。——译注）建议我做点野外工作。当时我就有一个想法：在动手发掘之前，需要先作个初步调查。因此，我们商定，由我到山西南部沿着汾河流域去作一番考察，以确定有无进行考古发掘的可能性。清华学校校长曹云祥先生欣然同意予以配合。（整个这次调查和半年以后的西阴村史前遗址发掘，都是以清华学校和弗利尔艺术馆合作的名义进行的；本文作者当时是清华的国学研究院人类学特约讲师。——译注）他以校长的名义给阎锡山省长写了一封信，商妥同意我去山西南部旅行。在这同时，恰巧中国地质调查所正要派袁复礼先生到同一地区进行地质学的田野调查工作。袁先生是一位富有经验的地质学家，他曾经和安特生一道在甘肃考察了两年，对史前考古学极感兴趣。这样，我们就决定结伴同行。动身的日子稍有些延误，直至1926年2月5日（正是中国旧历新年的前一周）我们方才离开北京。

2月7日，我们抵达太原，8日用了一整天时间进行各种拜会和购置用具。我离开北京时，带了许多封给山西省省长和有影响力的有关官员的介绍信，其中一封是由现在清华国学研究院的资深教授梁启超先生写的。这封信同其他许多信件一样，说明了我此行的目的和当前考古工作的必要性。省长由于要公在身无法接见我们，不过我们还是见到了他的秘书，秘书代表省长对我们提出的全部要求作了承诺。这些诺言后来也都很好地履行了。

我们在9日离开太原（图31），横跨过地质学上所称的黄土地区，三天后到达介休。太原以南地区到处可以看到广泛采用的拱形结构，这给我留下了很深的印象。这似乎是山西建筑式样的一个特色。我最先看到的一组这样的建筑，是在正太铁路沿线。一路上我们发现，从大型的建筑物到小客栈都采用这种拱形结构。这种建筑称为窑房。当地的读书人告诉我：这样的房子冬暖夏凉，样式是从古代的洞穴演变来的。今天我们在这个地区仍能看到从黄土窑洞向极其复杂的窑房演变的所有过渡形态。

(31) Our cart in front of a roadside temple 骡车在路旁小庙前

We took advantage of the Chinese New Year to see the city of Chieh-hsiu (Fig. 32) and also made some measurements of the natives, who seem to be quite a heterogeneous group. I saw bearded men who can be compared with the average Armenian; I saw also men with 100 per cent yellow moustaches. One of the commonest physical types found in this district is the round headed individual with a long face, a disharmonious type according to physical anthropology. Such an occurrence did not, however, surprise me at all, as both dolichocephalic and brachycephalic people are found in this region. Very likely it is the mixing of these two fundamental types that has given rise to this disharmony.

(32) Chieh-hsiu: in front of Kuan-yao Miao 介休县关岳庙前

On the 15th, we started our first trip to the mountain (Mien-shan) in the southwestern part of the district where some of the ancient temples are found. Of two of these, especially, I made some detailed study. Both temples are Buddhist, one located at the foot of the mountain, the other near the top of one of the peaks. The one at the foot was first built in the T'ang Dynasty, but has been destroyed and

rebuilt many times since, only the bell and drum-tower still retaining a pre-Yüan style. The temple on the peak, also, was first built in the T'ang period, but burned during the Ming. The stratification of the three different layers of culture is here plainly visible. One of the halls is located very near to a cave. The images that are worshipped at present are evidently of recent origin. Behind them is another row of images cast in iron; and finally in the cave I found two broken statues of stone, one with a head and one without, carved in simple, bold style, showing T'ang workmanship; but they are cast away in the rear of the cave and covered by dust. Perhaps, however, the most interesting thing we saw on this trip is a stone ox washed down by a mountain torrent some time ago, from where no one knows.

趁旧历新年之际，我们观光了介休城（图32），并对当地居民作了一些人体测量，他们看上去不像是纯一的群体。我看到一些人的髭胡堪与一般的亚美尼亚人相媲美；我也看到一些长着纯黄色胡髭的人。这个县最常见的一种体质形态是圆头长面型，即体质人类学上所谓的不协调型。可是，这种情况一点也没有使我惊奇，因为长颅的和短颅的人在这里都能见到。很可能是这两种主要类型的混合导致了这种不协调型的出现。

15日，我们开始了去这个县区西南部绵山的首次旅行。我们在那里见到了些古老的庙宇，我特别对其中的两座作了详细研究。它们都是佛教寺院，一座位于山脚，另一座靠近一个山顶。山脚下的那座庙始建于唐代，但已多次毁坏和重建，只有钟和鼓楼还保留着元代以前的风格。山顶上的那座寺院也是始建于唐代，但于明代烧毁。在这里，三种不同文化层的层次一目了然。其中一座殿紧挨着一口窑洞。人们现今在那里朝拜的佛像显然是新修的；在这些佛像后面另有一排铁铸的佛像。最后，在窑洞里面我发现有两个残破的石像：一个有头，一个无头，雕工简朴，风格粗犷，显出是唐代的做工。但这两座像却被抛弃在窑洞的最里面，为尘土湮没。不过，我们在这次旅程中看到的最有意思的应该是一头石牛了，这头石牛不知是在什么年代也不知是从什么地方被一次山洪冲来的。

The river Fêng has its source at Kuan-ch'in-shan and flows in a straight southerly direction till it reaches Chiang Chou. From I-t'ang southward, it cuts through the Ho-shan range for about 40 miles, after which it flows through the plain again. For a whole day, the 23rd, after leaving Chieh-hsiu, we wormed our way through the Ho-shan along the river bed. About noon we reached Hsia-mên Ts'un which is one of the most beautiful villages I have seen in this province: the buildings of brick and limestone, the windows and doors arched.

From there southward, the mountains on both sides rise steeply, and in them are many limestone caves, some of which I explored, but found only traces of modern habitation. We stopped at Ho-chou,

between which place and Lin-fêng Hsien there are many historic places; but as I did not intend to make any intensive study north of the latter, we passed this region rather hurriedly and reached Lin-fêng Hsien on the 25th.

Lin-fêng Hsien (or P'ing-yang Fu), a city that has aroused imagination in the past—the ancient capital of the Emperor Yao! What Chinese scholars are not acquainted with the list of virtues of this august monarch? Did he, however, also create a model city? Since he was, perhaps, the most self-denying emperor that the world has ever known, it would not be in harmony with his ethical principles if he should have used the national wealth to build luxurious palaces like those found in Troy and Knossos; but whatever he might have done in this respect, it is a fact that there is not even a tradition as to the exact location of his capital. The modern city of Lin-fêng Hsien is, like every other city in inland China, surrounded by machicolated walls. About a mile west of the city flows the Fêng River, and west of the Fêng is the famous Ku-i-shan where, according to the mythical tales of Chuang tzü, resided many fairies.

We rested in Lin-fêng Hsien for a day, and on the morning of the 27th started to explore Ku-i-shan in the western part of the district the place being popularly known as Hsien-tung (Fairies' Caves). A mile out of the western gate of the city, we crossed the Fêng River. Between the river and the foot of the mountain there is a series of *loess* terraces ascending higher and higher towards the mountain and dotted here and there by villages, some of which are merely a collection of cave dwellings. It took us more than half a day to reach the Northern Fairy Cave, where we were received by a monk—an old man, widely travelled, and evidently knowing something about his profession.

汾河发源于管涔山，流向正南，直到绛州。义棠迤南，汾河穿过霍山山脉近40英里之长（本文中作者在标示长度时，多半采用英制单位，但也杂用了市制和公制单位。——译注），而后进入平原。离开介休后，23日一整天我们沿着河床缓慢地探路通过霍山。大约中午时分，我们到达了夏门村。这是我在山西所见的一个最漂亮的村庄：房子是砖和石灰石砌成的，门窗呈拱形结构。

从这里向南，汾河两岸山势陡峭，山上有许多石洞。我勘察了其中的几个，但发现只有晚近住过人的痕迹。我们歇宿在霍州。霍州与临汾县之间有很多历史遗迹，但是我不打算在临汾以北作什么细致的考察，因此我们就很快路过了这个地区，于25日抵达临汾县。

临汾县（平阳府），这是一个勾起人们历史遐想的城市——尧帝的古都！中国的读书人有谁不熟悉这位伟大君王的种种崇高品德呢？可是，他是否也建造过一个典范城市呢？也许因为他是世界上历来最克己的一位君王，所以假如他耗费国帑去修建像在特洛伊和克诺索斯发掘出

的那种豪华宫殿，就不符合他的道德原则了。然而，不论他在这方面做过什么，事实上就连关于他的都城的精确位置的传说都没有。就像中国内陆地区所有的县城一样，现在的临汾县城是由带枪眼的城墙包围起来的。从县城往西大约一英里就是汾河，汾河以西就是著名的姑射山；按照庄子神话故事的说法，那里住着许多仙女（参看《庄子·逍遥游》：“藐姑射之山，有神人居焉；肌肤若冰雪，绰约若处子……”——译注）。

我们在临汾县休息了一天，27日早晨前往西部的姑射山进行考察，这个地方俗称仙洞（仙女洞）。我们在出城西门一英里的地方渡过汾河。在汾河与山脚之间的斜坡上有一排一排的黄土梯田逐级向山上延伸。山坡上到处是星星点点的村庄，其中有些仅仅是聚在一起的几个窑洞。我们花了半天多时间到达北仙女洞，那里接待我们的是一位道士，这是个曾经四处云游、对自己干的这一行颇多阅历的老者。

The temples in this mountain are for the Buddhists. They were originally built in the early part of the T'ang Dynasty; but in later periods they were repeatedly ruined and rebuilt. For some time in the Mongol Dynasty, the Taoists took hold of them and converted them into Taoist temples. They were, however, soon restored to the Buddhists again.

The purpose of my own visit to this place was to explore the limestone caves; that of Mr. Yüan, to investigate the coal region still further west; so on the morning of the next day, each of us pursued his own task. The whole region here is limestone formation, divisible into many different strata. A deep ravine cuts the ground into two perpendicular walls, north and south, in which are several rows of caves, most of them inaccessible, while some are well fitted for early human habitation. Of these I visited five, in the hope of unearthing some paleolithic remains, but the search proved fruitless. We left the mountain on the next day by a different route and made a further search at the foot of the mountain—only to be disappointed again. I had a long discussion with Mr. Yüan in the evening as to the exact route we should follow, and finally came to the conclusion that, so far as my personal work was concerned, I should follow partly the historical sites and partly the probably pre-historic settlements as my guides, so at 10 a. m. on March 2nd we left for Yao-ling.

The exact location of the tomb of the Emperor Yao is a long debated question. Previous to the Mongol Dynasty, this tomb was usually located in Shantung. The tomb in P'ing-yang Fu was not so well known at that time. The argument for its location in Shansi is that as Yao retired at quite an advanced age, it is improbable that he should subsequently have inspected his distant domains and died so far away from home. As the tomb in P'ing-yang Fu is near his

supposed capital, it is probably the true one—if, indeed, there be a tomb of this Emperor; but since the very existence of such a person is doubtful, we can only consider both tombs as variations, merely, of the same myth. All these considerations passed through my mind while we were riding towards the tomb of the Emperor. When we inquired about the way to Yao-ling, the natives simply stared at us, and it was a long time before we made out that the local name for the place is Shên-lin (Spirit Forest). There we arrived late in the evening, and found it surrounded by a wall enclosing a building of modest size, a solitary temple in the midst of mountains, where we stayed that night.

这座山上的寺院都是为佛教徒修建的。它们始建于初唐时期，但后来屡遭毁坏，又多次重建。元代时道家曾一度接管，把它们改建为道教的宫观，可是不久它们又复为佛教寺院。

我个人考察这个地方的意图，是要探寻一下石灰岩洞穴，袁先生的目的则是到还要迤西的地带调查煤田。这样，第二天一早我们就各自去干自己的工作了。这里整个地区都是石灰岩构造，分为许多不同的地层。一道深沟把地面截割成南北两堵峭壁；峭壁上有几排洞穴，其中多数是险峻难达的，但有些则很适于古代人类居住。我怀着发掘一些旧石器时代遗迹的希望，探查了其中的五个洞，但是毫无所获。次日我们沿着另一条路线离开这座山，并在山脚下作了进一步的考察，结果是再次落空。晚上，我跟袁先生就我们应该走的确切路线进行了长时间的讨论，最后得出这样的结论：就我个人的工作而言，我应当部分地以历史遗址、部分地以可能的史前定居点作为我前进的路标。这样，在3月2日上午10时，我们便动身前去尧陵。

尧帝陵墓的确切地点，是一个争论很久的问题。元代以前一直认为这个陵墓在山东。那时平阳府的陵墓尚不太为人所知。说这个陵墓在山西的论据是：尧帝到了年高退隐时，不大可能还去视察远方的国土而死在离家很远的地方。平阳府的陵墓位于传说中的尧的都城附近，所以这很可能是一座真的陵墓——如果这位帝王真有一座陵墓的话。但是，既然连这样一个人物是否确曾有过还属疑问，我们只能认为这两座陵墓不过是同一神话的两种说法而已。我们乘车向尧陵行进时，所有这些念头都在我脑海中浮现。当我们打听去尧陵的路时，当地人直盯着我们；弄了许久我们才知道当地把这个地方叫作神林。我们到达那里天色已很晚了，发现四周都是围墙，里面是座规模不大的屋宇——一座深山中的孤庙。当晚，我们就住在这座庙里。

The tomb is quite high, pyramidal in shape and half encircled by a rivulet (Fig. 33). It was officially lost for a long time, but was rediscovered in the Ming Dynasty, according to the inscription in the temple. The arguments as to whether this is the real tomb are difficult to follow; but in spite of them the question remains a question today, and undoubtedly will remain so until the spade of an archaeologist

shall clear it up.

(33) Supposed tomb of the Emperor Yao (from the southeast) 传说中的尧陵 (东南侧)

We worked about two hours in the morning and left this reputed resting place of the august Emperor at 10 a. m., arriving at Fou-shan Hsien late in the afternoon. On the fourth, we made very little progress. The ground was wet, and there were many steep ascents and descents. We covered about six miles in all and stopped at Hsiang-shui-ho. On this day I picked up my first piece of red pottery of an archaic character on a descending *loess* slope.

The next day we started early, while the ground was still wet. The road we followed lies deep down between *loess* cliffs. Such roads make it convenient to observe the exposed surface of the *loess*. The finding of the red pottery sherd was very encouraging and made me look carefully all along the way. Not long after we started from Hsiang-shui-ho, I began to see gray pottery sherds of the Chou and Han periods. All of a sudden I discerned a piece of red pottery decorated with black lying among the withered, wet grass. Then one after another came into view as we traced them to their source. It is a heap of earth about 10 feet in height and cut down vertically on one side to the public road. The upper surface is a long and narrow strip. This piece of land is owned by the Li brothers, who most politely received me and helped me with their spades to gather samples of the painted sherds from the exposed surface of their mound. When I left them, they were very willing to pose for a picture (Fig. 34) by the side of the heap where these pottery sherds were discovered—the first Yang-shao site to be found in southern Shansi. The rest of the day's journey was a

cheerful one, and at four in the afternoon we arrived at the city of I-ch'eng Hsien.

陵墓相当高，呈金字塔形，一半被溪水环绕（图33）。根据庙里的碑文，在官方记载中它曾湮没无闻了很久，直到明代重新发现。关于这是否是一座真正陵墓的争论，是难以进行下去了，可是无论如何这个问题在今天仍然是一个问题，而且无疑还将继续保留下去，直到考古学家的铲子把它彻底弄清楚为止。

我们上午工作了近两个小时，10点钟离开了这位伟大君王的著名的长眠之地，下午很晚才抵达浮山县。4日，我们没有往前走多少路。地是湿的，而且有许多陡峭的上下坡路。我们总共走了大约六英里路，在响水河边住下。这一天，在一个下倾的黄土斜坡上，我采集到第一片古朴风格的红色陶片。

第二天我们动身很早，地还是湿的。我们走的那条路是在黄土峭壁之间的深谷里。这样的道路便于观察暴露在外面的黄土层。找到红色陶片是很鼓舞人的，这使我一路上都在仔细察看。在我们从响水河启程后不久，我开始看到有周代和汉代的灰陶碎片。突然间，我认出枯萎的湿草中有一块带黑色花纹的红色陶片。接着，当我们去探溯来源时，这类陶片就一块接一块地映入眼帘。这是一个大约10英尺高的黄土堆积，在大路的一边为一个垂直的陡峭面，上部顶面是一条狭长带。这块土地属李氏兄弟所有。他们很殷勤地接待了我，并用锄帮助我搜集暴露在他们这块土墩表面的彩陶碎片。我离开时，他们非常乐意在那个发现陶片的土堆旁拍张照片（图34）——这是在山西南部找到的第一个仰韶期遗址。这一天剩下的旅程是很令人快慰的，下午4时我们到达翼城县。

(34) Site at Chiao-t'ou-ho where prehistoric pottery of the Yang-shao type was found
发现仰韶期史前陶片的交头河遗址

It was a whole day's journey from I-ch'eng to Chü-wo which, in turn, is about 60 *li* east of Chiang Chou—one of the most important cities in southern Shansi and a center for curio-dealers. At this city, the Fêng River turns westward. While we were in Chü-wo, we decided to pay a visit to Chiang Chou to have a look at the various curio shops in that city. This, I thought, might perhaps serve to help us in forming a notion as to the kinds of antiquities which are unearthed in this region. But this idea proved to be a delusion. All the curio-dealers have a common secret: if one inquires about the exact location of the place whence the things they exhibit come, the unanimous and invariable answer is that they do not know. In vain one may tell them that the curios would increase in value if their sources were known. Thus a whole day in Chiang Chou only convinced me that so far as real archaeological work is concerned, very little help can be derived from such people. Having gone to Chiang Chou from Chü-wo by the northern route through Hou-ma, we returned over a bypath through mountains in the south which has been gradually elevated from the Fêng River valley by *loess* deposit. A day and a half was spent in exploring the terraces, and although no particular archaeological results were obtained on this trip, we had a fine chance to study the *loess* orination (Fig. 35), a certain knowledge of which, I think, is necessary, if the archaeology of southern Shansi is to be properly understood.

从翼城到曲沃是一整天的路程，而曲沃位于绛州（绛州系指现今的新绛，不是绛县。——译注）以东约60里。后者是山西南部重镇之一，也是古董商人麋集之地，汾河从这里转向西流。我们到达曲沃后，决定去绛州观光一下，看一看那里各式各样的古董铺子。我想这或许有助于我们对这一带出土的古物的种类获得一些概念。但事实证明这只是一种幻想。所有的古董商人都有一个共同的秘密：假使有人询问他们所陈列出来的文物的准确出土位置，他们千篇一律、毫无例外的回答是不知道。即使有人告诉他们，古董如果有了肯定的出处就更值钱，那也是徒劳。这样，在绛州的一整天只不过使我确信：就真正的考古工作来说，从这些人那里是得不到什么帮助的。我们从曲沃来绛州时是经侯马走北边的大路，回程则是通过南边山间的一条小路，地势由于黄土堆积而离汾河河谷越来越高。我们花了一天半的时间勘查这高原上的梯田，虽然这段旅程没有什么特殊的考古收获，但使我们得到一个研究黄土构造的好机会（图35）。我认为，要正确了解山西南部的考古学问题，关于黄土地层构造的确切知识是必须具备的。

(35) Loess terraces south of Chiang Chou 絳州以南的黃土梯田

After we returned to Chü-wo, our next trip was to dash across Chung-t'iao-shan. This range, according to the local estimate, extends for about 800 *li* from east to west, parallel to the Yellow River on the south and the Fêng on the north, and inasmuch as early traditions about the Emperor Shun and the Hsia Dynasty are centered about these mountains, I decided to spend some time here. The next four days, therefore, were devoted to crossing and recrossing Chung-t'ao-shan; but as we found no archaeological prospects here, we turned immediately northward to An-i Hsien and Yün-ch'êng.

We arrived at Yün-ch'êng in the evening of the 17th and entered the city on the 18th. On the 19th we set out to visit the supposed tomb of the Emperor Shun, and on the way stopped at certain temples in Yün-ch'êng. In *Shansi-t'ung-chih* (Vol. 52, p. 2), it is recorded that the stone pillars of these temples were formerly the palace pillars of Wei Hui-wang (335-370 A.D.), recovered from the ruined city south of An-i Hsien. Some of them are now used as the entrance pillars in Ch'ên-huang Miao and Hou-t'u Miao, and those of Ch'ên-huang Miao certainly show peculiar features which are worth recording. Two pillars, hexagonal in section and carved with dragons coiled around them, are found at the entrance. The left one (Fig. 36) is especially interesting, because in the claws of the dragon are grasped two human heads with perfect Grecian features: curly hair, aquiline and finely chiselled nose, small mouth and receding cheeks. One head with the tongue sticking out is held at the mouth of the dragon, while the other is held in the talons of one hind leg. It is an unusually fine piece of sculpture in limestone, wonderfully spaced and with the most graceful

lines. The right one is inferior in its workmanship: evidently the two were not executed by the same hand. I saw 28 of this kind of pillar in the succeeding two days; but most of them were crude imitations. It is possible, however, that some are of the ancient type and were made earlier than others. The whole subject is well worth more detailed study.

我们回到曲沃后的下一步行程是尽快越过中条山。根据当地的估算，这座山脉从东到西蜿蜒约达800里，南面与黄河、北面与汾河走向平行。关于舜帝和夏代的一些古老传说都集中在这座山脉四周，因此我决定在这里花费些时间。我接着用了四天功夫在中条山往复穿行，但是当我们发现这里没有什么开展考古活动的前景时，就立即转向北边的安邑县和运城。

我们在17日傍晚抵达运城，18日进入县城，19日开始寻访传说的舜帝陵墓，途中又在运城的一些庙宇作了逗留。据《山西通志》（指光绪十八年——1892版的184卷本通志。——译注）第52卷第2页记载，这些庙宇的石柱以前是魏惠王（公元335年~公元370年在位。——按英文文本有误。魏惠王在位应是公元前370年~公元前319年，不算期间改元则为公元前370年~公元前335年。——译注）宫殿的柱子，是从安邑县南部一座城市的废墟中发现的，有几根现在用在城隍庙和后土庙的大门口上。城隍庙的那些石柱确实显出了值得一述的独有特色。大门口有两根六角形的、雕着蟠龙的柱子。左边的一根（图36）特别有趣。龙爪攫住两个纯粹希腊面型的人头：卷发，精雕细刻的鹰钩鼻，小嘴，后削的脸颊。一个吐舌的人头被龙嘴衔着，另一个人头则被一只后爪抓住。这是一件非凡的精致石雕作品，布局奇妙，线条绝美。右边石柱的工艺就逊色一些，显然不是出自同一匠人之手。此后两天内我共看到了28根这类的石柱，但多数是拙劣的摹制品，不过有些也可能是古代标本，制作年代较早。整个这类文物很值得进一步详细考察。

The tomb of Shun (Fig. 37) has a very different appearance from that of Yao. It is located about 30 *li* northwest of the city of An-i Hsien in the midst of a vast plain with apparently no natural barrier on any side to shelter it from "the wind and the water." Half of the early references to the tomb of this emperor put its location at Ch'ang-wu. Yet Chang Chin-chün quite convincingly argued that it must be in An-i (*Shansi-t'ung-chih*, Vol. 56, pp. 20-23). The problem is similar to that concerning the tomb of Yao, and consequently the solution must be sought in the same way.

(36) Details of the left hand stone pillar at the entrance to Ch'ên-huang Miao, Yün-ch'êng 运城城隍庙大门左侧石柱细部

On the 20th, we were invited to dinner by the magistrate of An-i Hsien, Mr. Chêng, who is a student and collector of antiquities. He introduced us to a small museum in his *yamên* where he has gathered together a large number of Buddhist *stelae* and ancient tablets (Fig. 38) which were originally scattered all over the district of An-i. Only a part of all he found has been moved to his *yamên*; but his catalogue includes those which still remain in the different villages. He draws rather a sharp line of demarcation and leaves all the post-Sung

sculptures unrecorded. It is an unusual work that he is doing, and gives one a ray of hope that some of the ancient monuments in inland China may yet be preserved.

(37) Supposed tomb of the Emperor Shun 传说中的舜陵

舜陵（图37）在外貌上与尧陵全然不同。舜陵位于安邑县城西北30里左右，在一片开阔的平原当中，显然没有天然屏障遮挡任何一方的“风水”。早先关于这位皇帝的陵墓的资料，有半数提到它位于苍梧，但张京俊非常有说服力地论证它肯定在安邑（《山西通志》第56卷20~23页）。（引自张京俊的《舜陵辩》。——译注）这个问题跟有关尧陵的问题相像，因此也要按同样方式来寻求答案。

20日，安邑县陈县长请我们吃饭。陈先生是位古器物学者和收藏家。他带我们到他衙门里一个小博物馆去看他的藏品：他把原先分散在安邑境内各地的大量佛教造像碑和其他古碑收集在一起（图38）。搬到衙门里来的只是他所找到的物品的一部分，在他的目录中还包括仍然留在各个村子里的碑碣。他划了一条相当明确的界线：宋代以后的石刻一律不予登录。他正在做的是一件不寻常的事，并给人以一线希望——中国内陆地区的一些古迹还是有可能保存好的。

After the dinner we were taken about the city, where we saw some more of the dragon pillars, mostly in Taoist temples. The ancient city itself, where some of these pillars are supposed to have been found, is less than a mile from the southern gate of An-i. The remains of the old wall are still visible, but, if the place was a city at all, it was indeed a very small one, measuring about 400 by 250 yards. It may, however, be the site of an important ancient building.

(38) Type of Buddhist *stela* collected by the Magistrate of An-i Hsien 安邑县县长所藏
佛教石碑一例

We left Yün-ch'êng on the 21st, and on the 22nd we arrived at

Hsia Hsien—center of the traditions of the ancient Hsia Dynasty. The temple of the Great Yü and the tombs of his descendants as well as many of the famous ministers of that dynasty are said to be located here, and all these I visited (Fig. 39); but I must confess that I am not at all able to determine whether, judged by their appearance, they are the real tombs or not. They all look like the ordinary burial mounds, except that they are larger. However, while on our way to visit these tombs the unexpected happened. It was after riding through the village of Hsi-yin that, suddenly, a large field of prehistoric potteries was discovered! Mr. Yüan was the first to see it. The site (Fig. 40), extending to several *mou* of land, is apparently larger than the one we found at Chiao-t'u-ho, and the pottery is somewhat different, too. While we were picking up at random the sherds exposed on the surface, the villagers gathered in large number, so we did not stay very long lest there be too much excitement created.

(39) Supposed tombs of the Hsia emperors 传说的夏诸王陵

(40) Site at Hsi-yin Ts'un where prehistoric pottery was found 发现史前陶片的西阴村遗址

饭后，我们被招待参观了县城。我们在城里又看到了一些龙柱，它们多半在道教的宫观里。传说出土某些柱子的那座古城本身，离安邑县南门不到一英里路。旧城墙留下的残迹依然可见；不过，这里即便原来是座城，它也实在是个很小的城，面积约为400码×250码。可是不管怎么说，它有可能是一个重要的古代建筑的遗址。

我们于21日离开运城，22日到达夏县——传说的夏朝中心。据传大禹庙以及禹王后裔和许多著名大臣的陵墓都在这里（当地称其为夏后氏陵。传说禹葬在会稽，太康葬在河南太康县，这里只有启和太康以下的诸王的陵寝。——译注）。所有这些我都去寻访了（图39）。不过说实在的，从外表上判断，我根本无法肯定这些是否是真正的陵墓。它们看起来都像是普通的坟冢，只是稍大一些。可是，在我们寻访这些陵墓的途中，出现了意想不到的事。当我们穿过西阴村后，突然间一大块到处都是史前陶片的场所出现在眼前（图40）。首先看到它的是袁先生。这个遗址占了好几亩地，比我们在交头河发现的遗址要大得多，陶片也略有不同。在我们随意捡拾一些暴露在地表的碎陶片时，聚拢了不少村民。我们没在这里逗留多久，以免引起过多的注意。（同年10月，本文作者和袁复礼先生再次来到此地，进行了有名的西阴村史前遗址的发掘。——译注）

When we left An-i Hsien, the magistrate had given us a copied list of the names and locations of the various votive stones which are still scattered in the different villages of his district, and as we were on our way northward again, we determined to stop and see some of them. Three places were visited on the 25th and the 26th, where besides *stelae*, we saw also a number of individual Buddhist figures which are preserved in good condition, the most perfect piece being in San-lu-li

Ts'un. Unfortunately, it is preserved in a dark room, where a picture could not be taken, as I had no flash light with me.

On the 26th, while Mr. Yüan went away on some special geological mission, I started for Chi-san Hsien to have a look at the so-called T'ang wall paintings at Hsiao-ning Ts'un, some of these paintings having been recently sold to curio-dealers who sent them to Peking for sale. Hsin-hua-shih is a Buddhist temple built in the 12th year of K'ai-huang of the Sui Dynasty near Ch'a-tien-chieh. It has been destroyed and repaired many times; but the front hall still retains some reminiscence of T'ang architecture. It is in the central and the third hall that the walls are painted on three sides. The paintings of the side walls of the third hall and those of the southern wall of the central hall (opening towards the north) have been taken away by curio-dealers. The rest is still intact; and the date is to be found on the northern wall of the third hall, being the *wu-hsü* year of Yüan (1298 or 1358 A.D.). The courtyard between the front hall and the central hall was locked, and my guide assured me that there was nothing worth seeing inside the yard. Nevertheless, I had him open it for me, in spite of his assurance, and by sheer accident I found the protruding corner of a stone which lay buried in the ground. I asked the villagers to dig it out for me, and it proved to be a votive *stela* (Fig. 41) carved at the time when the temple was first built. This little discovery rounded out my trip, and from this day on I marched directly northward and returned to Peking.

(41) Votive stela found at Hsin-hua-shih 兴化寺发现的造像碑

我们离开安邑县时，县长给我们开了一份关于分散在他所辖各村里的各种各样碑碣的名称和位置的单子。于是我们再次朝北走的时候，决定停下来看看其中的几个。25日和26日我们寻访了三个地方，除造像碑外，我们还看到了一些单个的佛像。它们保存完好，最好的一个是在三路里村。遗憾的是，这座像立在一间昏暗的屋子里，由于我没有带闪光灯，无法给它拍照。

26日，袁先生去完成专门的地质考察任务，我启程去稷山县看一看小宁村的所谓唐代壁画。这些画中有一些新近卖给了古董商人，已被送往北京出售。兴化寺是一座佛教寺院，在隋朝开皇十二年建于翟店街附

近。这座寺院几经破坏和修复，但前殿还保留了唐代建筑式样的一些痕迹。在大殿和后殿，三面墙上都有彩绘。后殿两侧墙壁上所有的画和大殿南墙（殿门朝北）的画，已被古董商人剥走。其他的还没被触动。后殿北墙上标明的作画年代是元朝戊戌年（公元1298年或公元1358年）。前殿和大殿之间的院子上了锁，向导对我保证说院子里没有值得一看的东西。然而我没有理睬他的保证，还是请他为我开了锁。十分偶然地，我发现一块埋着的石碑外露的一角。我请村民替我挖了出来。这原来是寺院始建时雕刻成的一块许愿的造像碑（图41）。这个小小的发现圆满地结束了我的旅程。我就在当天径直朝北行进，返回北京。

NOTES

1. Anthropometrical measurements at Chieh-hsiu

Through the kind arrangements of Mr. Huang Tzŭ-sen, Magistrate of Chieh-hsiu Hsien, I was able to measure 86 of the natives of this District who are serving in the Army Training Camp and the Police Court. With the exception of my series of Huang-p'i and Huang-kang, this is the largest of any series of anthropometrical measurements made in any one district. The following 13 measurements were taken of each individual: stature, auditory height, sitting height, head length, head breadth, horizontal circumference, minimum frontal diameter, bi-zygomatic diameter, nasion-menton height, nasion-prosthion height, nasal height, and nasal breadth. Observations were also made of the following descriptive characters: hair color, eye, brow, chin, shape of nose, malar bone, shape of face, prognathism, teeth.

2. Pottery Sherds from Chiao-t'ou-ho

The total number of sherds is 127. Of these, 42 are painted. Of the painted, 20 are with rims: 6 with bent rim, 1 with thickened rim, and 13 with plain rim. The paint used is black. The ground color varies from light brown to dark brown. The patterns consist of triangles with three sides concave, or with two sides concave and one side straight or convex; straight lines; crescent moon; big round dot; cross-hatched lines; shape of X with horns elongated into straight lines; and parallel lines with big dots between. Of the 85 unpainted, 21 are gray in color and are decorated with incised lines in parallel, cross-hatched or mixed directions; 2 are black and undecorated; 2 are dark violet and undecorated; 60 have the same ground color as the painted, and of these 17 are decorated with incised lines, 1 with ornamentation in relief, and 42 are plain. In addition to these potteries, there are also two broken pieces of finely made black stone

rings, and a small piece of the shaft of a human ulna.

附记

1. 在介休作的人体测量

通过介休县黄直生县长的好意安排，我对该县的86名本地人作了人体测量。这些人都是新兵和警察。除了我在黄陂、黄冈所作过的测量外，这是在一个县的范围内所作的规模最大的一组人体测量。对每个人都作了以下13个项目的测量（文中实际只列举了12个项目的名称。这12项以及正文下面所举的目测项目，绝大多数曾为作者写博士论文时实地采用过。这里对其中几个译名作些说明：听高，又名耳点高——即听觉器官的高度，指耳下垂上沿最低凹处至足跟的高度；鼻颧距，又名全面高——指鼻根部至下颧尖的长度；鼻齿距，又名上面高——指鼻根部至上门齿端的长度。——译注）：身高，听高，坐高，头长，头宽，头水平周长，最小额径，横经颧骨之面部直径，鼻颧距，鼻齿距，鼻长，鼻宽。本次观察还包括发色，眼睛，眉毛，下颧，鼻形，颧骨，面形，牙床凸度，牙齿。

2. 交头河收集的陶片

陶片总数为127片。其中42片是带彩的。带彩陶片中有20片是有边的：6片带卷边；1片带宽边；13片带平边。彩用黑色，底色从浅棕到深棕不一。图案有下列形状：3个凹边的三角形以及2个凹边和1个直边或凸边的三角形，直线，初月形，大圆点，格子线，铁十字形，中间带圆点的平行线。（这里用的一些译名基本采用作者本人在《西阴村史前的遗存》一书中文本里所用的名称。——译注）85片不带彩的陶片中，21片灰色的带有平行线、格子线或不定向的刻纹；2片无刻纹，黑色；2片无刻纹，暗紫色；60片有着与上述带彩陶片相同的底色，其中17片有线条刻纹，1片带有凸纹，42片是平的。除这些碎片外，还有2块制作精细的黑色石环碎片和一小条人的尺骨碎片。

3. Pottery Sherds from Hsi-yin Ts'un

The total number is 86. Of these, 14 are painted. Of the painted, 7 have rims—3 bent and 4 plain. Triangles, straight lines and big dots are the chief decorative patterns. They are often combined. Of the unpainted, 15 are gray or black in color and 57 are red or dark brown. Of the gray or black, 11 have incised lines and 4 are plain. Of the red, 34 are incised and 23 are plain. One complete, rather ill-shaped cup is found in this collection. It is dark gray in color and not uniformly fired. The diameter of the rim varies from 5.5 cm. to 5.9 cm.; the height is 5.3 cm. There are 7 ridges at the bottom with 7 finger depressions between the ridges.

4. Votive stelae seen in An-i Hsien

In the list of ancient votive *stelae* given to me by the magistrate, there are 41 dated previous to the T'ang Dynasty. Of these, 28 have been moved to Fang kung-tz'ü, the museum in the magistrate's *yamên*. Twenty others are dated in T'ang and Sung, the latest date corresponding with 1101 A.D.

3. 西阴村收集的陶片

总数为86片。其中14片是带彩的。带彩陶片中有7片有边——3片带卷边，4片带平边。主要图案是三角形、直线和大圆点。几种图形通常结合使用。不带彩陶片中15片是灰色或黑色的，57片是红色或深棕色的。灰或黑色陶片中11片有刻纹，4片无刻纹。红色陶片中34片有刻纹，23片无刻纹。在这堆收集品中，还发现一个完整的、有些变形的杯子。杯呈深灰色，烧制的火候不均匀。杯沿直径从5.5厘米到5.9厘米不等，高5.3厘米。底部有7个隆起突，其间有7个手捺的凹印。

4. 安邑县所见的碑碣

在县长交给我的古代碑碣的单子上，注明41件是唐代以前的。其中28件已经移到县衙门的博物馆——房公祠。另20件注明是唐代和宋代的，其最晚日期相当于公元1101年。

李光谟 宋梅凤 译

[1] 由于空间有限，这里我们不能将李济先生的精彩报告全部呈现，包括其中的插图以及先生非常有趣的结论，对此我们深表遗憾。但是以下所选的片段至少可以让我们对他在山西南部的初步考古发现所取得的成果略有了解。——编者注

VI Some Anthropological Problems of China

It is easier to speak with definiteness on problems concerning archaeology, linguistics, ethnology and to a certain extent sociology and psychology than those concerning anthropology. The reason is not far to seek. Anthropology as a science, if it has long been conceived, is not yet born. It may never become a science. It has a greater chance to become a system of philosophy. But it is a good term to retain and useful for more than one purpose, since in the family of scientific vocabulary, it alone comprehends all the phases of humanistic study. One of its many definitions that has been handed down to us since its inception as a branch of scientific inquiry is: it aims to study man and his products. Ignoring the metaphysical dilemma upon which this definition rests, an anthropologist may enthusiastically go on working out his problem with a perfect good conscience that he is making contributions to this great study of humanity. He is justified to do so. But his results will be either archaeological, ethnological or linguistic, or any other of a sub-anthropological nature rather than anthropological in the strictest sense. They can be valuable only discreetly.

Anthropology conceived as a concourse of all humanistic studies has an inherent difficulty to tackle with. It all depends whether man can study himself in a really scientific sense, whether as William James once so curtly put in his discussion on introspection as a scientific method, one can see the form and color of his own eyes by turning his eyes rapidly. The European answer to it is of course not to answer on the very sensible ground that it has never been answerable. One may almost say to himself with a feeling of relief that since there are definite groups of phenomena known by the term: Man, and His Products, why not study them as they are inductively with the recognized biological principle of evolution as the guidance! This has been the course generally pursued, and speaking at large, the position of European and American anthropologists up to the present time.

That is probably the only course from a European and American point of view. But a Chinaman is not necessarily bound to take it, even he wants to study anthropology. Nor does he have the right to, as he lacks that great history of scientific scholarship as his background which is at once the pride and burden of all Europeans. An Easterner

is to be benefited by a knowledge of scientific development in the West, only in so far as it is negative. For failures are always to be avoided, while achievements shift their value from generation to generation, thus needing constant reexamination. To this rule the theory of evolution forms no exception.

陆国的若干人类学问题

确定地讨论考古学、语言学、人种学，以及一定程度上讨论社会学和心理学的问题，都要比确定地讨论人类学的问题要容易。原因很简单。尽管经历了长时间的酝酿，人类学仍未作为一门科学诞生。它也许永远不会成为一门科学。它更可能成为一个哲学体系。不过人类学确是一个有存在价值的术语，这不只是为一个目的，因为在科技术语的大家庭中，仅有人类学一词涵盖了人文学科研究的各个阶段。自从人类学作为科学探索的一个分支创立以来，关于它的定义众多，一个沿用至今的是：它致力于研究人类及其产品。不考虑这一定义在形而上学层面的困境，人类学家可以怀着为人类研究的伟大事业作贡献的美好愿望，孜孜不倦地致力于他的研究。他有理由这样做，但是，其研究结果可能是考古学的、人种学的、语言学的，或者其他亚人类学的，却偏偏不是严格意义上的人类学的。这些研究结果可能有价值，但须谨慎对待。

被认为是所有人文学科总汇的人类学，研究起来有一个固有的困难。它完全取决于人类是否能够从真正科学的角度来研究自己，能否像威廉·詹姆斯在探讨把内省作为科学研究方法时简述的那样——可以通过快速转动眼球看到自己眼睛的形状和颜色。欧洲人对此问题的回答，当然是不基于它从未得到解答这一实际前提。我们几乎可以安慰自己说，既然已有确定的现象组为研究对象——人及其产品，为什么不以公认的生物进化论为指导、用归纳法加以研究呢？这一直是人们通常采用的途径，笼统地说，也是迄今为止欧美人类学家采取的立场。

依欧美学者的看法，这也许是唯一的途径。但是中国人并不一定要采用这种方法，即使他希望从事人类学研究。同时他也并无此权利，因为他缺乏欧洲人引以为傲又视为负担的悠久科学研究历史为背景。东方人应能受益于西方科学发展的知识，但仅限于借鉴负面的例子，因为失败总是应当避免的，而成就的价值随不同代的人而改变，因此需要不断重新检验。在这一点上，进化论也不例外。

In the long list of eminent scientists in Europe and America, there is perhaps no abler biological thinker than Darwin whose discourse on evolution culminates all scientific achievements of the nineteenth century. The almost divine attempt of Herbert Spencer to fit all natural phenomena into his conceived and conceivable pattern of evolution has never been challenged in regard to its fundamental premise. Today the one thing that a school teacher is sure to know is that man is descended from a kind of monkey. He will tell you that in the course of time, Baboon begets Gibbon, Gibbon begets Chimpanzee, Chimpanzee begets Gorilla, Gorilla begets Pithecanthropus Erectus and Pithecanthropus Erectus begets Man—strangely reminiscent of the

Chapters on Genesis except the garment has changed its shape. Anthropological literature is literally saturated with Darwinism. Only lately, one eminent anthropologist has made this remark: anthropology is essentially a Darwinian science, accept Darwinism or reject anthropology. One discerns immediately that the Zeitgeist with which more than 10,000 articles on Pithecanthropus Erectus have been produced is still having its palmy days and the recent discovery of Rhodesiansis is likely to produce another scientific storm sweeping over five continents.

There is no necessity for any one to renew the Agassizian controversy over Darwinism just now. Yet it does not take one long to find that the Darwinian tyranny, enlightened as it is, is irritating in many respects to those who are devoting themselves to humanistic study. One finds too that some of the essential aspects of its meaning are extremely hollow. The interpretation of the survival of the fittest is only one of many examples that one can cite. Nor has there been a single successful experiment unveiling the mystery of heredity on which the whole Darwinian formula hangs. The net result is that there are as many interpretations of Darwinism as the number of interpreters. Thus it rivals the concept of God as a topic for speculation.

在欧美众多杰出的科学家中，恐怕没有一个生物学家比达尔文更为出色，他关于进化论的论述是19世纪所有科学成就的巅峰。斯宾塞企图将一切自然现象纳入他假想的、可以想见的进化模型，这一近乎神圣的创举，从未在其根本前提上遭到质疑。如今，校园老师确知的是：人是从某种猴子进化而来。他会告诉你，在漫长的时间里，狒狒生成了长臂猿，长臂猿生成了黑猩猩，黑猩猩生成了大猩猩，大猩猩生成了直立猿人，直立猿人最后生成了人。这奇怪地让人联想到《创世纪》中的某些章节，只是故事的外壳变了。人类学的文献中充斥着达尔文主义。就在最近，一位著名的人类学家还作了这样的评述：本质上，人类学是一门达尔文主义的科学——要么接受达尔文主义，要么拒绝人类学。人们会立即意识到，这种时代思潮虽已促成一万多篇关于直立猿人的文章发表，但它仍处在鼎盛时期，近期罗得西亚人的发现可能会再次掀起一场席卷五大洲的科学风暴。

现在没有必要重提阿加西斯对达尔文主义的反对。但是，不用花很长时间我们便可发现，达尔文思想的专制，虽然具有启蒙意义，但对人文学者来说在很多方面仍是令人恼怒的。人们还发现，其定义中的某些基本方面极其空洞。关于适者生存的阐释只是众多可供引用的例证之一；而且从来没有一例成功的实验揭开遗传定律的神秘面纱，而这一定律正是达尔文定律的立论根基。最终结果是，有多少达尔文理论的阐释者，就有多少种对该理论的解释。因此，这个话题引起的猜想简直可以与上帝这一概念相媲美了。

But Darwinism has stimulated research. As a working hypothesis it still offers an immense potentiality for further exploration. The danger spot of the whole theory, which one apprehends, lies in its ossification with age into a rigid dogma which would deaden the scientific spirit that has been originally stimulated by it, and that unfortunately seems to be the present ten-theory [Sic] in regard to the increasing zest shown by Europeans and Americans for anthropological study; it points out that this zest is impelled by their curiosity to prove how civilized they are rather than a real scientific interest. This may also serve to explain the ponderous faith of Europeans in human progress and incidentally as the foundation of their Greco-Roman Mania. Whatever one may say, Europe is on the tip-top of civilization, and will always be so as long as there are heaven and earth. All anthropologists, therefore, must do their homage to the classical scholars from a European point of view. If any European dares to break this tradition, he will be ostracized and considered as an outlaw to his class defying their ancestral God, which is the greatest triumph of Darwinian dogma.

Of course no seriously minded person would belittle the tradition of the Greeks and the Romans, or the theory of evolution as a pure hypothesis. It is altogether a different argument than self-pooled esteem that should lead an Easterner to start his scientific inquiry with thorough skepticism. Nothing harms one's mental habit so much as the acceptance of other's conclusion without first of all living through with their premises. The Chinese as a race is just beginning its serious scientific career; the first item on its programme, if it works, ought to be an examination of all the Western scientific dogmas by studying their details. Moreover, his task is not only to de-Europeanize science, but also denationalize himself as far as his attitude towards the object of his study is concerned. This applies particularly to those whose course of scientific pursuit is more of a humanistic nature in which the *ego* has a greater part to play.

The arguments advanced so far are intended to show that the anthropological problems of China are more than a purely technical question. It is true that we have many technical problems to solve. We need an archaeological survey, an anthropometrical survey, an ethnographical survey and a linguistic survey, all of which require a vast amount of energy and great ingenuity for solution. Their immediate solution is the more necessary in order to dispel some of the common misconceptions about China entertained in some parts of the world and created intentionally or unintentionally by the pseudo-scientific attempt of some over-enthusiastic and self-appointed authorities of the Far East. But in the nature of the case, these

problems, while difficult, are not baffling. Given time and money, they are capable of being solved within a fixed period. Looking from a different angle into this field, a Chinese anthropologist would feel the urgent necessity of transcending his national boundary. These are general problems which he alone, by virtue of the peculiar position that he occupies in the scientific world, can solve and from which responsibility he has no reason to evade. This brings us to the anthropological problem of China in its truest sense.

但达尔文主义催生了很多研究。作为一个作业假说，它仍然为进一步探索提供着巨大的潜能。在人们看来，该理论危险之处在于：因年久僵化，它已成为刻板的教条，最初激发科学探索精神的理论如今却要将其扼杀。不幸的是，在欧美越来越炙手可热的人类学领域，如今这似乎已成为金科玉律。这些学者对人类学研究的热情是受他们想要证明自己有多么文明的好奇心驱使，而并非出于真正的科学兴趣。这也可以用于解释欧洲人关于人类进步固化的坚信，同时也成为他们对希腊罗马狂热崇拜的基础。无论怎么说，欧洲始终处在文明的顶端，而且将永远如此。因此，在欧洲人看来，所有的人类学家都应该对那些古典学者心怀敬意。如果任何一个欧洲人胆敢背弃这一传统，他将会被排斥，并被视为反抗其祖先上帝的阶级叛徒：这便是达尔文教条最伟大的胜利。

当然，任何一个有头脑的人都不会轻视希腊和罗马传统，也不会认为进化论只是一个纯粹的假设。总的说来，教一个东方学者抱着彻底的怀疑态度开始科学探索的应是一种不同的观点，而不是一种自满。没有什么比在不了解别人立论前提的情况下就全盘接受其结论更有害思维的了。中国人，作为一个种族，刚刚开始我们严谨的科学事业。这一事业如果可行的话，首要任务就是通过研究细节去检验西方的一切科学信条。而且，我们的任务不仅是将科学去欧洲化，在涉及到个人对研究对象的态度时，还要让自己去民族化。这一点尤其适用从事人文科学研究的人，因为“自我”在这样的研究中的影响更大。

到目前为止，笔者的论述都旨在说明中国的人类学问题并不是一个单纯的技术问题。诚然，我们有很多技术问题有待解决。我们需要进行考古学、人体测量学、人种学以及语言学的调查，所有这些都需要大量的精力和高度的独创性来解决。要消除世界上某些地区民众所持有的、由远东地区某些过度热情的、自封的权威所进行的伪科学尝试而有意或无意创造出来的对中国的误解，就更需要立即解决以上问题。然而，这些问题虽然很困难，但本质上并非不可捉摸。只要有足够的时间和资金，它们都能在一定期限内得到解决。从另一个角度来看，中国人类学家更感到亟须超越自己的国界限制。这些普遍的问题，中国人类学家凭借其在学术界的特殊位置便可解决，且责无旁贷。这就将我们带到了真正意义上的中国人类学问题面前。

Certain premises have to be taken for granted before these problems could be brought out in the right perspective. They are time and changes. All genetic studies have time as their background.

Anthropology if rightly studied is essentially a genetic science and depends mainly for its results on historical and comparative method. It is in this sense only that anthropology may be considered as an evolutionary science; for the only logical meaning of evolution is also the simplest, namely, time accompanied by change. As such, it does take a Hackel to speak of its final works, for the ancient Greeks have defined it for us long ago. When Herbert Spencer elaborated it in term of complexity and heterogeneity, he not only smothered the soul of this term but also betrayed a refreshing ignorance of human psychology and unconsciously led his younger contemporaries astray. It is he together with Huxley who is more responsible for the hunting expedition of all European and American anthropologists for Man in "his bodily frame the indelible stamp of his lowly origin" than Darwin's own words. There is nothing wrong in this, so far as it serves only as an impetus for further research, but it resulted in a distorted proportion of our knowledge about ourselves. Now we know a great deal more about our bones and muscles thus, linking our stock with the Simian family with a great deal of pride, than our own mind. The reason is that evolution in the Spencerian sense finds more confirmation in one's body than in one's soul.

在正确认识这些问题之前，我们需要先接受几个前提。这就是时间与变化。所有遗传学的研究都是以时间为背景。如果得以恰当研究，人类学本质上是一门遗传科学，其结果主要依靠历史法和比较法获取。只有从这个意义上讲，人类学方可以被视为一门进化科学，因为对于进化唯一合乎逻辑的、同时也是最简单的解释，就是伴随着变化的时间。所以，虽然古希腊人早已给人类学下了定义，但要了解人类学的最新著作，却需要读恩斯特·海克尔。当斯宾塞从复杂性和异质性的角度讲解人类学时，他不仅窒息了这个词的灵魂，同时也意外地暴露了人类心理的无知，继而在无意识中将同时代的后辈引入了歧途。斯宾塞和赫胥黎应该对所有欧美人类学家猎寻人类“身上不可抹去的卑微出生的印记”这一行为负有更大责任，虽然这句话出自达尔文之口。如果只是作为后续研究的推动力而言，这并没有错，但它导致了我们对自身认识的极度失衡。如今，我们对自己的骨骼和肌肉有了足够多的了解，基于此，还满怀自豪地把我们的血统与猿类联系起来，而与之相比，我们对于大脑的了解却不甚了了。这是因为，在斯宾塞派看来，能够更好地印证进化的是人的身体，而非灵魂。

Yet it is commonly admitted that the study of man must begin with that on his very self as a separate entity, rather than through the sounds that he could utter, the metals that he could shape or the institutions that he could build. This forces us back to face the metaphysical dilemma to which we have a moment ago referred. In the light of psychology as a science, it is altogether too early to give an adequate answer to the question whether man can study his self.

But the peculiar position of a Chinese who has acquired an Indo-European language as an organ of thinking in addition to his own native tongue suggests at least a possibility of avoiding this metaphysical dilemma.

For it may be argued, much of the difficulty arising out of the study of our own mental constitution is due to the impossibility of rendering an impartial account of it by the very language with which the mental habit is formed. The Chinese linguists, and the European orientalists too should they acquire it as a part of their mental equipment rather than as a fulfillment of their simple curiosity, have obtained a mirror. If the nature of the language does effect the mode of thinking, the knowledge of a second tongue totally different from the first would give him a clear reflection of the original mode.

It is the written language as well as the spoken language that are meant here. Language has been traditionally treated by European scientists as a collection of sounds instead of an expression of something inner and deeper than the vocal apparatus as it should be. The accumulative effect of language-symbols upon one's mental formulation is still an unexploited field. Dividing the world culture of the living races on this basis, one perceives a fundamental difference of its types between the alphabetical users and the hieroglyphic users, each of which has its own virtues and vices. Now with all respects to alphabetical civilization, it must be frankly stated that it has a grave and inherent defect in its lack of solidity. The most civilized portion under the alphabetical culture is also inhabited by the most fickle people. The history of the Western land repeats the same story over and over again. Thus up and down with the Greeks; up and down with Rome; up and down with the Arabs. The ancient Semitic and Hametic peoples are essentially alphabetic users, and their civilizations show the same lack of solidity as the Greeks and the Romans. Certainly this phenomenon can be partially explained by the extra-fluidity of the alphabetical language which cannot be depended upon as a suitable organ to conserve any solid idea. Intellectual contents of these people may be likened to waterfalls and cataracts, rather than seas and oceans. No other people is richer in ideas than they; but no people would give up their valuable ideas as quickly as they do. Westerners have called their civilization dynamic which is essentially true and compatible with the nature of their language. But its mobile part is that of Tennyson's man rather than that of his brook, for it apprehends its coming by going and never stays. "Nothing is new under the sun" is a European proverb; yet every European tries to get something new everyday, and also gives it away as soon as they have got it—a defect inherent in their civilization.

然而，人们普遍承认的是：研究人类必须从研究作为独立的个体而存在的人本身开始，而不是通过他发出的声音、塑造的金属形制，或是建立的制度开始。这就迫使我们重新面对之前提到过的那个形而上的困境。如果将心理学作为一门科学来看，要给“人是否能够研究自己”这个问题一个令人满意的答案，还为时尚早。但是，那些在母语之外又习得一门印欧语言，并以之为思考工具的中国人的存在，至少表明避免这种形而上的困境的可能。

因为，有人可能会说，研究我们自身思维所遭遇的大部分困难是因为我们不可能用作为思维载体的语言对思维本身进行客观描述。中国的语言学家和欧洲的东方学者，如果习得一门外语作为思维工具，而不是纯粹为了满足好奇，便获得了一面镜子。如果语言的特性的确可以影响思维模式，那么，一门与母语截然不同的第二语言便可使人清晰反观其原思维模式。

这里所指的不仅仅是书面语，也包括口语。在欧洲科学家看来，语言历来只是声音的集合，而不是一种比发音器官更内在、更深刻的东西的表述，而它本应是后者。语言符号对人思维方式产生的累积效果仍旧是一个未曾开发的领域。以此为依据划分世界上各种族的文化，可以察觉到拼音文字的使用者与象形文字的使用者的文化类型有本质的区别，两种各有优劣。纵观拼音语言文明的各个方面，必须坦率地说，它在连续性方面天生就具有严重的缺陷。文明程度最高的拼音文化区也是最多变的群体居住区。在西方世界的历史中，同样的情况重复发生。希腊人经历了鼎盛与衰败，罗马人也是如此，阿拉伯人同样如此。古代的闪族人和含族人本质上也是字母文字的使用者，他们的文明与罗马、希腊文明一样缺乏连续性。当然，这种现象可以部分归因为字母语言的极大流动性，人们不能依赖这种语言作为一个合适的保存任何持久思想的载体。这些民族的智慧可被比作瀑布，而不是海洋。没有一个民族比他们更有想法，但是也没有一个民族会像他们那样快地丢弃那些很有价值的想法。西方人称他们的文明是动态的；本质上的确如此，也符合他们语言的特性。然而，流动的是丁尼生的民族，而不是他诗歌中的溪流，因为它以不断地离去来解释不断地到来，从不停息。“太阳底下无新事”是一句欧洲谚语，但欧洲人每天都试图找到些新鲜的事物，并且一旦找到就立即抛到一边——这是该文明的一大固有缺陷。

The Chinese language is by all means the counterpart of the alphabetic stock. It lacks most of the virtues that are found in the alphabetic language; but as an embodiment of simple and final truth, it is invulnerable to storm and stress. It has already protected the Chinese civilization for more than forty centuries. It is solid, square, and beautiful exactly as the spirit of it represents. Whether it is the spirit that has produced this language or whether this language has in turn accentuated the spirit remains to be determined.

The proposition laid out here is not for moralizing but for experimentalization. It is to be considered as the first anthropological

problem of China. The science of psychology has already reached a stage of development at which an anthropologist may utilize its result to his advantage. The influence of lines and forms exerted on the mental content of a psychological observer has long been reckoned with. Certainly it is reasonable to assume the existence of an intricate relation between the character of a written language on the one hand and the origin, growth, formulation and mobility of ideas on the other, which could be experimentally determined. If in term of an alphabetical language, one can describe the influence of hieroglyphic writings on his thinking mode, and then reverse the process to identify the result, it would not be too much to expect that man has finally achieved a method to study his most supreme self in the most objective way.

To study linguistics on a psychological basis as an anthropological problem is by no means a radical idea. It is the only logical outcome of the scientific movement for the study of man. To correlate language, culture and race with each other has already become an obsolete anthropological game. Classification of mankind on different anatomical basis could no longer be considered as the final goal of anthropological study just as classification of living organism can no longer be considered as the object of biological study. It is doubtful whether the classification of man should be considered as an anthropological problem at all; or granting that it is still of some use, whether it should rest on an anatomical basis. But at any rate, it could be considered only as a means for further end. The most wayward development of modern anthropological study is the gross assumption by anthropologists of a concomitant variation between body and mind. This is due more to the lack of psychological knowledge than any other single cause. The only remedy to it is a genetic study of mind for which the hieroglyphic alphabetic method has been proposed.

汉语在所有方面都与拼音文字相对立。它缺少拼音文字的大多数优点，但是作为简单终极真理的载体，它在动荡变迁中留存至今。它已保护了中华文明四千多年。它是稳固的，方正的，正如它代表的精神一样美丽。而究竟是这种精神造就了这门语言，还是这门语言强化了这种精神，这个问题仍有待确定。

在此提出的主张并不是为了说教，而是用来试验。这将被认为是中国的首个人类学问题。心理学已发展到可供人类学家利用其成果的阶段。线条与形状会对心理观察者的思考内容产生影响，这一点早已为人们所注意。我们当然有理由假定，在某一书面语言的特性与某些观点的起源、发展、形成和流动之间存在某种复杂的关系，而这种关系可以通过试验来确定。如果我们可以用拼音文字来描述象形文字对其思维模式的影响，然后反过来用象形文字来描述拼音文字的影响，那么，可以不

夸张地想见，人类终于找到一个研究终极自我的最为客观的方法。

以心理学为基础把语言学当成一个人类学问题来研究，这绝不是一个激进的想法。这是人类研究这一科学运动发展的唯一合理的结果。将语言、文化和人种相互联系已经是一个过时的人类学游戏。基于解剖结构的人类分类已不再可能被认为是人类学研究的终极目标，正如生物有机体的分类不再被视为生物学研究的目标一样。人类分类是否能被认为是一个人类学问题，这本身就值得怀疑；即使假定这种分类是有用的，它是否能以解剖学为基础也是一个问号。无论如何，它仅可以被视为达到下一步目标的方法。现代人类学研究最任性的发展就是人类学家草率地假定身体和思维是相随变化的。这更多的是因为缺乏心理学知识，而不是其他任何单方面的原因。对此唯一的解决方法是对人类思维的起源与发展进行研究——在此我提出了象形的、字母的研究方法。

To study mind on its own account and ascertain its different types and laws in order to give a more vital stimulus to anthropological study as well as a living interpretation of the existing anthropological data must be based on a broadly defined principle of evolution rather than by restrained Darwinian formulae which necessitates the assumption of a monotypical nature and hampers the range of investigation. The two types of language, for instance, which we have considered cannot be possibly explained on the old-fashioned evolutionary basis. This bi-linear development suggests plainly other cultured phases of a similar nature, and sufficiently warrants us to take departure from the orthodox anthropological method.

If the above considerations are of logical possibilities, it is evident that the other anthropological problems of China are to be deduced therefrom. Of course everybody is interested in the origin of the Chinese and their relation with the other races. In the light of our present knowledge, which is extremely limited, it is to be said that the Chinese are extremely heterogeneous and their origin is quite obscure. Thus it justifies a thorough anatomical and anthropological survey not only of the [Han] Chinese themselves, but also the Aborigines found in the Southwest of China, the Tibetans, Mongolians, and the Siberians, all of whom have contributed their quota to the formation of the Chinese. To this must be added the linguistic study by means of phonology, which, however, can be of use only as an accessory to the psychological method. As for the social institutions and the meaning of the different phases of material culture, they are closely dependent for their interpretation upon a revelation of the Chinese type of mind which I consider as qualitatively different from the alphabetical races. Facts are what we need to prove this thesis. The duty of a Chinese anthropologist at present is to collect facts.

以思维本身作为研究对象，查明其不同的类型和规律，从而更好地

激发人类学的研究、完善目前对现存人类学资料的解释，这必须基于广义的进化原则，而不是受限的达尔文公式，因为后者需要假定一个单一性，从而使研究范围受限。例如，上面提到的两种语言就无法用老式的进化论观点解释。这种双线发展明确提示了性质类似的其他文化阶段，并充分允许我们寻求正统的人类学方法之外的其他研究方法。

如果上述思考在逻辑上具有可能性，显然中国的其他人类学问题也可以随之被推断出来。当然，每个人对中国人类的起源及其与其他种族的关系都很感兴趣。以我们目前十分有限的知识来看，可以说中国人极其混杂，其起源也非常模糊。因此，不仅有必要对汉族人本身进行彻底的解剖学和人类学调查，还应该对中国西南部原住民、藏人、蒙古人和西伯利亚人进行研究，他们的血统都存在于现代中国人中。此外，还须进行语言学语音系统研究，不过，这只能作为心理学研究的辅助手段。至于社会制度和物质文化不同发展阶段的意义，对它们作出解释在很大程度上要依赖对中国人思维方式的揭示。在我看来，中国人的思维方式与使用拼音文字的种族的思维方式有着质的区别。这个论题还需要靠事实来证明，而目前中国人类学家的任务就是搜集论据。

佚名 译

VII Some Anthropological Problems of China: Reconsidered

Forty years ago, when the American Association for the Advancement of Science held its annual conference in Boston in 1922, I was persuaded and encouraged by my fellow students and teachers in the Peabody Museum at Harvard University to discuss publicly my youthful ideas about Chinese anthropology at a scheduled meeting of the anthropological section of the Association. As a result, a paper entitled "Some Anthropological Problems of China" was read before the gathering of some of the leading anthropologists of North America, including such eminent authorities as Franz Boas, Clark Wissler, Alfred L. Kroeber, Roland B. Dixon and a number of others. As I had the whole area of China to speculate upon, I found myself at a great advantage. The very topic aroused curiosity in the distinguished audience. One evening paper in Boston even gave a column to the event, and later on the editor of the *Harvard Graduates Magazine* must have thought rather well of the paper: for it was published in its subsequent issue^[1].

I recall this episode because it is needed as a background against which I am going to discuss certain anthropological problems of China which we are facing today. In the paper that I read forty years ago, as one of the early pioneers in the anthropological inquiry into the vast, unexplored Chinese field, I pleaded for an overall consideration of what I thought to be the preliminary requirements in this area. I advocated the simultaneous undertaking of an anthropometrical survey, a linguistic survey and an archaeological survey. I told that august body of learned men that in order to find out anything about the Chinese people, it is absolutely necessary first to collect systematically these relevant scientific data. I also mentioned certain specific problems, as they then occurred to me; and I said that if one wished to understand the nature of Chinese civilization, one must start with a thorough investigation of the Chinese written language. The paper was a short one, but the needs I presented and the problems I listed, definitely impressed my audience. Some of the senior members present in the meeting commented that there was something in what I said.

柒 再论中国的若干人类学问题

四十年前，当美国科学促进协会在波士顿举行1922年年会时，在哈佛大学皮博迪博物馆的同学和老师们的敦促和鼓励下，我去参加了协会人类学组的一次日程上的会议，把我关于中国人类学的一些幼稚想法拿出来公开讨论。于是，在这次北美顶级人类学家云集的会议上，在弗朗兹·博厄斯、克拉克·威斯勒、艾尔弗雷德·克罗伯、罗兰·狄克森等许多著名权威人士面前，我宣读了一篇题为《中国的若干人类学问题》的论文。因为我所要探索的是整个中国这个领域，所以我发现自己拥有很多有利的条件。题目本身就在尊贵的听众当中引起了好奇。波士顿的一家晚报甚至专栏报道了这件事，后来，《哈佛研究生杂志》在随后的一期^[2]里也刊登了我的这篇文章，想必该杂志的编辑认为它还不错。

我回顾这段经历，是因为要用它作为背景，来探讨我们目前面临的有关中国的一些人类学问题。在四十年前我宣读的那篇论文里，作为一名早期涉入中国这片广袤的、未经发掘的人类学研究领域的开拓者，我号召对那些我认为的该领域的首要问题作全面考虑。我建议同时着手进行人体测量调查、语言学调查和考古学调查。我向那些可敬的与会学者说，要对中国这个民族有所了解，首先系统地搜集上述各方面的相关科学资料是绝对必要的。我还提到当时想到的一些具体的问题；我说道，要想了解中国文明的本质，首先需要对中国文字有透彻的了解。这篇论文不长，但是我提出的需要和列出的问题肯定给我的听众留下了深刻印象。出席会议的一些资深学者认为我的发言言之有物。

It has been happily for me a piece of fortuitous coincidence that for the past forty years I have been able to follow uninterruptedly the course of my chosen profession though not without its accompanying vicissitudes. I have worked a little and thought more; but I have seen much. So it is to my own interest and in a way an amusing piece of experience to compare what I like to say today with what I did say forty years ago.

Today, China is no longer a virgin field for any anthropologist; it is true that the systematic surveys which I advocated in my student days were never systematically carried out. But there have been numerous individual and collective field works in anthropology and in related subjects in the past forty years. Quite a number of them are of first rate scientific quality. Many of you no doubt are familiar with the archaeological discoveries accomplished in China between 1920 and 1960. In linguistics, there have also been important contributions not only in the systematic recording of dialectic studies, but also in theoretical phonetics. It is in physical anthropology that the progress

has been comparatively slow. Nevertheless, everybody knows something about the Peking Man, whose discovery was itself a milestone that marked the progress of palaeoanatomical research in the scientific world. But one must admit, however, that in the study of the historical Chinese, the interest in their bodily changes has not been properly developed, though even in this respect, there are not without some important contributions. So, on the whole, we can say that as far as China is concerned, we have in each of the three important branches of the anthropological science, accumulated enough reliable data which may be used either for comparative purpose, or for the advancement of such scientific inquiries on a broader basis. In other words, we have broken the field; what needs to be done further is to continue its cultivation and wait for the harvest.

The first-hand materials collected by trained workers have certainly clarified a great deal of the myth about the Chinese people; they not only have solved a number of old problems, but also, what is even more important, have led to the discovery of many new ones.

这过去的四十年里，尽管也不是毫无曲折，但我得以没有间断地沿着我所选择的专业道路走了下来，这对我而言是一种幸福而幸运的巧合。我做了一些工作，但我思考的东西更多些；至于所见所闻就更加多了。因此，把我今天要讲的跟我四十年前讲过的作一比较，不但我自己感到有趣，而且在某种程度上也是一段有意思的经验体会。

今天的中国，对于任何一个人类学家都不再是一块处女地了。诚然，我在学生时代所建议的那些系统的调查从未系统地进行过。但在过去的四十年里，在人类学以及相关学科里曾进行过多次单独的和集体的实地考察工作。其中有相当一部分具顶尖的科学水平。你们当中有许多人无疑是熟悉1920年至1960年期间中国的考古发现的。在语言学上，不仅在方言的系统记录方面，而且在语音理论方面，都取得了重要成就。在体质人类学方面，进展则比较缓慢。不过，每个人对北京人都有所了解；北京人的发现，本身就是标志古人类解剖学研究在科学界取得进展的里程碑。可是也必须承认，在对历史上的中国人的研究方面，对其体质变化的兴趣并没有真正发展起来，尽管在这方面也不是毫无重要成就。因此，整个来看，我们可以说，就中国而言，我们在人类学这三个重要分科上都积累了相当数量的可靠资料；它们既可用于比较研究，又可用于推动在更广泛的基础上进行这类科学调查。换言之，这块园地已经开辟，需要进一步做的就是继续耕作，以期结果收成。

受过训练的工作者搜集到的第一手资料，确凿无疑地澄清了有关中国人的大量神话故事。这些资料不只是解答了一些老问题，更重要的是还指引人们发现了许多新问题。

As these problems are many-sided and complicated in nature, let me confine myself to a few examples. First and foremost, I should like to take up the problem of physical anthropology of the Chinese

people. The Chinese people, as is well-known, have always been classified as a branch of the Mongoloid race ever since anthropologists started classifying mankind. What do we know about the Mongoloid race? The question, unfortunately, is rather difficult to answer, even for the best authority on the racial history of man. Recently it has been suggested that the most representative physical traits of a Mongoloid are found on his face. They are: the almond eyes, the flattish forehead, the more or less depressed nasal root, the broad, heavily padded cheek bone. And there is also a theory to explain their origin and evolution. Professor Carleton Coon, the ablest exponent of this theory, is of the opinion that the particular facial appearance of the Mongoloid people was originated from the necessity of fighting against the bitterly cold weather during the last glacial age, when a group of early Mongoloid were trapped in dry cold region in northeastern Siberia. According to this theory, the people at that time had already invented shelter and clothing which were sufficient to keep their body in comfortable and balanced condition. But their face was by necessity exposed. So this severe cold climate wiped out the unfit by pneumonia and sinus infection; while those who happen to be protected in the sinus region and eye region by a thick layer of fatty substance and a small nasal aperture, were better qualified to survive in this cold climate than otherwise. The result of this severe struggle, as one sees, is the development of the Mongoloid face.

If we started with this definition of the Mongoloid and applied it to a racial study of the Chinese people, we would encounter from time to time some highly interesting problems. It is rather difficult to find typical examples of the Mongoloid among the Chinese people according to this definition, as difficult as, say, one should try to find a typical Nordic man or a Nordic woman in Switzerland in accordance with the definition of a taxonomist. It is true, that there are isolated examples of individual Chinese here and there, whose physical appearance may fit into the above definition. Yet they hardly constitute a type.

这些问题牵涉的方面很多，性质错综复杂，所以这里我只举几个例子。首先，也是最重要的一个，我想讨论中国人的体质人类学问题。大家都知道，自从人类学家开始对人类进行分类以来，中国人一直都被认定是蒙古人种的一个分支。那么我们对蒙古人种都知道些什么呢？遗憾的是，这个问题即使对于研究人类种族史的顶级权威来说，也很难回答。近来有人主张，蒙古人种最具代表性的体征表现在面部，即：杏仁状的眼，稍平的前额，多少有些塌陷的鼻根和宽广而扁平的颧骨。同时还有一种理论来解释这些体征的起源和演变。卡尔登·孔恩教授是倡导这一理论最力的人，他认为蒙古人种这种独特的面部外形，起源于最后一次冰河期中跟严酷寒冷的气候搏斗的需要，当时一个早期蒙古种群陷在

西伯利亚东北部的干冷地带。按照这个理论，那时的人已经发明了居所和衣服，足以使他们的身体处于舒适平稳的状态。但他们的面部却不得不裸露在外。这种酷寒气候，致使一些人患肺炎和鼻窦炎症而被淘汰，而那些碰巧在鼻窦和眼部有一层厚脂肪组织保护并且鼻孔小的人，则比没有这些体征的人更适应在这种寒冷气候生存。正如所见，这种严酷斗争的结果，就是蒙古人种的脸型演进。

如果我们从蒙古人种的这一定义出发，并把它应用于中国人的种族研究，我们将会不断遇到一些饶有兴味的问题。要按照这个定义在中国人当中找到标准的蒙古人种的例证，是颇为困难的，其困难程度可以说就像按照分类学家的定义在瑞士找出一个标准的北欧男人或北欧女人一样。不错，我们可以在各处找到体征符合上述定义的单个的中国人，但这些人远不能构成一个类型。

The physical type of the Chinese people as studied in the last forty years, shows a great deal of variation in stature, head form, nasal form, and even in pigmentation. One finds it, for instance, as in the case of the skeletal materials collected from the famous Anyang site, far from being homogeneous. The standard deviation calculated from a study of the cranial index of this series is considerably beyond the normal range, definitely indicating the miscellaneous origins of the skulls composing the series. I have myself occasionally tried to study the changes of physical type of the Chinese people in two different respects: geographical variation and historical evolution. While the data gathered are hardly enough to base any definite conclusion, they are nevertheless, quite illuminating. The great scope of geographical variation may be best illustrated by a survey of the regional distribution of the Chinese stature, head index, and nasal index. The northern Chinese for instance, are much taller than the southerners by an average sometime as great as almost 9 cm. As for the cephalic index, the Chinese people also differ in different parts of China. It has been found that both in eastern Shantung and western Kansu, there are concentrations of some comparatively long-headed people; while in central China, as Hunan, southern Hupei, and certain parts of Fukien, the local inhabitants are quite broad headed; but in general, the cephalic index of the southern Chinese is usually given as a little below 80, and the published figure for the northern average is over 81.

In the case of nasal index, the contrast between the north and the south, is even greater. Paul H. Stevenson calculated the northern average as 68.66; S. M. Shirokogorff, on the other hand, figured that the southern average is as high as 93.19. All the above mentioned results have aroused some popular interest, and are usually believed to be anthropologically significant. But none of them is considered by any anthropologist as relating to a typical Mongoloid character.

For typical Mongoloid traits investigated among the Chinese, we may take the study of the bi-zygomatic breadth as an example. We have at present more information about the result of this study than any other physical character, associated with the Mongoloid race. In 1932, *Biometrika* published a paper on a preliminary classification of Asiatic races by T. L. Woo and G. M. Morant. In this paper, 18 series of Mongoloid people, *alias* oriental races, were cited. The average values of bi-zygomatic breadth for the six series of northern Mongols range from approximately 140 mm. to 144 mm.; but those for the five series of Chinese and Japanese and seven series of southern orientals are found to be between 131-135 mm. only; whereas the average of the same measurement for the five Indian series studied in the same paper falls down to the min-max. range of 124-128 mm. Thus, the sharp contrast of the same measurement, appears not only between the orientals and non-orientals, but also between the sub-groups of the orientals, which is even more striking. The excessively large value of the average facial breadth of the northern Mongols constitutes without doubt a truly characteristic feature of the Mongoloid people. These people are mainly located at present in outer Mongolia and southern Siberia with the centers of their settlements in the neighborhood of Lake Baikal, Mt. Altai and the City of Urga, all north of the Gobi Desert.

近四十年来对中国人体征类型的研究表明，中国人在身高、头形、鼻形乃至肤色等方面差异是很大的。举例说，从著名的安阳遗址出土的人骨资料来看，中国人就远不属纯一人种。从研究这一组人骨的头指数计算出的标准差远远超出正常范围，这肯定地说明这一组颅骨的混杂来源。我本人曾试过从两个不同的角度探索中国人体征类型的变化：地理上的差别和历史上的演进。虽然搜集到的资料远不足据以得出任何肯定的结论，但它们却是很有启发意义的。地理上的差别之大，从对中国人的身高、头指数和鼻指数的地区分布的调查中就可以得到最好的说明。例如，北方的中国人就比南方的高出很多，有时平均竟达约9厘米。至于头指数，在中国，不同地区的人也各不相同。人们发现在山东东部和甘肃西部，集中居住着一些头比较长的人；而在中国中部，如湖南、湖北南部以及福建的某些地区，当地居民的头是相当宽的；但总的来说，南方的中国人的头指数通常略低于80，而北方人（按公布的数字看）则平均高于81。

就鼻指数而言，北方人和南方人的对比差别还要大些。许文生算出北方人的平均数为68.66；史禄国算出南方人的平均数则高达93.19。以上所提到的各种调查结果都曾引起广泛的兴趣，而且通常被认为在人类学上是有意义的。但是没有哪一位人类学家认为其中任何一项结果是典型的蒙古人种特征有关系的。

关于中国人中典型蒙古人种特征的调查，我们可以举双颧间宽的研究为例。目前我们所掌握的这方面研究成果的材料，多于任何其他有关

蒙古种族体征的材料。1932年,《生物统计学》杂志发表了吴定良和莫兰特合著的一篇关于亚洲种族初步分类的论文。这篇论文引证了18组蒙古人种或称东方种族的数据为例。6组北部蒙古人种的双颧间宽的平均值约在140~144毫米之间变动;但在另外5组的中国人和日本人以及7组的南部东方人身上,上述数值只处于131~135毫米之间;这篇论文研究的5组印度人的测量,平均数值下降到了上限128毫米、下限124毫米这个幅度。这样一来,同一测量得出的鲜明对比不仅出现在东方人与非东方人之间,而且出现在同属东方人的各个亚族群之间,后者甚至更引人注目。北部蒙古人种平均面宽的特大数值,无疑构成蒙古人种的真正有代表性的特征。这些人目前主要居住在戈壁沙漠以北以贝加尔湖、阿尔泰山和库伦(即乌兰巴托)一带为中心的外蒙古和南西伯利亚。

Broadly speaking, the average of the facial breadth of the Mongoloid people as represented by the Chinese and Japanese dropped nearly one cm. as compared with the northern Mongols. Whether the sudden decrease of this absolute measurement south of the Gobi Desert is due to environmental change or race mixture, or both, it is not easy to say. I have collected some historical data that may also be cited here. The measurements of bi-zygomatic breadth of the Chinese in various periods, for

(1) The Old Man of Choukoutien Upper Cave (1) is 143.0 mm. (10,000 B.C.)

(2) The Aeneolithic Series (19), the average is 130.7 mm. (3,000-2,000B.C.)

(3) The Yin Dynasty Series (20), the average is 136.9 mm. (1,400-1,100B.C.)

(4) The Modern North China Series (83), the average is 132.7 mm.

These samples were all taken from North China. It would be dangerous to make too much out of these figures; nevertheless, it is worth noting that the Chinese, at least the North China inhabitants, have not remained stable in the historical time even in this typical Mongoloid physical character.

The change of the bi-zygomatic measurement of the Chinese in the historical period is correlated with parallel changes in the cephalic index: of which the aeneolithic average is 74.96; that for the Shang Dynasty is 76.96; and the three north China modern series are given as: 77.56, 78.0 and 78.1 respectively. It may be remarked that brachycephalization as observed by a number of anthropologists in the past decade, is a general tendency among *Homo sapiens*; so there may not be any special historical significance as far as these figures are concerned. But there are other results, given in Woo and Morant's

paper, which are of undeniable great historical importance. They found, by means of the formula known as the Coefficient of Racial Likeness, a formula much used by the biometricians, that the Chinese and Japanese cranial series are highly differentiated from the northern Mongol series in other respects too. They are so different from the northern Mongols, that by a series of comparative studies, it has been demonstrated beyond any doubt that the Chinese and the Japanese are much more closely related to the southern Orientals, which include the Malaysians, the Tagals, the Dayaks, the Javanese, the Burmese, the Shans. Even the various Indian series seem to be closer to the Chinese and Japanese in their cranial structure than the northern Mongols.

大致来说，中国人和日本人身 上所表现的蒙古人种的面宽平均数，比北部蒙古人种的约下降了1厘米。戈壁沙漠以南的这个绝对测量数据的陡然下降，究竟是环境变迁还是种族混合所造成，抑或两种因素兼有，这很难说。我曾搜集到一些历史上的数字，可以在这里举出。以下是几个不同时期中国人的双颧间宽的测量值：

(1) 周口店山顶洞男性老人(1例)，数值为143毫米(公元前1万年)；

(2) 铜石并用期组(19例)，平均数值为130.7毫米(公元前3000年~公元前2000年)；

(3) 殷代组(20例)，平均数值为136.9毫米(公元前1400年~公元前1100年)；

(4) 现代华北组(83例)，平均数值为132.7毫米。

这些取样全都来自华北地区。从这些数字中作出过多的结论是危险的；然而值得注意的是，中国人，至少华北的居民，在历史上，即使在这一典型的蒙古人种体征上，也并非保持不变。

中国人双颧间宽在历史上的变化，与头指数的变化是平行照应的：头指数在铜石并用时期组的平均数为74.96，商代组为76.96，三个现代华北组分别为77.56、78.0和78.1。可以说，众多人类学家在过去十年里观察发现：短头化是智人的一个总的趋势；这样的话，上述这些数字也许就没有任何特殊的历史意义了。但是，吴定良和莫兰特的文章里确有一些成果具有无可否认的历史重要性。他们使用生物统计学家常用的所谓种族相似性系数的公式发现，中国人和日本人头骨组在其他一些方面也与北部蒙古人种组有很大差别。他们与北部蒙古人种的差别之大可以通过一系列的比较看出；这些比较毫无疑问地显示：中国人和日本人更接近于包括马来人、他加禄人、达雅人、爪哇人、缅甸人和掸人在内的南部东方人。就连各组印度人的头盖骨构造也比北部蒙古人种更接近中国人和日本人。

It may be pointed out here, also, that of the four Chinese cranial series employed in the above study, three were collected in North

China, mainly from Hopei, Shantung, and southern Manchuria. And one of the three series is from neolithic time. Everybody knows that in historical time, China was repeatedly invaded by the northern barbarians, which started some of the great population movements known in eastern Asia. In each case, the result was that many of the nomadic tribes from the Mongolian steppe settled in north China, especially in the Yellow River basin, where the original population had mostly migrated southward. What deserves our particular attention here is that the northern Mongols not only had contributed a Genghis Khan to world history, but also founded a dynasty for China, which lasted nearly a century. It is therefore an anthropological puzzle, as well as a historical myth, that the modern Chinese population should have almost no representation from the kins of Genghis Khan and his horde, according to the analysis of physical anthropology.

It may be too early yet to discuss this question. When more physical data are accumulated, the very nature of the problem may become completely metamorphosed. Still, the comparatively closer tie, which the Chinese people as a whole, have shown for the southern Orientals as compared with the northern Mongols, may be accepted as a piece of important anthropological observation that may stay long and stand enduring test. Recent discoveries of fossil men, south of the Yangtze River, also serve to indicate that more important contributions were made from the south toward the composition of the early population of China than from any other quarters; and, of course, Peking Man himself, as many eminent anthropologists suggested more than once, was probably of southern origin.

这里还要指出，上述研究中所引用的四组中国人头骨，有三组是在华北搜集到的，主要来自河北、山东和东北南部。这三个组中有一组是新石器时代的。大家知道，历史上中国一再遭受北方胡人入侵，造成东亚地区几次著名的人口大迁徙。每一次迁徙的结果是，许多蒙古草原上的游牧部落定居到华北，特别是黄河流域一带，而这些地方原先的居民则大部分南迁。这里值得我们特别注意的是，北部蒙古人种不仅为世界历史造就了一位成吉思汗，而且还为中国建立了一个维持了近百年之久的王朝。因此，根据体质人类学的分析，现代中国的人口中很少能找到同成吉思汗及其游牧部落有血缘关系的代表，这是一个人类学上的谜，同时也是一个历史的疑团。

也许现在讨论这个问题还为时过早。当体质资料搜集得更多的时候，问题的性质本身也许就完全改观了。中国人作为一个整体，所显示出的与南部东方人更密切的（跟北部蒙古人种相比而言）联系，这可以认为是人类学研究的一项长期存在的、经得住时间检验的重要成果。近期在长江以南的人类化石的发现，也还是有利于说明：在早期中国人口的组成上，南方所起的作用比任何其他地方都重要；此外，北京人本

身，正如许多著名人类学家不止一次地提出的，可能来源于南方。

When we turn our attention from somatology to cultural problems, we find ourselves in a less speculative position. Archaeological discoveries in this half a century, have made it quite clear, that the historical civilization of China was neither a complete gift from the west, nor a sudden development from an unknown origin. Like all other old world cultures, it was gradually evolved from a prehistorical past, which goes back to many hundreds of thousand years. If anything is remarkable about the cultural phenomenon of this area, it is its continuity despite the disconformities at several stages of its evolution; and as scientific archaeology progresses, these apparent gaps one after another are gradually closed. For instance, not long ago, all prehistorians had the impression that, with the exception of Peking Man and his culture, there was no early palaeolithic remains in this area to speak of; but now, new discoveries in the valley of the upper Yellow River have disclosed many sites of this period. Again not more than a decade ago, another impression among prehistorical archaeologists was, that *Pithecanthropus* migrated to the neighborhood of Peking from Java, without leaving any traces on his way; but recent fossil finds, south of the Yangtze River, certainly prove that the contrary is the case. Coming down to more recent times, many of us still believe that there is a big gap between the hunting culture of the late palaeolithic age and the sedentary village culture of the advanced neolithic period for Chinese prehistorians to account for. In other words, so far, Chinese archaeologists have not been able to prove the existence in the Chinese soil of any genuine mesolithic culture or an early neolithic civilization. Then, we have the problem of the beginning of the bronze age, and that of the Chinese written symbols, which could hardly have been evolved from the wide spread Yang Shao or Lung Shan culture. All these problems, many of us may have to admit, are impressive, challenging, and quite realistic. But, when they are more carefully scrutinized, it is equally obvious that if these questions appear imponderable, it is mainly because they are conceived on a holistic basis; which, one may observe, is the usual way that European and American scholars have studied Chinese civilization in the past three hundred years. Should they be approached from an anthropological viewpoint and defined with greater precision, those gaps apparent in the beginning might soon vanish in the course of accumulated new evidences.

当我们把注意力从人体学转向文化问题时，就会发现我们无需作那么多推测的了。半个世纪来的考古发现，已经澄清了这样一点：中国的历史文明既不是完全由西方送来的礼物，也不是从哪个不为人知的源头突然发展起来的。正像其他旧世界文化一样，它是从长达数十万年的史

前时期逐渐演变过来的。如果说这一地区的文化现象中有什么不同寻常的，那就是它的连续性，尽管在它演进的某些阶段上也出现了一些不衔接的现象；随着科学考古学的进步，那些明显的缺口也已一个接一个地逐渐合拢了。举例说，不久前，所有的史前学家都有一个印象，认为除了北京人及其相关文化之外，这个地区没有什么旧石器早期的遗存可言；可是目前，黄河流域上游地区的一些新发现，揭开了这一时期的许多遗址。另外，不足十年以前，史前考古学家们的另一个印象是：爪哇直立猿人在从爪哇迁到北京附近时，途中没有留下任何踪迹；可是近年来长江以南的化石发现，确凿证明了事实正好相反。直到不久以前，我们中间有许多人仍然相信，在旧石器晚期的狩猎文化与发达的新石器时代的定居村落文化之间，还有一个大空白有待中国史前学家解释。换言之，中国考古学家迄今为止还未能证明，在中国土地上存在过任何真正的中石器时期文化或新石器早期文明。再者，还有青铜时代开始的问题和中国的书写符号由来的问题；这些很难说是从广泛分布的仰韶或龙山文化演进而来。我们中许多人都不能不承认，所有这些问题都是重大的、富有挑战的，又是十分实际的。但是，这些问题一经认真推敲，同样可以明显地看出：它们之所以显得难以捉摸，主要是因为人们是在一种整体论的基础上思考这些问题；大家可以注意到，欧美学者近三百年来研究中国文明惯用的就是这种方法。如果从人类学的角度来探索这些问题并更加精确地作出解释，这些在开始看似明显的空白，可能随着新证据的积累很快就消失了。

As an anthropologist, one is more accustomed to treat his problem analytically; he is willing to pay more attention to what are usually considered as trifles; he views culture from many different angles and in all comparable perspectives. One finds this method of approach particularly effective in an inquiry, when terms, as "Neolithic" or "bronze age" are involved. An investigator with a preliminary training in comparative ethnology will find it easier to itemize the contents of those cultures, as indicated by these terms. And in his customary way, he may treat the diffusion and evolution of all the individual items before making any attempt to draw big conclusions. Following this method of approach, one often finds that the so-called historical cultural gaps in the areas treated, existed more on the foundation of ignorance than on actual facts. But it is important to realize that those gaps so frequently given in a number of responsible statements, have to be bridged by the accumulation of new facts, as well as by the adoption of a new method.

If we study the beginning of early Chinese civilization in this spirit, we can at least say that the way to solve this complicated and highly difficult problem is clear and plain. I have myself reported on the results of my investigation in the question of the ancient Chinese ceramics based on the materials collected from the Anyang excavation. I discovered in this study that the pottery of the Shang

Dynasty is divisible into several distinct groups; what interested me particularly is to find that the contemporary ceremonial bronze vessels did not at all reproduce the shapes of the pottery of this period. They are clearly imitations of the earthen wares of the late neolithic culture located mainly on the coastal region. But shape is only one aspect of what may be studied of the bronze vessels; and bronze vessels form only a part of the bronze culture complex. Another avenue of approach is the study of the decorative art found on the bronze articles. Here again one may investigate either the individual pattern or the complete composition. In the case of the Anyang collection, one will find that some of the bronzes are nakedly plain, some are richly adorned; some are covered with bands of simple figures; some are decorated by intricately composed designs. The ornaments may be plainly executed or inlaid with shells and colored stones; and, a number of these are cast in high relief. These different modes of expression may be reasonably taken as a definite indication of the many diversified backgrounds, datable to an earlier age, which jointly led to the final development and efflorescence of this creative art.

一个人类学家，更习惯于用分析法处理问题，喜欢把更多注意力投向通常被视为无关紧要的小事，并从多个不同角度和一切可以比较的视角来看待文化。人们发现，当某一考察工作中牵涉到“新石器时代”或“青铜时代”这样一些字眼时，上述的探索方法特别有效。一个受过比较民族学初步训练的调查者，会觉得把这些字眼所指向的文化内容加以逐条列项更容易一些。按照他的习惯，在尝试作出重要的结论之前，他要逐一探讨各个项目的传播和演变。如果遵循这样的方法，人们就常会发现，在这个领域中所谓历史文化空白，往往不是存在于确切事实之上，而更多是源于无知。但重要的是应该认识到：在许多负责任的论述中常常提到的那些空白，是需要用新事实和新方法加以填补的。

我们若本着这种精神去探究早期中国文明的开始，就至少可以说，解决这一复杂的高难度问题的途径是简明清晰的。我曾依据安阳发掘所搜集的资料撰写了关于中国古代陶器研究的报告。我在这项研究中发现，商代的陶器可以分为若干截然不同的类别；特别让我感兴趣的是，同时期的青铜礼器绝非重复当时陶器的形制。它们显然是主要位于沿海地区的新石器晚期文化中的陶器的模仿品。但是，形制只是研究青铜容器应注意的一方面，青铜容器又只是青铜文化复合体的一部分。另一条研究途径是考察青铜器上的装饰艺术。这里既可研究单个的纹样，也可研究总体的构图。在安阳的出土物中，人们发现有些青铜器完全平滑无纹，有些则是繁复装饰的；有些覆以简单图形的带纹，有些则饰有错综复杂的图案。饰纹有的是简单施上去的，有的则是用贝壳和有色石子镶嵌的，还有很多则是带有浮雕的铸件。所有这些不同的表现风格，可以合理地解释为确定是对多种多元背景的反映，而这些背景可以追溯到更早的时期，它们共同成就了这门创造性艺术的最终发展和繁荣。

This decorative art of the bronzes may also be compared with similar art in the medium of bone, wood and stone, etc., of which there are more and more reliable materials uncovered by field archaeologists. The results of such analytical studies and comparisons will do much to close the gaps in one's knowledge.

There are of course other finds of this period which may be treated in the same way; in fact, they can only be best studied by a similar method. Unless and until all the more important items of the cultural content of this complex have been thoroughly covered, it may be advisable to exercise some restraint in pronouncing one's view about the general nature of the Chinese Bronze Age.

I have taken this particular example and gone into it in some detail for one fundamental reason, that is, if the task of dating the Bronze Age of China is to be undertaken with some scientific care, one has to start with a group of artifacts whose provenances are definite and identifications precise. If this basic study could be carried on as a paleontologist studies his fossils in order and in detail, then, one might, with some justification, proceed to compare it with similar studies from other regions and induce generalizations. Very unfortunately, few publications of present day can meet this test, except what have been reported from field works recently.

It is therefore gratifying to note that in recent years not only are there more and more field anthropologists appearing in the Far East; but what is even more significant, is that the anthropological approach is gradually extending its influences even to the historians.

When Professor E. G. Pulleyblank delivered his inaugural lecture on taking the chair of Professor of Chinese in the University of Cambridge (1953), he said:

这种青铜器的装饰艺术也可以跟骨料、木料、石料等器物上的类似艺术相比较，田野考古学家发现了越来越多这些质料器物的可靠资料。这样的分析研究和互相比较的成果，将大大填补人们知识上的空白。

当然，这一时期还有其他一些发现物都可以按照同一方式加以考察；事实上，只有用类似的方法才能对它们进行最好的研究。在对这一复合体的文化内容中的所有较重要项目作彻底考察之前，建议最好是谨慎地发表对中国青铜时代的总体性质的看法。

我举这样一个特定的例子并作出比较细致的探讨，基本理由是：如果以科学的态度来确定中国青铜时代的年代问题，就需要从这样的器物开始——它们的出土来源是肯定的，它们的身份是确凿的。如果这项基础性的研究做得就像古生物学家对待化石那样按部就班和深入细致，那么才有理由进一步将其与其他地区的相似的研究作出比较，从而归纳出一般性的结论。非常遗憾的是，现在的出版物几乎没有能满足这个标准

的，近期田野工作的一些报告除外。

因此，令人高兴的是，近年来在远东不仅有了愈来愈多的从事田野工作的人类学家，更重要的是，人类学方法的影响逐渐扩大，甚至已影响到历史学家。

蒲立本教授在1953年发表就任剑桥大学中文教授的演讲中说道：

...if we will have the patience and perseverance to study Chinese history in its sources with the thoroughness and care that we expect in other scholarly discipline, if we do this not in a narrow spirit of pedantry but with our minds alert to the perennial problems that have assailed mankind everywhere...the basic biological urges of hunger and sex, the inadequacies of established social patterns to deal with new conditions, the oppression of the weak by the strong and the reaction of men driven to desperation, the universal aesthetic and religious aspirations of mankind, the problems of power and corruption...if we do this with imagination, but with imagination that will not go beyond what can be verified by evidence, we shall, I am sure, find that Chinese history throws light on our own history in countless ways and that mankind is indeed one.

Then Professor Pulleyblank continued to suggest the two practical methods of procedure: namely by piece-meal comparison and by detailed studies of the actual context. One may say that to an ethnologist, there is nothing new in Professor Pulleyblank's recommendation; but what is really important in his suggestions is the fact that a Cambridge professor now publicly advises his English speaking audience, the adoption of a scientific method in the study of Chinese history, which up to very recent years, had not been taken really seriously in the West, in spite of the fact that sinology had already an established chair in Europe's most well-known center of learning in the beginning of the XIX century.

For almost three centuries, Chinese civilization in the opinions of European scholars, was held either in the highest esteem or in utter contempt. In either case it was the outcome of an attempt to reduce an enormous and complicated panorama into a simplified image, strangely akin in their labor to that of an ancient Chinese landscape painter or a modern cartoonist, who can in his inspired moment make his subject matter sublime or ridiculous by means of a few strokes of the brush.

The tendency to holistic characterization of the Chinese civilization has been the dominant note of most European works on China, ever since Europe became interested in Cathay. While the Voltairians and Sinophiles idealized Chinese culture with some

exaggeration, it was more than counterbalanced by the Hegelian assault and the onslaught of its communist descendents; but both schools shared the same unconscious habit; they both suffered a deficiency in what the late Dr. Hu Shih called "evidential thinking."

.....如果我们也能像期待其他学科那样，以耐心和坚韧认真彻底地从原始资料中去研究中国历史，如果我们不是用一种狭隘的卖弄的心态，而是敏感警觉地去思考那些处处困扰人类的永恒的问题.....饥饿和性欲的基本生理冲动，已建立的社会模式之不足应付新的情况，强者对弱者的压迫以及被逼入绝境的人的反抗，人类普遍对美和宗教的渴望，权力和腐败的问题.....如果我们发挥想象力——但当然不是超乎证据所能验证之外的想象力——来对待这一切，我相信，我们将发现中国历史在数不清的方面能有助于我们理解自己的历史，将发现人类真正是一家。

蒲立本教授接着建议采用两种实际作法，即逐件比较法和对实际环境的细致研究。也许有人认为，蒲立本教授的劝告对于一个民族学家而言并无任何新奇之处；但他的建议的真正重要之处在于，一位剑桥的教授现在公开建议他的说英语的听众，要在中国史的研究上采用科学的方法。直到最近几年，中国史的研究在西方都一直未受到认真对待，尽管从19世纪初开始，欧洲最负盛名的学府中就已有了汉学讲习教授。

近三百年来，在欧洲学者的心目中，中国文明要么是获得至高的尊敬，要么就是受到极端的蔑视。两者都是试图把一幅庞大复杂的全景画简化为一幅简单图像的结果。他们的这种工作非常像中国古代的山水画家或现代的漫画家：灵感一来，几笔就可以把要表现的主题画得十分高雅或极具讽刺意味。

自从欧洲开始对中国发生兴趣以来，从整体上描述中国文明特点的趋向，一直是大多数研究中国的欧洲人论著的主调。伏尔泰主义者和中国迷们过于夸张地将中国文化理想化，而黑格尔主义者及其共产主义继承者对中国文化的抨击则矫枉过正。然而这两派都有同一种不自觉的习惯，就是缺乏已故胡适博士所称的有证据的思考。

One of the fetishes resulting from this eccentric development which still survives in some academic circles is the strange belief that a sinologist can study Chinese civilization without a competent knowledge of the Chinese written language. So when professor Pulleyblank preceded the main point in his inauguration address with a "if," one gets the impression that he did so with a great deal of courage and knowledge of the facts.

For a new historian to study China, however, a mere knowledge of the Chinese language is but the first step towards his necessary preparation. He should in addition learn and become quite familiar with what is being taught in current anthropology at large. He can learn something useful from every branch of the science of man,

especially from what these scientists have to say about the unity of modern man and his ancestors, and the antiquity of human culture.

From physical anthropology, the historian may learn the fact that while racial differences may appear to be real, the changes that take place constantly in the human physical type everywhere...for whatever reasons...have compelled many observant anthropologists and biologists to start questioning whether the term "race" could still serve any useful purpose in human biology.

From prehistorical archaeology and ethnology, the historian may learn much about cultural types, their local characteristics and their mutual relations. He may also learn the fundamental lesson that no natural or artificial barrier could stop the spread of basic inventions if they served any human needs. And, no basic invention could be identified with or monopolized by any particular regional group or a chosen people.

These lessons are useful to all historians. They are probably the best cures and the most effective correctives of parochialism, to which in one form or another, be it national attachment, religious ties, political affiliation, or partnership in the same philosophical ideas, not to mention the various common expressions of local bias and race prejudice, historians of all lands and all ages are prone to be addicted.

这种不正常的发展至今仍存在于某些学术圈中，种种对中国文明的盲目迷恋就是源自于此。其中有一种奇怪的看法就是：汉学家无需对中国文字有足够的知识就可以研究中国的文明。因此，蒲立本教授在切入他就任演讲的主要观点前还加上一个“如果”，使人感到他这样说是具备了相当的勇气和对实际情况的足够了解。

但是，对于一个刚开始研究中国史的人来说，仅有一些关于中国语言的知识，不过是他的必要准备工作的第一步。他还需要学习并逐步熟悉目前人类学所讲授的详尽内容。他可以从有关人类的科学的各个分支中，特别是从这些领域的科学家对现代人及其祖先的共性、对人类文化的古老性质的见解中学到一些有用的东西。

从体质人类学方面，历史学家可能认识到这样的事实：尽管种族差别看来像是实际存在的，时时处处发生在人类体质类型上的各种变化——不论是何种原因造成的——却使许多敏于观察的人类学家和生物学家不得不提出这样的问题：“种族”一词在人类生物学中是否还有什么真正意义？

从史前考古学和民族学方面，历史学家可能学到许多关于文化类型及其地方特色和相互关系的知识。他也可能学到这样一堂基础课：任何天然的或人为的障碍都无法阻止那些能满足人类需求的基本发明创造的传播。同时，任何一种基本的发明创造都不能视为属于某个特殊地域群体、某个特选的民族，或为他们所垄断。

这些功课对所有的历史学家都是有用的。它们可能是治疗狭隘局部观念的良方和矫正它的最有效方法。来自任何国度任何年龄层的历史学家，都有时不免沉溺在这种或那种形式的狭隘局部观念之中：民族感情，宗教联系，政治依附，对同一哲学观念的信从，更不用说种种地方偏见和种族歧视的常见表现了。

But for historians who are interested in Chinese civilization, there are some extra-curricula. I need, perhaps, to elaborate this point a little more. What I mean is that although theoretically speaking a well educated Chinese, according to present day standard, is supposed to be able to handle both his own mother tongue and at least one European language, but in reality such attainment is comparatively rare. So there is a scientific need, or a practical demand, in the international community of learning, of a group of trained historians and anthropologists, who can handle the Chinese language in both the written and spoken form as efficiently as one of the European languages.

With this as an introductory note, my proposition is that the problem of "Chinese Thought and Institutions,"^[3] a research program very much in vogue now in America, should be approached on a more strictly anthropological basis. There seems to be little doubt that much of what strikes the uninitiated as peculiar in Chinese institutions and Chinese thought may find its nearest explanation in the Chinese written language.

The Chinese have developed a written language with an uninterrupted continuity of more than three thousand years. It is a language in which new ideas in most cases are registered by the merging of meaningful symbols into one single character; in which, word-order and the ordering of words are the most conspicuous features in grammatical construction; in which tones and intonations have played a role unparalleled in any alphabetical language; and in which, symmetry outweighs any syllogistic consideration in every form of literary production. All these peculiarities have been closely interwoven into the fabric of the mental life of the educated Chinese and are strongly reflected in the institutions with which the literati class are intimately associated.

Now here comes my main point. As an investigator in the problems of "Chinese Thought and Institutions," while one may find much useful information by patient and intelligent examination of Chinese records from the original sources, in order to make his search really up-to-date he will have to supplement his documentary study with some direct observations. These supplementary evidences are especially needed in the studies of "Chinese Thought," about which

documentary data, in the majority of cases, may be so remote from realities that they can hardly reveal its true or complete nature. They should at least be checked with more experimental investigations which ought to be obtainable by studying the Chinese mental process in actual operation. The way to do it is of course somewhat delicate, and extremely difficult; it involves many interdepartmental disciplines. If I am permitted to make some suggestion here, let me call this special recommendation the psycho-bilingual-anthropological approach. The participant in this program must learn, as one of the fundamental requirements, to do his thinking in spoken as well as written Chinese; and secondly, he must be able to introspect objectively his thinking process done in the Chinese, and record it in another language with which he is equally familiar.

不过，对于有志于研究中国文明的历史学家而言，还需要上点补充的课程。也许我还需要对此多说几句。我的意思是说，从理论上讲，一个受过良好教育的中国人，按现在的标准应该既能运用他的母语，又至少能运用一门欧洲语言，但实际能达到这个要求的人是比较少的。因此，从科学的需要或从实际的需要来看，在国际学术界都应该有一批受过训练的历史学家和人类学家，他们能够像使用一门欧洲语言一样在书面和口头上有效地使用汉语。

用上述观点为导言，我的主张是，“中国的思想和制度”^[4]——这个当今在美国很时髦的研究计划，应当在更加严格的人类学的基础上进行。许多在那些尚未入门的人看来是中国制度和中國思想中的奇特现象，可能在中国文字中找到最切近的解释，这么说大概是没有什麼可怀疑的。

中国人发展了一种文字，三千余年，它不曾中断。它是这样的一种语言：在多数情况下通过把若干有意义的符号组合为一个方块字来记录新的思想；字序和词序是语法结构中最明显的特色；声调和语调所起的作用为任何拼音语言所不能比拟；在各种文学作品中对称原则的重要性超乎一切逻辑推理。所有这些特点紧密交错，编织成中国读书人的精神生活，并强烈反映在与知识分子阶层密切相关的各种制度上。

现在谈谈我的主要看法。作为“中国的思想和制度”问题的一个探讨者，经过对原始中文资料进行耐心的、理智的检验，固然可以找到许多有用的信息；但为了使他的研究真正与时俱进，他还需要用一些直接的观察来补充他对文献的研究。这种补充证据对研究“中国的思想”尤为需要，因为文献材料绝大部分可能远离现实，难以展示中国思想真实的、完整的性质。这些文献至少也要用更多的实验调查加以检验，这些调查可以通过研究中国人现实活动中的心理过程开展。这项工作做起来当然是相当精细的，也是十分艰难的，涉及到许多跨部门的学科。如果允许我在此提点建议，我将把这项独特的建议称为“心理学+双语研读制+人类学”的方法。参与这种研究计划的人所应达到的一个首要要求，即必须学会用中国话和中国文字去思考；其次，他必须能用中国语言客观地内

省自己的思维过程，并用他同样熟悉的另一种语言把这一过程记录下来。

If I am inclined to believe that this particular group of anthropological problems of China ought to be easier for a Chinese scholar to handle, my main reason is that, a Chinese scholar is supposed to possess the initial advantage of speaking the Chinese as a mother tongue. With this initial advantage, if he acquires a thorough training in scientific method and learns his foreign language well, what he needs further will be only a spirit of intellectual adventure and a sense of this particular problem. At any rate, the time has certainly come that some Chinese scholars should study their own mental characteristics; for in addition to the scientific value and the intrinsic interest in the problems themselves, they are a part of the fountain source from which all primary data of Chinese Thought may issue. On the other hand, non-Chinese scholars who have already developed an interest in the evolution of Chinese Thought and Chinese Institution, and who, besides, are naturally more objective in dealing with problems of this kind, have all the reasons to go to the root of the question by a more daring and direct approach as suggested above. It would be interesting, too, to find out whether introspective psychology could still revitalize its function by lending its technique to a new mode of operation in the study of the proposed thesis. In my judgement, and with all the premises as laid above, the psychological situation so created may be as appropriate as one can make for the conduct of such an experiment. Let us hope that before long, there may be some qualified and adventurous spirit who will be willing enough to try.

如果说我倾向于认为，这类特殊的中国人类学问题由中国学者来处理要容易些，我的主要理由乃是，中国学者应当是拥有以中国话为母语的基本优势的。如果他有了这项基本优势，又受到完善的科学方法的训练，并且外国语也学得很好，那么他进一步需要的只是一种智力上的探索精神和对这种特殊问题的敏感。无论如何，这样的时刻肯定已经到来——中国学者应当研究他们自己的精神特点。因为除了问题本身的科学价值和内在趣味外，他们自己就是提供中国思想的全部第一手资料的部分来源。另一方面，那些已经对中国思想和中国制度的演化产生兴趣、并且在处理这类问题时天然地比较客观的非中国学者，正如前面所说，有一切理由以更大胆和直接的方式去探寻问题的根源。探索一下内省心理学是否仍能通过将它的方法应用于研究上述命题的新活动方式来重新发挥作用，这也将是很有兴味的。在我看来，在前面规定的各种前提下产生出来的心理情境，可能最适于进行这种实验。让我们期待，在不久的将来，就会有一些合格的、富有冒险精神的人甘心情愿去作这种尝试。

VIII Racial History of the Chinese People

Ever since anthropologists started classifying man as a natural animal the Chinese people have always been considered to be a branch of the Mongoloid race. There are many different opinions regarding the exact position of the Chinese in this racial classification. But from the time of Blumenbach down to Professor William Howells, who made his latest statement in 1961, the racial status of the Chinese in the eyes of specialists has remained very much the same: they are Mongoloid. So in order to orientate ourselves into the racial history of the Chinese people, it may be pertinent to say a few words about the Mongoloid race first.

But this, unfortunately is rather a difficult task. What I mean is that physical anthropologists at present do not know very much about the origin and the evolution of the Mongoloid, although they have advanced a number of theories to interpret the physical characteristics of this particular branch of modern man. It has been, however, generally agreed that the most representative physical traits of the Mongoloid are found in his physiognomy. The characteristics of the modern Mongoloid man, it is often said, are revealed more by his face than any other part of his body. These traits include the almond eye with the Mongoloid folds, the flattish forehead, the more or less depressed nasal root, and the broad heavily padded cheek bone. In other words, the Mongoloid face as compared with either the Caucasoid or the Negroid, looks flat. The best known theory advanced to account for the origin and development of the Mongoloid facial characteristics is the climatic interpretation, which has been very eloquently expounded by Professor Carleton Coon and supported widely by many others.

The particular facial appearance of the Mongoloid people had its origin, according to this theory, in the necessity of fighting against the bitterly cold weather during the last glacial age, when a group of early Mongoloids were trapped in the dry cold region somewhere east of the Ural Mountains in northeastern Siberia. Man at that time had already invented both shelter and clothing which were sufficient to protect his body, but his face was by necessity exposed. This severe cold climate wiped out those who were physically unfit by the spread of pneumonia and sinus infection. Those who happen to be naturally protected in the sinus region and the eye region by a heavily padded layer of fatty substance and possessed smaller nasal apertures, were

better qualified to survive in this kind of climate than their fellow creatures devoid of these natural gifts. The result of this severe struggle is the development of the Mongoloid physiognomy.

捌 中国人的种族历史

自从人类学家开始将人类划为自然动物的那一天起，中国人就一直被当作蒙古人种的一个分支。关于中国人在此种族类别中的确切位置，存在着许多不同的观点。不过，从布卢门巴赫开始一直到1961年发表了最新声明的威廉·豪厄尔斯教授，在专家的眼中，中国人的种族身份几乎是一成不变的：中国人属于蒙古人种。因此，为了确定我们中国人的种族历史，也许有必要先讲一讲蒙古人种。

遗憾的是，要说清楚这一点还有相当的难度。我的意思是说，现在的体质人类学家对蒙古人种的起源和演进知之甚少，尽管他们提出了诸多理论来解释现代人中这一特定分支的体质特征。不过，他们在有一点上达成了共识，即，蒙古人种最具代表性的身体特征表现在他们的面部。通常来讲，现代蒙古人种的特征更多地是从他们的脸上而不是从身体的其他部位反映出来的。这些特征包括：长着蒙古褶的杏仁状眼，稍平的前额，有些塌的鼻根，以及宽阔扁平的颧骨。换句话说，与高加索人或尼格罗人相比，蒙古人的脸略显扁平。用来解释蒙古人种面部特征的起源与演进的最著名的理论就是气候说，卡尔登·孔恩教授曾有力地详释了这一说法，并得到了其他很多人的广泛支持。

根据该理论，蒙古人种特殊的面部外形源于抵御最后一次冰河期的酷寒天气的需要。那时候有一支早期的蒙古人被困在了西伯利亚东北部乌拉尔山东侧的干冷地带，人类当时已经发明了足以保护身体的掩蔽所和衣服，但脸部却不得不暴露在外。严寒气候造成了肺炎和鼻窦炎的蔓延，身体上不能适应的人就被淘汰了；而那些鼻窦部和眼部有着厚重脂肪层的、鼻孔小的人恰好拥有天然的保护，与没有这些天赋之物的同胞相比，他们更适合在这种气候条件下生存。这种严酷斗争的结果就是蒙古人种面型的演进。

It is also postulated in this theory that the evolution of the Mongoloid face started after the first migration of *Homo sapiens* to the new world. Professor Howells suggested that the Mongoloid face probably originated sometime between 25,000 and 10,000 B.C. He believes that about 600 generations were needed for the development of this group of physical characteristics.

It is obvious that this theory, although ingenious in several respects, still leaves the origin of the early Mongoloid in the category of a myth. At any rate, there still remain a number of other bodily characteristics, also considered to be typical of the Mongoloid race, such as the hair structure, the pigmentation, and the peculiar anatomy of the incisor teeth, which certainly need another theory to explain them.

Physical Anthropology of the Chinese People

So much for the Mongoloid race in general. Let us now turn our attention to the physical characteristics of the Chinese people, who are an offshoot of the Mongoloid race. One of the best papers on the anthropometry of the Chinese is that of Professor Paul H. Stevenson, who measured more than one thousand Chinese soldiers recruited mainly from the north China plain. This paper was published by the Academia Sinica in 1938. The author made 66 direct body measurements of these soldiers. In addition, he also recorded quite a number of non-metrical characters: namely, the skin color, the hair structure, the nasal form, etc. In this paper one may find some of the most reliable data about the bodily characteristics of the Chinese of the three provinces, Honan, Hopei and Shantung, where ancient Chinese civilization had its roots. With this paper as a reference point, one finds from the various physical measurements published from time to time by a number of investigators that the Chinese people are by no means homogeneous in their physical attributes; they vary from locality to locality. For example, the northern Chinese are taller than the southern Chinese by an average of sometimes as much as 9 cm., depending of course on where the samples are taken. Another instance which may be taken is the head form. One finds in Shantung as well as in Kansu concentrations of long-headed people, while in central China, like Hunan, Hupeh and certain parts of Fukien near the eastern coast, the local populations are quite broad-headed, the average index often exceeding 85. But in the text books, the cephalic index of the southern Chinese is usually given as a little below 80, and for the northern Chinese it is 81. In the case of the nasal index, the contrast between the north and the south, according to published figures, is really striking. The northern average given by Stevenson is 68.66, while Shirokogoroff calculated the southern average as 93.91!

气候说还假定，蒙古人种面型的进化是在智人第一次迁徙到新大陆以后才开始的。豪厄尔斯教授提出，蒙古人种的面型或最早形成于公元前25,000年到公元前10,000年之间。他认为，这组体质特征的演进大概需要600代人的时间。

很显然，这一理论在若干方面虽有其独到之处，但早期蒙古人种的起源问题仍然停留在神话阶段。至少，还有很多其他公认的蒙古人种典型的身体特征，如毛发结构、肤色以及门齿的独特解剖构造等，这无疑还需要另一个理论来加以解释。

中国人的体质人类学

关于蒙古人种大体上就先讲这么多。现在我们将注意力转到作为蒙古人种的一个分支的中国人的体质特征上来。许文生教授所著的有关中国人人体测量学的论文是这方面最优秀的论文之一，这篇论文于1938年由中央研究院发表。许教授是在对一千多名主要从华北平原招募的中国士兵进行测量的基础上完成这篇论文的。他对这些士兵进行了66项直接人体测量，另外还记录了许多非测量性状，即肤色、毛发结构和鼻形等。读者可以从这篇论文中找到有关中国古代文明发源地河南、河北和山东三省的中国人身体特征的可靠资料。以这篇论文为参照点，读者还可以从众多调查者发表的各种体质测量的资料中发现，中国人从体质特征上来看绝不是纯一的；人们的体质特征因地而异。例如，华北人平均比华南人要高9厘米，当然这也取决于样本的采集地。另外一个例子就是头形。人们发现，山东和甘肃有长头型的人密集分布，而在华中地区，如湖南、湖北和靠近东海岸的福建部分地区，当地居民头形颇宽，其平均指数通常超过85。然而，教科书给出的华南人的头指数通常要略低于80，华北人为81。至于鼻指数，根据已发表的数据，南北方的差异实在相当惊人。许文生提供的华北人平均鼻指数为68.66，而史禄国计算的华南人平均鼻指数高达93.91！

As we all know, stature, cephalic index, and nasal index are of considerable popular interest and have usually been taken as anthropologically significant by many professional anthropologists in the past. Unfortunately, so far as the Chinese area is concerned, the qualities of the published data are of unequal value. Nevertheless, they have served the purpose of showing the great variability of the physical character of the living Chinese population, which is confirmed also by some osteological measurements.

But none of these three measurements represents any typical Mongoloid character. Of the typical Mongoloid characteristics studied in current anthropology, two deserve special mention: one is the so-called almond eye, the other is the high cheek bone. While both characteristics distinguish the Mongoloid from other living races, the latter possesses the additional merit of being measurable on the skull as well as on the living face. The anatomy of the Mongoloid malar bone has been examined in every detail by many eminent physical anthropologists. Let us see what has been found out about these two racial traits among the Chinese people.

In the Stevenson paper, out of the 921 observations he made on the eyes of his soldiers, only 30.7% of them possessed the marked Mongoloid fold, 8.9% were found to be without any trace of it, while the remaining 60.4% were recorded as intermediate cases between the two extremes. Regarding the direction of the eye-slits there were 906 observations in his record; of these 14% were classified as horizontal, 5.1% as markedly sloping. The others, more than 80.0% of the total number, were only moderately or slightly sloping.

The malar bone is more capable of a number of direct measurements, of which the maximum bi-zygomatic width is specially important as its measurement can be carried on accurately on both the living person and the dead skull. In 1932, *Biometrika* published a preliminary classification of Asiatic races based on cranial measurements. In this study, by T. L. Woo and G. M. Morant, twenty-six published series of cranial materials were used for comparison. Out of these twenty-six series, no less than eighteen series were skulls of the Oriental or Mongoloid people. The authors of this paper divided the Orientals into three sub-groups: (1) the northern Mongolian, (2) the Chinese and the Japanese, and (3) other Orientals, including in these inhabitants of Java, Borneo and the Philippine Islands, etc. This tripartite division is based mainly on what the biometricians call "the Coefficient of Racial Likeness."

众所周知，身高、头指数和鼻指数是大家普遍都感兴趣的，过去的许多专业人类学家通常认为它们是人类学的重要指标。遗憾的是，就中国地区而言，所发表的资料的质量参差不齐。尽管如此，这些资料还是体现出了现生的中国人在体质特征方面的巨大差异性，这一点在一些骨骼测量中也得到了证实。

然而，这三项测量都没有显现出任何一项典型的蒙古人种特征。在当代人类学所研究的蒙古人种的典型特征中，有两点值得一提：一是所谓的杏仁状眼，二是高颧骨。这两点都是蒙古人种区别于其他现生人种的典型特征，而后者更是具有既可通过测量头骨又可通过测量活体面部来获取数据的优点。许多杰出的体质人类学家都对蒙古人种颧骨的解剖结构进行过细致的研究。让我们来看一看，关于中国人的这两项种族特征的研究有什么发现。

许文生在他的论文中提到，他对921位士兵的眼部作了观察，结果发现只有30.7%的人长着典型的蒙古褶，8.9%的人没有任何蒙古褶的痕迹，而剩下的60.4%则介于两者之间。关于眼裂倾斜度，许文生记录下了906例观察结果，其中14%的人可归为水平，5.1%的人明显倾斜，而占总数80%多的人只是中度或稍稍倾斜。

对颧骨能够作多项直接测量，其中最大两颧点间宽因其在活体和死者头骨上都能进行精确测量而显得尤为重要。1932年，《生物统计学》学报上发表了一份以头盖骨测量为基础的亚洲诸种族初步分类表。在这项研究中，吴定良和莫兰特对26组已发表的头盖骨资料进行了比较。在这26组资料中，至少有18组是东方人或蒙古人种的头骨。该文作者将东方人分为三个亚群：（1）北部蒙古人种，（2）中国人和日本人，（3）其他地区的东方人，包括爪哇、婆罗洲和菲律宾群岛等地的居民。这种三分法主要是以生物测量学家所谓的“种族相似率”为依据。

According to these authors, the average value of the bi-zygomatic measurement for the six series of the northern Mongols ranges from 139.5 mm. to 144 mm.; for the five series of the Chinese and the

Japanese, its range is from 132.2 mm. to 134.7 mm.; for the seven series of the other Orientals, it is 131.0 mm. to 134.7 mm.; whereas the value of the same measurement for the five Indian series studied in the same paper, diminish to the min.-max. range of 124.3-127.8 mm.

Thus the sharp contrast of the same measurements appears not only between the Orientals and the non-Orientals, but also among the three sub-groups of the Orientals. The excessively large value of the average cranial bi-zygomatic diameter of the northern Mongols constitutes obviously a characteristic feature of the Mongoloid race; they are, at the present time, mainly located in the neighborhood of Lake Baikal and the Altai mountains; the settlement area of this broad-faced population is apparently confined to central, eastern and southern Siberia, much to the north of the great Gobi Belt.

Generally speaking the average facial diameter of the Chinese and the Japanese according to the measurements of the skulls, shows a drop of more than half a centimeter as compared with the northern Mongols. Whether the sudden decrease of this absolute measurement south of the Gobi desert is due to environmental influence or racial mixture or both, it is not easy to say. Six years ago, I collected some historical data which may also be referred to here. They are the measurements of the bi-zygomatic diameter of the Chinese cranial series from various datable periods:

~~(1) 300 B.C.~~ Upper cave (1)
~~(2) 200 B.C.~~ Prehistorical (32)
~~(3) 100 B.C.~~ Tang Series (20)
~~(4) 300 A.D.~~ Tang Series (2)
~~(5) 1000 A.D.~~ N. China (83)

据这些作者提供的数据，6组北部蒙古人种的两颧点间宽测量平均值在139.5~144毫米之间，5组中国人和日本人的测量值在132.2~134.7毫米之间，而其他的7组东方人则在131.0~134.7毫米之间；然而，这篇论文对5组印度人进行了同样的测量，所得数值降到了124.3~127.8毫米之间。

因此，同样的测量得出的数值的巨大差异不仅出现在东方人和非东方人之间，也出现在东方人的三个不同亚群之间。北部蒙古人种极大的头盖骨两颧间距平均值无疑构成了蒙古人种的显著特征；他们现在主要居住在贝加尔湖和阿尔泰山附近；这一宽脸人群的居住区显然是在中、东和南西伯利亚一带，在大戈壁滩以北更为集中。

一般来讲，根据这些头骨测量数据，中国人和日本人面宽平均值总体上比北部蒙古人种低了半厘米还多。戈壁沙漠以南居民绝对测量值的骤降究竟是由于环境影响，还是种族混合，或是二者兼而有之，还很难说。六年前，我收集到一些历史数据，也可在此用作参考。这些数据是各个可确定年代的不同时期里中国人头骨组的两颧间宽的测量值：

公元前2000年史前 (83例)

Recently the osteological laboratory of the Institute of History and Philology of Academia Sinica at Nankang issued a preliminary report summarizing the results of a very extensive osteometrical analysis of the Yin-Shang dynasty crania excavated by the Institute from the Anyang area, totalling more than three hundred in the whole collection. Of these, there are 272 specimens whose facial bones are sufficiently well preserved for bi-zygomatic measurement. Professor Hsi-mei Yang, who is working on this collection has found it justifiable to classify his materials into five sub-groups on a morphological basis; they are,

(1) Sub-group I, composed of thirty specimens, characterized by broad and flat face with massive malar bones, narrow nasal bones and narrow nasal aperture, broad cranium, average cephalic index being 79.15.

(2) Sub-group II, composed of forty specimens, characterized by narrow and short face with moderate malar bones and low orbits, prognathous maxilla, depressed nasal roots, low and broad nasal aperture; skull cap comparatively long, average cephalic index being 75.00.

(3) Sub-group III, only two specimens studied; characterized by a narrow face with a high and narrow nasal bridge, moderate malars and prominent brow ridges; head form definitely dolichocephalic, the average index being 73.58.

(4) Sub-group IV, composed of 50 specimens, characterized by flat face, but not as broad as sub-group I, with massive malars, spacious orbits, pinched nasal bone and keel-shaped skull, the average cephalic index being 76.35.

(5) Sub-group V, composed of 50 specimens, size of skull smaller than the other four sub-types, with narrow face but not as short as sub-group II, skull cap narrow with protruding occipital, average cephalic index being 75.71.

The average bi-zygomatic measurements of the five classified groups are as follows:

Sub-group
Bi-zygomatic Diameter (Average)

南港“中央研究院”历史语言研究所人骨实验室最近发表了一份初步报告，概述了该所从安阳发掘出来的300多个殷商时期头骨的广泛骨测

量分析结果。在这些头骨中，有272个样本的面部骨骼保存得相当完整，可以进行颧骨间宽度测量。杨希枚教授参与了对这些采集物的研究，他发现，根据形态学原理，可以将此材料划分为5个亚群，它们分别是：

(1) 亚群I，包括30个样本，特征：脸部宽而扁平，大颧骨，窄鼻骨，窄鼻孔和宽颅骨，平均头指数为79.15；

(2) 亚群II，包括40个样本，特征：脸部窄而短，颧骨大小适中，凹眼眶，上颌突出，塌鼻根，鼻孔低而宽，颅顶相对较长，平均头指数为75.00；

(3) 亚群III，仅对两个样本进行了研究，特征：窄脸，鼻梁高而窄，颧骨适中，眉骨突出，明显的长头形，平均头指数为73.58；

(4) 亚群IV，包括50个样本，特征：脸部扁平，但较亚群I稍窄，大颧骨，宽眼眶，鼻骨紧缩，头骨呈龙骨状，平均头指数为76.35；

(5) 亚群V，包括50个样本，头骨尺寸小于前四个亚群类型，脸部窄，但长于亚群II，颅顶窄，枕骨突出，平均头指数为75.71。

这5类的平均两颧间宽测量值如下：

Ⅱ群

颧骨间宽 (平均值)

It is interesting to compare the averages of the bi-zygomatic measurements of the five sub-groups with those given in Woo and Morant's paper for the three Oriental sub-groups. Yang's sub-group I with an average 141.18 falls definitely within the range of the northern Mongols, while the mean values of Yang's sub-groups III & V are quite below the modern Chinese average and only slightly above the minimum of the "other Orientals." Sub-group IV is within the range of the modern Chinese and Japanese, but sub-group II is above it. Professor Hsi-mei Yang in his preliminary report also announced the results of some of his comparative studies. In 1963 Professor Yang brought some of the type specimens from the Anyang collection to the Smithsonian Institution at Washington D. C. where the authorities helped him to carry on a series of studies comparing his specimens with crania of other peoples available in storage there: sub-group I with the Buriats, Chuckchis and the Mongols of Urga; sub-group II with the Melanesians, Australoids and some African Negroes; sub-group III with American-British and Plains Indians; sub-group IV with the Eskimoid; sub-group V with some Hawaiian skulls. Professor Yang found in each of these five comparative studies some striking morphological resemblances.

All this leads me to the core of today's problem, namely the making of the modern Chinese people. As a matter of general observation it may be said that the continuous change in the physical

characteristics of the Chinese people is quite faithfully reflected in the present day geographical variations as recorded, although imperfectly, by many anthropometricians and craniologists. Let us go back once more to Woo and Morant's paper on the classification of the Asiatic races. In this paper four Chinese series of cranial measurements were discussed. The first Chinese series was taken from Goldon Harrower's work, which consisted of 31 male skulls of Fukien origin. The second series was composed of the data, collected by the Japanese anthropologist Dr. Koganei, in the provinces of Chihli, Shantung and Southern Manchuria in 1902; but the 70 skulls in his collection were soldiers killed in war time, so they are actually of unknown origin. The third and the fourth series were both taken from Davidson Black's works in which the origin of the materials used in his study were fully recorded. One consists of the measurements of 86 skulls from the northern provinces of China. The other was Black's monograph on 64 male skulls of the late neolithic and early bronze age. So we know more or less definitely about the geographical locations of three series among the data quoted by Woo and Morant in their paper.

将五个亚群的平均两颧间宽测量值与吴定良和莫兰特论文中三个东方亚群的数值进行比较，非常有意思。杨希枚划分的亚群I平均值为141.18，正好处于北部蒙古人种的数值范围内，而他的亚群III和亚群V的平均值却比现代中国人的平均值低得多，仅仅略高于“其他地区的东方人”的最小值。亚群IV的数值在现代中国人和日本人的数值范围内，而亚群II却比它要高。杨希枚教授在他的初步报告中还公布了他的一些比较研究的结果。1963年，杨希枚教授将安阳采集物中一些有类型代表意义的标本带到了美国华盛顿特区的史密森研究院，院方帮助他开展了一系列研究，将他带去的标本与院方保存的其他民族的头盖骨进行比较：亚群I与布里亚特人、楚克奇人和库伦蒙古人；亚群II与美拉尼西亚人、澳大利亚土著居民，以及一些非洲尼格罗人；亚群III与英美人和大平原印第安人；亚群IV与爱斯基摩人；亚群V与一些夏威夷人。杨教授发现，这5组比较研究的对象在形态学上都有一些惊人的类同之处。

所有这些将我们引向了今天所讨论问题的核心——现代中国人的形成。如果只作一般观察，我们可以说，根据许多人体测量学家和头盖学者的——尽管有所缺陷的——记录，中国人身体特征的不断变化是今天的地域差异的忠实反映。让我们再次回到吴定良和莫兰特划分亚洲种族的论文上去。这篇论文讨论了四组中国人头骨测量数据。第一组中国人系列取自古尔登·哈罗尔的著作，由31名福建籍男性的头骨组成。第二组是取自日本人类学家小金井博士1902年从直隶、山东和东北南部等地收集到的资料；不过，他收集的有70个头骨是阵亡的士兵，所以他们确切的籍贯不详。第三和第四组来自步达生的著作，他对研究中所用资料的籍贯作了翔实的记录。其中一组包括中国北方数省的86具头骨的测量数据，另一组则是步达生关于新石器时代晚期和青铜时代早期的64具男性头骨的专著。因此，我们多少能够准确地了解吴定良和莫兰特文章中所

引用的资料里其中三组所在的地理位置。

Applying the formula of C. R. L. (Coefficient of Racial Likeness), Woo and Morant found that among the four Chinese series, Koganei's group is more closely related to Harrower's Fukien Collection. The C. R. L. between these two series is 2.86; while Black's modern series shows only a moderate association with Koganei's, the C. R. L. of these two series is 5.6 which is a much larger figure than the C. R. L. between the Japanese series and the Fukien series 3.73. The prehistoric series of Black shows only a slight association with the three modern Chinese series; the C. R. L. between the prehistoric and any of the three modern Chinese series is more than 9 but less than 10.

If we compare these Chinese series with the other Oriental and non-Oriental races of Asia, according to the calculated C. R. L. shown in the above paper, we find some significant results. It is a fact that the modern Chinese crania are further differentiated from all the northern Mongolian series except those of the Chukchis, an isolated group located in the northeasternmost corner of Asia, on the coast of the Bering Strait. But with the other groups of Orientals in the south the Chinese series have demonstrated a relationship of a mixed character.

In the historical period of the last three thousand years, an anthropologist may find that the formation of the Chinese people in a cultural sense is richly documented both in the written records and the archaeological remains. As for the racial aspect, the data are only gradually accumulating. In the remaining few minutes, I am going to summarize for you some of the important historical notes I have made on this theme.

Franz Weidenreich, in describing the skeletal materials of what he called "the earliest Moderns in East Asia," namely the upper cave finds at Chou-k'ou-tien, concluded that the old male among them represents not only a very primitive form of modern man, but also a type of primitive Mongoloid. He said further that the recent northern Chinese, while more advanced in their physical characteristics are in fact traceable to ancestors like those represented by the old man in the Upper Cave.

The conclusion arrived at by this eminent anthropologist has given rise to much discussion. Recently both Soviet and China archaeologists have claimed discoveries of skeletal remains identifiable to Mongoloid, earlier than the dating of the CKT Upper cave. But more detailed evidence is needed for verification of these claims. Next to Weidenreich's study, Davidson Black's investigation of the north China prehistorical series may be considered. Black

remarked at the conclusion of his paper that the neolithic Chinese show a group of physical characters differing very little from the modern inhabitants of North China. He even went so far as to say that the neolithic Chinese were the proto-type of the modern inhabitants of North China.

应用“种族相似率”公式，吴定良和莫兰特发现，在四组中国人中，小金井的那组与哈罗尔的福建组更相近，这两组之间的种族相似率是2.86；步达生的现代组仅仅表现出与小金井组有一定的联系，这两组的种族相似率为5.6——这个数字比日本组与福建组的3.73的数值要大得多；步达生的史前组与三个现代中国人组只有细微的相似之处，史前组与三个现代中国人组中任何一组的种族相似率都大于9但小于10。

如果将这些中国人组与亚洲的其他东方种族和非东方种族相比较，依照上面论文计算出来的种族相似率，我们会有一些重大的发现。事实就是：现代中国人的头盖骨与所有北部蒙古组的头盖骨区别更大，只有生活在亚洲最东北端、白令海峡附近的一个孤立群体楚克奇人除外。而与南方的其他地区的东方人群体相比，中国人组则显示出与他们有特征混合的关系。

人类学家可以发现，在过去三千年的历史时期里，文化意义上中国人的形成在文字记录和考古遗存中都有丰富的记录；而在种族意义上，此方面的资料只是在逐渐积累。在剩下的几分钟里，我想简要地向你们讲一讲我在这方面所作的一些重要的历史摘录。

魏敦瑞在形容被他称为“东亚最早的现代人”，即周口店山顶洞发现的骨骼资料时，这样总结道：其中的老年男子不仅代表了现代人的原始形态，还代表了原始蒙古人种的一个类型。他还进一步认为，近代华北人，尽管在体质特征上更为先进，事实上可以追溯到以周口店山顶洞的老年男子为代表的祖先。

这位杰出的人类学家得出的结论引起了诸多议论。最近，苏联和中国的考古学家都宣称自己发现了可确认为比周口店山顶洞更早的蒙古人的骨骼遗存。但还需要更详细的证据来证实他们的说法。除了魏敦瑞的研究，步达生对华北史前组所作的调查也可加以考虑。步达生在他的论文的结论讲到，新石器时代的中国人显现出的一类体质特征几乎与现代华北居民无异。他甚至大胆判言，新石器时代的中国人是现代华北居民的原型。

Now with the study of the earliest historical crania nearing the final stage, we are in a position to make some amendments to Black's conclusion. The core of the problem with the Anyang data is, while comparative studies have made it quite clear that this collection is composed of at least five morphologically distinct units, of which four are identifiable with living ethnical groups, it remains rather obscure which of these units was typical of the ruling class of the Yin-Shang dynasty. The reason is: practically all these skulls in the Anyang

collection were excavated from what the field archaeologists call "the cranial pits," mainly sacrificial in nature. In other words, these skulls were offerings to the departed spirits of the masters of the Royal Tombs, whose own bodies were destroyed by tomb robbers long before modern scientific excavation took place. In the oracle bone inscriptions there are many records of the Yin-Shang people fighting against foreign invasions on both the northwestern frontier and the southeastern border. It is not unusual, according to these records, to find that the heads of captured invaders were chopped off and offered to the spirit of the departed ancestors, a practice which was evidently very fashionable with the warriors of the Bronze Age all over the Eurafrian and Asian continent.

It is possible that the sacrificial victims might have included in their number, members of the royal clan and even the descendents of royalty. It is a question that certainly should be investigated by social scientists, and historians. For the present, it is sufficient to note that in the latter part of the 2nd millennium B.C., north China was a meeting place for a variety of peoples: Eskimoid, Mongoloid, Australoid, Negroid, Caucasoid and a number of others. The Eskimoid and the Mongoloid are the numerically dominant groups; next are the various Melanesian types; the smaller headed skulls are not quite identifiable.

These identifications serve to indicate that the Chinese of this period were already in a melting pot.

现在，对最早历史期的头盖骨的研究进入尾声，我们可以对步达生的结论作一些修正。有关安阳资料的问题的核心在于：虽然比较研究已经确定这些采集物至少由五个形态截然不同的单元组成，而且其中四个单元可确认与现生种族群属于同一类型；然而，殷商王朝统治阶级代表的是其中哪一种还没有澄清。原因是：实际上，安阳采集物里所有的头骨都是从被田野考古学家称作“头盖坑”的地方发掘出来的，那里埋葬的主要是殉葬者。换句话说，这些头骨是被用来献祭王陵主人的亡灵的，而墓主本人的尸骨在现代科学发掘之前早已经被盗墓者毁坏。甲骨文上有许多关于殷商王朝人民与西北边疆和东南边境的外来入侵者作斗争的记录。根据这些记录，我们不难发现，砍下被俘获的入侵者的头颅来祭奠祖先的亡灵，这种行为在青铜时代的欧非和亚洲大陆的战事中显然相当盛行。

这些人牲当中可能会有王族成员，甚至王族后裔。这确实是一个亟待社会科学家和历史学家考证的问题。不过，目前我们只需要注意到公元前第二个千年的后期，华北是爱斯基摩人、蒙古人种、澳大利亚土著、尼格罗人、高加索人等多个种族的汇聚地就足够了。爱斯基摩人和蒙古人种群在数量上占绝对优势；其次是各种类型的美拉尼西亚人；头形较小的头骨的类型未能确认。

这些识别工作表明，这一时期的中国人已经处在一个“熔炉”之中。

In the dynasties that followed this period, we have more historical data for a study of migration of the Chinese people both within the boundary of China proper, and in the borderland area; successive invasions, mainly from the north, gave impetus to most migrations. In every case, the result was an intensification of the process of hybridization among different clans, tribes and nationals. There were at least four major population movements in the historical period. The first population movement of great importance took place in the Shang-Chou period when the Chou Dynasty replaced the power of the Shang in the 12th century B. C. It was followed by a second movement in the 5th century B.C. in the Chan-kuo period which lasted to the late 3rd century B.C. The best recorded population movements are those of the subsequent two periods about which I first worked out the general outline more than forty years ago, and which has been elaborated recently by an enormous number of historical documents. They are the Yüingchia movement in the 4th century A.D. and the Chingk'ang movement of the 12th century A.D. In both cases, the movement started with foreign invasions from the north, activating the momentum of the mass migration towards the south. The remnant indigenous people in north China, as a consequence, absorbed the invaders from the steppes, while emigrants from the Yellow River basin who crossed the Yangtze River and settled further south, mixed to some degree with the indigenous population of the southern territory.

Völkerwanderungs are not unlike atmospheric circulation; the major movements mentioned above were typhoons and hurricanes. In addition, there were also seasonal winds and gentle breezes which intervened regularly between the stormy years. I believe that all students of population studies would concur that to this day, in the land of the mainland of China, Völkerwanderung is still as active as in earlier historical times.

One of the main results of this perpetual motion as evidenced by the continuous historical marches is the highly hybridized character of the Chinese of the present day, homogenized by a unique culture. Two questions remain to be answered. What happened to the northern Mongols, whose ancestral type not only made a major contribution to the sacrificial pits in the royal tombs of the Yin-Shang period, but also produced a Chinggis Khan for world historians to ponder and created a dynasty for the Chinese people to endure? They seem to have left no noticeable somatic impression on the Chinese population in spite of the free philandering activities which they monopolized in China for nearly a century.

随后的几个朝代给我们提供了更多的历史资料，用来研究中国人在

中国本土和边境地区迁徙的情况；大多数的迁徙主要是在不间断的——尤其是北方的——民族入侵的推动下发生的。每一次迁徙都导致了不同氏族、不同部族和不同民族之间杂交进程的加剧。历史上至少有四次大的人口迁移。第一次重要的人口迁移发生在商周时期，即公元前12世纪，周朝夺取了商朝的政权。随后的第二次迁移发生在公元前5世纪的战国时期，这次迁移活动一直持续到公元前3世纪后期。文字记录最完整的两次人口迁移是后来的两次。四十多年前，我曾就这个问题拟过一份概要，最近又有许多历史文献对此作了详细的阐述。它们分别是公元4世纪的永嘉迁移和公元12世纪的靖康迁移。这两次迁徙的起因都是北方民族入侵迫使居民大规模地向南迁移。结果，留在华北的当地人吸收了来自西伯利亚大草原的入侵者；而那些跨过长江在更加偏南地区定居下来的黄河流域的移民，则在一定程度上与南方地区的土著居民融合了。

人口流动就像是空气流通；上面提到的主要迁移就像台风和飓风。另外，在暴风骤雨之间还有规律地穿插着季风和微风。我相信，所有从事人口研究的学者都会同意这样的说法：如今，中国大陆的人口流动仍然像在过去的历史时期里一样活跃。

不间断的历史演进证实了这种永恒运动的存在，它所造成的主要后果之一就是，今天中国人统一于一种独特的文化之下的高度杂成性。现在还有两个问题需要回答。北部蒙古人种究竟遭遇了什么？大量出现于殷商时期王陵殉葬坑中的正是他们祖先的遗骸；创建了一个令中国人饱受苦难的朝代，并给历史学家留下无限思考空间的成吉思汗，也正是源自他们的血脉。然而，尽管他们在统治中国近一个世纪的时间里恣意玩乐，但却没有明显地在中国人身上留下蒙古体征的痕迹。

The second question is about the Melanesian elements found in the Anyang skeletal remains. They certainly seem to have been present in Shang times in the neighborhood of the North China Plain. Were they ever mixed with other racial elements among the Chinese population?

These are questions for further investigations. But from the data which we have reviewed, one point emerges quite clearly: if the northern Mongols and the Melanesian group have not succeeded on China's mainland today it cannot have been due to any political reason, or race prejudice which is altogether a modern concept. Everybody knows the famous Confucian saying: EDUCATION WITHOUT DISCRIMINATION, a motto which helped the Chinese statesman for more than 2000 years to forge many racial elements into one people, and many local cultures into one civilization. If the northern Mongols and the southern Melanesians seem to have disappeared somatologically within the boundaries of China proper, the reasons, I venture to suggest, are mainly environmental.

I am using the word "environmental" in its broadest sense,

covering all the physical and the social aspects. There is little doubt that in the land of China, as everywhere else, group mores and individual variations of man's ability to adapt himself to the climatic and ecological changes and to the constant new demands of an active society and a dynamic polity have always played a fundamental role in the selective process. By continually moulding and remoulding the physical as well as the mental character of its inhabitants, this process developed a modern type of Chinese widely divergent from that of their neolithic ancestors as described by the late Professor Davidson Black. This divergence has been demonstrated rather convincingly by the study of Woo and Morant, who, by means of the formulae of C. R. L. have shown that the degree of association among the three modern series of Chinese crania is much closer than that of any one of the three compared with the prehistoric group.

Thus, in spite of the wide range of anthropometrical variations made apparent by recent surveys among the living inhabitants, a more or less convergent somate-type seems to be emerging in the mainland of China. And, its emergence will inevitably be accelerated by another quickened pulse of *völkerwanderung* which is already taking place in Eastern Asia. The recent population movement on a gradually enlarged scale is obviously a repetition of the many historical marches recorded in Chinese chronicles. Its ultimate consequence is very likely to be a further intensification of the hybridizing process of the immigrants with the native born along the migratory route. If racialists should insist on the existence of a pure Chinese stock, let me quote what Franz Weidenreich queried over twenty years ago. He asked: "Who are the individuals who produce the hybrids anew each day?" His own answer to this question is well-known: there has never been any "pure race" on this planet of ours. This theory, in my opinion can be fully confirmed by the racial history of the Chinese people.

另一个问题与在安阳遗骸中发现的美拉尼西亚种族成分有关。由此看来，商时期他们肯定在华北平原附近出现过。那么，他们是否曾经与中国人口中的其他种族成分相融合？

这些问题都有待进一步探讨。但是从我们回顾过的这些资料来看，有一点相当明确：假如北部蒙古人种和美拉尼西亚群体在今天的中国大陆未能得到延续，那绝不是出于任何政治因素，或是种族偏见（这是个纯粹的现代概念）。大家都知道孔子的一句名言“有教无类”；在过去的两千多年里，这句箴言帮助中国政治家把多种种族成分统一成了一个民族，将多种地方文化融合成了一种文明。如果说从人体学的角度而言，北部蒙古人种和南部美拉尼西亚人似乎已经从中国本土范围内消失了，我斗胆说一句，那主要是环境因素造成的。

我所说的是最广泛意义上的“环境因素”，包括自然的和社会的两个

方面。毫无疑问，不论在中国还是其他地方，群体习惯和个体在适应气候和生态变化、适应活跃的社会和动态的政体不断提出的新要求方面的能力差异，在优胜劣汰的过程中始终起着根本性的作用。这个过程不断地塑造和再塑造居住者的身体和心理特征，创造出了一类新型的现代中国人，全然不同于已故步达生教授笔下他们新石器时代的祖先。吴定良和莫兰特的研究已经相当有力地证实了这种差异。他们应用“种族相似率”公式证明：三个现代中国人头盖骨组之间的相似程度比这三组中的任何一组与史前群体之间的相似程度都要高得多。

因此，尽管近期的调研显示，现在的居民的人体测量数据的差异范围很大，但中国大陆似乎正在形成一种趋同的体型，而在目前东亚活跃的人口流动必将加速它的形成。近代人口迁移的规模正在逐渐加大，它很显然是中国编年史中所记载的数次演进的重复。它的最终结果很可能是移民们在迁徙的过程中与当地居民的杂交进一步加剧。假如种族主义者还坚持认为存在着纯粹的中国血统的话，那我不妨引用一下魏敦瑞二十多年前发出的一个疑问。他问道：“每一天是谁在创造新的混血儿？”他的回答广为人知：在我们这个星球上，绝没有任何“纯种”。我认为，这一论断可以通过中国人的种族历史得到充分证明。

胡鸿保、周燕 译

APPENDIX I Letter to the British China Indemnity Delegation

Tsing Hua College,

Peking,

June 5, 1926.

The British China Indemnity Delegation,

c/o British Legation,

Peking.

Dear Sires:

The undersigned beg to present to your delegation a few data on the importance of the [*Sic*] establishing a museum of Chinese anthropology and archaeology, and reasons to apply a grant from the Indemnity Fund.

I

The aggregation of the Chinese people, as many visiting anthropologists can testify, is composed of such a number of quite different racial elements and strains that their discrimination is often a puzzle even to the expert anthropologists. Such blending of races cannot but have a considerable influence upon the history and the development of the Chinese as a race. Compared with the advance of recent researches accomplished in Europe and America, and even in other parts of Asia, the anthropological data collected in China are very meager and sporadic. In view of the vast territory of China, it is quite possible that a systematic and combined effort of anthropological study, if it could be made, would yield surprisingly valuable results.

The science of archaeology is no less in need of development to a far greater extent than at present. It has been quite widely deplored that much of Chinese archaeological remains have suffered from the secret pillage and plundering by unscrupulous curiosity dealers. Their underhand method of collecting has resulted in hiding from the public any knowledge of the locality, position, and association of objects which are necessary for scientific study and preventing further systematic excavation. Such wanton destruction of ancient sites and

dispersion of remains into unknown channels can only be checked by conducting scientific expeditions for the purpose of excavation, the result of which will not only convince the public of the scientific value of ancient sites and remains, and their necessary protection, but also contribute to the progress of archaeological knowledge itself.

附录壹 致英“庚款”咨询委员会调查团

北京

英国公使馆转

英“庚款”咨询委员会调查团

敬启者：

现由以下签名者向贵会呈送以下资料，论列建立中国人类学及考古学博物馆之重要性，并陈述申请“庚款”基金资助之理由。

—

中华民族之总体，正如众多来访之人类学者所判识，实由诸多极不相同之种族成分和血统所构成；其间差异，即使对专业的人类学者而言亦常为难解之谜。此种种族之混合必对中国人之历史及发展产生极大影响。试观欧美各国乃至亚洲其他地区在此领域之最新研究进展，益觉中国之人类学资料搜集甚为贫乏零散。以中国疆域之广袤而见，若能在人类学方面展开系统、协力之研究，定能取得极有价值之成果。

人类科学极需大力发展。肆无忌惮的古董商明抢暗窃，已使中国众多考古遗址惨遭破坏，令人不胜惋惜。此辈之卑劣采集手段致使公众对古器物之出土地点、层位及连带关系全然无从得知；而此种知识乃为科学研究与进一步系统发掘所必须具备。古遗址惨遭破坏，遗物四散流失，唯有实行以发掘为宗旨之科学探索方得遏止。科学发掘之结果，不仅能使公众确信古代遗址、遗物之科学价值，及对其施以保护之必要，并能促进考古学知识之进步。

In this connection, the undersigned are not unaware of the existence of several establishments which might be in a position to carry forward the work mentioned. Unfortunately owing to the lack of financial aid or to the insufficiency of the technical staff they have not been able to perform these duties as actively as might be expected. The Historical Museum under the Ministry of Education had conducted only two excavations and these in cooperation with a representative of the Smithsonian Institution. The Art Museum under the Ministry of Interior has fulfilled only the function of an exhibition.

On the other hand several scientists interested in the subjects have worked either independently, or under the auspices of organizations whose primary function is rather remotely related to archaeology. The finds of culture of New Stone Age in North China by Dr. J. G. Andersson and members of the Geological Survey, the

anthropological measurement made by Dr. Black and Dr. Stevenson of P. U. M. C. and the recent anthropometrical work by Dr. Chi Li in Hupeh, Honan, Shansi are a few instances of the widely scattered efforts in this field. The need of combined efforts is evident to avoid much duplication of work and to promote new lines of research. We can count on quite a number of both Chinese and foreign experts now in Peking to aid in this work. But an organized center should exist and this should be full-equipped and [Sic] modern museum which can fulfill the function of a centralizing organization.

II

The proposed museum shall be located in Peking as a National Institution. It shall serve as a clearing house of all the archaeological and anthropological work done in China. It shall have a free hand in its administration from other organizations. Therefore an independent administration with Boards of Trustees and Counsellors can best serve the purpose. It may start from a small beginning but its aim shall be to carry out active research and systematic excavations. But at the same time it shall be so organized that rapid expansion and enlargement of the scale of its work, is possible.

Its activities shall comprise:

(1) Field Expeditions: including archaeological excavations and anthropological measurements, together with photographing, rubbing, and modelling of valuable objects, etc.

就此端而言，以下签名各位深知已有若干机构或有能力推进上述工作。无奈财力匮乏、技术人员不足，迄今未能如预期般积极履行其职责。教育部下属之历史博物馆仅在与史密森研究院之代表合作下进行过两次发掘。内务部下属之艺术博物馆也只是尽到了展览的职责。

另一方面，有志于此项工作之若干科学家或独力、或依靠与考古学关系较远之机构的资助工作。安特生博士及地质调查所人员在华北对新石器时期文化遗存之发现，北京协和医学院步达生博士及许文生博士所作之人类学测量，以及李济博士最近在湖北、河南、山西等地进行之人体测量工作，仅为此领域内零星分散工作之少数例证。实行联合协作之必要性显而易见，以避免过多重复劳动，并发展研究工作之新取向。可预期，眼下北京相当数量之中外专家必将支持此项事业。然须建立一有组织的中心，而此中心应为一设备齐全的现代博物馆，以行统一组织之职能。

二

以上拟议之博物馆可设于北京，作为一国立机构。此馆将成为全国一切考古学及人类学工作之“结算中心”。馆务行政有不受其他机构干预

之自由。为此，应有独立之行政部门，并设立理事会及董事会以保证实现此目的。起步不必求大，但目标应指向积极之研究工作及系统之发掘工作。同时，该馆须合理组织，为其工作范围的快速扩展创造条件。

馆务活动拟包括以下方面：

(1) 田野考察：包括考古发掘，人类学测量，连同摄影、墨拓以及重要实物之模型制作等。

(2) Laboratory Research: including description and identification of objects, anthropometrical calculation and comparisons, etc.

(3) Publication: including the writing and printing of memoirs, reports, and guide books on the investigation and exhibited objects.

(4) Exhibition: including cleaning, restoration, mounting of exhibits.

III

Therefore herewith the undersigned apply for a grant from the Indemnity Fund to finance the above-outlined undertaking. Our estimated annual budget and initiative expenditure are as follows:

(1) Annual Expenditure:

1) Field excavations (for the work of four parties for five months out of a year)

~~7800~~ Equipment: tents, tools, photograph, surveying.

~~6000~~ Field Expenses: personal maintenance.

~~5800~~ Fees of local working men.

~~7000~~ Packing and transportation.

~~2000~~ Laboratory work

~~3400~~ Publications (four volumes a year)

~~8000~~ Mounting of exhibits

~~5700~~ Administration and salary

~~8500~~ Maintenance of buildings & repair

~~\$9000~~ 00M [Sic]

(2) Initial expense of building the Museum.

~~5000~~ Ground

~~250000~~ Construction

~~350000~~ Furnishings, including cases, furniture, light and heat.

~~\$650000~~ 00M [Sic]

Respectively submitted

Chi Li. Ph.D. (Harvard). Lecturer of anthropology, Tsing Hua College; former Dean and Professor of anthropology of Nan Kai University.

(2) 实验室研究：包括实物之说明、鉴别，人体测量之计算、比较等。

(3) 出版：包括撰写和出版介绍调查工作与展出物品的论文、报告和手册。

(4) 展览：包括展品之清理、修复、陈设。

三

为此，以下签名者特向英“庚款”基金提出对上项事业资助之申请。
估计年预算及启动费用大致如下：

(1) 年度费用：

1) 田野发掘（按每年四队为期五个月的工作计）：

~~28000~~元：帐篷、工具、照相器材、测绘用具

~~60000~~元：生活费用

~~35000~~元：人工工资

~~70000~~元：包装与运输

~~20000~~元：实验室工作

~~34000~~元：出版（每年四卷）

~~80000~~元：展品陈设

~~57000~~元：行政费用及薪金

~~85000~~元：房屋修建与维护

~~90000~~元

(2) 建造博物馆之启动费用：

~~50000~~元：地租

~~25000~~元：修建

~~35000~~元：陈列柜、家具、照明和供暖设施

~~50000~~元

呈报人：

APPENDIX ii Letter OF INVITATION from Hu Shih

104 East 81 Street

New York 28, N. Y.

February 16, 1955

Dear Fellow Member ____:

There are twelve members of the Academia Sinica in North America. They are:

Y. R. Chao, Cambridge, Mass.

K. K. Chen, Indianapolis, Ind.

S. S. Chern, Princeton, N. J.

Hsiao Kung-chuan, Seattle, Wash.

Hu Shih, New York, N. Y.

Li Chi, Seattle, Wash.

Li Fang-kuei, Seattle, Wash.

Li Shu-hua, New York, N. Y.

Robert K. S. Lim, Elkhart, Ind.

G. H. Wang, Baltimore, Md.

Hsien Wu, Brookline, Mass.

Wu Ta-you, Ottawa, Canada

During my last two visits to Taipei, President Chu Chia-hua of the Academia Sinica and the other members now in Taiwan agreed that an informal meeting of the members of Academia Sinica now scattered in many parts of the North American continent might be held for the purpose of renewing friendship, receiving reports of the A. S., and exchanging news regarding its future.

When Dr. Li Chi came to New York last November, he again urged me to try to call such a meeting. Dr. Li is now lecturing at the University of Washington, Seattle, Wash., where two other members of the A. S., Dr. Li Fang-kuei and Dr. Hsiao Kung-chuan have been teaching and doing research work.

Last week, Dr. Y. R. Chao, who had just returned from a European trip and is now residing at Cambridge, Mass., came to New York and met with three other fellow-members, Drs. S. S. Chern, Li Shu-hua and myself. This question of holding an informal meeting of the Members of the A. S. in North America was informally discussed. The discussion was resumed the next day by Dr. Chao and myself.

附录贰 胡适的一封邀请信^[1]

尊敬的_____院士：

“中央研究院”院士现正在北美的计有十二位，他们是：

赵元任 塞州
陈省身 纳利士
李书华 哥顿
萧公权 州
郑东 州
李济 州
郑东 州
郑东 州
郑东 州
郑东 州
郑东 州
郑东 州
郑东 州
郑东 州

我两次访问台北时，“中央研究院”朱家骅院长和现居台湾的另外几位院士都说到，目前散居北美大陆各地的“中研院”院士有必要举行一次非正式聚会以重叙旧情，了解“中研院”的近况，并就研究院的未来交流信息。

李济博士去年11月来纽约时再次敦促我设法安排这样一次会面。李博士现正在华盛顿州西雅图市的华盛顿州立大学讲学；另两位院士李方桂博士和萧公权博士也都在该校授课和做研究工作。

赵元任博士刚从欧洲旅行回来，现居住在马萨诸塞州的剑桥。他上星期来到纽约，会见了另三位院士：陈省身博士、李书华博士和我。我们聊起举行一次现住北美的“中研院”院士非正式会晤的问题。第二天赵博士和我又继续作了商讨。

Because of the four-quarter system of the University of Washington, the three Seattle members can only have their vacation from March 18-28. It is suggested to call a meeting of the A. S. members on Saturday and Sunday, March 19-20, in New York. I have volunteered to write to the members and to take charge of the arrangements as to the place of meeting and hotel accommodation.

There is a fund held by Dr. Chao for the A. S. in the U. S. A. We are authorized to draw on this fund to pay traveling and living expenses of the members attending this meeting according to the following suggested scale:

\$400 for each member coming from the Pacific Coast.

\$150 for each member coming from Indiana and Ottawa.

\$100 for each member coming from Baltimore and Boston.

\$50 for each member coming from the New Jersey and New York area.

If all twelve members can come, the total expenses will amount to \$2,100 plus rent for the meeting place.

There will be no "official business" to be transacted. Dr. Li Chi will report on the present situation, new buildings at Nankang and future plans of the A. S. It will be entirely a meeting of old friends and friendly chats.

Kindly airmail or wire me whether you can come on March 19-20. When all replies are in, I shall immediately make the hotel arrangements and notify you of the meeting place and your hotel reservations. The meeting will probably begin in the afternoon of Saturday, March 19th.

Hoping the above information and suggestions may meet with your approval.

Sincerely yours,

由于华盛顿州立大学实行一年四季度的学制，住在西雅图的三位院士只有在3月18日至28日才有假期。为此，特建议院士的聚会于3月19日至20日（周六和周日）在纽约举行。我自告奋勇写信给诸位院士，并负责安排聚会场所和旅馆预定。

赵博士手中保管着“中研院”在美国的一笔经费。我们受权可以使用这笔经费支付各位院士参加此会的旅费和生活费用，其标准暂定如下：

来自西海岸的院士每位400美元；

来自印第安纳和渥太华的院士每位150美元；

来自巴尔的摩和波士顿的院士每位100美元；

来自新泽西和纽约地区的院士每位50美元。

十二位院士如全体出席，外加会场的租金，全部费用总计为2100美元。

会上没有什么需要处理的“公事”。李济博士将向大家报告“中央研究院”的现状、南港新院址的建设和研究院今后的计划。这纯属一个老朋友会面和聊天的聚会。

诸位是否能在3月19日和20日参加此会，请通过航空信或电报告知。收到全部回音后，我会立即预定旅馆，并通知诸位开会地点和每个

人预定的旅馆房号。开会时间暂定在3月19日（周六）下午。

希望以上信息和建议能得到诸位的赞成。

您诚挚的朋友

胡 适

编后记

《中国文明的开始》（英汉对照）结集了李济先生学术生涯各阶段重要的英文演讲稿和论文，文章按发表年代排列，可大致反映作者学术思想的发展过程。其中对个别问题的引述难免有赘述之处，但对作者一生学术发展脉络的呈现是清楚的。

作者在不同时期语言习惯略有不同，在一些专有名词和集合名词等的拼写上略有差别，语言方面也难免有个别纰漏之处。需要特殊说明的是，《山西南部汾河流域考古调查》一文中关于地名、人名的拼写与普通话的读音略有出入，如平舌与翘舌、前鼻音与后鼻音等，应是依据当地口音拼写而成。鉴于所选文章大多都曾在国内外知名学术期刊上发表，并为学者所频繁援引，在与作者家人商议后，决定尊重作者的写作风貌，不予改动。

在本书的编辑过程中，李济先生的哲嗣、资深翻译家李光谟先生，在原文的核实、历史的考证和译稿的审校等方面给予我们宝贵的指导和建议，并热心地为我们提供了珍贵的参考文献和信息。在此，我们对李光谟先生严谨的治学态度表示崇高的敬意，对先生悉心的帮助表示真诚的感谢。

编者深知，虽殚精竭虑，遗误在所难免，敬请广大读者批评指正，以便在再版时加以修订，使之更臻完美。

除非我们不知尊重这古国灿烂文化，如果有复兴国家民族的决心，对我国历代文物，加以认真整理及保护时，我们便不能忽略中国建筑的研究。

——梁思成

“博雅双语名家名作”出版说明

1840年鸦片战争以降，在深重的民族危机面前，中华民族精英“放眼世界”，向世界寻求古老中国走向现代、走向世界的灵丹妙药，涌现出一大批中国主题的经典著述。我们今天阅读这些中文著述的时候，仍然深为字里行间所蕴藏的缜密的考据、深刻的学理、世界的视野和济世的情怀所感动，但往往会忽略：这些著述最初是用英文写就，我们耳熟能详的中文文本是原初英文文本的译本，这些英文作品在海外学术界和文化界同样享有崇高的声誉。

比如，林语堂的*My Country and My People*（《吾国与吾民》）以幽默风趣的笔调和睿智流畅的语言，将中国人的道德精神、生活情趣和中国社会文化的方方面面娓娓道来，在美国引起巨大反响——林语堂也以其中国主题系列作品赢得世界文坛的尊重，并获得诺贝尔文学奖的提名。再比如，梁思成在抗战的烽火中写就的英文版《图像中国建筑史》文稿（*A Pictorial History of Chinese Architecture*），经其挚友费慰梅女士（Wilma C. Fairbank）等人多年的奔走和努力，于1984年由麻省理工学院出版社（MIT Press）出版，并获得美国出版联合会颁发的“专业暨学术书籍金奖”。又比如，1939年，费孝通在伦敦政治经济学院的博士论文以*Peasant Life in China—A Field Study of Country Life in the Yangtze Valley*为名在英国劳特利奇书局（Routledge）出版，后以《江村经济》作为中译本书名——《江村经济》使得靠桑蚕为生的“开弦弓村”获得了世界性的声誉，成为国际社会学界研究中国农村的首选之地。

此外，一些中国主题的经典人文社科作品经海外汉学家和中国学者的如椽译笔，在英语世界也深受读者喜爱。比如，艾恺（Guy S. Alitto）将他1980年用中文访问梁漱溟的《这个世界会好吗——梁漱溟晚年口述》一书译成英文（*Has Man a Future? —Dialogues with the Last Confucian*），备受海内外读者关注；此类作品还有徐中约英译的梁启超著作《清代学术概论》（*Intellectual Trends in the Ch'ing Period*）、狄百瑞（W. T. de Bary）英译的黄宗羲著作《明夷待访录》（*Waiting for the Dawn: A Plan for the Prince*），等等。

有鉴于此，外研社人文社科出版分社推出“博雅双语名家名作”系列。

博雅，乃是该系列的出版立意。博雅教育（Liberal Education）早在古希腊时代就得以提倡，旨在培养具有广博知识和优雅气质的人，提高人文素质，培养健康人格，中国儒家六艺“礼、乐、射、御、书、数”亦有此功用。

双语，乃是该系列的出版形式。英汉双语对照的形式，既同时满足了英语学习者和汉语学习者通过阅读中国主题博雅读物提高英语和汉语

能力的需求，又以中英双语思维、构架和写作的形式予后世学人以启迪——维特根斯坦有云：“语言的边界，乃是世界的边界”，诚哉斯言。

名家，乃是该系列的作者群体。涵盖文学、史学、哲学、政治学、经济学、考古学、人类学、建筑学等领域，皆海内外名家一时之选。

名作，乃是该系列的入选标准。系列中的各部作品都是经过时间的积淀、市场的检验和读者的鉴别而呈现的经典，正如卡尔维诺对“经典”的定义：经典并非你正在读的书，而是你正在重读的书。

胡适在《新思潮的意义》（1919年12月1日，《新青年》第7卷第1号）一文中提出了“研究问题、输入学理、整理国故、再造文明”的范式。秉着“记载人类文明、沟通世界文化”的出版理念，我们推出“博雅双语名家名作”系列，既希望能够在中国人创作的和以中国为主题的博雅英文文献领域“整理国故”，亦希望在和平发展、改革开放的新时代为“再造文明”、为“向世界说明中国”略尽绵薄之力。

外语教学与研究出版社·人文社科出版分社

前言

2011年是梁思成先生（1901-1972）诞辰110周年纪念，因此外语教学与研究出版社准备将先生的古建筑英文文稿整理，以平装本和限量珍藏本两种形式出版。先生的英文文稿大多完稿于1946年以前，是在古建调研工作的空隙中完成的。他在忙于撰写调研报告的同时，为什么还要坚持用英文写中国古建筑的介绍文章呢？

他始终认为，中国古建筑史上各民族不同文化的交流濡染是极有趣的现象，也是丰富和发展本民族文化必不可少的要素。比如，印度的塔（“窣堵坡”，stupa）流传到我国，经汉民族文化的濡染演化而成为各种形式的塔，成为中国建筑文化中一个独特的标志，而窣堵坡却变成了中国式塔的塔刹。

先生在美国研习时曾对西方古建筑下过苦功夫，因而他也热衷于把中国的古建筑介绍给外国读者。这次集录的英文文稿，绝大多数是他在20世纪三四十年代发表在美国一些刊物上的。特别指出的是，《蓟县独乐寺观音阁山门考》因篇幅较长，原准备出一个小册子，但未实现，这次一并发表，虽非完全英汉对照，却呈文稿本真原貌。书中图版及照片大部分是由先生当年亲自绘制和拍摄的。外研社人文社科分社社长吴浩和编辑任小玫、张昊媛为本书的出版，花费了很多心血。我再次感谢外研社的朋友们，他们完成了先生未竟的遗愿。谢谢！

CHINESE ARCHITECTURE

中国建筑

[年份不详]

I. General Characteristics

[A] Early Origin

Among the family of architecture of the world, Chinese architecture may be considered an independent branch by itself. Its history is as long as the history of Chinese civilization.

From every source of information—literary, graphical and exemplary—there can be gathered convincing evidences testifying to the fact that the Chinese people have always employed an indigenous system of construction and a conception of planning which have retained their principal characteristics from the earliest times till the present day. Over the vast area from Xinjiang to the Northeast, from Inner Mongolia to the South Sea coast, the same system of construction and planning is prevalent. Beyond China, in Korea and Japan in the east and Vietnam in the south, the same system of construction and similar plan arrangements are much used. And these have all along been the countries whose people have established very intimate contacts with the Chinese for thousands of years. The ability of this system to perpetuate itself for over four thousand years over such a vast area and still remain a living architecture, and to retain its principal characteristics in spite of repeated and continuous foreign influences, hostile or friendly, economical, cultural or military, is a phenomenon comparable only to the continuity of the civilization of which it forms an integral part.

1. Neolithic Remains

Excavation in 1954 at the village of Banpo, near Xi'an, led to the discovery of a number of pits in the loess stratum. They were identified as remains of human habitations of the Neolithic period.

Along the periphery of one of the larger pits of an oblong plan, of which only a portion now remains and estimated to have a major axis of about 20 meters long, is a low earthen wall in which are a row of holes containing charred studs of logs, evidently the lower ends of posts of a house that was later destroyed by fire. It is the remains of the earliest houses known in China today. Of course, it would be too far-fetched to assume that any of the characteristics of the architecture that later developed in China may be traced in these primitive sites.

壹 概览

〔1〕早期溯源

中国建筑在世界建筑群体中，可谓自成一体。中国建筑的历史与中国文明史相生相伴、源远流长。

从收集到的一些遗存文字、图案和标本等实物中可以找到充分的证据证明，国人一向采用的本土营造体系和设计构思，其主要特征从古至今未曾改变。在广袤的大地上，从新疆到东北，从内蒙古到南海沿岸，同样的营造和设计体系被广泛采用。甚至在周边国家，如东边的朝鲜和日本，以及南边的越南，也常常采用中国的营造体系和类似的平面布局。数千年来，这些国家一直和中国保持着密切的往来。四千多年来，尽管中国接连不断地受到外界的影响，无论是敌视的或是友善的，还是在经济、文化或军事方面，但在如此广袤的土地上，中国的建筑体系依然能够持久留存，栩栩如生，从而构成了绵延不断的中华文明的一部分。

1. 新石器时代的遗存 1954年在西安附近半坡村考古挖掘时，发现了黄土地层的数个地坑，经确认是新石器时代人类聚居的穴居地遗址。

[1] 其中的一个四方平面只有部分得以保存，据估算其主轴长约20米。当中的一个较大坑穴的外围是一堵低矮的土墙，上有一排洞眼，洞眼内为烧焦的木楔残物，显然是木骨泥墙房屋的柱础毁于火灾的痕迹。这是迄今所知中国最早的房屋遗址。当然，如果认为以后中国建筑发展的任何特征都可以追溯到这一原始遗址，那也未免太牵强附会了。

2. Earliest Site Suggestive of Later Chinese Characteristics

Near Anyang, Henan Province, at the site of the palaces and necropolis of the Yin emperors, circa 1400 BC–1120 BC, archaeologists found the earliest remains of buildings that suggest the possible embodiment of the basic characteristics which later evolved

and matured into architecture unique to China and her neighboring countries. At the site is large rammed-earth platforms, on top of which are placed at regular intervals undressed boulders, each covered by a bronze disc. On top of these discs are found charred logs—the lower ends of wooden posts that once supported the super-structures which were burnt down at the sack of the capital circa 1120 BC. The arrangement of these bases of columns testifies to the existence of a structural system that had by this time already taken a very definite form. (Figure 1)

〔 B 〕 Basic Characteristics

The basic characteristics of Chinese architecture may be considered from two aspects—the structural system and the plan arrangement. The structure of the individual building, as it is found today as well as more than three thousand years ago, consists of, in general parti, a raised platform or stylobate which forms the base for a structure with a timber skeleton of posts and lintels which in turn supports the roof, generally pitched and with overhanging eaves.

2. 具有中国建筑特征的最早遗址 在河南安阳附近所发现的公元前约1400年到公元前1120年殷商王宫和陵墓遗址中，考古学家找到了后来演变和发展成为中国及周边国家建筑独有的基本特征的可能例证。遗址中大型夯土台基的顶端，间隔均匀铺陈着原料石块，石块上均覆盖着青铜圆板，上置柱础，即曾经用以支撑上部结构的木柱下端。大约在公元前1120年，都城被攻陷，上部结构被焚。从这些柱础的排列看来，此时的结构体系已明显成型。（图1）

【1】

〔2〕基本特点

中国建筑的基本特点可从结构体系和平面布局两方面来考量。现今发现三千多年前的单体建筑，其结构通常包括一个垒抬提升的台基或柱座，以作为整座建筑的基础。建筑有着木结构的立柱和横梁，用以支撑屋顶；屋顶则通常带坡度，有飞檐。

This osseous construction lends complete freedom in walling and

fenestration and renders a house, by merely adjusting the proportion between walls and openings, practical and comfortable in any climate varying from that of the tropical south to that of sub-arctic Manchuria. (Figure 2) It is this extremely high degree of flexibility and adaptability that enables this architecture to follow the Chinese people to wherever place they chose to settle down and live without encountering any difficulty in sheltering its occupants from the elements, however diverse they may be. Perhaps nothing analogous is found in the architecture elsewhere until the invention of the reinforced concrete and the steel framing system in the nineteenth century.

这一框架结构在屋墙上开窗通风极为方便，只需调节好墙体和门洞、窗口之间的比例，即可使房屋不管是处于炎热的南方还是在寒冷的东北都既实用又舒适。（图2）正是由于这一建筑结构极高的灵活性和适应性，中国人无论走到哪里，在哪里居住，无论他们生活方式如何不同，都不会受到恶劣天气的困扰。在19世纪钢筋混凝土及钢结构出现之前，恐怕很难在其他地方找出类似的建筑。

【2】

In plan, a "house" in the Chinese sense of the word is generally composed of a number of such individual buildings which are then connected to each other by auxiliary buildings—verandas, loggias, portals, etc.—so disposed of to form one or a series of courtyards or patios. Such courtyards are generally paved and often planted with trees and flowers, forming very pleasant "out-door living rooms." As a rule, the buildings around a courtyard are generally symmetrically arranged along a principal axis. But for gardens, or when required by the topography, informal arrangements become the rule.

1. The Structure of the Individual Building

It is necessary to analyze the Chinese frame construction in order to have a better understanding of Chinese architecture. The basic unit of the skeleton is a frame composed of two posts supporting a beam, on top of which, in turn, are one or two or even three successive tiers of beams standing on studs. As the tiers pile up, the lengths of the beams above diminish, and, on the uppermost and shortest beam stands a king post, the top of which forms the apex of a triangle thus formed. This is what one will see in a transversal section drawing of a building. Such a unit is called a *liangjia* or "beam-frame." A pair of such *liangjia* placed side by side at certain distances, and connected to each other by lintels or tie-beams reaching from the top of the post of one *liangjia* to that of the adjacent *liangjia*, define a space called *jian* or bay.

在平面布局术语中，汉语的“房屋”一词，通常是指数座单体建筑，通过游廊、凉廊、门廊等附属建筑，将彼此连接起来，形成一个或一系列院落。这些庭院一般都经过铺设，蒔花种树，形成赏心悦目的“露天客厅”。院落四周的建筑，通常沿中轴线对称排列。对于园圃，可因顺地形地势不拘一格，予以适当变通。

1. 单体建筑结构 如想更好地了解中国建筑，就有必要分析中国的框架结构。其基本框架单位是由两根柱子支撑着一根横梁的结构。横梁之上，相继依次排列着单层或两层用直立柱支撑的横木。层层垒高的同时，横木长度向上依次缩短，最上层也就是最短的横木上架设中柱，其上端由此构成三角形稳定结构的顶点。这就是建筑剖面图中所显示的形式。这样的一个单位称为一副“梁架”。梁架组对间隔排列，由从一个梁架立柱顶端延伸到相邻梁架的横梁或系梁连接组成的空间，称作“间”或“格”。

A building, usually oblong in shape, is constructed by a repetition of these *jian* and *liangjia*. On the ends of the successive tiers of beams are placed purlins on which, in turn, are placed rafters. The rafters are covered with sheathing and tiles to complete the roof. The spaces between every two posts can be filled with walls, windows, doors or light movable partitions, or as for a garden pavilion, left entirely open on all sides.

2. The Dougong

One particular feature in this structural frame deserves special attention. It is the *dougong*, employed generally in buildings of a monumental character. In order to counteract the shearing stress at the joints of vertical and horizontal members, particularly at the points where the beam is supported by the post, the architect of

perhaps more than two thousand years ago invented the method of putting trapezoidal blocks and bow-shaped "arms" in tiers as corbels, and thus created a transitory element known as dougong. The term means simply block (dou) and "arm" (gong). The tiers of "arms," when extending into the interior of the building, receive the ends of the principal beams, while the other half of the "arms," extending outward, receive the overhanging eaves of the roof. The dougong was originally conceived as a structural element, but its decorative potentiality was soon discovered and exploited to the utmost degree. (Figure 3)

建筑通常呈矩形，由若干“间”和“梁架”组成。横木各层末端架设桁条，其上架椽。椽上覆盖木板，木板上铺置瓦片，构成屋顶。每两根立柱间为墙体、门窗或轻型活动隔扇，为花园亭台时四面则完全敞开。

2. 斗拱 这种框架结构的一个显著特点值得格外关注，这就是通常在大型建筑中采用的斗拱。为了平衡垂直和水平部件连接处的剪应力，尤其在立柱支撑横梁的部位，大约两千多年前的建筑师就想出了一个办法，将梯形的“斗”和弓形的“拱”作为枕梁托置于梁之间，因而创造出了斗拱这一过渡构件。这一名称包含了“斗”和“拱”两层意思。一层层的“拱”的一端延伸至建筑内部，以承托主梁末端；“拱”的另一端则向外延伸，以承托屋顶飞檐。最初，斗拱只被视为一个结构部件，但其装饰潜能很快被发现，并被发挥到极致。（图 3）

中國建築之“ORDER” 斗拱, 檐椽, 柱礎 THE CHINESE “ORDER”

[3]

3. Modular System

From a treatise on architecture, the *Ying-tsoo-fa-shih*, first published in the year 1100 AD, it is known for certain that not later, and possibly even much earlier, than then, the dimension of one member of the dougong—the width of the gong or “arm”—was set as the module for determining the proportions of every structural member as well as that of the entire building. The module is classified

into a certain number of "sizes" or "classes" for buildings of different sizes and functions. By employing this modular system in the process of designing, the architect's work is much simplified and structural members could be prefabricated elsewhere and then assembled at the building site. Certainly, judging from the scientific standards of today, this rather rudimentary system could stand no comparison with the modular, prefabrication, standardization and typification of today. Nevertheless, it may justly be called an elementary prototype of the modern method.

From another point of view, the dougong, together with its column and eave, is in certain respects similar to the order in European classical architecture. The difference lies in the fact that the European order was employed essentially as an aesthetic consideration while the Chinese "order," if it may be so called, has remained throughout structural in function and its aesthetic quality is integrally identified with the construction. The dougong was also employed as a purely decorative architectural treatment on masonry buildings, such as pagodas. The earliest example is found on some ashlar monumental piers, called *qie*, of the second century AD.

4. The Roof

Another characteristic to be noticed is the important role played by the roof in Chinese architecture. From poems of as early as the eleventh century BC, there were already verses eulogizing the beauty of the roof. Wings of birds were used as metaphor for describing the out-stretching eaves. The typical Chinese roof is pitched and the surface is formed by a slightly "sagged" plane. This effect is acquired by adjusting the lengths and elevation of each tier of beam of the *liangjia*. The ridges where two roof-planes meet are usually accentuated by raised moldings and decorated with ornaments of mythological animal motifs. Perhaps by the time not later than the eleventh century AD, colored glazed tiles, usually of yellow or green, were used on roofs. The glistening colors make the roof a glorious crowning feature of the building.

3. 模数制 从最初刊行于公元1100年的建筑专著《营造法式》中可以确切得知,当时甚至是更早些时候,就把斗拱的拱的宽度确定为决定每个结构部件乃至整个建筑比例的度量单位。这一度量单位根据建筑的不同尺寸和功能分为一定数量的“尺寸”或“级别”。这一模数体系在设计中的应用使建筑师的工作大为简化。一些建筑构件可以在别处预制,然后在建筑工地组装。当然,从今天的科学标准来看,这一相当原始的建筑程式无法与今天的模件、预制、标准化和典型化相提并论。尽管如此,将其称之为现代化建筑程式的基本原型还是当之无愧的。

从另一个角度看，斗拱结构，加之立柱和屋檐，在某些方面类似于欧洲古典建筑中的“柱式”。不同之处在于，欧洲的“柱式”的应用本质上出于审美的考虑，而中国的“柱式”——如果可以这么表达的话——则自始至终承担着结构功能，而其审美特性与建筑整体是融为一体的。斗拱在砖石建筑中也只是起着装饰性的作用，比如砖石砌筑的宝塔。斗拱的这一功能，已从公元2世纪遗留下来的、被称为“阙”的石碑基中找到了最早的例证。[2]

4. 屋顶 另一个值得注意的特点是屋顶在中国建筑中扮演的重要角色。早在公元前11世纪的诗歌中，就有了称颂屋顶之美的诗文，用飞禽的双翼来比喻向外延展的屋檐。[3] 典型的中国式屋顶，是由稍微倾斜的斜坡平面层层组成的。这种效果是通过调整“梁架”每一层梁的长度和高度而形成的。屋顶坡面两两相交的屋脊，通常通过加高的线脚予以强化，并用神兽饰物点缀。或许在不晚于公元11世纪之时，明黄色或碧绿色的琉璃彩瓦就已经常用于屋顶。熠熠生辉的色彩，使得建筑物的屋顶如同灿烂的冠冕一般辉煌。

The architects of ancient China paid much attention to the depth of the overhang of the eave. Generally it is designed so that the entire south wall will be completely under the shadow of the eave during the latter part of June to assure maximum coolness in the summer and, while in the winter months, the sunlight may reach far into the back part of the room. (Figure 4)

中国古代的建筑师非常重视飞檐的进深。设计时通常要使6月的下半个月期间整面南墙都处于檐影遮蔽之下，以保证夏季最大限度的凉爽。而在冬季的岁月里，关于采光条件，又能做到让阳光可以一直照射到房屋后部。（图4）

5. Color

The decorative potentiality of paint, a material at first employed essentially for the protection of timber, was discovered by the architect and made the maximum use of since about a thousand years ago. From the *Ying-tsao-fa-shih*, one can see that by the Song Dynasty (960–1279 AD), the decorative use of paint had already formulated into a definite system, which was, in general principle, followed till today. The posts, doors and windows and the walls of monumental building are usually painted red, while the lintels and dougong above are decorated with patterns painted principally in a combination of blue and green, relieved with specks of red and gold. Thus the parts exposed to direct sunlight are warm while the shadowed portions are cold in tone of colors, thereby accentuating the effects of contrast between light and shade. The same distribution of colors is also carried into the interior of the building. Indeed, in the handling of colors, the architects of ancient China have displayed, perhaps, more audacity than their colleagues in other countries.

5. 色彩 最早基于保护木材的目的而使用的油漆材料，其装饰效果直到大约一千年前才被建筑师发现并应用到极致。根据《营造法式》的记载，我们可以得知，及至宋朝（公元960—1279年），油漆的装饰性使用已成固定程式，其总体原则沿用至今。重大建筑的柱体、门窗和墙体通常为朱红色，而上方门楣和斗拱装饰有以蓝绿色为主色、以朱红色和金黄色为点缀辅色的图案。这样一来，直接向阳的部分为暖色调，而阴影部分为冷色调，加强了光与影的对比效果。同样的色彩分布也适用于建筑内部。的确，在色彩的处理上，中国古代的建筑师比其他国家的建筑同仁或许要大胆破格得多。

Of course, such lavish play of color is generally employed on buildings of monumental character. The same color scheme, but more restrained and subdued, are also used on residential buildings in North China. But in the south, where the climate is warm, especially in the average dwelling houses, white walls and natural or dark brown timber is generally the rule. Such quiet combination of colors is perhaps more apt to induce a feeling of coolness.

6. Versatility in Planning

The skeleton system of construction lends great versatility in plan arrangements. This system, besides the freedom it gives to fenestration, also permits the free arrangement of interior partitions to fulfill different requirements. Through the manipulation of

columniation, almost any desired shape of plan can be acquired. The skeleton system also possesses a high degree of adaptability to the ups and downs of tricky topography. This asset the Chinese architect did not fail to utilize to the highest degree.

Needless to say that the above mentioned are not all the characteristics of Chinese architecture. But they are the basic and most outstanding ones that give Chinese architecture its own character.

当然，浓艳重彩的装饰，主要是用于某些标志性的重大建筑。同样的色彩装饰也见于华北民居，但色调更加拘谨柔和。而在气候温暖的南方，尤其在普通民居中，则较常采用白色的墙体和自然色或深棕色的木材。这种素色搭配可能更易于产生清凉之感。

6. 布局的多样化 中国建筑的骨架结构体系带来了平面布局的多样化。这一体系，除了给开门辟窗提供自由空间外，还可根据不同需求对内部间隔进行自由安排。通过调整柱间距，几乎可以形成任何想要的平面布局。这种结构体系也具有高度的适应性，可适用于各种高低不平的复杂地势。关于这一点，中国的建筑师将其发挥到了极致。

毫无疑问，以上所述并非中国建筑的全部特点，但却是中国建筑基本的同时也是最突出的特征。

II. A Brief Review of the Historical Development of Chinese Architecture

Before proceeding into a discussion of the types and certain representative examples of Chinese architecture, perhaps it is necessary to trace, however briefly, the development of Chinese architecture through the past three or four thousand years. Taking into consideration the social, economical, political and technological developments as they were reflected in architecture, the developments of Chinese architecture may be tentatively divided into the following six principal stages.

[A] The First Stage: Before 220 AD

From the very early days of primitive society to the downfall of the first great Chinese empire—the Han Dynasty—in the year 220 AD, is the stage marking the dawn of Chinese architecture to its age of early maturity. The natural cave was a natural solution to the primitive man's domicile problem. The site of the famous Peking Man at Zhoukoudian near Peking revealed to us the fact that the primitive

man living in North China five hundred thousand years ago had not yet made any attempt to construct for himself a shelter.

貳 中国建筑发展历程概述

在讨论中国建筑的具体类型和代表性实例之前，或许有必要简要回顾一下中国建筑在过去三四千年之间的发展情况。考虑到建筑所反映的社会、经济、政治和技术发展历程，可试将中国建筑的发展历程分为以下六个主要阶段。

〔1〕第一阶段：公元220年以前

时间起始点为原始社会早期，至公元220年中国伟大的封建王朝汉朝衰败，这一阶段标志着中国建筑从起步发展到早期成熟阶段。天然洞穴是原始人类解决居住问题的自然途径。著名的京郊周口店“北京猿人”遗址，向我们证明了50万年前生活在华北地区的原始人还未曾有过为自己建造房屋的任何尝试。

The remains of the earliest constructed dwelling are those found at the village of Banpo, as mentioned above. But the first indications of the basic characteristics of Chinese architecture are not to be seen until the Yin Dynasty, circa fifteenth century BC to eleventh century BC, at Anyang, the site of the Yin capital.

From about 1000 BC to 220 BC is a period in which several hundred semi-independent principalities were gradually unified into a centrally administered empire, as a result of which the Qin Dynasty was founded. A certain number of tombs and a few gigantic earthen terraces are the only remnants we have of this period. But from a few decorative patterns engraved on bronze vessels, depicting dwelling houses of the time, it can be seen that the characteristics mentioned above had by this time definitely taken shape. From literary sources, we learned that the palaces and tombs of the emperor who for the first time unified China—Qin Shihuangdi—were indeed extremely extensive in scale, rich and elaborate in architectural treatment and luxurious in furnishing.

Principles for laying out the capital city of a ruling king or emperor were specified as early as the eleventh century BC.

From 206 BC to 220 AD is the period of the famous Han Dynasty, the great dynasty that, on the basis of the short-lived Qin Dynasty, consolidated China into a great empire. By this time, China had

already entered into a stage of fully matured feudalism. As a result of the political and economical unification and the redistribution of land after several centuries of incessant wars, together with the introduction of ferro implements, productivity reached an unprecedented high. The prosperity of the period was reflected vividly in its architecture, which was given the opportunity of making a big stride forward in its development. According to literary records, the palaces of the Han emperors were so vast that they had "a thousand doors and ten thousand windows." There were "warm pavilions" for the winter and "cool palaces" for the summer. The beams and columns were decorated with gold and precious stones. The dougong were elaborately painted and the rafters exquisitely carved. The walls were covered either with mural paintings of mythological beings and ethereal clouds or with rich brocade hangings. During the later half of the dynasty, when land and wealth became more and more concentrated, nobilities, high officials and even rich merchants, fattened by unscrupulous exploitation, also built for themselves luxurious mansions and gardens. Meanwhile the housing of the urban poor became a problem. History recorded a decree mandated by an emperor ordering the erection of "two hundred regions of houses in Chang'an to house the poor."

最早的人为建造的住所遗址，为上文提到的西安半坡村。但中国建筑早期的基本特点，直到大约在公元前15世纪至公元前11世纪时期的殷朝才开始显现，遗址位于都城所在地安阳。

大约在公元前1000年至公元前220年的这段时期，数百个半独立的诸侯王国逐渐统一成一个中央集权的帝国，于是秦朝建立了。这一时期除几处陵墓遗址和为数不多的巨型土台之外，并无其他遗迹史料可循。但是从青铜器上所刻的几处描绘当时居住房舍的装饰性图案可以看出，此时上文所述特点业已成型。文献表明，历史上第一位统一中国的皇帝秦始皇的宫室与陵墓规模极其宏大，建筑富丽堂皇，装饰极为豪华。

君主或帝王的都城布局原则，早在公元前11世纪时就有规定。

公元前206年至公元220年，为著名的两汉王朝。在短命的秦王朝基础上，汉朝将中国建成为一个强大的帝国。此时，中国已经进入封建主义完全成熟的阶段。历经数世纪之久的战事之后，政治和经济上重新统一，土地重新分配，铁器开始推广，生产力达到了空前的高度。这一时期的繁荣景象，从其建筑中得到了生动的体现，建筑也得以向前迈进了一大步。据文字记载，汉朝皇帝的宫殿宏伟壮丽，有“千门万牖”的说法。这些宫廷建筑冬有“暖亭”，夏有“凉宫”。横梁立柱，金雕玉刻；斗拱彩绘繁复，椽子精工雕琢。墙上绘有神灵和祥云壁画或饰以绫罗绸缎。后汉即东汉时期，土地和财富更加集中，贵族、高官甚至富商大贾大肆搜刮掳掠，也为自己建造豪华的宅第和苑囿。与此同时，广大城市贫民的住房却成为一个问题。据历史记载，曾有皇帝下诏，命令在长安

城里划出两百个“闾里”“街巷”的面积建房造屋，以供下户贫民居住。 [4]

It was the belief of that time that the gods and immortals had the preference to dwell in high towers. So, in order to induce the condescension of these heavenly beings, very high towers were also erected in the imperial parks.

Trade contacts with West Asia during this period also brought from the West cultural elements which are reflected also in architecture. The arch appeared for the first time in this period. Some archaeologists and architectural historians brought forth the contention that it is an importation from the West. But no agreement has been reached on the controversy. History also records for the first time the using of human figures as architectural embellishments. Notable among these are the twelve bronze figures in front of the palace of Qin Shihuangdi. The winged-lion, probably of Assyrian origin, appeared in sculpture and the grape, then a new comer to China, became a favorite decorative motif.

Buddhism was also introduced into China at this time. At the end of the second or the beginning of the third century AD, the Buddhist pagoda, developed from the indigenous high towers for the gods and immortals, was recorded in history to have made its appearance.

All these new elements from the West had greatly enriched the architecture of China.

[B] The Second Stage: Buddhist Influence, 3rd to 6th Century

From the beginning of the third century to the end of the sixth century AD was a period in Chinese history in which the situation of division lasted longest and war was almost incessant. It was also a period in which Chinese culture, including architecture, was greatly influenced by, and absorbed most from, Indian and Central Asian culture. In such a period of political unrest and economic insecurity, the newly imported religion of Buddhism found a favorable soil for nurture.

The social situation was duly mirrored in architecture. Miniature capitals for petty "emperors" were built and destroyed as the "dynasties" were established and vanquished. The Han people (the national majority of China today), whose rulers being driven to the south of the Yangzi River, saw six dynastic changes in three centuries. Only the Northern Wei Dynasty in the north, founded by the Toba tribe, enjoyed a comparatively long regime of one and a half

centuries. Buddhist temples and pagodas were built almost everywhere. It may be assumed that, prior to this time, the only monumental buildings in the cities were the palaces of the emperors and mansions of the nobilities. But with the sporadic construction of Buddhist temples and pagodas, there appeared in the cities, besides the palaces and mansions, rich and monumental temple buildings and ensembles accessible to the public and, therefore, of a more or less popular nature. These undoubtedly greatly altered the general appearance and silhouette of the Chinese cities.

当时据信，长生不老的神仙喜居高塔。因此，为了赢得天神的青睐，皇家园林中修建了很多高塔。

与西亚贸易的接触，给中国带来西方的文化元素，同样在中国建筑中有所反映。拱门在这一时期首次出现。一些考古学家和建筑史学家对拱门的建造是否由西方引入争论不休，但迄今尚无定论。此外，建筑装饰中的人形也首次出现，其中较为著名的是秦始皇宫殿前的12个铜人。雕塑中还出现了带翼的狮子，可能是来自亚述文化；而当时刚传入中国的葡萄，也成了热门的装饰性主题图案。

佛教也在此时传入中国。在公元2世纪末或3世纪初，从为神灵修建的本土高塔发展而来的佛塔，如记载所示，已在历史上出现了。

所有这些来自西方的新元素，都极大丰富了中国的建筑。

〔2〕第二阶段：佛教的影响（公元3世纪至6世纪）

从公元3世纪初到6世纪末，是中国历史上纷争历时最久、战争频繁不断的时期，同时也是包括建筑在内的中国文化吸收印度和中亚文化最多、受其影响最大的时期。这样一个政局动荡、经济萧条的情况，就为新近传入的佛教的滋生和发展，创造了良好条件。

当时的社会状况也相应地在建筑中有所反映。那时候，群雄割据、交相秉政、称霸一方的“帝王”，都各自兴建了规模不大的国都，随后朝纲衰落凌替，都城也烟消云泯。汉族（当今中国人口最多的民族）的统治者被驱逐到长江以南，在三个世纪中经历了六次王朝更迭。只有由拓跋部在北方建立的北魏王朝，持续了相对较长的一个半世纪。佛教寺庙和宝塔几乎遍及各地。据推测，此前城市中最雄伟的建筑就是帝王宫殿及贵族宅邸。但随着佛教寺庙和佛塔的零星建造，城市中除了宫殿官邸之外，还出现了华丽而巨大的庙宇建筑和建筑组群，准许民众入内，因而也就多少带有亲民的大众化性质。这无疑极大改变了中国城市的整体景观和风貌。

History cited the donation by an empress to a Buddhist temple, a pagoda measuring "one thousand feet in height," only to be destroyed in a war a few years after its completion.

The principal remains of this period are a number of rock-cut or cave temples and a few masonry pagodas. Some of the cave temples, such as those at Yungang near Datong, at Maiji Shan near Tianshui and at Tianlong Shan near Taiyuan are given architectural treatments of a high degree of perfection.

The oldest Buddhist pagoda standing in China today is one from this period. The pagoda of Songyue Si in the Song Mountains, Henan Province, built in the year 520 AD, measuring about 40 meters high and sparsely embellished with a few motifs of Indian origin, heralded the appearance of a new architectural type in China.

From these remains of the period, it is seen that Chinese architecture in this stage was how much influenced by that of India, Western Asia, and even, Greece. Buddhism brought forth to the Chinese architects new problems and laid down new requirements. These new requirements and problems must be fulfilled and solved with new conceptions. The architects of the period successfully accomplished their task by ingeniously adapting and developing their traditional architecture and created new types and ensembles to meet the new demands. Western influences are also seen in decorative motifs, some of which have, in due course of time, so climacized that they became inseparable and indiscernible elements in Chinese art and architecture.

[C] The Third Stage: the Glorious Tang Dynasty, 7th to 9th Century

By the end of the sixth century, China was once more unified. The recovery of production after a long period of wars, the political reunification and the development of foreign trade all became powerful impetus to architectural activities.

The Sui Dynasty, a mere "prelude" to the Great Tang Dynasty, planned and started building an imperial capital—Chang'an, Xi'an of today—in magnitude unprecedented in history. With a definite attempt to build a city with zoning according to functions, the imperial palaces, the area for government offices, residential super-blocks (called fang) and trading squares were all arranged with precise order in the rectangular, walled city. All these areas and blocks were divided and inter-connected by a checker-board system of boulevards, arterial streets and minor streets. (Figure 5)

据历史记载，某皇后曾为佛教寺庙捐赠一座佛塔，“高千尺”，但建成数年之后即毁于战乱。

这一时期的主要遗存建筑物，包括一些石窟或洞窟以及凤毛麟角的砖石宝塔。其中一些石窟，如大同附近的云冈石窟、天水附近的麦积山石窟以及太原附近的天龙山石窟，建筑处理都达到了较高的水准。

中国保存至今最古老的佛塔就出自这一时期。河南省嵩山嵩岳寺塔，建于公元520年，高约40米，雕饰有一些印度图案，标志着一种新的建筑形式在中国的出现。

从这一时期遗存的建筑可以看出，中国建筑在此时期很大程度上受到了印度、西亚甚至希腊的诸多影响。佛教为中国建筑师带来了新的问题，并提出了新的要求。要满足新要求，解决新问题，就必须采用新的理念。当时的建筑师成功地做到了这一点：他们巧妙地修改、发展了传统建筑，对形式和整体进行了创新，以适应当时新的要求。西方的影响也可从装饰图案中看出，其中的一些随着时间的推移变得非常本土化了，甚至已演变发展成为中国艺术和建筑中不可分割的部分。

〔3〕第三阶段：盛唐时期（公元7世纪至9世纪）

到公元6世纪末，中国再度统一。连年战乱之后生产的恢复、政治上的重新统一以及对外贸易的发展，都对建筑业的繁荣起到了强有力的推动作用。

为大唐揭开历史序幕的隋朝建立后，开始大兴土木，在汉长安城（即今日西安）旧址的基础上建造新都。其规模之宏大，可称史无前例。新都的建设明确根据建筑的性质进行分区规划；宫殿、官府和坊市都在城墙围蔽的四方城垣里归整排列。所有这些区域都由畦分棋布的纵横干道和大街小巷分隔和连接。（图5）

唐長安城平面圖

【5】

In the city of Chang'an during the Tang Dynasty, there were traders in large numbers from various Western Asian countries. There were also Buddhist missionaries from India and artists from Khotan, Afghanistan, etc. Painting, sculpture, music, dancing were all enriched by the absorption of Western influences. In architecture, either technologically or artistically, an unprecedented high tide was reached.

The oldest specimen of the timber skeleton structures existing in China date from the Tang Dynasty. Here we see that the carpenter's art had reached a high degree of mastery. The structural members are

logically and organically integrated. The architectural treatment shows a high degree of refinement and sensitiveness. The only two examples are the principal halls of the Nanchan Si and of Fokuang Si, both situated in the Wutai Mountains in the Province of Shanxi.

The pagoda, which in the previous stage of development was mostly built with wood, was, by this time, gradually substituted by masonry structures. New types of pagodas were innovated from time to time. The facades of some pagodas were given architectural treatments representing the forms of timber construction—the column, the lintel, the dougong and the eave. This conception is identical with the way the classic orders were employed on the facades of European architecture.

唐朝的长安城内，来自西亚诸国的商贩为数颇多，还有来自印度的佛教徒和来自和阗、阿富汗等地的艺术家。绘画、雕刻、音乐、舞蹈均因受西方影响而得以大大丰富。建筑方面，不管是技术或是艺术方面，均进入了前所未有的全盛时期。

中国现存最早的木结构建筑典范就出自唐代，从中可见木匠工艺的精湛程度。结构部件合理而有机地耦合在一起，建筑处理手法也展现了高度的精湛入微的水平。仅存的两个实例是均位于山西省五台山的南禅寺和佛光寺的主殿。

此前佛塔多用木造，此时首次逐渐以砖石结构取而代之，形式上不断推陈出新。部分佛塔的立面进行了木结构式的处理——采用了立柱、横梁、斗拱和屋檐。这一概念与欧洲建筑立面采用的古典柱式相同。

The plan of the pagoda in this period is generally squared in shape. The superstructure is hollow, like a covered smoke stack. The floor is of wood. The treatment of the mass form may be classified into two main categories according to the division of floor heights and the application of eaves. One we may call the "multi-storied" pagoda, which is a super-position of a number of single-storied pavilions. Another we may call the "multi-eaved" pagoda, which takes the form of a lofty main story topped by tiers of eaves almost one right on top of another. In general effect, the pagodas of this period are rather austere, some very robust and even severe.

The wide spread use of masonry indicates the advances made in both the technique of making and using of brick. The arch was used on almost all openings of brick pagodas. One arched structure of supreme importance in the history of bridge architecture is the open-spandrel bridge at Zhao Xian, Hebei Province. Built during the Sui Dynasty (588–618 AD), with a principal arch spanning nearly 38 meters, it boasts to be the earliest open-spandrel bridge known in the world. (Figure 6)

[D] The Fourth Stage: Large Ensembles Standardization and Refinement, 10th to 14th Century

From the beginning of the tenth century to the middle of the fourteenth century, there were a series of wars among the Han people themselves and also between the Han people and various branches of the Tungus and Mongols from the north. The quick succession of the Five Dynasties and Ten States were eventually, in the year 960 AD, unified by the Song Dynasty, only to be, in turn, incessantly oppressed first by the Khitans and later by the Nüchens from the northeast. Finally, in 1280, the Mongols conquered the entire land and China became a part of the great Mongol Empire, called the Yuan Dynasty in Chinese history.

Except for the mere half-a-century after the founding of the Song Dynasty, there were hardly any interlude of peace. Corrupt government officials and high concentration of land piled up wealth for the ruling class, who became great patrons in architecture and objet d'art in general. Meanwhile peasants were driven into rebellion and "vacuums" were created to invite invasion.

[6]

这一时期佛塔的平面布局基本呈方形。上部结构中空，类似加盖的烟囱；地面则为木制的。根据地面高度的分隔和屋檐的应用，可以将佛塔形式分为两大类。一种即所谓“多层”佛塔，即楼阁式塔，由多个单层亭阁重叠起来。另一种称作“多重檐”佛塔，即密檐式塔，形式上类似于较高的主楼层上屋檐层层错位堆叠的处理手法。总体效果上，该时期的

佛塔相当朴实无华，有的则显得庄严甚而肃穆。

大规模使用砖石标志着砖石制作和运用技术上的进步。几乎所有砖塔的入口都采用拱门。在桥梁建筑史上非常重要的一座拱形建筑是河北省赵县的安济桥。它建造于隋朝（公元588—618年），主拱跨度几乎达38米，为世界上目前所知最早的空腹拱桥（又称敞肩拱桥）。（图6）

〔4〕第四阶段：大型建筑群标准化和精细化（公元10世纪至14世纪）

从公元10世纪初到14世纪中叶，汉族内部及汉族与北方的通古斯族和蒙古族之间爆发了一系列战争。五代十国迅速更替之后，宋朝终于在公元960年统一中原，但仍然不断地受到东北的契丹以及后来女真族的侵扰。最终于公元1280年，蒙古征服全部疆土，中国成为大蒙古帝国的一部分，这在中国历史上称为元朝。

这一时期除了宋朝建国初期的半个世纪以外，鲜有和平的缓歇。朝廷官员的腐败和土地的高度集中化，为统治阶级积累了大量财富，他们由此得以出资促进建筑和艺术发展。与此同时，农民被迫起义造反；由此形成的“真空地带”，招致了外来侵略。

The principal developments of this stage are the great increase in the sizes of architectural ensembles and the advances made in architectural refinements. The imperial palaces of the Song rulers were cited in history to have consisted of more than three thousand jians. In order to economize on materials and labor and to speed up the processes in designing and construction in such vast scale, the method of typification and standardization was sought. Thus, centuries of heritage in the art and technique of building was summarized, systematized, and compiled into the famous treatise on architecture, the *Ying-tiao-fa-shih*. As mentioned above, a modular system was definitely set, with which the dimensions and proportions of the building was computed and structural as well as decorative members could be prefabricated elsewhere and be shipped to and assembled at the building site. Ever since, standardization and typification with the modular system has become the common practice in Chinese architecture. Specific dimensions and proportions may vary from time to time and in different localities, but the principle is the same. The compilation and publication of the *Ying-tiao-fa-shih* must thus be considered an event of great historical significance in the development of Chinese architecture.

这一时期的主要发展在于建筑群规模扩大以及手法日趋华丽精细。史书记载，宋朝的皇宫超过三千来间。为节约材料和劳力，并且加快大规模建筑物的设计速度和建造进程，出现了典型化和标准化的追求。因此，数世纪以来的建筑艺术和建造技术得以总结、系统化并编成著名

的建筑文献《营造法式》一书。如前所言，模数制已确定下来，并据此规制计算建筑的尺寸和比例。结构性部件和装饰性部件可以在别处预先制作，尔后运至建筑现场进行组装。自此以后，应用模数制的标准化和典型化在中国建筑中成为惯例。^[5] 具体的尺寸和比例因时因地制宜，但原则始终如一。《营造法式》的编撰出版因而成为中国建筑发展史上的一个重要事件。

· PLOT PLAN · SHAN-HUA SSU · TA-TUNG · SHANSI ·

[8]

There are still a considerable number of edifices from this period standing today. (Figures 7, 8) Except a few bridges, all are religious buildings—temples and pagodas. Among these, all the temple buildings are of timber construction; but the pagodas left to us from this period, though most of them are masonry structures, also include a unique specimen of wooden pagoda. (Figures 9, 10)

As the number of buildings that survived till today became greater, examples representing varieties in use, construction and form also increased. Among the timber skeleton buildings, besides the most commonly seen principal hall, there are preserved also libraries, side-halls, gateway buildings, etc. The buildings are also seen in various story-heights, from the single-storied hall to a pagoda of five principal and four mezzanine stories. Various roof forms—the wudian or hip-roof, the xieshan or gabled-roof with eave under the gable and the double-eaved roof—are found. These roof forms, although known to have been created perhaps even as early as the Han Dynasty, and depicted in paintings and sculpture in the cave temples, but with the exception of the wudian, no actual specimen survived from the former periods. The dougong became smaller, in comparison with the former stage of development, in proportion. But still, in the northern provinces, and during the early part of this stage of development, the more robust proportion of the former stage was retained for a considerable length of time. Thus, local characteristics can be more

noticeably detected.

In plan arrangement, there are a few ensembles partly, or to a certain degree completely, preserved. A principal building is often flanked by a smaller building on each side, all arranged in a row and facing the same direction. Buildings on either side of the courtyard are given more importance. Instead of the veranda or gallery of uniform height, it is accentuated by placing in its middle a building of more prominence. With this treatment, a cross-wise axis is definitely introduced.

现存的这一时期的宏伟建筑，数目较大。除寥若晨星的几座桥梁之外，全部为寺庙和佛塔等宗教建筑。（图 7，8）其中，所有寺庙均为木结构。至于此阶段所有留存的佛塔，则大多为砖石结构，只有一座独特的木构架八角塔（即山西应县佛宫寺释迦塔，俗称应县木塔）除外。（图 9，10）

随着遗留实物数量的增多，用途、建造和形式方面各种类型的个案也随之增加。在木骨架建筑中，除最常见的主殿外，还保留有藏经楼、配殿、山门等。建筑层高不定，从单层的殿堂到主层五层和夹层四层的佛塔都有。不同的屋顶形式，如庑殿、歇山、重檐等，均可找到实例。这些屋顶形式虽然可能早在汉代就已建造出来，并在石窟的壁画和雕刻中也都有所呈现，但是除了庑殿之外，并无更早的实物得以留存下来。较先前阶段，斗拱的比例变小。但在北方诸省中，这一阶段的早期，在较长一段时间内仍保持了前一阶段的较大比例的斗拱。因此，地方特征表现较为显著。

在平面布局上，屈指可数的几个建筑群得到了部分的或某种程度上全面的保存。主建筑两侧经常排列有较小的建筑，按同一方向连成轴线。庭院两侧的建筑也得到了重视。长廊或走廊也并非高度取齐，而是在庭院正中设置更为突出的建筑。如此一来，形成了鲜明的十字交叉轴线布局。

中國營造學社測繪 民國廿三年九月實測 廿四年六月製圖

【9】

It is quite natural that the number of masonry pagodas that survived till today should be much greater than that of wooden buildings. With the single exception of the wooden pagoda mentioned above, all the pagodas from this period that are still standing are masonry structures.

Pagodas of this period assume a greater variety of forms. Instead

of the square plan, which was almost the absolute rule in the former stage of development, the octagon became the favorite plan shape of this period and thereafter. (Figures 11, 12)

相比于木建筑而言，留存至今的砖石佛塔数量自然更多。除上文提及的应县木塔这一例外，这一时期所有保留下来的佛塔均为砖石结构。

这一时期的佛塔形式多样。布局方面，除了此前阶段几乎作为绝对法则的方形，八边形成为了此时和之后最受欢迎的平面布局。^[6]（图 11, 12）

【10】

【11】

【12】

【13】

The "multi-storied" and the "multi-eaved" are still the two principal types in the treatment of the mass and silhouette of the pagoda. But the octagonal plan has given them an effect of slenderness and richer play of light. In general, the pagoda of this period became more refined and elegant. Some of them are more restrained, attaining

their aesthetic effect by well studied proportion and are sparingly ornamented. But there are also a considerable number of them that are given architectural embellishments in imitation of the timber construction, giving the pagoda a richness unseen in masonry structures in former periods. (Figure 13)

[E] The Fifth Stage: Age of Peking European Influence, 1368–1949

From the latter half of the fourteenth century to the first decade of the present century, there were only two dynasties and they both succeeded in maintaining their regimes for a comparatively long duration. The Ming Dynasty drove away the Mongols and reestablished a regime of Han rulers. It was an age of national revival. The Yuan capital Dadu was sacked and a new capital was built in Nanjing. But only thirty years later, the capital was moved to Peking, utilizing the greater part of the destroyed Dadu. The Qing Dynasty, established by the Manchus, inherited Peking almost intact. For more than five centuries, Peking was twice enlarged and survived without going through any large scale destruction. The city, with its palaces and parks, stands as the most important monument of this period.

Every newly founded dynasty brought along with it a redistribution of land and a rise in production and consequently greater building activity. The first hundred years or so of both these dynasties were periods of comparative peace and prosperity. All kinds of handicraft were brought to ever higher perfection. All these factors found expression in the architecture of the time. Both the Ming and Qing Dynasties left to posterity innumerable buildings, some still standing today in perfect state of preservation. Unlike the earlier periods, dwelling houses of the ordinary people have also been preserved.

Needless to say, the Imperial Palaces of Peking, first laid out and built in the early part of the fifteenth century and renovated, some even completely rebuilt, in later ages, as a group, stand one of the most magnificent ensemble created by any architect of any time. (Figures 14, 15)

“多层”和“多檐”仍然是佛塔体量和轮廓处理方面主要的两个类型。八角形的平面布局产生了纤细修长、光影重重的效果。整体而言，这一时期的佛塔更加精致典雅。有一些较为保守，比例恰当，装饰简约，从而达到了审美效果。但也有相当数量的佛塔模仿木结构建筑的装饰风格，这样就使砖石佛塔相较此前更加富丽华美。（图 13）

〔5〕第五阶段：北京—欧式影响风行的时代（公元1368至1949年）

从14世纪下半叶到20世纪头十年，经历了两个朝代，且均持续了相对较长的时间。明朝赶走了蒙古人，重新建立了汉族统治，可算是民族复兴。元大都遭到劫掠，新的都城在南京兴建。但仅30年之后，明朝又迁都北京，在元大都的大部分废墟旧址上兴建新都。清朝是由满人建立的，大体沿袭了前朝北京的格局。在五个多世纪里，北京城两度扩建，免遭大肆破坏而得以保存。北京城及其宫殿苑囿，是这一阶段最重要的历史遗迹。

新建各朝之初，土地重新分配，生产力得到提升，并由此促进了建筑业的发展。这两个朝代开初的一百年左右，均是相对和平、繁荣的时期。各种手工业空前蓬勃发展。所有这些因素，在当时的建筑中都得以展现。明清两代留下来不胜枚举的建筑，有些至今仍得到完好保存。和前期不同，这一时期的一些民居也被保存下来。

毋庸置疑，开始设计并营造于15世纪早期、其后又整修甚至重建的故宫建筑群，是任何时期、任何建筑师能建造出的最宏伟壮丽的建筑作品之一。（图14，15）

【14】

【15】

Mansions of nobilities and high officials as well as dwellings of the common people, some built four or five centuries ago, still stand in good condition. Compared to remains of earlier periods, religious buildings are found to be of less importance. Parks and gardens several hundred years old still give pleasure to the mass of people in their time of leisure. (Figures 16, 17) Even tombs of emperors, pompous ensembles, magnificently laid out and originally surrounded by groves of evergreens, have become favorite weekend resorts.

(Figures 18, 19)

许多达官贵族的宅邸，乃至普通民居，四五百年后依然保存得相当完好。宗教建筑，与早期遗存的建筑相比，则相形式微。具有数百年历史的各种园林景区，仍是公众休闲游乐的好去处。（图 16，17）不少皇帝陵墓，修建得十分华丽壮观，气势恢宏，周围绿树成荫，蕴含有“万年长青”之寓意；也已成为最受欢迎的周末游览胜地。（图 18，19）

【18】

【19】

From the architecture of this period, we see most clearly the marked class imprint of the social system. From the palaces and

mansions to the houses of the ordinary well-to-do, besides the spacious, comfortable quarters for the "masters and mistresses," without exceptions there are "servants' quarters," a miniature slum attached to every house. Nevertheless, they are still much better than the real slums of the masses of city poor. (Figures 20, 21)

From the plans, especially those of ensembles built in strict accordance with the official regulations, there is found the traditional preference for symmetrical arrangements. But one conspicuous characteristic is that when two or more groups of quadrangular courtyards are put adjacent to each other, there is an almost complete lack of correlation between the major axes of the groups which are parallel to each other. In places away from Peking, especially in the dwellings of the working people, great liberty is taken so as to arrange the houses to meet the demands of work and living.

Certain changes in construction details influenced to a considerable extent the general proportions of the buildings. The beam is brought into more direct contact with the column. To counteract the shearing stress, the width of the beam is increased to a dimension wider than the diameter of the column and placed directly on top of it. Even when the dougong is used, it is used merely as a "cushion," although still functioning as a weight bearing unit, but primarily for decorative purposes. On account of this, the size of the dougong, in proportion to the height of the building, is very much reduced, and the overhang of the eave becomes less far. Thus the buildings of this stage of development, especially those of the Qing Dynasty, present an appearance so restrained that it looks almost rigid when in comparison with the earlier buildings.

我们可从这一时期保存下来的建筑中清楚地看出，在当时的社会体制下，阶级划分的明显痕迹。从宫殿宅邸到小康民居，除供老爷和夫人使用的宽敞舒适的上房、正房外，无一例外都附有简陋的（倒座或鹿顶）平房供仆役使用。不过，这些仆役居室的条件仍远远优于广大城市贫民的栖身之所。（图 20，21）

在平面布局上，尤其是严格遵循官方规制的建筑组群，可以看出对对称布局这一形法传统的偏好。但还有一个显著的特点，即两组或多组四合院毗连时，这些庭院的主轴彼此平行，但其间几乎没有任何关联。在北京以外的地方，尤其是劳动人民的聚居地区，房屋布局视劳作和居住的需要而定，非常自由随意。

建筑细节上的某些改变，在很大程度上影响了建筑的整体比例。横梁更直接地与立柱相连。为了抵冲剪应力，横梁的宽度扩展得比柱径还要宽，并直接置于柱顶。即便是斗拱派上用场，也只是作为建筑中的一个“枕垫”；尽管仍然起着承重作用，但主要是装饰性的用途了。因此，斗拱的尺寸就建筑高度的比例而言大幅减小了，屋檐的外悬出檐部分也

大幅缩水。这样一来，这一阶段尤其是清朝的建筑，和以往的相比，造型上较为拘谨，甚至几乎显得刻板了。

【20】

【21】

The nineteenth century was an epoch of profound changes in the

history of China. Capitalism and imperialism brought the West to China, and along with it, Western architecture. New methods of construction, new architectural styles, new ways of using buildings, etc., etc., in short, an entirely new conception of architecture was introduced. In some coastal cities, where the imperialists acquired "concessions," even the city of the nineteenth-century Europe was reproduced.

The Qing Dynasty was overthrown in 1911 and a republic was founded. For a quarter of a century, China was torn by successive wars between the "warlords" and then eight years' war against the Japanese invaders. It was also in these years that Marxism-Leninism was introduced into China and eventually led to the formation of the Chinese Communist Party and finally the founding of the People's Republic in 1949.

The architecture of the first half of the twentieth century in China mirrored most faithfully the height of semi-feudalistic and semi-colonial state of Chinese society. In the countries and in the smaller towns, the traditional Chinese building is still the people's choice. But in the larger cities, especially in the so-called "treaty ports," the "foreign-style house" is the mode. Eclecticism, including the so-called "Chinese style" was the vogue for three decades or so, followed by a high tide of "contemporary architecture."

It was in such a state that the architects of China found themselves when China was liberated in 1949.

{F} The Sixth Stage of People's China, People's Architecture

In 1949, the Chinese people liberated themselves from the bondage of more than two thousand years of feudalism and a century of imperialism and founded the People's Republic of China. Architecture immediately became the common affair of the entire populace. As soon as the period of economic recovery, from 1949 to 1952, is over, with the generous help of the Soviet Union and the people's democratic countries, the reconstruction work under the First Five-Year Plan was launched forward. Numerous new industrial towns have been planned and started building. Certainly many more will be planned and built in the future. Reconstruction plans for many of the old cities are also gradually taking shape.

19世纪是中国发生深刻变化的历史时期。资本主义和帝国主义使西学东渐，也带来了西洋建筑，包括新的建筑方法、新的建筑风格、新的建筑功用等等。简而言之，引入了全新的建筑理念。一些中国沿海城

市，在帝国主义者得到“特许”的“租界”中，甚至复制了不少19世纪欧洲的城市建筑。

1911年，清朝政府被推翻，民国建立了。此后的四分之一世纪，中国饱受“军阀”混战之苦，后又经历了八年抗日战争。也正是在这一时期，马列主义被带进了中国，中国共产党成立了，并最终于1949年建立起了中华人民共和国。

20世纪上半叶的中国建筑如实地反映了中国半殖民地半封建社会鼎盛时期的风貌。在田间乡下和小城小镇，传统中国建筑仍然是人们的选择。但在较大的城市，尤其是在所谓的“通商口岸”，“洋房”甚为时髦。大约三十来年间，包括所谓“中式风格”在内的折中主义建筑蔚然成风，随后则是“当代建筑”的盛行时期。

1949年中国解放时，建筑师们正是处于这样一种历史背景之中。

〔6〕第六阶段：人民的中国，人民的建筑

1949年，中国人民从两千年多的封建主义和一个世纪的帝国主义束缚中解放出来，建立了中华人民共和国。建筑很快成为全体民众的共同事业。1949年到1952年的经济恢复时期刚一结束，在苏联和人民民主国家的慷慨相助下，随即开始了第一个“五年计划”，开展重建工作。无数新兴的工业城市开始进行规划兴建，当然，还有更多的要在未来进行规划和建造。很多古城的重建计划正在逐渐形成。

The Chinese people are at present endeavoring with all their efforts to have their four-thousand-year-old agricultural country basically industrialized in the short span of three Five-Year Plans. For the realization of this historical task, architects and engineers of China are offering every ounce of their strength.

Many old cities have changed considerably. New cities are planned and old cities, replanned. Workers' homes and dormitories are built in unprecedented numbers and with great speed, but they still lag behind the need of the people. Plans for residential buildings and certain public and office buildings have been worked towards the direction of standardization since 1953. A considerable number of hotels were built to accommodate the increasing number of visitors to various cities.

Public buildings of diverse nature, from government offices to department stores, etc., constitute none too small a part of the architects' work. The great number of educational buildings, from nurseries to institutions of high education, testifies the great attention the People's Government is paying to the education of the next generation. Hospitals and sanitariums are also built for the health of the great mass of workers, while the number of theaters, palaces of

culture, clubs, exhibition galleries, gymnasium, etc., is also considerable.

Needless to say, the one field in building activities that ranks in supreme prominence is that of industry. It is in this field that the Chinese architects found themselves face to face with entirely new problems. The state of industrial development under the reactionary regimes offered hardly any opportunity for the architects to practice in industrial architecture. But with the help of architects from the Soviet Union and other people's democratic countries, Chinese architects not only have learned, but are now able and competent designers in this particular field. The problems facing the Chinese architects are complex and difficult. To plan and build to answer the demands of socialism and of the great masses of working people is no simple task, but, under the leadership of the Chinese Communist Party, with the guiding principles of Marxism-Leninism, and, with the inexhaustible strength and wisdom of the working people, the Chinese architects are filled with self-confidence that they will create an architecture that is socialist in nature and endowed with national characters.

Having made a brief review of the stages of historical development of Chinese architecture, we shall now proceed with the examination of some of the representative specimens.

中国人民目前正在竭尽全力，力争在短短三个“五年计划”的时间之内，将这个拥有四千年历史的农业大国基本实现工业化。为了实现这一历史任务，中国的建筑师和工程师正在贡献自己的全部力量。

很多古城已经大为改观。新城市正在规划，旧城市则在重新规划。以前所未有的数量和速度修建了不少工人住宅和宿舍，但依旧不能满足人民的需求。1953年以来，民用住宅、公共建筑和办公建筑正朝着标准化的方向进行规划。大批酒店已经建成，以满足各个城市不断增长的游客的需求。

种类不同的公共建筑，从政府办公室到百货公司等，在建筑师的工作中也占据着不小的分量。兴建的从幼儿园到大学的大量教育建筑，体现了人民政府对下一代教育的重视。医院和疗养院为广大劳动人民而建造，而剧院、文化宫、俱乐部、展览馆以及体育馆等的数量也很可观。

无需多言，建筑活动中最重要的就是工业建筑。正是在这一领域，中国的建筑师发现自己遇到了全新的问题。反动政府统治之时，工业发展完全没有为建筑师修建工业建筑创造任何机会。但是，有了苏联和其他人民民主国家同行的帮助，中国建筑师不仅学会了方法，还成为了这一特殊领域能干的设计师。中国建筑师遇到的问题是复杂和困难的。设计和建造符合社会主义和广大劳动人民需要的建筑，绝非易事。但是，有了中国共产党的领导，有了马列主义的指导原则，有了劳动人民无穷无尽的力量和智慧，中国的建筑师们满怀信心，一定能够兴建兼具社会

主义与民族特色的建筑大业。

简要回顾了中国建筑发展的历程之后，我们可再来审视一些具有代表性的实例。

III. City Planning

[A] Principles for Planning a Capital

As mentioned above, the principles for laying out the capital city of a ruling king or emperor were specified as early as the eleventh century BC. In the *Zhouli* or *Book of Rites*, in the chapter "Kaogong Ji" which narrates the work of crafts, is mentioned that the capital of a king should be "nine li^[7] square with nine boulevards running longitudinally and nine boulevards running latitudinally. The longitudinal boulevards should be the width of nine carriages. The palaces should be located in front and the market places, at the rear; the ancestral temple to the left and the temple of the god of lands to the right."

In this simple statement, the basic principles are precisely put down. It is a faithful testimony of the social and political systems of the early days of feudalism. The lord was supreme. His palaces must be put in the center-front. The two temples to the left and right were to stand as permanent proclamations to his noble lineage of decent and indisputable right of sovereignty. The market places, which were the only places for the common people, logically, were located in the least important quarter.

It is interesting to note that this principle was not strictly adhered to in earlier days, such as the Chang'an of the Han Dynasty. It was not until the time when the teachings of Confucius were proclaimed by the feudal rulers as state teachings and the *Zhouli* included into the Thirteen Classics that the planning of an emperor's capital was given such ritual considerations.

[B] The Sui and Tang Capital Chang'an

The Chang'an of the Sui and Tang Dynasties was the first and largest city in the history of China that was planned and built, with certain modifications, on the principle specified in the *Zhouli*. Though completely destroyed at the end of the Tang Dynasty (beginning of the

tenth century), exact and minute descriptions by an early Song author and recent researches enable us to have a fairly accurate plan of the city as it existed before destruction. It was a rectangular city completely surrounded by walls on all sides, with three gates on each side. Streets were laid out like a chessboard, with the principal streets in line with the gates. The central part of the northern portion of the city was the Palace City within which were the palaces of the emperor.

叁 城市规划

〔1〕都城规划原则

如前所言，公元前11世纪就已经明确提出了帝王所在都城的规划原则。《周礼·考工记》，即专门描述工艺之术的章节中，讲到了都城应“方九里，（旁三门，）国中九经九纬，经涂九轨，左祖右社，面朝后市”^[8]。

这一简单的语句精确地阐述了基本的规划原则，并如实反映了封建社会初期的社会关系及政治体系。封建领主有着至高无上的权力，因此其宫殿必须位于正前方正中央的位置。^[9]左右两庙象征着王室世系相传的高贵血统及毋庸置疑的统治权威。与平民百姓唯一有关的“市”，自然占据最不重要的位置。

有意思的是，早期规划帝王之都时这些原则并未得以严格的遵循，比如汉朝的长安城就是这样。直到孔子的儒家学说被封建统治者确立为官方学说并且将《周礼》列入“十三经”之后，对国都建设的规划，才开始有了礼制性的考量。

〔2〕隋唐都城长安

隋朝和唐朝的都城长安，是中国历史上第一座同时也是最大的一座根据《周礼》的礼制营造原则规划建成的都城，当然也作了些变通。虽然唐朝末年（10世纪初）都城被毁，但是根据宋初某位作家精确而细致的描述和最新的研究发现，我们能够相当准确地了解到长安城被毁前的规划设计。该城为长方形，四周完全被城墙包围，各面开三座城门。街道格局如同棋盘般区划整齐，主道贯穿城门。城北中央是宫城，即皇帝的宫殿所在地。

To the south of this was the Imperial City, where the ministries of the government were located. Surrounding the Imperial City on three sides was the fang, each also surrounded by walls with a gate on each

side and with crossroads within. To the left and right and slightly in front of the Imperial City were two spacious market squares. At the southeastern corner of the city was a "green area" with attractive natural sceneries. It was a favorite resort for the rich and poor alike and had inspired many poets who immortalized the place through their verses.

All the common people lived in the walled fang or blocks, the gates of which would be locked as soon as the "evening drum" was beaten. Hence all residents must be home before that time. Only officials above a certain rank were permitted to open their gates facing the principal streets and had the right of way night and day. The basic conception of the city of Chang'an is a congregation of small cities surrounded by wall to form a big city. The small cities—fang—were separated and connected to each other by major and minor arterial streets. Such arrangements and restrictions mirrored the policy of discouragement of commerce, for no shop was permitted to open onto the principal streets. The street scene of the Chang'an during the Tang Dynasty must have been rather austere. However, official restrictions could not bind social and economical progress forever. By the tenth century, the walls of the fang were broken through and shops were built facing the streets. The street scene in the Chinese city took up an entirely new and different appearance.

[C] Peking, Capital of the Ming and Qing Dynasties

On the site where Peking, the capital of the People's Republic of China, stands today, a town or settlement have been in existence as far back as the Yin Dynasty (1765 BC–1122 BC). After having sacked the capital of the Jin Dynasty, Yanjing, which had grown up through nearly thirty centuries of development, Kublai Khan of the Mongols ordered the building of a new capital just to the northeast of it, called Dadu, the "Great Capital" and known as Khanbaliq in *Marco Polo's Travels*. It was planned according to the principle set in the *Zhouli*—the palace in the front, the market place at the rear, the ancestral temple to the left and the temple of the god of lands to the right. But Dadu suffered the same fate as that of Yanjing when the Mongols were driven out by the Han people who established the Ming Dynasty in 1368.

宮城之南是皇城，即行政官署所在地。皇城的三面外围均为坊，各坊四面又有围墙，城墙上各有一门，内有出入通路。皇城左侧、右侧及略偏南边，为两个面积宽敞的集市区。^[10] 长安城的东南角是有着秀美景色的“绿色园林区”，不但为贫富世人共爱，而且激发了不少文人骚客的诗兴，从而使此地不朽于世。

所有的平民都居住在坊内，坊门在“暮鼓”敲响之时便会锁上。因此，所有居民必须在此之前赶回家中。只有朝廷百司一定级别以上的官员才能将府门开向主街道，并享有不分昼夜均可通行的特权。长安城的基本建设理念，是由畦分棋布的、内向性封闭的小城围合聚拢而成一个大城的格局。小城即指“坊”，由大小主干道相隔相连。这种排列规整的布局及其限制作用，禁止在大街上开设商铺，体现了当时的禁商政策。唐朝那时的长安街道，一定非常俭朴无华。然而，官方的限制不能永久地阻挡社会和经济的进步。到公元10世纪时，各坊城墙被打破，店面朝街而开。当时中国的城市街景，呈现出一副截然不同的全新面貌。

〔3〕明清都城北京

中华人民共和国现在的首都北京城，始建于殷商时期（公元前1765—公元前1122年）。在蒙古可汗忽必烈攻占劫掠金朝的首都燕京（已有几近三千年历史）后，他下令在燕京的东北方向建立了一座新的都城，称为“大都”，取“伟大的都城”之义，而在《马可·波罗游记》中被称为“可汗大都”。该城依据《周礼》的原则规划，即“左祖右社，面朝后市”。而当汉人于1368年将蒙古人逐出中原并建立明朝之后，大都也遭遇了和燕京类似的被洗劫的命运。

Shortly afterwards, the ruined capital was reconstructed and renamed Beijing, the North Capital, known to Westerners as Peking. It has been, except for two short intervals, the capital of China ever since. The Peking up till the liberation in 1949, as the capital of an absolute monarchy, took its final shape in the year 1553, after three successive large-scale alterations. The reconstruction in 1553 added an "outer city" to the original square city, thus lengthened the principal axis of the city to eight kilometers. The composition of the entire city was basically symmetrical. The street system was laid out with that of the Mongol city as basis. The chessboard main streets divide the city into large "super-blocks," within which most of the minor streets run in the east-west direction. This "fish-bone" pattern of street system defines clearly the different functions of the major and minor streets on the one hand and enabled all the houses to have a southern exposure on the other. The planner had shown great ingenuity in the creation of such a system.

The string of natural lakes in the heart of the city did not embarrass the planner. The effect of symmetry in the street system was by no means destroyed. On the contrary, he made the best use of the irregular lines of the lakes to help soften the possible effect of harshness due to excessive emphasis on symmetry and succeeded in adding a touch of unexpected joy of playfulness to the majestic city. When a casual visitor who comes to Peking for the first time, after passing through streets lined with buildings on both sides and comes

suddenly to the head of a bridge, he is brought, most unexpectedly, face to face with a vast stretch of water surface, lined with such informal shorelines, and, on the slopes of the island-hill, such wooded shades of evergreens. He will be standing on or strolling over the marble bridge with exquisitely carved balustrades and enjoying the scenery composed of fairyland-like pavilions and loggias. It makes one wonder whether he is in the middle of a city of over three million inhabitants.

One of the unseen achievements of ancient Peking must not be overlooked, that is the sewage system first laid down six centuries ago. There was originally in Peking an ancient sewage system totaling more than three hundred kilometers in length, slowly built up through the centuries. Portions of it have already collapsed during the past few decades, but there are still more than two hundred kilometers of it in usable condition. After the liberation, the People's Government drained and repaired the still usable portion of the entire system and it is now an integral and important part of the new sewage system.

不久之后，这座被毁的都城得以重建，并被重新命名为“北京”，即“北方的京城”，西方人称之为Peking。除了两个短暂的时期以外，自此北京一直是中国的首都。^[11] 直至1949年解放之前，北京一直是君主专制政权的都城。历经三次大规模整修之后，它最终定型于1553年——这一年的重建工作主要是在原来方城的基础上增加了“外城”，从而将城市的中轴线延长至八公里。整座城市的构造基本呈对称状。街道设计以大都为基础，格网状的主干道将城市分为大的坊区，区内多数支干道为东西向。这种鱼骨状的街道体系一方面清晰地体现了主干道和支干道的不同功能，同时也使得所有房屋都能坐北朝南。这种体系的创建，体现了设计者的匠心独具。

城中心的天然湖区（即“海子”），也没能难倒设计师。这些海子更没有破坏街道体系的对称效果。恰恰相反，设计师充分利用了它们的不规则形状，来弱化因过分强调对称而有可能导致的刻板印象，成功地为这座庄严的城市增添了意外的愉悦之感。初次造访北京城的游客穿过两侧建筑林立的街道时，突然走到了一个桥头，与他不期而遇的，是一片河岸蜿蜒的广阔水域，以及水域当中小岛斜坡上成片的绿荫。他会驻足或漫步在有着精雕细刻的汉白玉栏杆的小桥上，欣赏着如梦如幻仙境般的亭台楼阁，间或怀疑自己是否真的置身于聚居着三百多万市井居民的凡尘闹市当中。

古都北京还有一项无形的、不容忽视的成就，那就是最先在600年前建成的排水系统。数世纪来逐渐建成的老北京城的排水系统总长为三百多公里，近几十年来部分已经坍塌，但仍有两百多公里的管道在继续发挥作用。解放后，人民政府排干沟渠中的废水并修缮了依旧可用部分，如今它已成为新排水系统中不可或缺的重要组成部分。

It must be pointed out here that the entire city of Peking was

planned with the emperor's palace—the Forbidden City—as the dominant feature occupying a vast area in the center of the city, surrounded by a massive wall and a moat. It solved excellently the problem of guarding the safety of the emperor, but today it stands an insoluble problem in a modern city as an obstacle to traffic.

〔 D 〕 Smaller Cities and Towns

For thousands of years, a city, regardless of its size, was seldom built without a wall. Whenever the topography permits, the city was laid out either square or rectangular, with chessboard-like road systems. But in the mountainous regions, cities were always planned and built in conformity to the terrain.

这里必须说明的一点是，整个北京城的规划基于一点，即以皇宫紫禁城为中心，它在城中央占据了很大面积，其外围是宏伟的城墙和护城河。这一设计曾成功解决了护卫皇帝安全的问题，但如今却成为现代城市中堵塞交通的难题。

〔 4 〕 小城镇

中国数千年来，凡是城市，不论大小如何几乎都筑墙而建。只要地形允许，城市格局非方则长，街道格网状分布。但是在山区，城市通常则要根据地形地势规划建造。

IV. Architecture of Domestic and Public Buildings

〔 A 〕 The Emperor's Palaces, Peking

The Emperor's Palaces, an enormous ensemble surrounded by a massive wall, called the Purple Forbidden City, are the nucleus around which the entire city of Peking was planned. The Forbidden City has within its enclosure numerous ensembles with a total of several hundred buildings, including halls of audience, offices for government administration, secretariats, living quarters for the emperor and his enormous family, living quarters for the army of courtiers and court ladies, kitchens, stables and other service quarters for the entire court. There are also in the precinct the emperor's private Buddhist chapel, libraries, art galleries and gardens. All these buildings for different

purposes are arranged in numerous ensembles, each consisted of several courtyards. Almost every building is roofed with yellow glazed tiles. The walls are all painted red and the shaded portions under the eaves of the buildings are decorated with painted patterns in blue, green and gold. Halls and pavilions of importance, as a rule, are elevated on top of white marble terraces which are arranged into one or three tiers according to the importance of the building. Each ensemble in the Forbidden City is composed with one axis, and, as mentioned before, little attention is paid to the axes of adjacent ensembles.

肆 民用建筑与公共建筑

〔1〕紫禁城——北京城的皇宫

巍峨高墙之内的皇家宫殿群，被称为“紫禁城”，也是整个北京城规划的核心。城内有数百座建筑，包括征召臣工觐见的大殿、奏事议政处、内廷机要用房、皇帝本人及皇室的寝宫、侍臣宫女的住所、御膳房、牲口厩以及宫廷里其他杂役的居住区域。城内还设有皇帝的专用佛堂、书房、雅玩收藏室以及御花园。这些功能不一的建筑都自成一体，每个建筑群由几个庭院构成。几乎所有建筑的屋顶都铺着黄色的琉璃瓦；城墙都刷成朱红色，檐下部分则以金黄、翠绿及碧蓝色的图案装饰。凡是重要的大殿和楼阁，通常都要建在汉白玉台阶之上。至于台阶的数目，通常是一层或三层，根据建筑的重要性而定。紫禁城中，各宫殿群均由一条中轴线贯通；但是正如此前提及，不太注意相邻宫殿群的轴线之间的关联关系。

1. Two Groups of Three Big Halls

On the principal axis of the Forbidden City are rhythmically placed in a string a double "triads" of monumental buildings, popularly known as the "Front Three Big Halls" and the "Rear Three Big Halls." Each of the "triad" consists of one rectangular hall in the front, a square hall in the middle and another, but smaller, rectangular hall at the rear. The rear "triad" is a repetition of the front "triad" in a reduced size. Both these "triads" each as a group, is raised on a marble terrace of three tiers and surrounded by galleries, pavilions, etc. and preceded in the forefront by a monumental gateway.

The Taihe Dian or Hall of Supreme Harmony is the principal hall of audience in the palaces and focal point of the whole Forbidden

City. With its six rows of twelve columns each, forming a hypostyle hall eleven bays in length and five in depth, double-eaved and hip-roofed, it is the largest single building of its kind in China. The present structure dates back no farther than 1697, being the substitute for the one destroyed by a fire in 1679. The seventy-two columns arranged in monotonous regularity, seemingly showing not much ingenuity, are yet a most impressive sight. The structure stands on a low marble platform, which in turn is elevated by three tiers of balustraded terraces, profusely decorated with the most exquisite carvings.

Compared to buildings of earlier dates, as will be seen from some examples to be cited later in this discussion, the dougong of this gigantic hall is very small in proportion. It has lost its original function as a structural unit and degenerated into mere decorations. From a distance, the presence of dougong is hardly noticeable. The walls, columns, doors and windows are painted red, the dougong and the architraves in blue and green and accentuated with gold. The whole structure is crowned by a roof of glazed yellow tiles, glistening like gold in the bright sunshine against the blue sky of North China. Elevated on the white marble terraces that seem to vibrate with their exuberant carvings, the great hall is an apparition of grandeur, dignity and gorgeousness that, once seen, is never forgotten.

Behind the Taihe Dian is the Zhonghe Dian, the Hall of Middle Harmony. It is a square, small pavilion-like structure with a pyramidal roof. Further back is the Baohe Dian, the Hall of Retained Harmony, a structure slightly smaller than the Taihe Dian that concludes the Front Triad with an appropriate rhythmic accent.

Both Triads are places for the most solemn ceremonies: the Front Triad is for audiences of the greatest importance and the Rear Triad was used exclusively for imperial nuptial ceremonies. Thus the buildings were rarely used. Their function is almost purely symbolic.

1. 前后“三大殿” 沿紫禁城的中轴线上，有节奏地间隔分布着两组建筑群，即通常说的“前三大殿”和“后三大殿”，各由前面的长方形宫殿、中间的正方形宫殿及后面稍小的长方形宫殿构成。后三大殿是前三大殿的缩小复制版。这两组宫殿群都位于三层汉白玉高台之上，并由廊台亭榭环绕，前方则是气势恢弘的入口通道。

太和殿是宫殿群乃至整个紫禁城中朝觐的主殿。殿内6排柱子，每排12根，其殿面阔11间，进深5间，重檐庑殿顶，它是中国现存古建筑中规模最大的殿宇。这座宫殿在1679年的火灾中被焚毁，现存的宫殿修建年代不迟于1697年。殿内72根柱子排列整齐，乍看并无创意，整体上却蔚为壮观。整个建筑位于低矮的汉白玉基座之上，基座之下是三层精雕细琢的汉白玉栏杆。

与文后将提到的早期建筑相比，在雄伟的太和殿中，斗拱的尺寸极小。它已经失去原先的构造功能，而沦为纯粹的装饰品，从远处看几乎毫不起眼。殿墙、柱子、门窗被刷成朱红色，斗拱和额枋刷成碧蓝色和翠绿色，间以鲜艳的金黄色。^[12] 整个建筑的屋顶铺饰着黄琉璃瓦，在北方艳阳蓝天的映衬下闪烁着熠熠金光。高踞在雕刻逼真生动的汉白玉基座之上的这座大殿，如此宏伟壮观、庄严华丽，真叫人过目难忘。

太和殿之后是中和殿。这是一座方形的亭状建筑，屋顶为攒尖形。再后方是保和殿，只比太和殿略小。这三者生动而有韵律地构成了前一组三大殿。

前后三大殿是普天之下最庄重的礼仪之地：最重要的朝会在前三大殿举行，后三大殿则在操办皇家婚礼时方才启用。因而，它们鲜有机会使用，功能几乎只是象征性的。

2. Other Groups in the Forbidden City

To the left and right, or east and west, of the two Triads of ceremonial halls are numerous smaller ensembles within the confines of the Forbidden City. Consisted of several courtyards and surrounded by high walls, each of such an ensemble is a separate unit by itself. Such walled ensembles are "apartments" for the everyday living of members of the imperial family. To each person—an empress dowager, an empress, a concubine, a prince or a princess—or, rarely, to two or three persons is assigned such an "apartment." Such arrangements reflect most vividly the demand imposed by the rules in court life for the highest degree of exclusiveness or isolation, not only with the outside world of common people, but even from each other of the family. The impression one gets today from these luxurious "apartments" is that they were once upon a time nothing but beautiful, gilded "cells" for the life-term imprisonment of those unfortunate blue-blooded "inmates."

{ B } Dwelling of the People

The palaces in Peking are by no means the norm exemplifying the dwelling houses of the great mass of people. In a classed society, needless to say, the best part of the working people's labor is robbed and enjoyed by the ruling-exploiting class. So, aside from the imperial palaces, outstanding buildings in the towns and countries were usually those of the landlords, officials and well-to-do. As a rule, these dwellings are also composed of courtyards and surrounded by walls. But in different localities, under different natural conditions and social requirements as well as possibilities in technical and material supplies, great variation is found. But in the countries, especially in South

China, the "orthodox" plan arrangement of courtyards and symmetry is not so strictly followed. Irregularity in planning is found everywhere. The construction also shows tendencies towards lightness.

In Peking, the average dwelling house is planned with one or several courtyards, with buildings on three or four sides. The construction is usually in strict accordance with the standards set by the Ministry of Construction in the eighteenth century. The buildings forming the quadrangle are detached from each other and so are usually arranged that they do not obstruct each other's view or sunshine. Thus the courtyards also function as very pleasant "outdoor living rooms."

2. 紫禁城里的其他建筑群 在前后三大殿的东西两侧，分别是紫禁城里众多的小型宫殿群。每组宫殿都自成一体，各由几个庭院构成，并被高墙环绕。这些高墙之内的宫殿是皇室成员的寝宫。皇太后、皇后、嫔妃、皇子或公主都独居一间，偶尔也有两三位皇室成员共用一处的情况。这种布局安排，生动地反映了宫廷生活准则中对最高级别的特权亦或说隔离的需要，不仅体现了皇家同外界隔绝，还体现了皇亲之间的相互孤立。如今，人们从这些奢华的寝宫看出，它们历史上只是漂亮豪华的、终身禁锢着不幸有着皇家血统之人的“金丝鸟笼”。

〔2〕百姓居所

北京城内普通大众的居所与宫殿却差之千里。在阶级社会里，劳动人民的成果无疑被统治阶级、剥削阶级掠夺和享用了。因此，除帝王宫殿之外，城里乡间耀眼的建筑通常也是那些地主、官僚及富豪的宅第。通常，这些建筑也由数个庭院构成，并被高墙环绕。但由于位于不同的地点，自然条件、社会要求及工艺和材料的限制，建筑格局上有很大的差异。但在农村，尤其是南方，正统的庭院和对称规划格局并没有得到严格遵守。不规则的构造到处可见，而营造也倾向于简洁轻巧的风格。

北京城里的普通民居包含一个或几个院落，周围三面或四面建有房屋。营造通常都严格依据了18世纪内务府内工部（后改称营造司）的规定。构成四合院的各房屋互不相连，所以通常互不遮挡视线或采光。因此，院子也担当起了宜人的“露天客厅”的作用。

In the towns and countries, less attention is paid to the formal arrangement of the buildings and to the size and shape of the courtyards. In North China, where the rainy season is short, buildings in the same ensemble are, as a rule, detached from each other like those in Peking. But in the rainy south, very often the buildings on all three or four sides of the courtyard are joined up into a continuous whole, or, when detached, connected with each other by verandas. An old residence in Shanghai is typical of this kind of arrangement.

In the North China plain, dwellings are usually only one story in height. But in certain places in the south and southwestern provinces, houses of two or three stories are quite common. The mansion of a former official in Yungding, Fujian Province is an ensemble composed of buildings of different story heights. In the Province of Yunnan, as in the typical residence of Kunming, the two story height is the norm. In the latter case, the plan of the house is usually arranged into a very compact square, leaving a small courtyard in the center, while the exterior is treated with rather forbidding walls relieved with a few small windows.

It is in the farm houses in South China that one finds the highest degree of flexibility in planning. One excellent example is the former home of Comrade Mao Zedong in Xiangtan, Hunan Province. The house is located at the foot of a gentle hill, facing a pond in front. The living quarters is in the form of an asymmetrical "U," part of it two stories in height and tile-roofed, while one leg of the "U" is lower and thatch-roofed. Adjacent to the other leg is a service yard in which are located the flour mill, cow barn, pig sty, etc. It is to be noticed that here the enclosed courtyard idea is completely discarded. There is neither the quadrangle nor the forbidding walls. The house is comfortably in harmony with nature and presents an appearance of cozy picturesqueness. Farm houses of this character are quite common in the regions south of the Yangzi River.

[C] Cave Dwellings

In the loess districts in North China, especially at places where the terrain is worn by nature into steep ravines, cave dwelling is quite common. The caves are usually dug horizontally into the wall or cliff of the loess like a tunnel. The interior is vaulted with brick masonry and the open end is closed by a wall with a door and a window. Cave dwellings have the advantage of being warm in the winter and cool in the summer. A "house" or family may consist of several such caves, but they are usually placed parallel to each other without interior communications.

至于小城小市和乡间郊野的建筑，更加不注重房屋合乎规格的布局及庭院的大小与形状。华北地区的雨季较短，同一组群的房屋，和北京城里的一样，通常也是互不相连的。但在雨季较长的江南地区，院子里四周的或三面的房屋是连为一体的，或者即使隔开也由走廊相连。上海的老房子就是这种格局的典型。

华北平原的民居通常是单层的。但在华南或西南诸省，却常见两三层房子。福建省永定某位官员的府邸是由数座层高不同的房屋构成的

客家土楼。至于云南典型的民居，以昆明为例，则以两层楼最为常见。其构造整体为紧凑的正方形，中间是天井，而外围则是仅有几扇小窗的高墙。

中国南方的农家院设计体现了建筑规划中最大程度的灵活性。一个典型例子便是毛泽东同志在湖南湘潭的故居。它位于起伏和缓的小山脚下，并面朝池塘。居住房屋呈非对称的马鞍型，一侧为两层的瓦顶楼，而另一侧则为低矮的茅草屋。楼房旁边是个农家场院，里面有磨房、牛栏、猪圈等。值得注意的是，庭院围合的思想在这里完全没有体现出来，既不用四合院的形式，又没有森严的高墙环绕。整个房屋与自然非常和谐，展现出温馨生动的场景。这种类型的农家院在江南非常普遍。

〔3〕窑洞

在华北的黄土高原地区，尤其是地表被侵蚀成险壑的沟谷之处，窑洞便很常见。窑洞通常水平打入黄土崖壁中，有如隧道。内部用砖石砌成拱顶，出入口的那堵墙有门有窗。窑洞有冬暖夏凉的好处。一家可由几个这样的窑洞构成，但通常窑洞并排，之间并不打通相连。

V. Religious Architecture

Cave Temples

The earliest remains of Buddhist architecture existing in China today are the cave temples. Unquestionably the conception was imported from India, having its prototypes in Karli, Ajanta and elsewhere in India. Although rock-cut tombs were already hewn during the Han Dynasty, possibly shortly after the beginning of the Christian era, and some of them given architectural treatment, nevertheless they were used exclusively for the dead. Although cave dwellings, like those just mentioned above, undoubtedly were in use even before the hewing of the rock-cut tombs, yet they made no pretension for monumentality. It was not until the arrival of the Indian idea that the cave ascended to architectural prominence.

In the middle of the fourth century AD, Buddhist believers started hewing caves as places for worship, and the practice was continued till the Ming Dynasty (1368–1644). The high tide was reached during the Northern Wei, Northern Qi, Sui and Tang Dynasties, from the middle of the fifth to the later part of the ninth centuries, assuming the scale of a nationwide "movement" of great popularity. It was only during the earlier years, approximately up till the middle of the

seventh century, that the caves were treated architecturally. Gradually the idea of opening up a cave was replaced by that of carving niches on the rock cliffs and became mere objects of sculpture. Architecturally speaking, the most important caves are those at Dunhuang, Gansu Province, Yungang, Shanxi Province, the Maiji Mountains, Tianshui, Gansu Province, Tianlong Shan, Taiyuan, Shanxi Province and Xiangtang Shan, Cixian, Hebei Province.

In most of these caves, with the exception of the last mentioned, the architectural treatment show surprisingly little influence from India and the architecture is essentially Chinese. The only noticeable indications of foreign influence are the concept of the caves itself and the Greco-Buddhist motifs in the ornaments, such as the acanthus leaf, the egg-and-dart, the swastika, the garland, the bead, etc. These motifs have enriched, and have since taken their permanent positions in, the vocabulary of Chinese ornamental motifs.

The architecture of these caves may be studied from two aspects: firstly, the caves themselves, including the architectural treatment of the exterior and interior; and, secondly, contemporary timber and masonry architecture depicted in the reliefs decorating the walls of the caves. Among the latter are depicted numerous halls and pagodas, replicas of the structures that once rose in great numbers all over the plains and hills of North and Central China.

伍 宗教建筑

佛窟

中国如今尚存的最早佛教建筑是佛窟。这种理念当然是从印度引进的，其原型如印度的卡尔利、阿旃陀及其他处的佛窟。汉朝时，可能是公元纪年开始后不久，已有石刻的墓穴，其中一些也有人工营造处理的痕迹，但都是为逝者而建。如前所提，尽管窑洞在石刻墓穴出现之前就已存在了，但当时却没有张扬。直到印度佛教的思想传入之后，石窟才上升到建筑的高度。

4世纪中期，佛教徒开始为宗教信仰而开凿洞窟，这一举措一直延续到明朝（公元1368—1644年）；从5世纪中叶至9世纪末，即在北魏、北齐、隋朝以及唐朝等朝代达到高潮，在全国掀起了大规模的信佛造佛“运动”。但也只是在约至7世纪中期之前的早期，洞窟的建筑风格才有所讲究。之后，在崖壁上雕刻的佛龛逐渐取代了向内开凿的洞窟，并发展成为纯粹的雕塑的创作对象。从建筑角度上讲，最重要的石窟是甘肃省的敦煌石窟、山西省的云冈石窟、甘肃天水的麦积山石窟、山西

太原的天龙山石窟以及河北磁县的响堂山石窟。

除上段提到的最后一个响堂山石窟之外，这些石窟的建筑风格很少体现印度的影响，而主要是中国风格。唯一明显受到外国影响的标志，便是石窟的概念本身以及饰品中的希腊—佛教图案，例如茛苕叶纹饰、卵锚饰、万字饰、花环纹饰、串珠纹饰等。这些图案丰富了中国装饰图案的语汇，并自此占据了永久性的地位。

这些石窟的建筑手法，可从两方面加以研究：首先是石窟本身，包括外部和内部的建筑处理；其次是装饰石窟墙体用的浮雕所描绘的同时期的木材及石材建筑。后者包括所绘大殿和佛塔，摹仿了曾经风靡于华北平原和华中山区的建筑风格。

These caves have preserved in stone faithful copies of the wooden architecture of their time. Among the salient characteristics we notice that the columns in most cases are octagonal, with capitals in the shape of a dou (the block in the dougong). Above the capital is placed the architrave, which, in turn, is to receive the principal dou of the set of dougong. This arrangement was in later ages modified by mortising the architrave directly onto the upper end of the column, thus making the dou on the column to function at the same time as the principal dou of the set of dougong.

In the architectural treatment of these caves, the element most informative to posterity is the presentation of the timber construction in stone carving. Here we notice that the dougong is ever the dominant decorative feature. The aesthetic potentialities of the structural system were by this time so much...

这些石窟忠实地保留了当时的木质建筑的风格。我们注意到的最明显的特点，便是柱头呈斗状的八边形立柱的运用。在柱头之上是过梁，用来承托斗拱中的主斗。这一组配方式后来经过修改，用榫将过梁与柱头直接联系起来。这样，柱头的斗状部分就类似于斗拱中斗的构件而且发挥着同样的作用。

这些石窟的建筑处理对后世最大的意义，在于以石雕形式再现了木结构建筑的风格。我们在此注意到，斗拱始终主要起着装饰性的作用。这一构件体系此时已充分显示出其美学蕴涵.....

(郑文博 任小玫 译 曾俊伟 校)

[1] 半坡遗址分为居住、制陶、墓葬三个区，涉及的房屋遗迹、圈栏、窖穴、陶窑、墓葬等，均在英文术语“pit”的覆盖范围之内——任小玫注。

[2] 阙是从防卫性的“观”演变而来的一种表示威仪和等级名分的建筑，由于双阙孤植而“中间阙然为道”，因而称“阙”——任小玫注。

[3] “如跂斯翼，如矢斯棘，如鸟斯革，如翬斯飞，君子攸跻。”这是《诗经》中对宫室建筑的描述，详见《小雅·斯干》。由此可知西周大屋顶已引人注目，但不知有无翼角——李革胜注。

[4] 根据“匠人营国”的制度，除皇城以外，居住区分为国宅与闾里两部分。“国宅”指王公贵族和朝廷重臣居住的地方，一般都环绕在王城左右或前后。“闾里”则是一般平民

居住的地方，但也是分等级的，较上层的从地理位置上看也是对称分布于皇城的东西两侧不远的地方——任小玫注。

[5] 木材加工远比石料快，加上唐宋以后使用了类似今天的建筑模数制的方法（宋代用“材”，清代用“斗口”），各种木构件的式样也已定型，因此可同时加工，制成后再组合拼装——任小玫注。

[6] 欧洲人用来表示中国的“塔”所用的“pagoda”一词来源存疑。很有可能pa-go-da只是三个中文字母的摹仿标音：ba（八）、go（角）和ta（塔）。因此，pagoda音为bagota，即“八角塔”——作者注。

[7] The li is a Chinese lineal measure equivalent to 500 meters. The li of the Zhou Dynasty is estimated to be about 440 meters long. 里是中国的长度计量单位，每里相当于500米，周朝时则约为440米——作者注。

[8] 意思是说，帝王都城的规制是城市平面应当见方九里，各边城门大小三个。城内街道划分成九纵九横。纵向街道宽度应为能同时行驶九辆马车。宫殿的左边是祖庙，右边是社稷。宫殿前面是群臣朝拜的地方，后面则是市场——任小玫注。

[9] 《周礼·天官》中就有此规定：“唯王建国，辨方正位”——任小玫注。

[10] 从战国到北宋初年，都城实行的是坊市制；北宋中期以后，采用的则是街巷制。至于文中所提的“集市区”，即隋代的“都会市”和“利人市”，各用两坊地的面积，因此作者形容其“面积宽敞”。都会市在朱雀街东侧，唐代称为“东市”；利人市在朱雀街西，唐代称为“西市”。东、西两市是商肆集中的商业区——任小玫注。

[11] 明朝初期，曾建都应天（今江苏南京）。1927年，南京国民政府成立。此后直至1949年，除1932年“一·二八事变”后短期迁都洛阳和全面抗战爆发后迁都重庆之外，南京一直作为国都——任小玫注。

[12] 在色彩应用上，故宫完全反映了“五行”思想：宫墙、殿柱用红色，红属火，属光明正大；屋顶用黄色，黄属土、属中央，皇帝必居中；皇宫东部屋顶用绿色，属东方木绿，属春，用于皇子居住——曾俊伟注。

A Han Terracotta Model of a Three-story House

一个汉代的三层楼陶制明器^[1]

〔年份不详〕

Like most people of the ancient civilizations, the Chinese believed in the life after death. He did not think that the soul would come back to the same body, as the Egyptians, but that the deceased was to live in another world where the daily life of this world would be led as usual. He would have to be living in a house, wearing clothes and eating the same grain as he did in his life of this side, and, in an important personage, he would be needing the service and attendance of servants.

The practice of human sacrifice was therefore not uncommon with the early Chinese. But the practice was apparently abandoned later, and, in its place, clay or wooden figures were used to accompany the dead; and, with the figures, undoubtedly all kinds of utensils necessary for a comfortable living.

Even as late as the seventh century BC, we find in *Cho Chuan*, the chronology of the state of Lu, recording the funeral of Chin Mu-kung: "Jen-hao, Court of Chin, died. The three sons of the Tze-chu family, Yen-hsi, Chung-hsing and Tsen-hu, were sacrificed as his attendants. All three were geniuses of Chin. The people were mournful over their death, and composed *The Poem of Huang-niao (Yellow Bird)*:

"If only their lives could be restored,

Let every man have hundred bodies.

..."

About seventy years after this song was sung, Confucius was born (551 BC). This master's doctrines never touched anything outside of this world or this life. He evaded all questions concerning the mysterious, such as ghosts, gods, death, etc. His mention of God has always been the vague Shang-ti or T'ien-ti. When he was asked on the question of spirits, his answers was "respect and keep away from them." One of his pupils asked about death, he again cunningly

replied, "Not knowing life, what do I know of death?"

During the century after Confucius the Middle Kingdom was producing an amazing number of thinkers. And about the fifth generation after him was Mencius, whom the Sung scholars considered the orthodox of the Confucian school. Among the numerous quotations in *Mencius* is this isolated utterance of a curse: "May the originator of Yung (tomb figures) be forever void of descendants!" which is the greatest of the three infidelities. The cause of this curse is not explained, but it must be either that it was too mysterious and superstitious which was not Confucius' taste to practice, or that the consequent extravagance or its use was in conflict with Mencius' economic principles.

中国人和古代文明中的大多数人一样，也相信人死后有灵魂。他们不像埃及人那样，认为灵魂还会回到原有身体里，而是认为死者会生活在另一世界，那里的日常生活仍同在世时一样。他将会生活在一所住宅里，穿衣、吃饭一如生前，并且他如果是位重要人物，还需要照顾和陪侍的奴仆。

因此，在中国早期，以活人殉葬的做法并不少见。但是这种做法后来明显是废止了，而是代之以泥制或木制的人俑来陪伴死者，同人俑一起当然还有为生活舒适的各种必要用品。

甚至晚至公元前7世纪时，我们在鲁国的编年体史书《左传》中，还读到秦穆公葬仪的记载，说到秦穆公任好亡，子车氏三子——奄息、仲行、针虎——皆随而殉葬。这三个人都是秦国的良臣，时人感伤其死，乃制《黄鸟》诗篇，其中说：

“如可赎兮，人百其身。……”

这篇诗篇唱出后大约七十年，孔子诞生了（公元前551年），这位导师的学说，从未触及现世和今生以外的任何事物。他回避全部神秘的问题，如鬼、神、死亡等等。他提到神的时候，总是模糊的上帝或天帝。当被问到神鬼问题时，他的回答是：“敬鬼神而远之。”他的一位弟子问到死亡问题，他又一次巧妙地回答说：“未知生，焉知死？”

在孔子之后的世纪中，中国产生了大批的思想家。而孔子后大概经过五代人，出现了孟子，他被宋代学者尊为儒家的正宗传人。在《孟子》书中大量的孟子语录里，有这么一句孤立的咒语，即：“始作俑（陪葬偶人）者，其无后乎？”而“无后”居三大不孝之首。这个诅咒的理由没有解释，但它很可能或是过于神秘和迷信，而与孔子的行事风格不合；或是使用过分与奢侈，而与孟子的节俭原则相背。

However, this art, which later flourished to its height during the T'ang Dynasty, was already widely practiced during the early half of the fourth century BC. Although we find no positive record of its practice before Mencius time, we may with fair justification date it considerably back, even earlier than Chin Mu-kung.

In spite of its popularity, the late Chou tomb utensils, pottery or wood, is yet little known to us. But of the next epoch—the Han—various kinds of funeral accompaniments had been unearthed and a great number of them distributed among these object are some small terracotta models of houses.

These models of houses are not uncommon in American museums. They represent from pig pens to palaces. Among these the new acquisition of the Fogg Museum of Harvard University is indeed a valuable example. Aesthetically it is not a masterpiece, but is of great importance to a student of architectural archaeology.

It is a three-story house or palace, measuring approximately 39½ inches in height. The terracotta is of a reddish buff color baked from the *huang tu* (yellow earth) that is common in North China. Each story is baked separately with the balcony or roof over it. Thus, the lower-story and the second-story balcony forms one section; the second-story and the third-story balcony another; and the third with the roof, another. It was glazed with a coat of green glaze, but now only a few flakes of silver gray glaze are visible. The original color is still recognizable where parts overhang allowing the dripping glaze to collect thick—such as the lower side of the tile ends. The whole house is built up from flat "boards" of clay, of a uniform thickness of approximately 3/8 of an inch, put together at angles. The joints are distinctly visible, and there is not a single bent or curved surface throughout. Where the short flight of steps is attached to the wall, we can still find traces of the scratched surfaces that were made to hole the two pieces securely together. The bracket and the corbels that support them seem to have been produced from molds. The two balconies are made from flat pieces with the open work cut out. The floors of the second and third stories or rather, in our case, the tops of the two lower sections have each a round hole about two inches in diameter, probably for the convenience of the handling of the potter. The round windows on the side of each floor may be explained as an outlet for the hot air in the process of baking, and to prevent the thing from bursting in the kiln. The front window lattice on the second floor is likewise a cut-out piece, but the potter here failed as a draughtsman to lay out the crossing of laths neatly. The grille-like front of the box window on the third floor is produced by a mold.

然而，这种在唐代以后极为盛行的艺术，无论如何在前4世纪上半叶已经广为使用了。虽然我们尚未发现在孟子以前其被使用的确切记载，我们仍可以有充分理由推前其年代，甚至早于秦穆公。

尽管它早已普及，晚周墓穴中的陶制或木制的随葬品，我们迄今仍知之不多。但是属于下一个朝代——汉代的各式各样的随葬品已经出

土，并且其中大量明器等已经散布在欧洲和美国的博物馆里了。其中最令人感兴趣的是一些陶制的房屋小模型。

这些房屋的模型（明器）在美国的博物馆中并不少见，从猪圈到宫室都有所体现。其中哈佛大学福格博物馆的新藏品确实是一件有价值的例子。从美学上说，它或许不是杰作，但是对于一位建筑考古的学者来说，则是非常重要的。

它是一座三层的住宅或宫室，高约39又1/2英寸。陶器是用中国北方普通的黄土烧成的，呈偏红的暗黄色。每一层楼都是连带着上面的阳台或屋顶一起分别烧成的。因此，底层和二层的阳台形成一部分；二层和三层的阳台是另一部分；三层带着屋顶是又一部分。它原涂有绿釉，但现在只有很少的银灰色残片尚能见到。而在陶器的釉子流淌聚集的部位，如瓦片的最底处，仍能辨认出原来的颜色。整个住宅是用平的泥“板”制成的，泥板的平均厚度约3/8英寸，将其以各种角度合在一起。结合处清晰可见，而且任何地方都没有一个折弯或曲面。在台阶与墙体的接触处，我们仍能发现刮平表面的痕迹，那是为了使两者牢固结合。托架和支承它的托臂好像是用模子制成的。两个阳台是用平片做成并切出栏杆孔眼。第二、三层的楼板，更确切说在我们这里是两个下面组件的顶部，各有一个约两英寸直径的圆孔，可能是为了陶工操作的方便。每层楼两侧的圆窗，可以解释为在烧制过程中的热气出口，以避免器物在窑内爆裂。二楼楼前窗的网格也是切出来的，但是陶工在这里却没能像绘图员那样使交叉的窗棂排列匀整。三层正面的格栅似的盒窗是用模子制出的。

House models like this must have been produced in the great demand of the surviving sons and daughters who were anxious to provide their parents with a comfortable lodging in the other world.

Architecturally it is of great significance. Of Han Dynasty architecture, no actual edifice has come down to our time, and a future discovery is not probable. In the few reliefs in the Wu Family Tombs near Chiahsiang Hsien, Shantung Province, palace of one, two, or even three stories were represented. But its drawing can give only a very vague idea of the appearance of the actual building. The other source of information is the numerous stone piers that form the monumental gateways leading to the roads of spirits of the Han tombs. These sculptural pieces almost invariably have each an elaborately carved top in the form of a cornice with a roof over it. It is an imitation of wooden structure and gives a fairly good idea of the system of construction. But the lower portion is a mere tablet, and tells nothing about the habitable part of a house.

The third source, in plastic form, is the clay models that were unearthed. Whether these houses were meant for the deceased to live in the other world or not is uncertain, but outwardly they are fairly good representations of the domestic architecture of its period.

This one in the Fogg Museum has a unique combination of a number of the architectural elements. We may without much doubt assume that there is not more than one room in each story. The first floor, as we may call it, has two doorways in the front. These two doorways open out to a small porch landing which is approached by a short flight of steps running parallel to the front facade. The spirit of the deceased, who is to go in and out of these doorways by way of this porch is prevented from falling over it by a balustrade on two sides. This balustrade on this small landing, as well as the two larger balconies on the two upper floors, distinctly shows its wood structure. It consists, in its scheme, of three horizontals—a hand rail, a base rail, and an intermediate piece—supported by studs at certain intervals. Where the joints occur, nail heads are shown in the form of decorative metal buttons. Where the balustrade of the landing meets the steps, it is ingeniously eased off in a downward curve, as can be seen in the illustration. This interesting way of ending railing is represented also in the Han model house in the Museum of the University of Pennsylvania. It probably was a common treatment of the subject by the architects in those days. At this point on the railing is a peculiar piece of horizontal board of plank, apparently nailed down in the middle on top of the railing. It may be a piece supposed to be pivoted on this rail like a turn-stile, and when turned over, could be locked, so that the advance of any intruding ghosts might be barred.

这种房屋模型想必是为满足孝子贤孙们想给先人提供舒适阴宅的急切愿望而生产的。

在建筑学上，它极有意义。关于汉代建筑，没有真正的大型建筑物保存至今，并且未来的发现也不大可能。在山东省嘉祥县附近武氏祠的少数浮雕中，刻画了单层、双层甚至三层的宫室，但这种描绘只能给予实际建筑形象以非常模糊的概念。另外的信息来源是汉墓神道前形成纪念性入口的石阙。这些雕刻的石阙几乎都有带屋顶檐口形式的精心雕刻的顶部，是木结构的仿制品，而且相当准确地表达出结构系统。但是下面的部分则只不过是块平板，完全没有表现出住宅的使用部分。

第三个在造型上的来源，则是出土的陶制模型（明器）。这些住宅是否原本是为死者准备的在阴间的生活之处虽然难以肯定，但是从外观上，它们却是该时代居住建筑的极好表现。

福格博物馆的这个明器，是许多建筑要素的独特组合器。我们可以不用过多怀疑地设想：它每层至多只有一个房间。我们称之为首层处，前面有两个出入口。这两个出入口开向一座小的门廊平台，从平行于前立面的几步台阶可以通至其上。自这个门廊出入的死者鬼魂，由两面的扶手栏杆保护着，以防其跌落。小平台的栏杆也像上边两层较大的阳台一样，明显是模仿木结构的。它的组成包括三条水平带——一扶手、一基座以及一中间部分——由一定间隔的立柱支承。当出现结合点处，则

有表现装饰性金属圆纽形状的钉头。在平台扶手栏杆到台阶处时，巧妙地变成向下的曲线，如插图中可以看到的（见后）。这种结束扶手的有趣方法，也同样表现在宾夕法尼亚大学博物馆所藏的汉代明器上。这大概是当时建筑师们的一般处理方法。在扶手的这个点上是一块特殊的水平板，表面上钉在扶手顶部的中间。它可能是可以在扶手上旋转的一块板，像一个转挺，转动后能将平台锁上，将任何闯入的恶鬼拒之门外。

The house itself is shown in an indication of, if we may call it, "half timber construction," that is, a framework of uprights and lintel is first constructed, and the wall spaces between are filled in with solid masonry or merely plaster on lath. The latter case is still commonly practiced in Japan today, and this model is undoubtedly the miniature of a near ancestor of the architectural forms which were introduced to the Islands at the Suiko period.

The two doorways leading to the porch are expressed structurally with jambs on the sides and a common lintel over head. One of them is left ajar, and the other closed. The closed door is well rendered by a few parallel vertical lines suggesting a wood texture. The open door is slightly lower than the closed one, probably due to the inaccuracy of the potter.

The two side walls have each a round hole like a bull's eye window. The same are also found on the two upper stories. It is possible to explain it as an escape for hot air to prevent the house from bursting during the process of baking. But they show a very consistent architectural scheme not to be overlooked.

On the front wall are two projecting corbels, flanking the two doors. On them are the two brackets which support the second floor balcony. One of these corbels is cleverly merged with the narrow side of the balustrade of the landing. The precise form of these brackets is not yet known to us. They are certainly not the same thing that is commonly seen in Chinese and Japanese architecture, both ancient and modern. It is an upright supporting a horizontal on top, but to assure its rigidity, another horizontal is put across the upright at a little distance down, and the ends of the horizontals are held in place by means of some almond shaped "nuts." The two horizontals are decorated with a simple panel, more likely meant to be painted on, and the short stub between them has a monster's mask with a large ring in its mouth. The short piece supporting the lower horizontal is decorated with a leaf form. These brackets were made from a mold.

Immediately above these brackets is the second-floor balcony, showing the same structural detail as the smaller one underneath; but it is carried around and it overhangs the front and the sides of the house. It has three bays in front and the ends are strengthened by an

extra post, with the intermediate horizontal stopping only at the inner post. Nail heads in form of bosses are used at joints, and, on the base rail, on axis of the bays. This balcony, the ones above and beneath it, as well as the timbers framed in the walls of the first floor, are all decorated with lines crossing each other to make a diamond shape, which is characteristic of many other decorated sculptures of the Han Dynasties.

这个住宅本身表现的样式，我们或可称之为“半木构架”——即先造起由立柱和梁组成的框架，再将其间的墙体部位以实砌体或板条抹灰填充。后面这种作法，在今天的日本仍然普遍实践着，而这个明器无疑是近于初始形式的建筑小模型，该种建筑形式是在推古时期被日本岛国引进的。

通向门廊的两个门，从结构上表现出两边有门框和顶上有一通梁。一个门半开着，另一个关着。关着的门刻画入微，以几条平行的垂直线表现着本材质感。开着的门稍低于关着的门，这可能由于陶工做得不够精确。

两侧墙上各有一个像圆窗似的洞口。同样在上面两层也有。它可能解释为热气出口，以防模型在焙烧的过程中爆裂。但是它们也显示出一种不应忽视的非常协调的建筑设计。

在正面墙上，双门的两旁是两个突出的托臂，其上是两个托架支撑着二层阳台。托臂之一聪明地并入了平台扶手栏杆的短边。这些托架的精确形式我们尚不清楚。它们肯定与古代或现代的中国和日本一般见到的斗拱不是同样的东西。它是一根直立件顶上支撑着一个水平件，但为了保证其刚性，又有另一水平件穿过垂直件放在稍下边，水平件末端是用一些扁桃状的“坚果”来固定位置的。两个水平件以简单的镶板装饰，很像本应是上面涂色的，而在其间的短柱则有一个嘴里衔着大环的兽面。支承下面水平件的短件以叶形装饰。这些托架全用模子制成。

紧接在这些托架上的是二层阳台，同下面较小的平台一样表现着同样的结构细部；但是它是环绕房子四周的，并且悬挑在房子前面和边上。阳台在前面分成三个柱间，在端部则另有较粗的立柱加固，只是在内柱之间带有中间水平栏板。凸圆状的钉头用于连接点，在底横杆上和柱间轴线上。这个阳台，以及它上面和下面的阳台，同首层墙上的框架木材一样，都用互交成菱形的线装饰，它是汉代许多装饰性雕刻的特点。

The balustrades at the two ends of the building are left merely a smooth low wall, undecorated. The underside of the second-story balcony is decorated with a series of closely drawn parallel line suggesting the so-called combed line ornament.

There are still two riddles in this balcony which remain unsolved. First, the little extra boards at the corners of the railings, nailed down in the same manner as the "turn-stile" on the lower floor. An excuse

for its presence is difficult to find. Second, the two lower corners of the balcony are smoothly sliced off. It is not likely to be a faithful reproduction of the structural detail, as the architects or carpenters of the Han would know well enough not to weaken an important joint. It is probably a potter's technicality. The balcony is much wider on the side than in front. The overhang is also braced at one end to the wall by a diagonal piece. The second-story eave receives the same treatment.

The second story is quite different from the first. There is no doorway on any wall in spite of the balcony around it. There is only a rectangular window on the front, the frame of which projects slightly from the wall surface. Diagonals crossing each other make this a latticed opening. The wood frame and the lattice are ornamented with lines. The ornamental nail heads also appear on the window frame.

The walls of this story have no indication of the timber frame. Two brackets like those of the lower floor project from the wall, at the corresponding position supporting a roof, instead of the balcony, which comes over the roof.

The roof is very interesting. It shows only the tiles. The rafters underneath them are innocently forgotten by the potter. The tiles are apparently similar to those of the orient today. The tubular ridges, the supposed to be concaved spaces between them, the double crested hips, all are precisely the same as those of today. The tile ends are decorated with a simple design of two concentric circles; the band between them is divided into four quadrangles with a little boss in each. Inside of the inner circle is a slightly larger boss. The potter made the tubular ridges too thin for the end design so that the jointing of the two makes a clumsy shape resembling a horse's hoof.

The third or top story has a balcony exactly like that of the second. It is the same in every detail—even the curious corner board on the railing and the sliced off lower corners.

在建筑物两头的栏杆，则仅处于光溜无装饰的矮墙状态。二层阳台的底面以一系列刻画稠密的平行线加以装饰，使人想到所谓的齿纹饰。

这个阳台仍然有两个谜团没有解开：第一，附加的小板以首层栏杆上同样的方式钉在扶手角上，这难以找出其存在的理由。第二，阳台两个拐角的下边被整齐地切掉了。它不大可能是结构细部的忠实再现，因为汉代的建筑师或木工们也很清楚，不能削弱此重要节点。它大概是某位陶工的技术问题。侧面的阳台比正面的要宽得多。悬挑部分也由墙上伸出的斜撑加固。二层的挑檐也有同样的处理。

二层与首层完全不同。二层虽有阳台环绕，却在任何墙上全没有门。在正面上只有一个长方窗，其窗框稍稍突出于墙面。窗棂斜向交叉

而成为斜条格窗。木窗框和斜条全用细线装饰。装饰性钉头也出现在窗框上。

这层墙壁并未表现出木框架的迹象。两个托架像下层一样突出于墙面，而在原阳台的位置上托起了屋檐，阳台则在屋檐的上面。

屋檐非常有趣。它只表现着屋瓦，下面的椽子则被陶工无辜地省略了。屋瓦显然与今天东方的那些类似。筒形的脊背、其间想象应是下凹的空间、双顶饰的斜脊，全部同今天的一模一样。瓦端头（瓦当）简单设计成两个同心圆来装饰，两圆之间分成四个四边形，每个中间有个小凸圆饰，而在内圆的中心则是稍大的凸圆饰。陶工的筒形瓦垄做得太浅了，因而贴上圆形瓦当后成了不规矩的马蹄形了。

第三层或顶层的阳台极像第二层的那样，每个细部完全相同——甚至扶手上奇特的角处板和被切掉的下边拐角。

House model, unglazed clay with polychrome, Han Dynasty (206 BC–221 AD), Fogg Museum at Harvard University. 哈佛大学福格博物馆藏 汉明器

This floor, too, is doorless, but it has two windows in front. One is a mere rectangular opening, the jambs of which are decorated with diamond cross lines. The other window has a curious cage masking the entire opening. It looks as if a box is put against the wall. The top is taken off, and the front is in the form of a grill or lattice. The enclosed space forms a protruded sill of considerable room. The sweet

daughter of the house must have carefully caressed her delicate flowers planted in pots and placed on this sill, or else she must have leaned pensively over this high window meditating about some romantic Prince Charming that might one day come from a distant land to ask her father for her hand.

A pair of brackets is again placed at exactly the same position supporting the crowning roof. This one is not unlike the skirt-like roof dividing the two upper stories except that instead of carrying the balcony, the four sloping sides go up to meet in a ridge, which is in the form of a shallow crescent. The tubular ridges at the sides have no decorative tile ends, as on the second floor. The rear surface of the top roof is left simply plain, with a crude suggestion of the double crested hips. The Han potter, like some American architects of today, must have forgotten or purposely neglected the other three facades.

As a whole, the potter conceived the piece in terms of different architectural elements with no sense of scale whatsoever. The brackets are huge, and also the roof tiles. The balcony is much too narrow, and its railing is heavy. However, it is superfluous to criticize it from such a viewpoint. The innocence and naivety of this ancient craftsman is most entertaining.

The question of multi-story buildings may be of some interest. Although the trick of superposing one house over another was known to the ancient Chinese, the use of such for habitation is found only in a comparatively late date. Ch'in Shih-huang-ti's palace, the O-fang-kung is said to have a sitting capacity of ten thousand on the upper floor, and beneath it, a flag on a fifty-foot pole could be hoisted.

The chronology shows that the early Han emperors built quite a number of t'ai (towers), mainly for sporting or religious purpose. It is not until the great Han Wu-ti that the definite evidence of upper story living have been recorded. Not satisfied with merely a glorious long reign of over fifty years, he became desirous to find the elixir of life, and to get into communication with the immortals. Kung-shun Ch'ing the magician said that the immortals loved living in lo (house of more than one story), so a number of them were ordered to be constructed. Kung-shun Ch'ing was charged to live in them with all ceremonial apparatus to wait for the visit of the immortals.

这层也没有门，但正面有两个窗户。一个不过是一长方形的开口，窗框饰以斜交线。另一个窗户则用奇怪的笼子遮住了整个窗口。它看上去像是个箱子反扣在墙上。它的顶板已经去掉，而正面像网或格栅。闭合的空间形成一间相当大的突出的窗台。这所住宅里的可爱小姐，曾经一定细心抚弄她摆在这个窗台上的娇嫩盆花，或者心事重重地斜倚在窗边，默想着浪漫的白马王子，他可能有朝一日，自远方来请求她的父亲

把女儿嫁给他。

再一次置于相同位置上的一对托架，支撑着屋面。它与将上面两层隔开的裙状屋檐样子相似，只是不再支承阳台，而是四面坡屋面向上汇于一条微呈新月形的房脊上。侧面的瓦垄没有像二层的屋檐那样有端头瓦当。屋顶的后坡表面是没有装饰的，双顶饰的斜脊也做得粗糙。汉代的陶工，也像今天某些美国的建筑师一样，一定是忘掉或有意忽略其他三个立面了。

从整体看，陶工在构想这些不同的建筑组件时，毫无尺度比例的概念。托架巨大，屋瓦也是这样。阳台过于狭窄，而其扶手却极粗。然而，用这种观点去批评它未免太过分。这位古代匠师的天真和质朴是最有趣的。

多层建筑物的问题可能有点意思。虽然古代中国人已知将房屋叠加起来的手法，而将其用于住房仅发现在较晚时期。据说秦始皇的宫殿（阿房宫）“上可以坐万人，下可以建五丈旗”。

史书记载：汉朝初年的皇帝们曾建了许多台，主要为游乐或宗教目的。直到汉武帝，才有住楼上的确切记载。他不满足于五十多年的盛世王朝，开始渴望长生不老，并且得与诸神交往。方士公孙卿进言说，诸神喜欢住在多层的楼上，因此遵旨建成了许多楼房。皇帝命公孙卿住于楼上，备好全部礼器，静待众神造访。

The reliefs from the Wu family tombs show a number of two- or three-story buildings. Generally the first floor is for service; the second for men, and other social and business affairs, as feast scenes are often shown; and the third is most logically assigned to women, as the sexes had always been most carefully separated since the earliest time.

This model is important for its completeness in showing the architectural elements. Of special significance is the use of brackets, which is a unique feature of Chinese architecture. It must have originated back of history, far beyond the memory of the BC chroniclers.

Curious enough is that every house in the Han reliefs has columns, but none of our Han models has any trace of it. It is not a good excuse to say that the material is not fit for it, as we can see that house models with columns of later periods have been found. Our knowledge may have to stop here for the time being. Some future discoveries may help to throw more light on this, and many other problems. The secret remains always a secret until it is revealed.

武氏祠的浮雕上表现着许多二层或三层建筑物。一般讲，首层是作服务之用的；二层是为男人们提供的，并且是处理社会或其他事务之处，因为经常可见宴会情景；第三层最符合逻辑的是分配给妇女们，因为自古以来，男女从来就是严格分开的。

这个明器的重要性在于其表现建筑物各组成部分的完整性。尤其意义重大的是托架（斗拱）的使用，它是中国建筑中独有的特征。它肯定是大大早于有史书的时代所创始的。

十分奇怪的是：汉代浮雕中每个住宅都有柱子，但是在我们的汉代明器中却没有它的踪迹。如果说这种材料不宜于表现柱子，其理由似难成立，因为我们已经发现较晚时期的有柱子的明器。我们的理解目前仅止于此。某些未来的发现将可能帮助我们更多了解这个疑问以及其他许多问题。秘密在揭露之前总还是秘密。

Two Liao Structures of Tu-lo Ssu, Chi Hsien

蓟县独乐寺观音阁山门考^[1]

〔1932〕

I. INTRODUCTION

Records and descriptions of ancient Chinese architecture are often found in the classics and essays such as *The Kao-kung-chi of Chow-li*^[2], *The O-fang-kung Fu*^[3], *The Liang-tu Fu*, *The Liang-ching Fu*,^[4] and *The Lo-yang Chia-lan Chi*^[5] (Figure 1). In these the palaces and temples of old are described most beautifully and often in exquisite meter, but the impression the reader obtains is merely a hazy picture of the grandeurs, the intricate construction and the elaborate ornaments of these structures. The Ming and Ts'ing Dynasties have handed down more records of old palaces, among which the *Yuan-ku-kung Yi-lu*^[6], or *Recollections of the Old Yuan Palaces*, by Hsiao Hsun of the Ming Dynasty, is well known to Chinese scholars. Nevertheless, these records are no more than long lists of names of different buildings, with figures indicating their dimensions, and characters indicating their positions relative to the cardinal point.

壹 绪言

近代学者治学之道，首重证据，以实物为理论之后盾，俗谚所谓“百闻不如一见”，适合科学方法。艺术之鉴赏，就造形美术言，尤须重“见”。读跋千篇，不如得原画一瞥，义固至显。秉斯旨以研究建筑，始庶几得其门径。

我国古代建筑，征之文献，所见颇多，《周礼·考工记》、《阿房宫赋》、《两都赋》、《两京赋》，以至《洛阳伽蓝记》（图1）等等，固记载详尽，然吾侪所得，则隐约之印象，及美丽之辞藻，调谐之音节耳。明清学者，虽有较专门之著述，如萧氏《元故宫遗录》，及类书中

官室建置之辑录，然亦不过无数殿宇名称，修广尺寸，及“东西南北”等字，以标示其位置，盖皆“闻”之属也。

蓟县独乐寺伽蓝配置略图

To obtain knowledge of the actual appearance of the architecture of its structure through reading these records is as difficult as to try to recognize a person's face from a description. The study of ancient Chinese architecture, like all other plastic arts, must naturally be undertaken with the aid of actual specimens, and not merely through literature.

Wood has since time immemorial been the principal material used in Chinese buildings. It is used as a structural frame, and walls are filled in as "curtain walls." The system is identical with that of the reinforced concrete or steel frame systems of today. When wood is used to form the structural frame, its durability becomes the one factor that determines the length of life of the building. Unfortunately it is an impermanent material and thus a wooden edifice of ancient period is rare and therefore especially valuable. But, under favorable circumstances, wood can easily last over a thousand years or more. The Scientific Expedition to the Northwest that returned to Peiping in 1931, brought back from Chinese Turkestan numerous wooden chien, or thin sheets of wood, of the Han Dynasty, all in a remarkable state of preservation. As they are all over two thousand years old, they can testify to the durability of wood under certain circumstances.

【3】Facade of south of Kuan-yin Ke. 观音阁南面立面图

读者虽读破万卷，于建筑物之真正印象，绝不能有所得，犹熟诵《史记》“隆准而龙颜，美须髯，左股有七十二黑子”，遇刘邦于途，而不之识也。造形美术之研究，尤重斯旨，故研究古建筑，非作遗物之实地调查测绘不可。

我国建筑，向以木料为主要材料。其法以木为构架，辅以墙壁，如人身之有骨节，而附皮肉。其全部结构，遂成一种有机的结合。然木之为物，易朽易焚，于建筑材料中，归于“非永久材料”之列，较之铁石，其寿殊短；用为构架，一旦焚朽，则全部建筑，将一无所存，此古木建筑之所以罕而贵也。然若环境适宜，保护得法，则千余年寿命，固未尝为不可能。去岁西北科学考察团自新疆归来，得汉代木简无数，率皆两千年物，墨迹斑斓，纹质如新。固因沙漠干燥，得以保存至今；然亦足以证明木寿之长也。

【4】 Cross section of Kuan-yin Ke. 观音阁断面图

The oldest known examples of wooden architecture are the few Suiko (593–628 AD) structures of Horyuji in Nara, Japan, built some thirteen hundred years ago by Koreans, or even possibly Chinese builders who went to Japan across the Channel from Korea. The climatic conditions of Japan are not particularly advantageous for the preservation of wooden architecture. But the comparative rarity of civil wars, as well as the love for art and antiquity on the part of the Japanese fighting nobility may account for the comparatively large number of wooden structures preserved in Japan. While in China, if any structure escaped destruction at a change of dynasty, it was a matter of sheer luck. Chinese conquerors usually followed the example of Hsiang Yü who set fire to the palaces of the Ch'in Emperors, and the flames, it is recorded in the histories, lasted for three months.

至于木建筑遗例，最古者当推日本奈良法隆寺飞鸟期诸堂塔，盖建于我隋代，距今已千三百载^[7]。然日本气候湿润，并非特宜于木建筑之保存，其所以保存至今日者，实因日本内战较少，即使有之，其破坏亦不甚烈，且其历来当道，对于古物尤知爱护，故保存亦较多。至于我国，历朝更迭，变乱频仍，项羽入关而“咸阳宫室火三月不灭”，二千年来革命元勋，莫不效法项王，以逞威风，破坏殊甚。在此种情形之下，古建筑之得幸免者，能有几何？故近来中外学者所发现诸遗物中，其最古者寿亦不过八百九十余岁^[8]，未尽木寿之长也。

蓟县独乐寺观音阁及山门，皆辽圣宗统和二年重建，去今（民国二十一年）已九百四十八年，盖我国木建筑中已发现之最古者。以时代

论，则上承唐代遗风，下启宋式营造，实研究我国建筑蜕变上重要资料，罕有之宝物也。

翻阅方志，常见辽宋金元建造之记载；适又传闻阁之存在，且偶得见其照片，望而知其为宋元以前物。平蓟间长途汽车每日通行，交通尚称便利。二十年秋，遂有赴蓟计划。行装甫竣，津变爆发，遂作罢。至二十一年四月，始克成行。实地研究，登檐攀顶，逐部测量，速写摄影，以纪各部特征。

Recent researches and discoveries have not yet revealed edifices of wood over a thousand years old in China. Until recently, the oldest known wooden edifice was the Library of Hsia Hua-yen Ssu, Ta-t'ung, built in 1038. But in April, 1932, the author had the good fortune to discover two Liao structures among the buildings of the Tu-lo Ssu of Chi Hsien, in the Province of Hopeh. The Tu-lo Ssu is a temple built in 984 AD—the second year of T'ung-ho, of the reign of Emperor Sheng-tsung of the Liao Dynasty which was contemporary with the Northern Sung Dynasty.

The two above-mentioned buildings are significant not only because they are the oldest wooden structures yet discovered in China, but because stylistically they show the transition between the T'ang and Sung styles, a rare feature that reveals a most interesting chapter in the history of Chinese architecture.

归来整理，为寺史之考证、结构之分析及制度之鉴别。后二者之研究方法，在现状图之绘制；与唐、宋（《营造法式》），明、清（《工程做法则例》）制度之比较；及原状图之臆造（至于所用名辞，因清名之不合用，故概用宋名，而将清名附注其下）。计得五章，首为总论，将寺阁主要特征，先提纲领；次为寺史及现状；最后将观音阁山门作结构及制度之分析。

除观音阁、山门外，更得观音寺辽塔一座，附刊于后。

此次旅行，蒙清华大学工程学系教授施嘉炆先生^[9] 惠借仪器多种，蓟县王子明先生及蓟县乡村师范学校校长刘博泉，教员王慕如、梁伯融，工会杨雅园诸先生多方赞助，予以种种便利。而社员邵力工、舍弟梁思达同行，不唯沿途受尽艰苦，且攀梁登顶，不辞危险，尤为难能。归来研究，得内子林徽因在考证及分析上，不辞劳，不惮烦，予以协作。又蒙清华大学工程教授蔡方荫先生^[10] 在比较计算上予以指示，始得此结果。而此次调查旅行之可能，厥为社长朱先生^[11] 之鼓励及指导是赖，微先生之力不及此，尤思成所至感者也。

II. General Characteristics

Of the Liao structures of Tu-lo Ssu, only the three-storied Kuan-yin Hall and the Shan-men or Main Entrance still remain. These are not only the oldest examples of wooden architecture known to us, but, as already stated, they are especially important in showing the transition between the T'ang and Sung periods and thus very valuable to the structure of Chinese architecture. The second year of T'ung-ho corresponds to the first year of Yung-hsi, of the reign of Tai-tsung, second emperor of the Northern Sung Dynasty. This was the 24th year of the Sung Dynasty and only 77 years since the overthrow of the T'ang sovereignty.

It was not until 116 years after the erection of these edifices that the famous *Ying-tsao-fa-shih*^[12] was first published. It is interesting to note how much nearer style of the Tu-lo Ssu structures are to the late T'ang than to the matured Sung style. Li Chieh, the author of the *Ying-tsao-fa-shih*, better known as Li Ming-chung, was imperial architect to the Emperor Hui-tsung, who was a ruler of no high ability although he was an artist of the first rank. He was later captured by the Chin Tartars, who had by this time conquered the Liao Tartars and become the invaders of the northern border of the Sung domain. With the capture of Ch'in-tsung, Hui-tsung's son and successor, the Northern Sung Dynasty ended in 1127.

貳 总论

独乐寺观音阁及山门，在我国已发现之古木建筑中，固称最古，且其在建筑史上之地位，尤为重要。统和二年为宋太宗之雍熙元年，北宋建国之第二十四年耳。上距唐亡仅七十七年，唐代文艺之遗风，尚未全靡；而下距《营造法式》之刊行尚有百十六年。《营造法式》实宋代建筑制度完整之记载，而又得幸存至今日者。观音阁、山门，其年代及形制，皆适处唐宋二式之中，实为唐宋间建筑形制蜕变之关键，至为重要。谓为唐宋间式之过渡式样可也。

The *Ying-tsao-fa-shih* is the most complete treatise on architecture of the Northern Sung style, a Vignola and a Kidder combined. A comparison of the Kuan-yin Hall and the Shan-men of the Tu-lo Ssu with the specifications and designs of the *Ying-tsao-fa-shih* has revealed to us many hitherto unknown architectural characteristics besides illustrating many statements in the book which have been almost meaningless to us before.

The general arrangement of the whole temple during the Liao Dynasty is unknown. From the old records we learn that Buddhist

temples of the Sui and T'ang Dynasties were usually divided into a number of cloisters or yuans surrounded on all sides by colonnades. Examples of such arrangements can still be found in the Horyuji at Nara, Japan. But in the case of Tu-lo Ssu, one can now find no trace of the colonnade that must have once connected the Shan-men with the rear part of the temple. The P'ei-tien or Flanking Hall in front of the Kuan-yin Hall along its east and west sides, as well as the several courtyards to the rear, are all reconstructions. Neither is the courtyard to the east in its original condition as in 1753, during the reign of Emperor Ch'ien-lung of the Ts'ing Dynasty, it was demolished to make room for the erection of an imperial apartment which stood ready for the occasional visits of the Emperor. These changes necessarily affected the general parti of the temple. Only the Hall and the Shan-men survived in these disasters.

The most important characteristic of the Hall and the Shan-men is its striking resemblance to the architecture so faithfully represented in the mural paintings of the Grottoes of Tun-huang (Figure 30). This architecture is mostly of the late T'ang or Wu-tai periods, antedating the Tu-lo Ssu structures by a hundred years or so. In these paintings there are representations of halls, one or two stories in height, with heavy overhanging eaves supported by a system of tou-kung, or brackets, of gigantic proportion. The exterior appearance of both the Hall and the Shan-men is curiously similar to the buildings in the paintings, while it is radically different from not only the Ts'ing buildings we see today, but also from the comparatively nearer style of the *Ying-tsao-fa-shih*.

This resemblance in exterior appearance is neither a coincidence nor a conscious imitation, but the natural consequence of a similar system of construction based upon the wooden structural frame.

The Chinese structural framing system may be divided roughly into three principal parts: the vertical supports, or columns; the horizontal members, or the beams, purlins; and the transitional members, or system of members, the characteristic tou-kung or brackets.

The columns of the Kuan-yin Hall, taking the material used into consideration, are rather stout in proportion, thus giving an impression of stability. The columns of the Shan-men are the same in diameter as those of the Hall while they are shorter. The columns on the second and third stories of the Hall are also the same in diameter, but shorter than those below. It is evident, therefore, that the height of the column is in proportion to the diameter as is the case with the Ts'ing style or the Roman orders. The rounded head (Figure 33) as

well as the slight inward inclination of the column are also among the few notable characteristics.

独乐寺伽蓝之布置，今已无考。隋唐之制，率皆寺分数院，周绕回廊^[13]。今观音阁山门之间，已无直接联络部分；阁前配殿，亦非原物；后部殿宇，更无可观。自经乾隆重修，建筑坐落于东院，寺之规模，更完全更改，原有布置，毫无痕迹。原物之尚存者惟阁及山门。

观音阁及山门最大之特征，而在形制上最重要之点，则为其与敦煌壁画中所见唐代建筑之相似也。壁画所见殿阁，或单层或重层，檐出如翼，斗拱雄大。而阁及门所呈现现象，与清式建筑固迥然不同，与宋式亦大异，而与唐式则极相似。熟悉敦煌壁画中净土图（图30）者，若骤见此阁，必疑身之已入西方极乐世界矣。

其外观之所以如是者，非故仿唐形，乃结构制度仍属唐式之自然结果。而其结构上最重要部分，则木质之构架——建筑之骨干——是也。

其构架约略可分为三大部分：柱，斗拱，及梁枋。

观音阁之柱，权衡颇肥短，较清式所呈现现象为稳固。山门柱径亦如阁，然较阁柱犹短。至于阁之上中二层，柱虽更短，而径不改，故知其长与径，不相牵制，不若清式之有一定比例。此外柱头削作圆形（图33），柱身微侧向内，皆为可注意之特征。

The tou-kung or bracketing system is a peculiarity unique to the Chinese style architecture—in the broader sense which therefore includes the Japanese style. It is a motif structural in function, while at the same time highly decorative in appearance. It is the transition as well as the connection between the horizontal members above and the vertical supports below. The position it occupies in Chinese architecture is much like that of the order in the Greco-Roman styles. One may justly say that the development of the tou-kung has influenced the development of the Chinese structural system just as the order has influenced Western architectural styles.

The origin of the tou-kung is unknown. As early as the Chou Dynasty, it was often mentioned in literature. Among the sepulchral sculpture of the Han Dynasty one finds the tou-kung in stone, imitating a highly perfected wooden construction. During the T'ang and Sung Dynasties, the tou-kung was used primarily for its structural value—for the support of the heavy overhanging eave; it was logical both in proportion and arrangement. But, during the Ming and Ts'ing Dynasties, the tou-kung gradually lost its original function, became more intricate and delicate, and assumed a weak and frail proportion. Since the Ming Dynasty, the tou-kungs have increased in number and have become almost purely ornamental. The degeneration of the tou-kung has reached the utmost limit.

Returning to the Tu-lo Ssu, the height of tou-kungs of the Hall

and the Shan-men is approximately half the height of the column, or one-third of the entire story, while the Ts'ing regulation allowed only a proportion of about one-fourth or one-fifth of the column, or one-sixth of the height of the entire story. A simple comparison of the height of the tou-kung to its height or the column is a fair means of judging the importance of the tou-kung. Structurally, these Liao tou-kungs are also different from those of the Sung or Ts'ing system. They are constructed so as to serve each its particular function, and they are units of an organic, logical whole. In the case of the Kuan-yin Hall, the tou-kungs support either the eave, the balcony, or the beams and purlins; they are placed either on a column, or between columns, or at a corner; they are used either on the exterior or the interior, on the first, second, or third stories. Each one was designed to fulfill its particular function. These are in all twenty-four different kinds of tou-kung, each kind alone being an exemplification of architectural logic.

The beams and other horizontal members in the Hall and the Shan-men are all laid according to the simple lintel system, involving no complicated theory of mechanics. The only peculiarity of the beams as compared with those of later Chinese structures is the proportions of the cross section.

斗拱者，中国建筑所特有之结构制度也。其功用在梁枋等与柱间之过渡及联络，盖以结构部分而富有装饰性者。其在中国建筑上所占之地位，犹柱式之于希腊罗马建筑；斗拱之变化，谓为中国建筑制度之变化，亦未尝不可，犹柱式之影响欧洲建筑，至为重大。

唐宋建筑之斗拱以结构为主要功用，雄大坚实，庄严不苟。明清以后，斗拱渐失其原来功用，日趋弱小纤巧，每每数十攒排列檐下，几成纯粹装饰品，其退化程度，已陷井底，不复能下矣。

观音阁山门之斗拱，高约柱高一半以上，全高三分之一，较之清式斗拱——合柱高四分或五分之一，全高六分之一者，其轻重自可不言而喻。而其结构，与清式、宋式皆不同；而种别之多，尤为后世所不见。盖古之用斗拱，辄视其机能而异其形制，其结构实为一种有机的、有理性的结合。如观音阁斗拱，或承檐，或承平坐，或承梁枋，或在柱头，或转角，或补间，内外上下，各各不同^[14]，条理井然。各攒斗拱，皆可作建筑逻辑之典型。都凡二十四种，聚于一阁，诚可谓集斗拱之大成者矣！

观音阁及山门上梁枋之用法，尚为后世所常见，皆为普通之梁，无复杂之力学作用。其与后世制度最大之区别，乃其横断面之比例。

The Ts'ing regulation specifies that the proportion of the width to the height of the cross section of a beam be either eight to ten or ten to twelve, resulting in almost a square. The Sung regulation, as specified in the *Ying-tsoo-fa-shih* seems to be more scientific, requiring

a proportion of two to three. The Liao proportions, as seen in the Hall and the Shan-men, are one to two, just those most practiced in modern construction. It is incredible that a thousand years of evolution in Chinese architecture has brought us not only to no new knowledge, but positively to greater ignorance in the mechanics of materials.

Another characteristic of importance is the high degree of standardization in the size of the timbers. In the Kuan-yin Hall, there are only six different sizes in its structural members. This extreme degree of standardization must have simplified to a very great extent the processes of designing, cost estimation, as well as construction.

Among the less important characteristics may be mentioned the ceiling of the Hall and the tile ornaments of the roof. The caisson of the Hall has an appearance quite different from the corresponding sections of the Imperial Palaces of the Peiping of today. The check-squares are rather small in proportion to the timbers that are used to form them. This peculiarity is also found in the architecture of the Kamakura period in Japan. The roof-tiles are later substitutes of the Liao original. The ornamental ridge-ends of the Shan-men are particularly interesting. Prior to the Sung Dynasty, this feature was a kind of fish-tail, turned upwards and inwards towards the center of the building, while the post-Sung examples were all in the form of a dragon's head with a small tail turned up and outward. On the Shan-men one finds a combination of both: the lower part is already the dragon-head of today while the top still retains the upward-inward tail of the T'ang manner. This ornament may not be the original of the Liao period, but is probably a Ming reproduction of the original. As a milestone marking a step in the history of architecture, no better example can be found.

The peculiarly low ch'ün-chien or "pedestal" of the masonry wall is also noteworthy. It is less than half the height of the Ts'ing specifications. The few Liao structures in the northern part of Shansi Province all possess this same characteristic, which must have been particular to that age.

The colossal statue of the Eleven-headed Kuan-yin, although it was remodeled at the time of the reconstruction of the Temple, still retains much of the T'ang flavor. The two smaller Bodhisattvas standing on either side of the central figure are particularly T'ang in character. They could undoubtedly be placed in their due position in the history of Chinese sculpture.

梁之载重力，在其高度，而其宽度之影响较小；今科学造梁之制，大略以高二宽一为适宜之比例。按清制高宽为十与八或十二与十之比，

其横断面几成正方形。宋《营造法式》所规定，则为三与二之比，较清式合理。而观音阁及山门（辽式）则皆为二与一之比，与近代方法符合。岂吾侪之科学知识，日见退步耶！

其在结构方面最大之发现则木材之标准化是也。清式建筑，皆以“斗口”^[15] 为单位，凡梁柱之高宽，面阔进深之修广，皆受斗口之牵制。制至繁杂，计算至难；其“规矩”对各部分之布置分配，拘束尤甚，致使作者无由发挥其创造能力。古制则不然，以观音阁之大，其用材之制，梁枋不下千百，而大小只六种。此种极端之标准化，于材料之估价及施工之程序上，皆使工作简单。结构上重要之特征也。

观音阁天花，亦与清代制度大异。其井口甚小，分布甚密，为后世所不见。而与日本镰仓时代^[16] 遗物颇相类似，可相较鉴也。

阁与山门之瓦，已非原物。然山门脊饰，与今日所习见之正吻不同。其在唐代，为鳍形之尾，自宋而后，则为吻，二者之蜕变程序，尚无考。山门鸱尾，其下段已成今所习见之吻，而上段则尚为唐代之尾，虽未可必其为辽原物，亦必为明以前按原物仿造，亦可见过渡形制之一般。

砖墙下部之裙肩，颇为低矮，只及清式之半，其所呈现现象，至为奇特。山西北部辽物亦多如是，盖亦其特征之一也。

观音阁中之十一面观音像，亦统和重塑，尚具唐风，其两傍侍立菩萨，与盛唐造像尤相似，亦雕塑史中之重要遗例也。

III. History

About 180 li directly east of Peiping (Peking) is the old city of Chi Hsien. During the Han Dynasty, it was a part of Yü-yang Chün. It was not until the reign of Emperor Hsuan-tsung, 712-756 AD, of the T'ang Dynasty that the Magistracy of Chi-chou was first founded. The Tsin rulers of the Wu-tai period ceded the land as a bribe to the Liao Tartars, and, thereafter, for a period of nearly four hundred years, the land was under the control of the northern invading tribes. The Chin Tartars once returned Chi-chou to the Sung, only to snatch it back a few years later. Even during the Yuan and Ming Dynasties it continued to be the zone of conflict between the Chinese and the invaders from the North, a city of strategic importance, guarding the entrance to old Peking.

Chi-chou is not only a city of military importance, but also a name that has been dear to artists and poets for over a thousand years. The quaint fortified city is located at the foot of Pan Shan, the beautiful hill that has been the subject of so many poems of the T'ang

and Sung Dynasties.

Being a city of no little importance, Chi Hsien is well provided with public buildings of all kinds—offices, schools, garrisons, barns, as well as Taoist and Buddhist temples (Figure 5). And the one temple that had been the religious center, for over a thousand years, to the Chi people, is no other than the Tu-lo Ssu, situated just inside the Western City Gate. Its three-storied Kuan-yin Hall towers over the city wall and is visible miles away. On the fifteenth day of the third moon every year, a fair is always given in the temple; pilgrims from all parts of the hsien will come, to participate in and enjoy the different acrobatic side-shows and tournaments, and to ascend the celestial hall to view the mountains and the plain, and finally to pay homage to the almighty God (or Goddess) of Mercy. This has been the custom for centuries, the origin of which is perhaps as old as the city itself.

【5】 Map of Chi-chou.[Copy of *Chi-Chou Chih* during Kang-hsi Period] 蓟州城图 [摹自康熙《蓟州志》]

叁 寺史

蓟县在北平之东百八十里。汉属渔阳郡，唐开元间，始置蓟州。五代石晋，割以赂辽，其地遂不复归中国^[17]。金曾以蓟一度遣宋，不数年而复取之。宋元明以来，屡为华狄冲突之地；军事重镇，而北京之拱

卫也。蓊城地处盘山之麓。盘山乃历代诗人歌咏之题，风景幽美，为蓊城天然之背景。

蓊既为古来重镇，其建置至为周全，学宫衙署，僧寺道院，莫不兼备（图5）。而千数百年来，为蓊民宗教生活之中心者，则独乐寺也。寺在城西门内，中有高阁，高出城表，自城外十余里之遥，已可望见。每届废历^[18]三月中，寺例有庙会之举，县境居民，百数十里跋涉，参加盛会，以期“带福还家”。其在蓊民心目中，实为无上圣地，如是者已数百年，蓊县耆老亦莫知其始自何年也。

But, in spite of the religious and social importance of Tu-lo Ssu, the history of the temple is shrouded in mists. Its origin is unknown. It is said that the tablet in the little pavilion placed at the middle of the roof-ridge of the Hall once bore the characters "Built in the Tenth Year of Cheng-kwan" (636 AD); some say that the inscription was "Built under the direction of Yü-ch'ih Ching-teh"; while another version of the story combines these two and the inscription is reported as "Built in the Tenth Year of Cheng-kwan under the direction of Yü-ch'ih Ching-teh." Yü-ch'ih Ching-teh was a general under T'ang T'ai-tsung, and having successfully assisted the Emperor in building the Empire, was later entrusted with the erection of many important palaces and temples. Thus he became a legendary figure, to whom any building that is considered old is attributed. Now the tablet is no longer the original, but a plain one without any inscription, so that the date and the name of the architect if it is supposed to have cannot be assumed as authentic. And, even if they are accepted, they mark only the founding of the history of the temple. The Kuan-yin Hall and the Shan-men as they stand today could not have been built at the founding of the temple as they are decidedly of a period later than the T'ang.

The people of Chi Hsien also take delight in telling that the Tu-lo Ssu, the Temple of "Unshared Joy," is the site where An Lu-shan, the rebellious Tartar general, then garrison commander of Yü-yang, took his oath of office before he started his march against the romantic Emperor Hsuan-tsung. The wicked general, it is said, named the temple "Tu-lo" because he did not want his joys shared by others.

To the northwest of the city is a river by the same name. It is a problem whether the temple is named after the river, or the river after the temple, or both named by the selfish Tartar rebel.

The Temple must have been founded no later than the beginning of the T'ang Dynasty. A passage from the *P'an-shan Chih*^[19] is quoted in the *Jih-hsia-chiu-wen Kao* as follows:

"Tu-lo Ssu, date of founding unknown; reconstructed in the Liao

Dynasty. In the temple is a stele by Liu Cheng, Hsueh-shih of the Han-lin Yuan, erected in the fourth year of T'ung-ho. The inscription reads 'The late Shang-fu, Prince of Ch'in, requested the Great Master T'an-chen to Tu-lo Ssu to repair the Kuan-yin Hall. In the tenth moon, in the winter of the second year of T'ung-ho, the great Hall was reconstructed. It measured two stories in height, and had five bays from east to west, and eight rafters from south to north. The statue of the Eleven-headed Kuan-yin was also remodeled.'

The reign of T'ung-ho was about three hundred years after the beginning of the T'ang Dynasty which was marked by a hitherto unequalled spread of Buddhism. Many temples and statues were then erected so that it is quite probable that the Tu-lo Ssu was founded then, and for three centuries or more, well protected by the devout public.

独乐寺虽为蓟县名刹，而寺史则殊渺茫，其缘始无可考。与蓟人谈，咸以寺之古远相告；而耆老缙绅，则或谓屋脊小亭内碑文有“贞观十年建”字样，或谓为“尉迟敬德监修”数字，或将二说合而为一，谓为“贞观十年尉迟敬德监修”者，不一而足。“敬德监修”，已成我国匠人历代之口头神话，无论任何建筑物，彼若认为久远者，概称“敬德监修”。至于“贞观十年”，只是传说，无人目睹，亦未见诸传记。即使此二者俱属事实，亦只为寺创建之时，或其历史中之一段。至于今日尚存之观音阁及山门，则绝非唐构也。

蓟人又谓：独乐寺为安禄山誓师之地。“独乐”之名，亦禄山所命，盖禄山思独乐而不与民同乐，故尔命名云。蓟城西北，有独乐水，为境内名川之一，不知寺以水名，抑水以寺名，抑二者皆为禄山命名也。

寺之创立，至迟亦在唐初。《日下旧闻考》引《盘山志》云：

“独乐寺不知创自何代，至辽时重修。有翰林院学士承旨刘成碑。统和四年孟夏立石，其文曰：‘故尚父秦王请谈真大师入独乐寺，修观音阁。以统和二年冬十月再建上下两级、东西五间、南北八架大阁一所。重塑十一面观音菩萨像。’”

自统和上溯至唐初三百余年耳。唐代为我国历史上佛教最昌盛时代；寺像之修建供养极为繁多，而对于佛教之保护，必甚周密。在彼适宜之环境之下，木质建筑，寿至少可数百年。

Then came the disturbances of Wu-tai after the overthrow of the T'ang line, when the religious fervor, curiously coincidental with the political and social welfare, sank down to the unprecedentedly low ebb. It was at this time that the Chi district was ceded to the Liao Tartars, and, most probably, the buildings of the Tu-lo Ssu reached a state of deterioration that made reconstruction necessary. The supposition that the Tu-lo Ssu had already had a history of three hundred years or more prior to the reconstruction in 984 AD is not

altogether untenable.

The stele of Liu Ch'eng has since long disappeared, while the name of the erector is also unknown to history. Shang-fu, Prince of Ch'in, whose proper name is Yeh-lü Nu-kwa, was a Prince of royal blood and a general, who, more than once, defeated the Sung army in the vicinity of Ting-chou and Wang-tu, situated in the southern part of the Province of Hopeh. Chi-chou, which is nearer to the northern border of the present province, was then considered safe in the interior of the Liao domain, where constructions could be carried on without the danger of being interrupted by the receding Sung. Yeh-lü Nu-kwa was, therefore, the client or donor of the reconstructed Tu-lo Ssu, while T'an-chen, Buddhist monk of high prestige, supervised the construction.

It has already been noted that, chronologically, the Liao structures of the Tu-lo Ssu belong rather to the late T'ang than to the matured Sung style. It is also interesting to note that, geographically, during the T'ang Dynasty Chi-chou was a part of China, where the cultural influence from Ch'ang-an could not but have dominated, while after the fall of T'ang, it fell into the hands of the "barbarians." There the old cultural sway nevertheless naturally lingered on, and more likely, retained more of the T'ang flavour than in China proper, for the very reason that it was separated from China where new movements in culture continued to develop, sweeping away and replacing the old as time went on. Therefore, the Tu-lo Ssu structures, as is the case with Roman colonial architecture, may be built in a manner older than its accepted date, while further down south in the Sung territory, the Chinese had modified architectural style to something that is more akin to that of the Ying-tsao-fa-shih.

The hall that we see today answers well to the description of the Liu Ch'eng stele, "two stories in height, five bays from east to west, and eight rafters from south to north." In reality, the Hall is of three stories but the second story, which is a sort of mezzanine, is invisible from the exterior. The Hall thus has the appearance of a two-storied building, or a building of two principal and a mezzanine stories. "Eight rafters" means that there are nine purlins running from east to west, thus dividing each row of rafters into eight sections.

殆经五代之乱，寺渐倾颓，至统和（北宋初）适为须要重修之时。故在统和以前，寺至少已有三百年以上之历史，殆属可能。

刘成碑今已无可考，而刘成其人者，亦未见经传。尚父秦王者，耶律奴瓜也。^[20]按辽史本传，奴瓜为太祖异母弟南府宰相苏之孙，“有膂力，善调鹰隼”，盖一介武夫。统和四年始建军功。六年败宋游兵于定州，二十一年伐宋，擒王继忠于望都。当时前线乃在河北省南部一带，

蓟州较北，已为辽内地，故有此建置，而奴瓜乃当时再建观音阁之主动者也。

谈真大师亦无可考，盖当时高僧而为宗室所赏识或敬重者。观音阁之再建，是在其监督之下施工者也。

统和二年，即宋太宗雍熙元年，公元984年也。阁之再建，实在北宋初年。《营造法式》为我国最古营造术书，亦为研究宋代建筑之唯一著述，初刊于宋哲宗元符三年（公元1100年）^[21]，上距阁之再建，已百十六年，而统和二年，上距唐亡（昭宣帝天祐四年，公元907年）仅七十七年。以年月论，距唐末尚近于《法式》刊行之年。且地处边境，在地理上与中原较隔绝。在唐代地属中国，其文化自直接受中原影响，五代以后，地属夷狄，中国原有文化，固自保守，然在中原若有新文化之产生，则所受影响，必因当时政治界限而隔阻，故愚以为在观音阁再建之时，中原建筑若已有新变动之发生，在蓟北未必受其影响，而保存唐代特征亦必较多。如观音阁者，实唐宋二代间建筑之过渡形式，而研究上重要之关键也。

阁之形式，确如碑所载，“上下两级，东西五间，南北八架”。阁实为三级，但中层为暗层，如西式之mezzanine。故主要层为两级，暗层自外不见。南北八架云者，按今式称为九架，盖谓九檩而椽分八段也。

We are able to trace only four of the numerous restorations that must have occupied to the temple since the T'ung-ho reconstruction. All these restorations occurred not earlier than the beginning of the seventeenth century. For six hundred years since it was, i.e., during the Liao, Chin, Yuan and Ming Dynasties, no record of restoration can be found anywhere.

The earliest of the recorded restorations is that of the Wan-li period, near the end of the Ming Dynasty. Wang Yü-pei, lang-chung of the Treasury, is the principal director of this "good act" as recorded in his essay "Tu-lo Ssu Ta-pei Ke Chi" or "Memoirs of the Hall of Great Mercy of Tu-lo Ssu." No date is given in this essay, but it must have been written very soon after 1595, the year Wang Yü-pei passed his examination for the degree of Chin-shih, after which he was appointed Chu-shih and subsequently promoted to the position of lang-chung. In this early restoration, no alteration was made to the structural parts.

The change of dynasty from Ming to Ts'ing instigated three massacres of Chi-chou city. It is said that the people of the city gathered at Tu-lo Ssu and defended the Holy Structure at the expense of numerous lives, or it would have suffered the same fate as so many other once famous but now destroyed buildings.

In 1658, it was repaired by Wang Hung-tsao, director (Shang-shu) of the Treasury, who also recorded in an essay "Hsiu Tu-lo Ssu Chi" a list of the personnel who participated in the event, among whom were

Hu Tso-kuo^[22] , the magistrate and the monks Chun-shan and Miao-ch'eng. Like the former one, this reparation consisted in merely retouching the paint and ornaments, involving little or no structural changes. It is to be noted that this was the first restoration in the Ts'ing Dynasty.

The *Chi-chou Chih* or the *Chronicle of Chi-chou* mentioned another reparation in 1753, the eighteenth year of Ch'ien-lung, when "an imperial apartment was erected in the Eastern Cloister, with wooden railings and spirit screen at the main entrance to match, thus altering the appearance to a great extent." This must have caused a radical departure from the plan of its original parti, for prior to this date, the temple must have been as usual in the T'ang period, surrounded on all sides by verandas, which led from the Shan-men around the Hall to the rear of the Temple. The Ch'ien-lung addition necessarily caused the destruction of certain parts of the veranda on both the east and west sides, resulting in the plan that is found today.

自统和以后，历代修葺，可考者只四次，皆在明末以后。元明间必有修葺，然无可考。

万历间，户部郎中王于陞重修之，有《独乐大悲阁记》，谓：

“……其载修则统和已酉也。经今久圯，二三信士谋所以为缮葺计；前饒部柯公^[23]，实倡其事，感而兴起者，殆不乏焉。柯公以迁秩行，予继其后，既经时，涂暨之业斯竟。因贍礼大士，下赌金碧辉映，其法身庄严钜丽，围抱不易尽，相传以为就刻一大树云。”

按康熙《朝邑县后志》：

“王于陞，字启宸，万历丁未进士。以二甲授户部主事，升郎中，督饒蓟州。”

丁未为万历二十五年（公元1595年）。其在蓟时期，当在是年以后，故其修葺独乐寺，当在万历后期。其所谓重修，亦限于油饰彩画，故云“金碧辉映，庄严钜丽”，于寺阁之结构无所更改也。

明清之交，蓟城被屠三次，相传全城人民集中独乐寺及塔下寺，抵死保护，故城虽屠，而寺无恙，此亦足以表示蓟人对寺之爱护也。

王于陞修葺以后六十余年，王弘祚复修之。弘祚以崇祯十四年（公元1614年）“自盘阴来牧渔阳”。入清以后，官户部尚书，顺治十五年（公元1658年）“晋秩司农，奉使黄花山，路过是州，追随大学士宗伯菊潭胡公来寺少憩焉。风景不殊，而人民非故；台砌倾圯，而庙貌徒存。……寺僧春山游来，讯予（弘祚）曰，‘是召棠冠社之所凭也，忍以草莱委诸？’予唯唯，为之捐资而倡首焉。一时贤士大夫欣然乐输，而州牧胡君^[24]，毅然劝助，共襄盛举。未几，其徒妙乘以成功告，且曰宝阁配殿，及天王殿山门，皆焕然聿新矣”（《修独乐寺记》）。

此入清以后第一次修葺也。其倡首者王弘祚，而“州牧胡君”助之。

当其事者则春山妙乘。所修则宝阁配殿，及天王殿山门也。读上記，天王殿山门，似为二建筑物然者，然实则一，盖以山门而置天王者也。以地势而论，今山门迫临西街，前无空地，后距观音阁亦只七八丈，其间断不容更一建筑物之加入，故“天王殿山门”者，实一物也。

【6】 A distant view of Kuan-yin Ke. 观音阁远望

The four posts supporting the eave at the four corners of the Kuan-yin Hall much have been added at this reparation. The corners of the eave were probably found to be tumbling after seven hundred years. The addition of these posts was a necessity without which the entire structure would have been reduced to ruins a hundred years ago. The shan-hua-pan, or "gable board," that covered and concealed the beautiful overhanging gable, of which only a few millions of the grills of the transom are left today, as also the doors and windows, was all added or "restored" at this time.

Ch'ien-lung had the good fortune to be the Emperor when the Ts'ing Dynasty was at its height. The entire Empire enjoyed great prosperity and the Imperial Treasury was full of gold and silver. Being a great traveler and lover of art, the Emperor seldom failed to visit any temple of renown, where he, sometimes ordered the temple to be "restored," but more often pulled down and reconstructed, thus destroying innumerable treasures of T'ang and Sung architecture, especially around the neighborhood of Peking. It is miraculous, and most fortunate for the student of architectural archaeology, that the

Kuan-yin Hall, together with the Shan-men, actually escaped the "restoration" of the art-loving Emperor in spite of the erection of the imperial apartment to the east of the temple.

乾隆十八年（公元1753年）“于寺内东偏……建立座落，并于寺前改立栅栏照壁，巍然改观”（《蓟州沈志》卷三）是殆为寺平面布置上极大之更改。盖在此以前，寺之布置，自山门至阁后，必周以回廊，如唐代遗制。高宗于“寺内东偏”建立座落，“则寺内东偏”原有之建筑，必被拆毁。不唯如是，于“西偏”亦有同时代建立之建筑，故寺原有之东西廊，殆于此时改变，而成今日之规模。“巍然改观”，不唯在“栅栏照壁”也。

乾隆重修于寺上最大之更动，除平面之布置外，厥唯观音阁四角檐下所加柱，及若干部分之“清式化”。阁出檐甚远，七百余年，已向下倾圮，故四角柱之增加，为必要之补救法，阁之得以保存，唯此是赖。

关于此次重修，尚有神话一段。蓟县老绅告予，当乾隆重修之时，工人休息用膳，有老者至，工人亨以食。问味何如，老者曰：“盐短，盐短！”盖鲁班降世，而以上檐改短为不然，故曰“檐短”云。按今全部权衡，上檐与下檐檐出，长短适宜，调谐悦目，檐短之说，不敢与鲁班赞同。至于其他“清式化”部分，如山花板，博脊及山门雀替之添造，门窗隔扇之修改，内檐柱头枋间之填塞，皆将于各章分别论之。

高宗生逢盛世，正有清鼎定之后，国裕民安，府库充实；且性嗜美术，好游名山大川。凡其足迹所至，必重修寺观，立碑自耀。唐宋古建筑遗物之毁于其“重修”者，不知凡几，京畿一带，受创尤甚。而独乐寺竟能经“寺内东偏”座落之建立，观音阁山门尚侥幸得免，亦中国建筑史之万幸也。

光绪二十七年（公元1901年），“两宫回銮”之后，有谒陵^[25]盛典，道出蓟州，独乐寺因为座落之所在，于是复加修葺粉饰。此为最后一次之重修，然多限于油漆彩画等外表之点缀。骨干构架，仍未更改。今日所见之外观，即光绪重修以后之物。

On their return to Peking in 1901, after the "Boxer Rebellion," Emperor Kwang-hsü and the Empress Dowager visited and paid homage to the Imperial Tombs at Tsun-hua Hsien, east of Chi-chou. Being the site of the imperial apartment, the Tu-lo Ssu then received its last "restoration" which consisted mostly in the retouching of the painted ornament on the inside of the building giving the structures the appearance that we see today.

After the erection of the imperial apartment, the Tu-lo Ssu became a forbidden ground. The annual fair was held in front of the temple throughout the Ts'ing Dynasty instead of in the temple grounds.

Since the overthrow of the Manchu monarchy in 1911, the temple has become once more the monument of the people. It enjoyed for a

time an overwhelming popularity expressed in incense and sacrifice. A country normal school was established in the western courtyards in 1917. From 1924 to 1929, the central and eastern portions were occupied by different armies that caused a tremendous amount of damage to the various buildings, especially to the windows and doors, as well as to the ceiling boards, which were broken and used as fuel.

In 1930, the entire property was given into the charge of the Normal School, which turned all the modern parts into school buildings, but left the two Liao structures untouched. Fortunately, the school authorities are now beginning to realize the significance of the two invaluable treasures they have in their custody, and are anxious to do whatever they can to protect and conserve these ancient monuments.

【7】Rear hall and censer. 后殿及香炉

有清一代，因座落之关系，独乐寺遂成禁地，庙会盛典，皆于寺前举行。平时寺内非平民所得入，至清末遂有窃贼潜居阁顶之轶事。贼犯案年余，无法查获。终破案于观音阁上层天花之上；相传其中布置极为完善，竟然一安乐窝。其上下之道，则在东梢间柱间攀上，摩擦油腻、尚有黑光，至今犹见。

鼎革以后，寺复归还于民众，一时香火极盛。民国六年，始拨西院为师范学校。十三年，陕军来蓟，驻于独乐寺，是为寺内驻军之始。十六年，驻本县保安队，始毁装修。十七年春，驻孙殿英部军队，十八年

春始去。此一年中，破坏最甚。然较之同时东陵盗陵案，则吾侪不得不庆独乐寺所受孙部之特别优待也。

北伐成功以后，蓟县党部成立，一时破除迷信之声，甚嚣尘上，于是党部中有倡议拍卖独乐寺者。全蓟人民，哗然反对，幸未实现。不然，此千年国宝，又将牺牲于“破除迷信”美名之下矣。

民国二十年，全寺拨为蓟县乡村师范学校，阁、山门并东西院座落归焉。东西院及后部正殿，皆改为校舍，而观音阁、山门则保存未动。南面栅栏部分，围以土墙，于是无业游民，不复得对寺加以无聊之涂抹撕拆。现任学校当局诸君，对于建筑，保护备至。观音阁山门十余年来，备受灾难，今归学校管理，可谓渐入小康时期，然社会及政府之保护，犹为亟不容缓也。

【8】 Plan of Main Gate (Shan-men), Kuan-yin Ke, Tu-lo Ssu. 独乐寺观音阁山门平面图

现状

统和原构，唯观音阁及山门尚存，其余殿宇，殆皆明清重建。今在街之南，与山门对峙者为乾隆十八年所立照壁。街之北，山门之南为墙，东西两端辟门道，而中部则用土坯垒砌，与原有红墙，显然各别。此土墙部分，原为乾隆十八年立栅栏所在，日久栅栏朽坏，去岁蓟县乡村师范学校接收寺产后，遂用墙堵塞，以防游民入校。虽将山门遮掩，致使瞻仰者不得远观前面立面之全部，然为古物之保存计，实亦目前所不得不尔者。栅栏之前有旗杆二，一杆虽失，而石座夹杆则并存。旗杆与栅栏排列并非平行，东座距壁0.28米而西座距壁0.73米。座高1.57米，见方约0.84米。与北平常见乾隆旗杆座旨趣大异。且剥蚀殊甚，殆亦辽物也。

栅栏之内为山门（图12），二者之间，地殊狭隘。愚以为山门原临街，乾隆以前未置栅栏，寺前街道，较他部开朗，旗杆立于其中，略似意大利各寺前之广场，其气象庄严，自可想见。山门面阔三间，进深二间^[26]，格扇装修，已被军队拆毁无存、仅存楹框。南面二梢间^[27]，立天王像二尊，故土人亦称山门曰“哼哈殿”。天王立小砖台上。然砖已崩散，天王将无立足之地矣！北面二梢间东西壁画四天王，涂抹殊甚，观其色泽，殆光绪重修所重摹者。笔法颜色皆无足道。

山门之北为观音阁，即寺之主要建筑物也。阁高三层，而外观则似二层者。立于石坛之上，高出城表，距蓟城十余里，已遥遥望见之（图6）。经千年风雨寒暑之剥蚀，百十次兵灾匪祸之屠劫，犹能保存至今，巍然独立。其完整情形，殊出意外，尤为难得。

【9】Longitudinal section of Kuan-yin Ke. 观音阁纵断面图

阁檐四隅，皆支以柱，盖檐出颇远，年久昂腐，有下倾之虞，不得不尔。阁中主人翁为十一面观音像，高约16米，立须弥坛上，二菩萨侍立（图9）。法相庄严，必出名手，其年代或较阁犹古，亦属可能。与大像相背，面北部分尚有像，盖为落伽山中之观音。此数像者，其意趣尚具唐风，而簇新彩画，鲜艳妖冶，亦像之辱也。坛上除此数像外，尚有像三躯，恐为明以后物。北向门额悬铁磬一，万历间净土庵物，今为学生上课敲点用。庵在县城东南，磬不知何时移此。

阁与山门之间，为篮球场，为求地址加宽，故山门北面与观音阁前月台南面之石阶，皆已拆毁，其间适合球场宽度。球场（即前院）东西为配殿，各为三楹小屋，纯属清式。东配殿门窗全无，荒置无用，西配殿为学校接待室。

阁之北，距阁丈余为八角小亭，亦清构。亭内立韦驮铜像（图2），甲冑武士，合掌北向立，高约2.30米，铸刻极精。审其手法，殆明中叶所作。光绪重修时，劣匠竟涂以灰泥，施以彩画，大好金身，乃蒙不洁，幸易剔除，无伤于像也。

【10】Iron bell. 铁钟

亭北空院为网球场，场北为本寺前殿，殿三楹，殊狭小，而立于权衡颇高之台基上。弦歌之声，时时溢出，今为音乐教室。前殿之后为大殿，大小与前殿略同，为学校办公室。东西配殿为学生宿舍，此部分或为明代重修。然气魄极小，不足与阁调和对称（图7）。庭中有铁香炉一座，高约2.60米，作小圆亭状，其南面檐下斗拱间文曰：

顺天府蓟州

独乐寺大殿前进

□炉一座

本寺僧正 □僧□

□□ □□(?)

元成(?)

□智

□□

惠贤

惠荣

铸钟信人

王璩

藉此得知明孝宗时首座之名。

【11】 Main Hall located in the eastern yard.东院座落正厅

前院东配殿之北，墙有门，通东院，即乾隆十八年所建之“座落”也。入门有空院，其北为垂花门，内有围廊，北面广厅，东西三楹，南北二间，其一切形制，皆为最合规矩之清式。厅现为大讲堂（图11）。其后空院，石山大树犹存，再后则小屋三楹，荒废未用。

前院西配殿之北，墙亦有门，通两院，殆亦同时建。入门为夹道，垂花门东向，内有小廊，小屋三楹，他无所有。现为校长及教员宿舍。

此部之后面，尚有殿二进，东西配殿各一座，皆三楹。现为学生宿舍及食堂。其西尚有大门三楹，外临城垣，内有礅□^[28]，颇似车骑出入之门。在寺产完全归校以前，此即学校正门也。

总之，寺之建筑物，以观音阁为主，山门次之，皆辽代原构，为本次研究主物。后部殿宇，虽属明构，与清式只略异，东西两院，则纯属极规矩之清式，无特别可注意之点也。

【12】 The Shan-men. 山門

IV. The Shan-men

〔 A 〕 General Appearance

The Shan-men of the Tu-lo Ssu is a one-story building of moderate size but monumental proportions, and is the propylaea or main entrance to the temple. The longer facades are on the north and are each divided into three bays. The central and slightly wider one with its gigantic doors is the main thoroughfare and the side ones with window and railings as rooms for the guardian Lokapalas. The Shan-men is covered by a gray tile roof, sloping on all four sides, with heavy overhanging eaves. It is supported by a system of tou-kung, or brackets, of bold proportion. The general proportion is altogether different from that of the Ming and Ts'ing styles, giving an impression of vigor, stability and dignity. The use of the "four sloped roof" on a building of secondary importance and size is unknown to later styles (Figure 26). The pien, or sign board, under the southern eave, bearing the characters for "Tu-lo Ssu" is attributed to Yen Sung, one of the best known treacherous prime ministers of the Ming Dynasty.

肆 山门

〔1〕外观

山门为面阔三间、进深二间之单层建筑物。顶注四阿^[29]，脊作鸱尾，青瓦红墙。南面额曰“独乐寺”，相传严嵩手笔。全部权衡，与明清建筑物大异，所呈现现象至为庄严稳固。在小建筑物上，施以四阿，尤为后世所罕见（图26）。

【13】Longitudinal section of the Shan-men. 山门纵断面图

〔B〕Plan

The plan of the Shan-men is a rectangle, three chients or bays long and two chients wide, formed by twelve columns arranged in three rows of four in each row. The tang-hsin-chien or central bay, measuring 6.10 m. from center to center of columns, is the main thoroughfare. It can be shut off with the doors between the chung-chus, or columns on the longitudinal axis. The shao-chients, or end bays, are smaller than the tang-hsin-chien; in the two southern chients are two statues of guardian Lokapalas, practically filling the entire chien, while on the walls of the two northern chients are mural paintings of the four Lokapalas. The distance between the chung-chus and the yen-chus, or columns under the eave, is smaller than the width of the shao-chien, resulting in the intersection of the main ridge of the roof with the two hips at a point somewhere in the shao-chien

instead of on the chung-chu.

【14】 Cross section of the side bay, Shan-men. 山门次间横断面图

【15】 Cross section of the central bay, Shan-men. 山门当心间横断面图

〔2〕平面

面阔三间，进深二间，共有柱十二。当心间（今称明间）面阔6.10米，中柱^[30]间安装大门，为出入寺之孔道。梢间面阔5.23米，南面二间立天王像，北面二间原来有像否，尚待考。中柱与前后檐柱间之进深为4.38米。因进深较少于梢间面阔，故垂脊与正脊相交乃在梢间之内而不在中柱之上也（图8）。

〔C〕 Base and Steps

The Shan-men stands on a stone base, or terrace, of low proportion paved with square brick tiles. The distance from the yen-chu to the edge of the terrace is wider on the front and rear than on the sides of the building. Thus the border around the yen-chu is not equally wide on all sides, contrary to the practice of the Ming and Ts'ing styles. This was probably because it was not designed to accommodate circulation around the building. It should be remembered that the Shan-men in its original surroundings was not a free-standing building like the one we see today, but connected with the rear of the temple by colonnades leading from the two narrow sides, and it was therefore only natural to narrow down the terrace slightly at those sides. On the southern side there are steps leading from the street level up to the terrace and these, according to the practice from the Sung Dynasty until today, should be as long as the

width of the tang-hsin-chien. But the present steps are only a dingy narrow "restoration" of modern times. The steps to the north of the base have been destroyed.

〔D〕 Columns and Bases

The columns of the Shan-men, twelve in number, form the main supports of the heavy roof above. The height of the columns is about 8.6 times the diameter, slightly shorter than that of the Ionic order. Considering the material used, this proportion seems rather heavy, especially when compared to the wooden columns of American colonial architecture. The column has a very slight entasis of about 2.5 per cent of the length. The tapering from the bottom towards the top is almost imperceptible and nothing like the very marked entasis of the Greco-Roman orders.

Measurements taken cross-section-wise show that the distance between the top of the columns is smaller than that between the bases by about two per cent of the height of the column. In Chapter V of the *Ying-tsoo-fa-shih*, the following passage occurs.

"In the erection of a column, the top should incline slightly inward, with the roof protruding out, this is called *ch'e-chiao* (meaning 'tilted-foot'). On the front and rear of the building, the *ch'e-chiao* should be 1 fen to every *ch'ih* of the height of the column (1%); while on the sides of the building it should be 8 li (0.8%). [31] When it comes to a corner column, the inclination should be in both directions in accordance to this rule (diagonally)."

The columns of the Shan-men were undoubtedly erected in the manner described above, but with an even greater inclination, so marked that it is noticeable to the naked eye (Figure 26).

〔3〕 台基及阶

台基为石质，颇低；高只0.50米。前后台出[32] 约2.20米，而两山[33] 台出则为1.30米，显然不备行人绕门或在两山檐下通行者。南面石阶三级，颇短小，宽不及一间，殆非原状。盖阶之“长随间广”，自李明仲至于今日，尚为定例，明仲前百年，不宜有此例外也。北面石阶已毁，当与南面同。

〔4〕 柱及柱础

山门柱十二，皆《营造法式》所谓“直柱”者是。柱身与柱径之比

例，虽只为8.6与1之比，尚不及罗马爱奥尼克式^[34] 柱之瘦长，而所呈现象，则较瘦；盖因抱框^[35] 等附属部分遮盖使然。柱之下径较大于上径，唯收分^[36] 甚微，故不甚显著，非详究不察；然在观者下意识中，固已得一种稳固之印象。兹将各柱之平均度量列下：

柱高米
柱径米
收分‰

前后柱脚与中柱脚之距离为4.38米，而柱头间则为4.29米，柱头微向内偏，约合柱高2%。按《营造法式》卷五：

“凡立柱，并令柱首微收向内，柱脚微出向外，谓之侧脚。每屋正面，随柱之长，每一尺即侧脚一分；若侧面，每长一尺，即侧脚八厘。至角柱，其柱首相向各依本法。”

山门柱之倾斜度极为明显，且甚于《营造法式》所规定，其为“侧脚”无疑（图26）。

【16】Plan and cross section of the Shan-men 山门平面和断面图

This refinement is identical with that of the Parthenon, another important but unnoticed evidence of the influence of Greco-Buddhist art in China.

The chu-ch'u, or base of the column, is of local greenish slate stone, measuring less than twice the diameter on its side, differing from both Sung and Ts'ing regulations that call for a base the side of which is twice the diameter. This dimension refers to the plinth of the base, which is usually sunken in the ground with the top of the plinth flushing with the finished floor. On the top is the part corresponding to the torus and the moldings in the Roman columns, called fu-p'en, the "upset basin." The fu-p'en of the Ying-tsao-fa-shih is very similar to

the torus and the fillet in the base of a Roman order, but usually decorated with elaborate carvings. But in the case of the Shan-men, the fu-p'en is merely a slightly raised disc with no carving, more like those of the Ts'ing style.

[E] The Tou-kung, or Bracketing System

Structurally analyzed, the tou-kung is merely a system of corbelling, consisting of a number of kungs or horizontal "arms," put one on top of another—the higher the position, the longer the "arm"—with tous, or blocks, or "cushions" as Dr. Siren calls them, at the end and center of each lower kung to support the upper one. The kungs are put often both parallel and perpendicular to the facade, the former to enable a far overhang of the eave and the latter to take care of the load of the purlins. The kungs perpendicular to the facade are called hua-kung, and each "step" of the corbel is called a t'iao, and, starting from the bottom, each t'iao is given a numeral "first," "second," etc. to designate its position. The kungs parallel to the facade, and on the center-line of the column, are of only two lengths: the shorter and lower one is called the ni-tao-kung, while the longer and upper one is called the man-kung. Those parallel to the facade, but supported on the end of a hua-kung, are called the ling-kung if they are on the end of the uppermost, and, therefore, longest hua-kung. Those on any other hua-kung but between the ling-kung and the center-line of the column are called the kua-tzu-kung.

Under the intersection of the 1st hua-kung and the ni-tao-kung is the large lu-tou, the foot of the entire p'u-cho, or set of tou-kung, standing right on top of the column. On the ends of all kungs are smaller tous called san-tou, and at the intersection of kungs, chiao-hu-tou.

On the exterior of the Shan-men, supporting the eave, are three different kinds of tou-kungs: 1. chu-t'ou-p'u-cho; 2. chuan-chiao-p'u-cho; 3. pu-chien-p'u-cho.

柱身经历次重修，或坎补，或涂抹，乃至全柱更换，亦属可能。观音阁柱头，皆“卷杀^[37] 作覆盆样”（图33），而山门柱头乃平正如清式，其是否原物，亦待考也。

柱础^[38] 为本地青石造，方约0.85米不及柱径之倍，而自《营造法式》至清《工程做法》皆规定柱础“方倍柱之径”，此岂辽宋制度之不同欤？础上“覆盆”较似清式简单之“古镜”，不若宋式之华丽也。

[5] 斗拱

山门外檐斗拱，共有三种，分述如次：

【17】Chu-t'ou-p'u-cho, Shan-men. 山门柱头铺作侧样

1. Chu-t'ou-p'u-cho or "the set of tou-kung on the column"

The lu-tou stands right on top of the column instead of on a p'u-p'ai-fang, or plate, differing from the practice of the Ming and Ts'ing styles (Figures 16, 17). From the lu-tou extending two hua-kungs, one on top of the other. At the end of the second hua-kung is a ling-kung, intersecting with the shua-t'ou, a member parallel to, above, and of the same size as a hua-kung, but instead of the rounded curve near the end, it is beveled off from the upper surface into a wedge, with the inclined surface making an angle of 30 degrees with the ground. On

the ling-kung are placed three shua-t'ous, in which is the t'i-mu, which in turn supports the liao-yen-ch'uan, or eave supporting purlin. The t'i-mu is a member unseen in later structures, the term occurs in the *Ying-tsao-fa-shih*, with dimensions and proportion, but its function and position is not defined. From the passage "the lower surface is rounded off by four fens...and when it is used in gable construction, it should follow the length of the purlin," a rough idea of its shape can be gathered, and its position is found to be related to the purlin. This unknown member in this p'u-cho, as well as in the gable of the Hall, seems to answer very well to the description. And since there is no reason to contradict its being something else, I call it the t'i-mu, for the time being at least, till evidence is brought up to contradict it.

1. 柱头铺作^[39] 清式称柱头科（图16，17）。其栌斗（今称坐斗）“施之于柱头”，不似清式之将“坐斗”施于“平板枋”上。自栌斗外出者计华拱（今称翘）两层，故上层长两跳^[40]。上层跳头施以令拱（今称厢拱），与耍头相交，置于交互斗（今称十八斗）内。其耍头之制，将头作约三十度向外之锐角，略似平置之昂，不若清式之作六十度向内之钝角者。令拱之上，置散斗（今称三才升）三个，以承拱形小木，及其上之搏（今称桁）按《营造法式》卷五，有所谓“替木”者，其长按地位而异，“两头各下杀四分……若至出际，长与搏齐”。此拱形小木，殆即“替木”欤？与此“替木”位置功用相同者，于清式建筑中有“挑檐枋”，长与檩同，而此处所见，则分段施于各铺作令拱之上，且将两端略加卷杀，甚足以表示承受上部分散之重量，而集中使移于柱头之机能，堪称善美。

【18】 Chuan-chiao-p'u-cho and the rear of the pu-chien-p'u-cho,
Shan-men. 山门转角铺作并补间铺作后尾

Intersecting with the first hua-kung is the ni-tao-kung, and with the second hua-kung is the man-kung. It is interesting to note in this case that the man-kung is not a kung in the real sense, but a fang, here called the chu-t'ou-fang, of the same size as the kung, but extending through the entire length of the facade. In later styles, the chu-t'ou-fang, supported by the man-kung, usually intersects with the third hua-kung, or shua-t'ou as the case may be. But here the chu-t'ou-fang is supported on the ni-tao-kung, with the man-kung carved in relief on

the fang, a characteristic not found in the representations of buildings in the mural paintings of Tun-huang (T'ang), or in the specifications of the *Ying-tsao-fa-shih* or in still existing old buildings such as the Ch'u-chu-an in Shao-lin Ssu, Sung-shan, or in late Northern Sung, or any of the Ming and Ts'ing structures. But, this characteristic is common to the approximately contemporary Upper and Lower Hua-yen Ssu at Ta-t'ung and the Wooden Pagoda of Fo-kung Ssu at Ying Hsien, Shansi Province. The above-mentioned characteristic therefore must have been peculiar to the Liao period.

On the end of the second hua-kung is a ling-kung, a transverse member supporting the eave-purlin, but on the end of the first hua-kung, such a member is absent, another peculiarity not found in later styles. In Chapter IV of the *Ying-tsao-fa-shih*, there is the following statement describing the "ensemble of the p'u-cho":

"If a transverse kung is used on every t'iao, the p'u-cho is called chi-sin; if used on every other t'iao, it is called t'ou-sin."

In the very few existing structures contemporary to the *Ying-tsao-fa-shih* only the chi-sin system is used. To the builder of the Ming and Ts'ing Dynasties, even the term t'ou-sin was unknown. It is only in these Liao structures that we see an actual example and possibility of such a system of construction.

与华拱相交而与建筑物表面平行者为泥道拱（今称瓜拱）及与今万拱相似之长拱。然此长拱者，有拱之形，而无拱之用，实柱头枋（清式称正心枋）上而雕作拱形者也。就愚所知，敦煌壁画、嵩山少林寺初祖庵、[\[41\]](#) 营造法式及明清遗构，此式尚未之见，而与独乐寺约略同时之大同上下华严寺、应县佛宫寺木塔皆同此结构，殆辽之特征欤？

华拱二层，其上层跳头施以令拱，已于上文述及；然下层跳头，则无与之相交之拱，亦为明清式所无。按《营造法式》卷四，《总铺作次序》中曰：

“凡铺作逐跳上安拱谓之‘计心’。若逐跳上不安拱，而再出跳或出昂者谓之‘偷心’。”

山门柱头铺作，在此点上适与此条符合，“偷心”之佳例也。

前后檐柱柱头铺作后尾为华拱两跳，跳头不安拱，而以上层跳头之散斗承托大梁之下。使梁之重量全部由斗拱转达于柱以至于地，条理井然，为建筑逻辑之最良表现（图13-15）。

山柱柱头铺作后尾，则唯华拱四跳，层层叠出，以承平枋。跳头皆无横拱，为明清制度所无（图17，18）。此式《营造法式》亦未述及。然考之日本镰仓时代所建之奈良东大寺南大门，及伊东忠太博士发现之怀安县照化寺掖门[\[42\]](#)，皆作此式，虽内外之位置不同，而其结构法则一。此式在日本称“天竺样”，虽称“天竺”，亦来自中土，不过以此示别

于日本早年受自中国之“唐样”，及其日本化之“和样”耳。

服部胜吉《日本古建筑史》所引《东大寺造立供养记》关于寺中佛像之铸造，则有“……铸物师大工陈和卿也，都宋朝工舍弟陈佛铸等七人也，日本铸物师草部是助以下十四人也。……”等句，是此寺所受中土影响，毫无疑义。前此只见于日本者，追溯其源，伊东先生得之于照化寺，今复见之于蓟县遗物，其线索益明瞭矣。

At the rear of the chu-t'ou-p'u-cho are two t'iaos of hua-kung, with no transverse kungs at the ends; on the shua-t'ou at the end of the second hua-kung is supported the principal beam, the ends of which are made into the shape of shua-t'ous, intersecting with other kungs of the p'u-cho, thus making a strong and logical union between the beam and the tou-kung (Figures 13-15).

On the narrow side of the building, the rear of the chu-t'ou-p'u-cho is different from these of the longer facade in the following respect. It does not support any beams which are all placed parallel with the transversal axis of the building. Here the second hua-kung, the shua-t'ou, and another similar member above, all have the rear ends prolonged into fangs on the longitudinal axis, with the form of kungs carved on the fang in relief, four successive t'iaos without a single transversal kung. This characteristic will be discussed under the topic "pu-chien-p'u-cho."

From the structural point of view, to disguise a fang in the form of a kung may be considered an architectural dishonesty. Existing examples as well as diagrams in the *Ying-tsao-fa-shih* all show the use of a fang immediately above the man-kung; no instance of the fang carved with a kung is found in later structures. But the logical development of such a system is easily traced in the T'ang engraved drawing of a temple on a stone lintel over the western doorway of the Ta-yen T'a of Sian Fu. A set of ni-tao-kung is represented there as supporting a chu-t'ou-fang superposed on another set of ni-tao-kung and chu-t'ou fang identical to those below (Figure 19). Should one imagine the ni-tao-kung of the upper set as elongated into a fang, while still retaining the kung in relief, while the chu-t'ou-fang of the lower set is carved with a man-kung, the result would be exactly a tou-kung of the Liao style, as those found in the Shan-men and the Kuan-yin Hall of the Tu-lo Ssu.

【19】Chu-t'ou-p'u-cho of a stone lintel, Ta-yen T'a of Sian Fu (drawing by Liu Tun-tseng). 西安大雁塔门楣石柱头铺作（刘士能先生制图）

至于斗拱之正面，则枋斗之内，与华拱相交者，有泥道拱（今称正心瓜拱），其两端施以散斗（散斗之在正心上者今称槽升子）；其上则为柱头枋，枋上刻成长拱形。再上为第二层柱头枋，亦刻作拱形，长与泥道拱同，其上为第三层柱头枋，又刻作长拱形。其全部所呈现象，为短拱上承长拱之结合共二层，各拱头皆施以散斗。

上述泥道拱，即今之正心瓜拱。其长拱殆即《营造法式》所谓“慢拱”是。《营造法式》卷四有各拱名释，谓“造拱之制有五”，而所释只四。同卷中又见“慢拱”之名，慢拱盖即第五种拱而为李所遗者。但卷三十木作图样中，又有慢拱图，其形颇长。清式建筑中，与之位置相同者称“万拱”，南语慢万同音，故其名称无可疑也。

在结构方面着眼，将多层枋子雕作拱形，殊不合理。《营造法式》以至明清制度，皆在慢拱之上施以枋子，无将枋上雕作拱形者。然追溯古例，其所以如此之故，颇易解释。按西安大慈恩寺大雁塔门楣雕刻所见，乃正心瓜拱上承正心枋，正心枋上又有小坐斗（《营造法式》所称“齐心斗”？），斗上又有正心瓜拱及正心枋。是同一物而上下两层叠叠者也（图19）。今若将此下层正心枋雕以慢拱之形，再将上层正心瓜拱伸引成枋，则与山门所见无异。其来历固极明显也。

2. Chuan-chiao-p'u-cho or "the set that turns the corner"

The chuan-chiao-p'u-cho may be considered an intersection of two sets of chu-t'ou-p'u-cho (Figure 20). As the adjacent sides are identical, either may be taken for the front. Therefore, on the center-line of the column, both on the front and side, are two t'iaos of hua-kung. In the first t'iao, the rear of the hua-kung is at the same time the ni-tao-kung on the other side, and vice versa when viewed from around the corner. The rear of the second t'iao, likewise extends to become the first chu-t'ou-fang on the other side, while the shua-t'ou becomes the second chu-t'ou-fang. The third chu-t'ou-fang, in this case, does not reveal its end, but intersects with the one on the other side that is hidden behind the eave-purlin. This system of extending the rear of a member to form another member on the adjacent facade is called lieh-kung in the *Ying-tsao-fa-shih*. On the end of each t'iao of hua-kung is placed a transversal kung in the "chi-sin" manner.

On the mitre-line of the building, bisecting the right angle, formed by the intersection of the kungs and fangs of the adjacent facades, and perpendicular to each other, are three t'iaos of chiao-kung or corner kungs. The uppermost t'iao is on the level of the ling-kung, supporting the chiao-liang, or hip-rafter, above. On the same level is another long kung, on the axis of the column, but making a right angle with the mitre kungs, with shua-t'ous on its ends to support the t'i-mu. The author takes the liberty to call this characteristic mo-chiao-man-kung, or "diagonal man-kung."

The rear of the chuan-chiao-p'u-cho is formed by the rear ends of the chiao-kungs, five t'iaos altogether in number, corbelling out one above and beyond the other. The uppermost or fifth t'iao is just in position to receive the intermediate purlin or hsia-p'ing-chuan.

This will be discussed more fully under the next topic.

【20】Chuan-chiao-p'u-cho, Shan-men. 山门转角铺作

2. 转角铺作 清式称“角科”。其结构较柱头铺作为复杂，盖两朵[43]柱头铺作相交而成（图20）。于柱之中线上，其正面及侧面皆有华拱二层。上层华拱之上，正面侧面皆各出耍头，与柱头铺作上者同。而此面耍头之后尾，则为他面第二层柱头枋，换言之，则正侧二面第二层柱头枋相交后伸出而为耍头也。此面第一层华拱之后尾为彼面泥道拱，第二层华拱后尾则为彼面刻成慢拱形之第一层柱头枋。此种做法，即清式所谓“把臂”，宋式称为“列拱”者是，每层华拱跳头，皆施以拱，成所谓“让心”者。

屋角四十五度斜线上，有角拱三层，最上者与跳头令拱平，以支角梁。与角拱成正角，而施于柱中线上者，有长拱一道，与令拱平，唯安于二层跳头之瓜子拱（今称外拽瓜拱）上，姑名之曰“抹角慢拱”。其拱端亦安散斗，以承檩下之替木。

转角铺作之后尾乃由角拱后尾五层叠成，与山柱头铺作后尾同其形制，其最上一跳则以承正面及山面下平枋（今称下金桁）之相交点。

3. Pu-chien-p'u-cho or "the set that fills the bay" (Figures 16, 21)

The function of the pu-chien-p'u-cho is to prevent the sagging of the middle portion of the purlin which is supported at the two ends by the chu-t'ou-p'u-chos. It is placed midway, or nearly midway, between

the columns. The lowest member of the set, a short stud, stands on the lintel, or lan-erh; on the stud is placed a large tou, which holds two t'iaos of hua-kung. The upper hua-kung has a short t'i-mu on its end, immediately beneath the eave-purlin. Intersecting with the lower hua-kung in the large t'ou is the first chu-t'ou-fang, which is carved with a ni-tao-kung in relief, while the upper hua-kung intersects with the second fang in which the man-kung is carved. The third chu-t'ou-fang is again carved with a ni-tao-kung. The distribution of these carved fangs is such that the lengths of the kungs of the pu-chien-p'u-cho is just the reverse of that of the chu-t'ou-p'u-cho, fitting but not interfering each other. This distribution would have been impossible if the Kings had been real, instead of being carved as the fangs.

3. 补间铺作 (图16, 21) 清式称“平身科”。其机能在防止两柱头间之檩及上部向下弯坠。其位置在二柱头之间。其最下层为“直斗”, 立于阑额 (今称额枋) 之上, 直斗之上置大斗, 大斗之上安华拱两跳, 上层跳头施以替木, 以承檐檩 (今称挑檐桁)。下层华拱与第一层柱头枋相交安于大斗口内。此第一层柱头枋雕作泥道拱 (瓜拱) 形, 其上第二层柱头枋则雕作慢拱, 第三层又雕作泥道拱。与柱头铺作上各层枋上所雕拱, 长短适相错。若皆为真拱, 则此相错排列, 为事实上所不能, 亦其不合理处也。

此种补间铺作, 与明清制度固极不同, 而与《营造法式》亦迥然异趣。明清式之补间铺作, 多者可至七八攒——如太和殿。《营造法式》卷四《总铺作次序》则谓:

“当心间须用补间铺作两朵, 次间及梢间各用一朵。其铺作分布, 令远近皆匀。”

而独乐寺观音阁及山门, 补间铺作皆只一朵 (即一攒), 虽当心间亦无两朵者。

【21】 Pu-chien-p'u-cho, Shan-men. 山门补间铺作侧样

Here we have another motif that is unknown, or at least not used, in later ages, namely, the short stud. The use of such a stud was quite commonplace in the pre-T'ang dynasties, as exemplified in the mural paintings and cave sculptures of Tun-huang, Yun-kang, Lung-men and T'ien-lung Shan. But in the *Ying-tsao-fa-shih*, the stud is not even mentioned, thus leaving us in total ignorance of the name of a once very popular architectural motif. But in Japan, the short stud has been retained in later monuments, and there it is known as 束. The Chinese equivalent is yet to be determined.

In earlier examples, the short stud is usually found supporting a tou which in turn supports the fang, with no intersecting hua-kungs. But in the Ming and Ts'ing styles, the pu-chien-p'u-cho developed to such an extent that it was actually identical with the chu-t'ou-p'u-cho in construction, the only difference being in its position. But in the case we see here in the Shan-men, two t'iao of hua-kung are placed in the tou, intersecting with the chu-t'ou-fang. At the end of the second t'iao is placed a short t'i-mu that receives the purlin above it. As far as complexity is concerned, this arrangement may be fairly considered as a transition between the pre-T'ang and Ming or Ts'ing styles. This short stud is preserved only in the two p'u-chos on the eastern facade, but it has been sadly abused by restorers of the Kwang-hsü period who painted it over with an all-over pattern of frets, together with the wall between the p'u-chos, ignoring totally its structural function. To an

unobservant eye, it is as good as lost.

The point of greatest significance in the pu-chien-p'u-cho is the arrangement of the rear ends of the hua-kungs. Four t'iaos of hua-kungs are placed one on top of the other till the uppermost is high enough to support the p'ing-ch'uan, or intermediate purlin. With the exception of the uppermost t'iao, which carries a p'an-chien, or long fang on its end, not one of these hua-kungs carries any transversal member, either the kung or the fang. This system is again unknown to later ages, and not even mentioned in the *Ying-tsao-fa-shih*. But on the Nandaimon of the Todaiji at Nara, Japan, a structure of the Kamakura period, as well as the Chao-hua-ssu at Huai-an Hsien, an identical treatment of the hua-kung is seen. It was undoubtedly a feature once very common in China and later taken up and much used in Japan where it is known as the Tenjiku style. Although nominally from India, its Chinese origin can never be denied. The discovery of such a construction here is another evidence of its genealogy.

On the interior of the Shan-men are two different kinds of tou-kungs:

4. Chu-t'ou-p'u-cho on the chung-chu

The chung-chu, whose literal translation is the "central column," is a column on the longitudinal axis of a building and at the same time in the interior. (Those on the exterior being called shan-chu, or "gable columns.") The p'u-cho on the chung-chu is used to support the middle of the principal beam, the two ends being supported by the yen-chus. Parallel with the beam and beneath it, are two t'iaos of hua-kung, extending from the lu-tou, like the rear of the exterior chu-t'ou-p'u-cho. Intersecting with these hua-kung, and also with the beam, are one ni-tao-kung and three tiers of chu-t'ou-fang, which are also carved with kungs in relief, like those on the exterior.

至于其结构，则与宋元明清更异，如直斗一物，在六朝隋唐遗物中，固所常见；在《营造法式》中则并其名亦无之；日本称之为“束”，刘士能先生称之为“直斗”，今沿刘先生称。隋唐直斗上多安一斗以承枋，而无拱交于其口内。明清补间铺作则似柱头铺作，以栌斗安于平板枋上。此处所见，则直斗之上，施以华拱二跳，以承檐桁，盖二者间之过渡形式，关键至为明显。今南北西三面直斗皆已失，唯东面尚存，劣匠施以彩画，竟与垫拱板画成一片，欲将其机能之外形一笔抹杀；幸仔细观察，原形尚可见也。

补间铺作之后尾，与山柱柱头铺作后尾略同，为四层华拱，跳头无横拱，层层叠出以承下平枋。其梢间铺作与山面铺作皆不在二柱之正中，与《法式》“令远近皆匀”一语不符，前者偏近角柱，后者偏近山柱，而二者与角柱间距离则同，盖其后尾与转角铺作之后尾共同承支前

后下平樑及山下平樑之相交点，其距离乃视下平樑而定也。

山门内檐斗拱，则有：

4. 中柱柱头斗拱 其机能在承托大梁之中段，将其重量转达于柱。华拱二跳自栌斗伸出，与外檐柱头铺作后尾同，前后二面皆如此。正面则泥道拱一道，上承三层枋，枋上亦雕拱形，如外檐所见。

5. Interior pu-chien-p'u-cho

Structurally, the pu-chien-p'u-cho in the interior is practically of no value. It is composed of the three fangs extending from the rear of the chu-t'ou-p'u-cho of the narrower facade. Near the center of each bay, these fangs are carved into the forms of different kungs like those on the exterior chu-t'ou-fangs, and the spaces between each tier of the kungs are taken care of by tous, while the lowest fang is supported by a larger tou which is placed on top of a short stud standing on the lan-erh. Having no overhanging roofs for them to support, intersecting hua-kungs are totally absent in this particular case, which is similar to many of the pre-T'ang examples.

Before leaving the subject of the tou-kung, it may be interesting to make an analysis of the dimensions and proportion of the different members of the entire p'u-cho, and also to compare them with those of the Sung and Ts'ing styles.

In Chapter IV of the *Ying-tsao-fa-shih*, on the making of the tou, it is specified that:

"The lu-tou...should be thirty-two fen square...by twenty fen in height. The upper eight fen of the height compose the erh, the middle four fen the p'ing, and the lower eight fen the i. The kou (mortise on the tou to receive the kung) should be ten fen wide by eight fen deep."

From this passage it is clear that the proportion of the length or width to the height is 8:5. The Shan-men, in this particular respect, is similar to the Sung style while differing from the 3:2 of the Ts'ing regulations. The proportion of the erh, p'ing and i, which are called the tou-erh, sheng-yao and tou-ti respectively in the Ts'ing style, is however definitely different to both the Sung and Ts'ing regulations which specified that it should be 2:1:2. In the Shan-men under consideration the approximate proportion is 6:4:7. The depth of the kou is slightly less than either the Sung or Ts'ing lu-tous, causing a great influence on the proportion of the entire p'u-cho. The proportions of the chiao-hu-tou and the san-tou are also slightly different from the *Ying-tsao-fa-shih* proportions, but being much smaller in size, their influence on the appearance of the p'u-cho is far less prominent.

All the kungs, regardless of their lengths, are the same in their cross sections, about 16.5 cm. × 24 cm., which is in accordance with the 2:3 proportion of the *Ying-tsao-fa-shih*. The Ts'ing proportion was 1:2.

5. 补间铺作 内檐补间铺作乃将外檐补间铺作而去其华拱所成。其直斗立于阑额上，其上承枋三层，枋亦雕成拱形。当心间铺作上，第一层枋雕作泥道拱，第二层则雕作慢拱，第三层不雕。梢间唯第一层雕作拱形，二三层不雕。此三层枋子者，实山面柱头铺作后尾伸引而成，亦有趣之结构法也。

大梁以上尚有斗拱数种，当于下节分析之。

至于斗拱各部尺寸，亦饶研究价值，兹先表列如左：

龕 (米)

0.32

交互斗

散斗 5

外檐铺作大斗

按跳定

泥道拱

慢拱 5

金拱 5

替木 5

考之《营造法式》，卷四有造斗之制：

“栌斗……长与广皆三十二分……高二十分；上八分为耳，中四分为平，下八分为欹，开口广十分，深八分。底四面各杀四分，欹□一分。”

其长广与高之比例为八与五之比；0.51米与0.32米亦适为八与五之比，故在此点，与宋式同，而异于清式之三与二之比。宋式之耳、平、欹，及清式之斗口、升腰、斗底，皆为二一二之比；而山门栌斗此三部乃0.37、0.26、0.43米^[44]。其开口之深度，较宋清式略浅，而其影响于全朵之权衡则甚大。

交互斗及散斗与法式所述亦略有出入，然因体积较小，故对于全朵权衡之影响亦较小也。

关于拱之横断面，《法式》所定宽与高为二与三之比，此处所见虽略有不同，大致仍符合。而清式则为一与二之比。

In both the Sung and Ts'ing styles, the lengths of the different kungs are set in definite proportion to the width of the k'ou, i.e., the width of the kung. The Ts'ings required a length of 6.2 times the k'ou for the kua-kung (called ni-tao-kung by the Sung) and 9.2 times the k'ou for the wan-kung (called man-kung by the Sung), while in the *Ying-tsao-fa-shih*, with the width of the k'ou set as 10 fen, the length of the ni-tao-kung was specified as 62 fen, the kua-tze-kung 62 fen, the ling-kung 72 fen while the man-kung is not mentioned. Judging from the similarity of lengths in the Sung and Ts'ing kungs, it is fairly safe

to assume the man-kung would have been specified to be 92 fen long. The measurements of the Liao kungs in the Shan-men however revealed to us something quite different; the ni-tao-kung is slightly less than 71 fen long while the man-kung reached the tremendous length of more than 115 fen. It is evident that the Liao kungs assume a much slenderer proportion than those found in later architecture.

The lengths of the hua-kungs are rather indefinite, depending entirely upon the distance of each t'iao, which seems to be rather irregular. The first t'iao measures 45 cm., and the second t'iao, 35 cm., unlike the even extension of the Ts'ing t'iaos.

The gentle curve at the ends of the kungs is formed by a series of straight planes. There are four such planes on the hua-kung and three on the ni-tao-kung. This particular process of making the curve is termed chüan-sa.

[F] Liang and Fangs, the Horizontal Members

1. The Lan-erh

On the heads, and connecting, the columns are horizontal lintels, whose upper surfaces flush with the tops of the columns, and the ends are fitted into mortises cut out from the columns. These lintels are known in the *Ying-tsao-fa-shih* as lan-erh, and later as eh-fang. Originally they were not intended to carry any weight, their sole function being to hold the columns in position. When the pu-chien-p'u-cho was introduced, the lan-erh began to assume another duty until in the Ming and Ts'ing periods, the pu-chien-p'u-cho became so numerous that the size of the lan-erh was necessarily enlarged to a stupendous dimension. And in addition the p'ing-pan-fang, or plate, which was placed on top of it, was introduced to carry the tou-kungs.

In the case of the Shan-men, the lan-erh measures 37 cm. $\times$ 15 cm., which is a rather slender dimension. The p'ing-pan-fang, whose use the Liao builders undoubtedly knew, is not in evidence. The pu-chien-p'u-cho is placed directly on the lan-erh.

2. The Liang-chia or the "Truss"

The central portion of the roof is held up by two "trusses," placed on the chu-t'ou-p'u-cho. They are not trusses in the true sense, being a series of lintels on posts supported by the longer lintel below, exerting no thrust as a true truss does. In the Shan-men, the "truss" is formed by the combination of two liangs, or beams, the shorter one with its

two t'o-tuns or beam-supports, is placed on the longer and lower one, which is in turn supported by the chu-t'ou-p'u-cho.

宋式口广十分，泥道拱长六十二分，慢拱长无可考^[45]。清式瓜拱之长与斗口之比亦六十二分，而万拱则为九十二分。山门泥道拱长1.17米，口广0.165米，其比例约为七十一分弱；慢拱长1.90米，约合一百十五分强，故辽拱之长，实远甚于宋以后之拱。

华拱之长，视出跳之数及其远近而定。然出跳似无定制，第一跳长0.49米，第二跳则长0.35米，耍头则长0.47米，不若清式之各跳均匀也。华拱卷杀，每头四瓣，每瓣长约0.075米；泥道拱则每头三瓣，与宋清制度均同。

〔6〕梁枋

阑额横贯柱头之间，清名额枋。其广0.37米，厚0.15米。厚约当广之五分之二。额上无平板枋，异于清制。补间铺作即置于阑额之上。

山门有梁二架（图13-15），置于柱头铺作之上，梁端伸出，即为耍头，成铺作之一部分。清式耍头只用于平身科（即补间铺作），柱头科上梁头则大几如梁身，不似辽式之与拱同大小也。

The portion of the beam that extends beyond the center-line of the column below is shaped into a shua-t'ou, forming a part of the p'u-cho. The shua-t'ou is found only on the chu-t'ou-p'u-cho in the Ts'ing style; while on the chu-t'ou-p'u-cho, the end of the liang is almost as big as the liang itself. Since the shua-t'ou, the end of the beam, is at the same time a part of the tou-kung, the connection between the two parts cannot but be strong, and the transition logical. Moreover, the shua-t'ou is made to intersect with ling-kung for the supporting of the t'i-mu and the eave-purlin, resulting in the organic union of the different parts.

The beam is supported at the middle by the chu-t'ou-p'u-cho on the chung-chu, reducing the span of the beam by half, although, judging from its size, it could without difficulty stand the load for the last thousand years without the intermediate support.

The t'o-tun, or beam-support, which lifts the shorter and upper beam on the longer and lower beam is a simple p'u-cho in form and construction. Two intersecting kungs are placed in a large tou; the one parallel with the beam supports the shorter beam above, and the one perpendicular to the beam supports the p'an-chien, an auxiliary horizontal member, usually of the size as the kung, and running parallel and beneath the purlin (Figure 22). It is to be noted that the t'o-tun is not placed directly on the main beam, but on a thin plate, measuring 21 cm. × 6 cm. Its position is not mid-way between the

center-line of the ridge and the external columns, but nearer to the latter; the distances to the two center-lines being 2.41 m. and 1.88 m. respectively.

The upper beam, called the san-chia-liang, or the beam of three supports, is placed on the above mentioned t'o-tun. Its ends are also shaped like the shua-t'ou. The middle of the san-chia-liang is supported by a short stud, standing on the middle of the wu-chia-liang. Above it, and on the san-chia-liang is the t'o-feng or "camel's back," forming the base of the chu-ju-chu or "dwarf column," which supports the tou, the ni-tao-kung with its intersecting wing-shaped kung, the p'an-chien, the t'i-mu, and ultimately the ridge-purlin. The ridge-purlin is supported on the sides by two hsieh-chus, or inclined columns, forming a sort of bracing to prevent the purlin from inclining to either side. The triangular spaces beneath the hsieh-chu were originally empty, but are now filled up with brick and plaster, the original light effect therefore becoming totally lost (Figure 23).

耍头既为梁头，而又为斗拱之一部分，梁与斗拱间之联合乃极坚实。同时耍头又与令拱交置，以承替木及“撩檐枋”^[46]（今称挑檐枋），于是各部遂成一种有机的结合。梁之中段，置于中柱柱头铺作之上，虽为五架梁，因中段不悬空，遂呈极稳固之状。梁上檐柱及中柱之间置柁橼，然其形不若清式之为“橼”，乃由大斗及相交之二拱而成，实则一简单铺作（图22）；其前后拱则承上层之三架梁，左右拱则以承襻间（今称枋）。然此铺作，不直接置于梁上，而置于梁上一宽0.21米、厚0.06米之墩背上。其位置亦非檐柱及山柱之正中，而略偏近檐柱。距檐柱1.88米，距中柱则2.41米。

三架梁与下平枋相交于此铺作上，梁头亦形如耍头。枋上复有散斗及替木以承平枋。梁之中段则置于五架梁上直斗之上；其上则有驼峰，驼峰上又为直斗，直斗上为交互斗（或齐心斗），口内置泥道拱及翼形拱一。泥道拱上为襻间（今称脊枋），枋上置散斗，枋端卷杀作拱形，以承替木及脊枋。自枋之前后，有斜柱下支于三架梁，平枋之前或后，亦有斜柱下支于五架梁。斜柱下空档，现有泥壁填塞，原有玲珑状态为此失去不少（图23）。

【22】 The T'o-tun, Shan-men. 山门大梁柁榑

【23】 The chu-ju-chu, Shan-men. 山门侏儒柱

The wu-chia-liang is known in the *Ying-tsao-fa-shih* as the ssu-ch'uan-fu or the beam of four rafters' length, while the san-chia-liang is called the p'ing-liang. The wing-shaped kung is not named in the famous book, but on page 22, Chapter XXXI, in the drawing of the cross section of a small building, is shown a motif very similar to it; judging from its position, it may well be considered the prototype of the p'eng-liang-yün of the Ts'ing style.

In Chapter V of the *Ying-tsao-fa-shih*, on the making of the chu-ju-chu, it is specified that:

"If the truss construction is exposed, a tou should be placed on the chu-ju-chu; on the t'ou should be placed one or two pieces of p'an-chien. The size of the p'an-chien should be the same as the ts'ai, and

its length in accordance with the width of the bay. Its end should be made into a half kung extending beyond the chu-ju-chu with the other half in the p'an-chien itself..."

The chu-ju-chu construction of the Shan-men answers very well to the above specifications (Figure 24).

The beams, which are the principal members of the "truss," are also worth studying. Beams are divided into two main categories in the *Ying-tsao-fa-shih*: the yüeh-liang or "crescent beam" and the chih-liang or "straight beam." Those used in the Shan-men and the Kuan-yin Ke are of the latter kind. Their peculiarity lies in the cross section of the beams. The Ts'ing regulations required the proportion between the depth and the width of the beam to be 10:8 or 12:10; the cross section resulting in almost a square. They did not know that the strength of the beam lies in the depth rather than in the width. The *Ying-tsao-fa-shih* set the proportion of 3:2, a much more logical shape. But in the case of the Shan-men, the wu-chia-liang measures 54 cm. $\times$ 30 cm., and the san-chia-liang measures 50 cm. $\times$ 26 cm., both being very near the modern practice of the 2:1 proportion. It seems that the Chinese builders of the Ts'ing Dynasty compared to their ancestors had a very poor knowledge of the strength of materials.

Refinement is also evident on these beams. They were shaped with a slight bulge near the middle on the sides of the beam. This was certainly done not for structural value, but in order to soften the mechanical harshness of the straight lines as the slightly curved face of the Parthenon. It may not be altogether incredible to suppose that the T'ang and Sung architects learnt delicate techniques of this kind, indirectly, of course, through Gandara and India, from Greece.

[G] The Heng or Purlin

At the end of the beams and on the chu-ju-chu are placed henges, (also termed lins), or purlins. The Chinese purlin, unlike those of the Western method of constructions are round in cross section. The Ming and Ts'ing methods of construction placed these henges, in addition to the above-mentioned places, also on the center-line of the columns. They were then termed cheng-hsin-heng or "center-line purlins," and if on the end of the uppermost hua-kung, they were called the t'iao-yen-heng or "eave-lifting purlins."

五架梁于《营造法式》称“四椽栿”，三架梁称“平梁”。平梁上之直斗称“侏儒柱”。斜柱亦称“义手”，见《法式》卷五《侏儒柱》节内。翼形拱不知何名，《法式》卷三十一第22页图中有相类似之拱；以位置论，殆即清式所谓“捧梁云”之前身欤？

《营造法式》卷五《侏儒柱》节又谓：

“凡屋如彻上明造，即于蜀柱之上安斗，斗上安随间襻间，或一材或两材。襻间广厚并如材，长随间广，出半拱在外，半拱连身对隐。……”

“彻上明造”即无天花。柱上安斗，即山门所见。襻间者，即清式之脊枋是也^[47]。今门之制，则在斗内先作泥道拱，拱上置襻间。其外端作拱形，即“出半拱在外，半拱连身对隐”之谓欤？（图24）。

此部侏儒柱之结构，合理而美观，良构也。然至清代，则侏儒改称脊瓜柱，驼峰斜柱合而为一，成所谓“角背”者，结构既拙，美观不逮尤远。

〔7〕 桁

侏儒柱之机能在承脊枋，而枋则所以承椽。而用枋之制，于檐枋——清式称檐桁或檐檩——一部，辽宋清略有不同，特为比较。

Of the twenty-two cross section drawings in Chapter XXXI of the *Ying-tiao-fa-shih*, five include the cheng-hsin-heng but omit the t'iao-yen-heng, in place of which is represented a fang, rectangular instead of round in cross section. In the remaining seventeen drawings no heng are represented in either position, but fangs are indicated.

The Hall of Ch'u-chu-an, of the Shao-lin Ssu in Sung-shan, was built in the seventh year of Hsuan-ho (1125), contemporary to the publication of the famous book on Chinese architecture. In the structure of this hall only cheng-hsin-heng were employed. It is evident that it was customary in the Sung period to omit either t'iao-yen-heng, or both the t'iao-yen and the cheng-hsin-heng. But in the Shan-men and Kuan-yin Ke of Tu-lo Ssu, the placing of the heng and the fang is just contrary to the Sung method. Here it is the cheng-hsin-heng that has been omitted while on the end of the uppermost hua-kung is placed a large, round t'iao-yen-heng (Figure 17).

清式于正心枋上置桁（即枋），称“正心桁”，而于斗拱最外跳头上亦置桁，称“挑檐桁”。

《营造法式》卷三十一殿堂横断面图二十二种，其中五种有正心桁而无挑檐桁，其余则并正心桁亦无之，而代之以枋。嵩山少林寺初祖庵，建于宣和间，正与《营造法式》同时，亦只有正心桁而无挑檐桁，其为当时通用方法无疑。

独乐寺所见，则与宋式适反其位置，盖有挑檐桁而无正心桁者。同一功用，面能各异其制如此，亦饶趣矣（图17）。

《营造法式》造梁之制多用月梁，于力学原则上颇为适宜。《法式》图中亦有不用月梁而用直梁者。山门及观音阁所用亦非月梁。其最异于清式者，乃在梁之横断面。《工程做法则例》规定梁宽为高之十分

之八，其横断面几成正方形。不知梁之载重力，视其高而定，其宽影响甚微也。《营造法式》卷五则规定：

“凡梁之大小，各随其广分为三分，以二分为厚。”

〔H〕 The Chiao-liang or Hip-rafter

In the construction of a hipped roof, the Chinese method had always been to place the hip-rafter on the purlins, contrary to the practice in modern construction. But the function of the hip-rafter is no different from that of the purlin, that is, to support the rafters. The hip is built in sections spanning the spaces between the purlins, running in a direction bisecting the right angle of the two adjacent walls. The lowest section is longer than the span and overhangs a considerable distance beyond the corner column on the mitre-line. This is the lao-chiao-liang or "old corner beam." On top of the lao-chiao-liang and extending even further out, forming a corbel, is the tze-chiao-liang or "little corner beam."

其广与厚之比为三与二，此说较为合理。今山门大梁（《法式》称“檐椽”）广（即高）0.54米，厚0.30米，三架梁（《法式》称“平梁”）广0.50米，厚0.26米，两者比例皆近二与一之比。梁之载重力既不随其宽度减小而减，而梁本身之重量，因而减半。宋人力学知识，固胜清人；而辽人似又胜过宋人一筹矣！

梁横断面之比例既如上述，其美观亦有宜注意之点，即梁之上下边微有卷杀，使梁之腹部，微微凸出。此制于梁之力量，固无大影响，然足以去其机械的直线，而代以圆和之曲线，皆当时大匠苦心构思之结果，吾侪不宜忽略视之。希腊雅典之帕蒂农神庙亦有类似此种之微妙手法，以柔济刚，古有名训。乃至上文所述侧脚，亦希腊制度所有，岂吾祖先得之自西方先哲耶？

〔8〕角梁

垂脊之骨干也。于屋之四隅伸出者，计上下二层，下层较短，称老角梁或大角梁，上层较长者为仔角梁，置于老角梁之上。

The sections of the hip-rafter spanning the spaces between the higher purlins are termed the yin-chiao-liang or "hidden corner beam" in the *Ying-tsoo-fa-shih*, but it was known to the Ts'ing architects as the yiu-ch'iang. When the point of intersection of the two hips and the ridge is directly above a chung-chu, as in most cases, the load is carried down straight to the column. But in the Shan-men, the shao-chien or end bay is smaller than half the width of the building, so the mitre-lines and the longitudinal axis meet at a point quite far in the

shao-chien. This necessitates the use of two kungs extending from the chu-ju-chu to transmit the load to the column (Figure 24).

The end of the lao-chiao-liang is finished in two fine, restrained curves, architecturally far superior to the complicated pa-wang-ch'uan curve of the Ts'ing style. The tze-chiao-liang is smaller than the lao-chiao-liang in cross section, but much longer. Its outer end is terminated by a t'ao-shou, the head of a monster, in terracotta; and from underneath is hung a bronze bell. Both ornaments are believed to be not earlier than the Ming Dynasty.

[I] Chü-che

Chü-che, literally meaning "raise and bend," is the method used in deciding the pitch and in plotting the curve of the Chinese roof (Figures 13-15). In Chapter V of the *Ying-tso-fa-shih* is the following rule:

"For raising the roof: For Palaces, halls, multiple-storied buildings and towers, the distance between the front and rear liao-yen-chuans" should be taken and divided into three equal parts. The altitude measuring from the top of the liao-yen-chuan to the top of the chi-ch'uan should be equal to one part. For halls and buildings covered with tubular tiles, the distance should be divided into four parts, and the altitude should be equal to one part; this may be further increased by eight-one hundredth...

For bending the roof: The first bend from the top should be one-tenth the height of the raise, and each bend below is lessened by half. For instance, if the raise is twenty feet in height, a straight line is drawn from the top of the chi-ch'uan to the top of the liao-yen-ch'uan. The first bend from the top is bent down two feet. Again a straight line is drawn from the top of the ch'uan of the first bend to the top of the liao-yen-ch'uan, and the second bend is bent down one foot...and so forth..."

A few words of explanation are perhaps necessary to make these passages clear. The liao-yen-ch'uan is called t'iao-yen-heng in the Ts'ing style, and the chi-ch'uan is the chi-heng or ridge-purlin.

【24】The ridge-purlin, chu-ju-chu and pu-chien-p'u-cho, interior tou-kungs of the Shan-men. 山门脊搏与侏儒柱并内檐补间铺作

由平搏以达脊搏者今称“由戗”，《法式》卷五则称为“隐角梁”。大角梁及隐角梁皆置于搏（即桁）上，前后角梁相交于脊搏之上。清式往往使梢间面阔作进深之半，使其相交在梁之中线上。山门因面阔较大，故相交在梢间之内，而自侏儒柱上伸出斗拱以承之（图24）。

大角梁头卷杀为二曲瓣，颇简单庄严，较清式之“霸王拳”善美多矣。仔角梁高广皆逊大角梁，而长过之。头有套兽，下悬铜铎，皆非辽

〔9〕举折

今称“举架”，所以定屋顶之斜度，及侧面之轮廓者也（图13-15）。山门举折尺寸，表列如下：

翻翻米迷）

椽端四强至平搏中

平搏中至脊搏中

椽端四强至脊搏中

The method for-plotting the curve is first to draw a straight line from the top of the ridge-purlin to the top of the eave-lifting purlin, and at the line of the first intermediate purlin from the top, a vertical line, perpendicular to the ground, is dropped down. One-tenth the total altitude is measured off on this line, deciding the height of the top of the first intermediate purlin. From the top of this purlin, another straight line is drawn to the top of the eave-lifting purlin, and at the line of the second intermediate purlin, a vertical line is also dropped. One-twentieth of the total altitude is measured off to give the top of the next purlin below. The same process is repeated until the top of the lowest intermediate purlin is reached, and every bend is half the height of the one above.

The measurements of the roof of the Shan-men revealed to us an example that was built almost in exact accordance to the *Ying-tsao-fa-shih* rules, entirely different from the rules of the Ts'ing style, according to which the roof is "built up" by a series of rafters each put in an angle greater than the one below. Thus the height of the ridge is therefore a consequence of the meeting of the two "built-up" slopes of the roof, contrary to the earlier method, according to which the pitch is first decided and the curved slope is the consequence of the "bends."

The distance between the front and rear liao-yen-ch'uan is 10.26 m., while the "raise" is 2.57 m., just one-fourth of the distance; but the additional raise of eight per cent was apparently ignored. The intermediate purlin—there is only one in this case—whose center line is horizontally 2.72 m. from the projection of that of the liao-yen-ch'uan, is raised 1.11 m. The figure drawn from these dimensions gives at the line of the intermediate purlin a "bend" of about 0.257 m. below the straight line drawn from the ridge to the eave-purlin, a perfect example of the "bending" method described in the *Ying-tsao-fa-shih*.

The general effect resulting from this method of chü-che is radically different from that of the Ts'ing methods. In the Ts'ing

structures, the slope of the roof near the ridge is often set at 45 degrees to the ground, whereas in the earlier examples, the pitch is usually set at a proportion of 6 to 10, or about 30 degrees. The earlier edifices, therefore, often give an impression of gentility and ease in swing which is totally lacking in later structures.

〔J〕 The Eave

In close relation to the chü-che, and influencing the external appearance of the building is the overhang of the eave. The Ts'ing regulations call for an overhang of approximately three-tenths or one third the height from the ground to the eave, giving an impression of restraint. But in the *Ying-tsao-fa-shih* the overhang of the eave is specified as from 9 to 11 times the diameter of the rafter, regardless of the height of the building. But on account of the comparatively large size of the tou-kung, the overhang is usually great, often reaching half the height of the eave from the ground. The impression it gives is that of the vigor and freedom which one often senses in front of an Early Renaissance Italian Palazzo.

此第一举（即椽檐搏至平搏）之斜度，即今所谓“四举”；第二举（平搏至脊搏）之斜度，即今所谓“六举”。而全举架斜度，由脊至檐，为二与一之比，即所谓“五举”是。其义即谓十分之长举高四分、五分或六分是也。《法式》卷五：

“举屋之法，如殿阁楼台，先量前后椽檐方相去远近，分为三分，从椽檐方背至脊搏背，举起一分。如□瓦厅堂，即四分中举起一分。又通以四分所得丈尺，每一尺加八分……”

若由脊搏计，则□瓦厅堂之斜度，实乃二分举一分，即今之五举^[48]。山门举架之度，适与此合。宋式按屋深而定其“举”高，再加以“折”，故举为因而折为果。清式不先定屋高，而按步数（即宋式所谓椽数）定为“五，七，九”或“五，六五，七五，九”举，此若干斜线连续所达之高度，即为建筑物之高度。是折为因而举为果。清式最高一步，互折达一与一之比，成45度角，其斜度大率远甚于古式，此亦清式建筑与宋以前建筑外表上最易区别之点也。

〔10〕 椽

与举折有密切关系，而影响于建筑物之外观者，则椽出檐之远近是也。清式出檐之制，约略为高之十分之三或三分之一，其现象颇为短促谨严。《营造法式》檐出按椽径定，而椽径按搏数及其间距离定，与屋高无定比例^[49]。然因斗拱雄大，故出檐率多甚远，恒达柱高一半以上。其现象则豪放，似能遮蔽檐下一切者。与意大利初期文艺复兴式建筑颇相似。

The height from the top of the liao-yen-fang to the top of the terrace is 6.09 m., while the distance from the center-line to the tip of the eave is 2.63 m., about 4.32/10 or 1/2.31 of the height. This great overhang together with the gentle slope of the roof, is one of the important factors that constitute to the character of the building.

The shaping of the rafter-ends is also worth noticing. The ends of the ch'uan or rafter and the fei-tzu or flying rafter are all slightly tapered. It is specified in Chapter V of the *Fa-shih* that:

"for all fei-tzu, the width should be eight-tenths, and the depth seven-tenths, the diameter of the ch'uan; both the width and the depth are each again divided into five parts; on each of the two sides, one part is tapered off, but from the bottom, two parts are tapered while the top is uncut...."

The rafters of the Tu-lo Ssu structures were apparently shaped in accordance with the above quoted method, or some method similar to it. This particular kind of refinement was totally unused in buildings of the Ts'ing Dynasty.

[K] Roof-tiles and Ornaments

The writer was informed by an old gentleman of Chi Hsien that the original tiles of the Kuan-yin Ke and the Shan-men were very large, measuring about a foot and half in width and four feet in length. They were replaced by smaller ones during the repair of the Kwang-hsü period. A certain gentleman of the town is in possession of a piece of the original tiles, but the author was disappointed when he asked to be allowed to see it. The tremendous length of four feet of the original tile is certainly doubtful, but that the present tiles are not the original ones is unquestionable. However, the most important and noticeable parts of the roof-tiles are the two ridge-end ornaments or tz'u-wei (Figure 25). The tz'u-wei is a motif first introduced by a Taoist monk into Chinese architecture during the time of Han Wu-ti for the superstitious reasons. T'ang examples can still be seen in mural paintings of Tun-huang and on the roof of the Toshodaiji in Nara, Japan, where it assumes the form of a fin-shaped tail, rising from the end of the ridge, and turning up and pointing in towards the center of the building. During the Ming and Ts'ing Dynasties, its name was changed to wen or lips, where it assumes the form of a dragon's head, facing in and biting the ridge in its mouth as though trying to swallow it, while the "tail" turns up and outward.

山门自台基背至椽檐搏背高为6.09米，而出檐自檐柱中线度之，为2.63米，为高之十分之四·三二或二·三一分之一。斜度既缓，出檐复远，

此其所以大异于今制也。

椽头做法，亦有宜注意者，椽头及飞椽头（即飞子）皆较椽身略小。《营造法式》卷五檐节下：

“凡飞子，如椽径十分，则广八分厚七分；各以其广厚分为五分，两边各斜杀一分。底面上留三分，下杀二分。……”

此种做法，于独乐寺所见至为明显。且不惟飞子如是，椽头亦加卷杀，皆建筑上特加之精致也。

梢间檐椽，向角梁方面续渐加长，使屋之四角，除微弯向上外，还要微弯向外，《营造法式》称为“生出”，清式亦有之，但其比例略异耳。

〔11〕瓦

蓟县老绅士言，观音阁及山门瓦，原皆极大，宽一尺余，长四尺，于光绪重修时，为奸商窃换。县绅某先生，曾得一块，而珍藏之。请借一观则谓已遗失。其长四尺，虽未必信，而今瓦之非原物，固无疑义。其最可注意者，则脊上两鸱尾，极可罕贵之物也（图25）。鸱尾来源，固甚久远，唐代形制，于敦煌壁画及日本奈良唐招提寺见之，盖纯为鳍形之“尾”，自脊端翘起，而尾端向内者也。明清建筑上所用则为吻，作龙头形，其尾向外卷起，故其意趣大不相同。

【25】Tz'u-wei, Shan-men. 山门鸱尾

The name "tz'u-wei" is used in the *Ying-tsao-fa-shih*, but no drawing can be found to identify its actual appearance, except in Chapter XXXII, in "the drawings for Cabinet Works," a number of Buddhist shrines are shown with wens identical to the later wens. But here in the case of the Shan-men, the dragon's head is similar to the modern designs, but the inward turn of the tubular "tail" is something unseen in later models. It is probably a Liao original, or a later replica of a Liao original, an interesting evidence of the transition.

About midway down the hip is the shou-t'ou or beast's head. It is

known in later periods as the ch'ui-shou, the sloping beast. At the end of the hip, i.e., the corner of the roof, is the hsien-jen or immortal whose correct name is pin-chia or lady-in-waiting in *Fa-shih*; but here she is represented as a fierce, bearded, armored warrior, in a dignified sitting pose, with his right arm raised as though getting ready to strike any sparrow that might happen to perch in front of him!

In between the shou-t'ou and the pin-chia are a number of chou-shou or running beasts, known in the *Fa-shih* as the tsun-shou or sitting beasts. Whether they are running or sitting depends upon the designer, and in many cases on the spectator who views them from below. There are four of them at each corner, even members are employed unlike the Ts'ing image of odd numbers. The distribution of these beasts is here different from both the later practice of putting them close to each other, and the excessively scanty spacing of putting three tiles between each beast as specified in the *Fa-shih*. They are here spaced with one tile between, and a happy medium seems to have been stuck between the two extremes.

[L] The Masonry Walls

The two narrower facades and the spaces in between the chung-chu and shan-chu, i.e., in the two end bays on the longitudinal axis, are all built in with brick walls. They were undoubtedly built in during one of the Ts'ing restorations. It is therefore all the more interesting to note that they were not built in accordance with Ts'ing regulations, in which the ch'ün-chien, the lower part of the wall, is specified to be one-third the total height of the wall, while here it is only 97 cm. high in relation to the 4.33 m. of the height of the wall, that is less than one-fourth (Figure 12).

There are traces of brick walls between the lower parts of the columns in the front and rear in the end bays. They were recently destroyed.

《营造法式》虽有鸱尾之名，而无详图，在卷三十二《小木作制度图样》内，佛道帐上有之，则纯为明清所习见之吻，非尾也。此处所见，龙首虽与今式略同，而其鳍形之尾，向内卷起，实后世所罕见；其辽代之原物欤？即使非原物，亦必明代仿原物所作。于此鸱尾中，唐式之尾与明清之吻，合而为一，适足以示其过渡形制。此后则尾向外卷，而成今所习见之吻焉。

正脊与垂脊，皆以青砖垒成，无特殊之点。但《营造法式》以瓦为脊，日本镰仓时代建筑物亦然，是独乐寺殿堂原脊之是砖是瓦，将终成永久之谜。垂脊之上有兽头（今称垂兽），脊端为“仙人”，《法式》称“嫫伽”，而实则甲冑武士也！嫫伽与垂兽间为“走兽”，《法式》亦

称“蹲兽”，其数为四。宋式皆从双数，而清式从单。其分布则不若清式之密，亦不若宋式“每隔三瓦或五瓦安兽一枚”之疎，适得其中者也。

〔12〕 砖墙

两山及山柱与中柱间皆有砖墙，其为近代重砌，毫无可疑，然其制度则异于清式。清式以墙之最下三分之一为“裙肩”，此处则墙高4.33米，而裙肩高只0.97米，约为全高之 $1/4.5$ ，其现象亦与清式所习见者大异（图12）。此外则别无特殊可志者。姑将其各部尺寸列下：

砖墙高度
裙肩高度

梢间檐柱与角柱间，尚有槛墙痕迹，高1.13米，厚0.43米，亦清代所修，而近数年始失去者。

【26】 General view of the Shan-men. 山门全貌

〔M〕 Windows and Doors

Not a trace of the Liao original windows or doors is conserved. Even the windows that once sheltered the end bays are missing. The only thing of the sort that can be seen is the two large gates, the design of which tells its date of construction—Ts'ing. A few of the transoms are still left with grills of geometrical patterns, similar to those of the Imperial Palaces in Peiping. Separating the central bay, which was the main thoroughfare, from the end bays, which were rooms for the Lokapalas, were originally wooden railings. Probably they were destroyed only recently.

〔13〕装修

辽代原物，一无所存。清物则大门二扇，尚称完整。考其痕迹，南北二面梢间之外面，清代曾有槛墙，上安槛窗。今抱框及上中槛尚存，横披花心亦在，其楞子为清故宫内最常见之“菱花”几何形纹样。檐柱与中柱间，当曾有栅栏，想已供数年前驻军炊焚之用矣。

〔N〕Painting

The painting is the worst part of the modern touches. It was probably done during the Kwang-hsü restoration in accordance with paintings of the Chien-lung period. The painters were totally ignorant of the functions of the different components of the architecture, and taste was altogether lacking in their distribution of colors. With the exception of the tou-kungs, which are tolerable and not too outrageous, the entire painted decoration is merely an exhibition of the lowest degeneration of decorative art. Because of the difference in structure, the Ts'ing system of painted ornaments could not be very well applied to a Liao building, while the lack of creative ability prevented the painters from inventing something new. The Ts'ing system of ornamentation was thus forced onto the Liao structure, making a clown of the dignified old monument. The filled-in spaces between the tou-kungs are treated with an all-over pattern of frets. This pattern was carried right across and over the short stud of the puchien-p'u-cho, as if purposely trying to disguise its structural value. To paint a religious building in a ridiculous manner like this is not only sacrilegious but mocks the functional value of the architectural parts.

〔14〕彩画

彩画之恶劣，盖无与伦。乃光绪末年所涂者。画匠对于建筑各部之机能，既毫无了解，而于颜色图案之调配，更乏美术。除斗拱所施，尚称合宜外，其他各部，皆丑劣不堪。因结构之不同，以致清式定例不能适用，而画者又乏创造力，于是阑额作和玺，檐枋（桁）作“大点金”，大点金而间以万字“箍头”又杂以“苏画枋心”。数层柱头枋上彩画亦如是，而枋心又不在其正当位置。替木上又加以「卍」纹。尤为荒谬者则垫拱板上普遍之万字纹上添花，竟将补间铺作之直斗亦置于其掩盖之下，非特加注意，观者竟不知直斗之存在。喧哗嘈杂，不可响尔。夫名刹之山门，乃法相庄严之地，而施以滑稽如彼之彩画，可谓大不敬也矣。

〔O〕Statues

In each of the two end bays is a colossal figure of a Lokapala, modeled in clay. They are the familiar conventional figures often seen at the entrances of Chinese temples. Their expressions are fierce, and their draperies suggestive of violent movement. Both figures are beginning to fall forward, and are held in position by iron chains and rods from behind. The painting on the figures is new (Figure 27).

〔 P 〕 Mural Paintings

On the two end walls, in the northern end bays, are painted the Four Heavenly Kings. On the east are Tseng-ch'ang-t'ien (Virûdhaka) and Ch'ih-kuo-t'ien (Dhritarâshtra) on the west wall are To-wen-t'ien (Vais'ravana) and Kwang-mu-t'ien (Virupâksha). The paintings show very little merit from point of view of the technique of the painter, but the composition is fairly interesting. It is quite possible that they are older originals retouched and traced over in one of the later restorations. The murals were packed over with paper and have been much defaced and marred by its removal (Figure 28).

〔 Q 〕 The Pien

Under the eave on the southern (front) facade is the signboard with the characters 独乐寺 ("Tu-lo Ssu"). The board measures more than two meters by one while each character is about 90 cm. square. The calligraphy is attributed to Yen Sung, a treacherous prime minister of the Ming Dynasty (Figure 29).

〔 15 〕 塑像

南面梢间立塑像二尊，土人呼为哼哈二将，而呼山门为“哼哈殿”。像状至凶狞，肩际长巾，飘然若动。东立者闭口握拳，为哼（图27）。西立者开口伸掌为哈。实为天王也。像皆前倾，背系以铁索。新涂彩画甚劣。

〔 16 〕 画像

北半梢间山墙，画四天王像。东壁为增长（南）持国（北），西壁为多闻（北）广目（南）（图28）。笔法平庸，而布局颇有趣，盖近代重修而摹画者耶？驻军曾以纸糊墙，今虽撕去，而画受损已多矣。

〔 17 〕 匾

山门南面额曰“独乐寺”，匾长2.17米，高1.08米，字方约0.9米。相传为严嵩手笔（图29）。

【27】 A Lokapala in the end bay, Shan-men. 山门东间天王塑像

【29】 The pien of Tu-lo Ssu, Shan-men. 山门匾

V. The Kuan-yin Ke

〔A〕 Exterior Appearance

The Kuan-yin Ke is a three-storied building of two main floors and a mezzanine which is not visible from the exterior. It resembles strikingly the two- or three-storied buildings represented in the T'ang mural paintings of the caves of Tun-huang (Figure 30). The bold proportions of the tou-kungs, the heavy overhang of the eaves, together with the gentle pitch of the roof line, endow it with an air of dignity and composure that nevertheless is full of vitality, a characteristic found only in architecture of a new and growing epoch. The three tiers of tou-kungs on the exterior vary in form and structure according to their respective position and function. The roof is of the hsien-shan kind, a combination of the pitched and gabled roof.

伍 观音阁

〔1〕 外观

阁高三层，而外观则似二层；其上下二主要层之间，夹以暗层，如西式所谓mezzanine者，自外部观之不见。阁外观上最大特征，则与唐敦煌壁画中所见之建筑极相类似也（图30）。伟大之斗拱，深远之檐出，及屋顶和缓之斜度，稳固庄严，含有无限力量，颇足以表示当时方兴未艾之朝气。其三层斗拱，各因其地位而异其制。

〔30〕 Mural paintings of the caves of Tun-huang. 敦煌壁画净土图

The recess of the gable from the eave, technically termed shou-shan, is greater than that of the Ts'ing style, resulting in a comparatively short ridge and small triangular gable, or shan-hua. Surrounding the third story on the exterior is a balcony, commanding an admirable view of the surrounding landscape. At the four corners on both stories are posts supporting the heavy overhanging eaves which threaten to fall down. This entire structure stands on a low base or terrace of stone, called the t'ai-chi, in front of which is another terrace one step lower, called the yueh-t'ai. On this yueh-t'ai are two square "beds," in one of which still stands an old cypress tree (Figure 31).

屋顶为“歇山”式^[50]，而收山殊甚，正脊因之较清式短，而山花^[51]亦较清式小。上层周有露台，可登临远眺。今檐四角下支以方柱，以防角檐倾圯。阁立于低广石台基上，其前有月台，台上有花池二方，西池内尚有古柏一株（图31）。

【31】 Southern side of Kuan-yin Ke. 观音阁南面

〔B〕 The Plan

The Kuan-yin Ke is a peristylar hall of five bays by four, with the longer facade facing south. The columns on the exterior are 18 in number, while in the interior there are 10 (Figure 8), forming the cella of the Hall. Within the area bound by the inner columns is a platform, situated slightly to the northern half of the space. On the platform is the colossal standing figure of an Eleven-headed Kuan-yin, with two Bodhisattvas in attendance, all three statues resembling strongly the sculptures of the T'ang period. There are three other seated figures on the platform, apparently of a much later date. On the northern side of the platform, back to the colossal figure is another figure of a Kuan-yin, sitting on a hilly setting. In the bay on the western end is the stairway that gives access to the mezzanine and upper floors.

The mezzanine floor is situated between the ceiling of the lower story and the floor of the upper story. It is not visible from the

exterior. Being behind the roof of the lower story and the brackets of the balcony above, fenestration is almost totally illuminated. With the exception of the western end bay, which is used as the hall leading to the stairs, the entire space between the exterior and interior rows of columns is left unused. The central space, bound on the four sides by the inner columns is unfloored, but provided with a balcony which enables the worshipper to go around the body of the figure, which pierces through all the three stories (Figure 9). The stairway from below is accessible at the northern end of the stair-hall, while to the south is another flight of stairs leading to the upper floor.

〔2〕平面

阁东西五间，南北四间；柱分内外二周。外檐柱十八，内檐柱十（图8）。最中为须弥坛，坛略偏北，上立十一面观音像一，侍立菩萨像二，其他像三；与大像相背有山洞及像。西梢间内为楼梯，可达中层。

中层位于下层天花板之上，上层地板之下，其外周为下檐及平坐铺作所遮蔽，故无窗。其檐柱以内，内柱（清称金柱）以外一周，遂空废无用。内柱以内上下空通全阁之高，而有小台可绕像身一周（图9）。楼梯在西梢间北端，至中层后折而向南，可达上层。

上层平面图 Plan of Upper Story

中层平面图 Plan of Mezzanine

【32】Plan of Kuan-yin Ke. 观音阁平面图

The upper story is one spacious room with the three middle bays

open. Now that the doors are destroyed, it gives more than ever a feeling of spaciousness and loftiness. The entire upper story is surrounded on the exterior by a balcony, supported on a series of toukungs, commanding a magnificent vista of the city in front and the hills at the rear. In the center of the room is a hexagonal opening, surrounded by balustrades, from which one can obtain an excellent view of the figure, particularly the head and the bust (Figure 32). The bays that are not open are filled in by walls of earthen plaster on laths of twigs.

The inter-columniation of the different bays is not equal, but wider in the center and narrower at the ends. The width of the end bays in both facades is the same, that is to say, the inner columns are all equidistant from their corresponding outer columns forming an aisle all the way around the nave. It is interesting to note that the three superposed "orders" of the inner peristylar columns are placed directly one on top of the other, on the same center line, while the two upper "orders" on the exterior columns are placed not directly on the lower columns, but on the beam spanning the space between the inner and outer columns. This moves the outer columns on the two upper stories a little distance back of the lower rows, thus making the upper stories considerably smaller than the lower one and thus giving an appearance of stability.

上层极为空朗，周有檐廊^[52]，可以远眺崆峒盘谷。内柱以内，地板开六角形空井，围绕佛身，可以凭栏细观像肩部以上各部（图32）。南面居中三间俱辟为户，可外通檐廊，北面唯当心间辟户。其余各间则皆为土壁，梯位置亦在西梢间，可以下通中下二层。

下层面阔，当心间较阔于次间，次间又阔于梢间；进深则内间较深于前后间。而梢间之阔与前后间之深同，故檐柱金柱之间乃成阔度相同之绕廊一周。而内部少二中柱，为佛坛所在。其特可注意者，乃中上二层之金柱，立于下层金柱顶上，而上中层檐柱乃不立于下层檐柱顶上，而向内立于梁上，故中上二层外周间较狭，而阁亦因之呈下大上小之状。

[C] The Terrace

The sub-structure to the entire Kuan-yin Ke is the stone t'ai-chi forming that the footing to the Hall, and is the transition between the structure and the ground. In relation to the entire building, the terrace seems rather low. The exterior appearance of the Hall would be greatly improved if the terrace were increased to double its height. But whether the present height is that of the original or not is doubtful. The stone used for the side walls of the terrace is local

granite, roughly dressed. The top of the terrace is paved with square brick tiles. The space within the peristyle is on the same level as the outer part of the terrace, forming the floor height of the lower story.

In front of the t'ai-chi, and lower by one step, is the yueh-t'ai, a little more than three bays in length, with its width less than half its length. The side walls are of the same material as the t'ai-chi, and the top paved with the same tile. Two unpaved squares on the yueh-t'ai from the "flower-beds," in one of which may still be seen an old cypress tree.

On both the east and west of the yueh-t'ai, and butting against the side of the t'ai-chi, is a flight of steps. The steps to the southern side, once the main access to the terrace and the Hall, were destroyed in 1931. The stones for the steps are still piled up nearby. A similar flight of steps is provided on the northern side of the terrace.

[D] The Column and the Base

In form the columns of the Kuan-yin Ke are quite similar to those of the Shan-men. After a thousand years' reparation and restoration, in addition to the natural shrinkage and expansion of the wood, the columns have become quite un-uniform in size, and to obtain an accurate measurement is impossible. However, the average of the dimensions taken show definitely that there is no definite proportion between the diameter to the height of the column. This differs from both the Greco-Roman and Ts'ing styles. In Chapter V of the *Ying-t'sao-fa-shih* on the making of columns, no definite proportion is given between the diameter and height of the column. In the case of the Shan-men and the Kuan-yin Ke, although there is no definite diameter to the columns, they nearly all measure half a meter across. It may not be altogether without justification to presume that they were all meant to be of the same size regardless of their height and position. The slight variation in size found today is due to inexact workmanship or the shrinkage of materials in past ages.

兹将各层各柱脚间尺寸列下：

內櫺進深

以上度量，不唯可见中上二层檐柱之内移，且可见柱侧脚之度^[53]

〔3〕台基及月台

观音阁全部最下层之结构为台基，全部之基础，而阁与地间之过渡部分^[54]也。台基为石砌，长26.66米，宽20.45米，高1.04米。以全部权衡计，台基颇嫌扁矮，若倍其高，于外观必大有裨益。然台基今之高度，是否原高度，尚属可疑，惜未得发掘，以验其有无埋没部分也。砌台基之石，皆当地所产花岗岩，虽经磋琢，仍欠方整，殆亦原物而经重砌者。台基之上面，墁以方砖；檐柱以内，即为下层地面。

台基之前为月台，长16.22米，占正面三间有余，宽7.70米，而较台基低0.20米。月台亦石砌，与台基同。上墁方砖。台上左右有花池二，方约2米，西池内尚有古柏一株，而东池一株并根不存矣。

月台东西两方，与台基邻接处，有阶五级，可下平地。南面原亦有阶，然因有碍球场，已于去岁拆毁。今阶石尚存月台东阶下，拆毁痕迹尚可见。台基北面亦有阶。

〔4〕柱及柱础

观音阁柱与山门柱形制相同，亦《营造法式》所谓直柱者也。山门诸柱，原物较少，而观音阁殆因不易撤换，故皆（？）原物，千年来屡经修葺，坎补涂抹之处既多且乱，致使各柱肥瘦不同，测究非易。

The entasis on the columns of the Ke is peculiarly slight. It is difficult to make any measurement on account of the unevenness and inexactitude of the columns.

However, the ch'e-chiao or slanting of the columns can generally be easily seen. A passage from the *Ying-tsao-fa-shih* has already quoted in discussing the columns of the Shan-men. Referring to the ch'e-chiao of multiple-story buildings, the handbook says that the degree of inclination should be carried all the way up. Measurements taken at different levels show that the ch'e-chiao is strictly observed in the Ke columns, as the distances between the outer and inner columns steadily diminish from the lower to the upper ends. This is plainly visible even to the naked eye (Figure 31).

It is to be noted that the three-story height of the Kuan-yin Ke is actually composed of three separate stories of structural framework, each complete in itself with its "order" of columns, tou-kungs, and horizontal liangs and fangs. Therefore, the superposition of the different stories is worth studying. It has already been mentioned in a previous paragraph that the outer columns of the mezzanine do not stand directly on top of the lower-story columns, but on a beam, and the distance between the center lines of the lower and upper columns is 0.355 m. The column on the beam does not stand directly on the

beam, but interposed by a base which is merely an old kung put upside down. This kung is at least as old as the end of the T'ang Dynasty, as it is evident that it must have been taken from some old buildings that were destroyed prior to the building of the Kuan-yin Ke in 984 AD. The function of this interposition is primarily to take care of the strong shear exerted on the beam on account of the closeness of the columns above and below. But the two t'iaos of hua-kungs under the beam have reduced greatly the actual span of the beam on which the upper column stands, and the successive tiers of corbelling are made to react as one single member, transmitting the load to the column below.

然测究之结果，乃得知各柱因位置之不同，尺寸略约，姑列如下表：[55]

高(米) 柱径(米)

檐柱	0.48
内柱	0.45
檐柱	0.48
角柱	0.48
内柱	0.45
中柱	0.48

综前列诸度量及山门柱度量，得知柱径与高无一定之比例。清式定例，柱高为柱径之十倍，而独乐寺所见，则绝无定例。考之《营造法式》卷五，用柱之制，亦绝无以柱高或径定其比例及尺寸者。山门及观音阁，其柱径虽每柱不同，然皆约略为0.5米，愚以为原计划必每柱皆同径，不分地位及用途；其略有大小不同者，乃选材不当或施工不准及后世斫补所使然耳。

阁柱收分尤微，虽有亦不及1%。然因各柱尺寸不同，亦难得知确为何如。

其最显而易见者，则柱之侧脚度也。关于此点，上文已详加申述，然于楼阁柱侧脚之制，则《法式》有下列一段：

“若楼阁柱侧脚，只以柱以上为则，侧脚上更加侧脚，逐层仿此。”

按前页各层面阔进深尺寸表，梢间面阔及前后间进深，向上层层缩减，可知其然；即未测量，肉眼描视，亦显现易见也（图31）。

阁高既为三倍，柱亦为三层垒叠而上达，而各层于斗拱檐廊等部，各自齐备；故阁之三层，可分析为三个完整之结构垒叠而成[56]。然则各层相叠之制，亦研究所宜注意。中层檐柱，不立于下层檐柱之上，而立于其上之梁上，二柱中线相距0.355米。惧其不固也，更以横木承之。而此横木，乃一旧拱，其必为唐以前物无疑。上下二柱既不衔接，则其荷重下达亦不能一线直下，而藉梁枋为之转移，此转移荷重之梁枋，遂受上下二柱之切力[57]，为减少切力之影响，故加旧拱以增其力。但枋下梁拱叠出，最上受柱重之枋，已将其重量层层移向下层柱心，而切力亦在拱之全身，而不独在受柱之枋。此法固非极善，然因斗

拱结构完善，足以承重不欹也（图9）。清式楼阁有童柱之制，与此略同。然因童柱立于梁中，而不在梁之一端，故其应力亦不同也。

The outer columns of the top story are placed directly on those of the mezzanine story. The foot of the upper column is mortised and jointed to form a part of the chu-t'ou-p'u-cho beneath it, with its foot standing on the lu-tou, as if standing on a regular base. The inner columns are also superposed in the same manner. Many of the mortised feet of the upper columns have split and threaten to give way under the slightest access of load (Figure 46).

The heads of the columns are rounded off like a fu-p'en or "in the shape of an inverted bowl." This characteristic is especially noticeable in the dark parts of the mezzanine, where the contours of the columns are not deformed by the plaster and paint of later ages (Figure 33).

The base of the column of the lower story is of the same material as that of the Shan-men. It is about 90 cm., less than twice the diameter of the column, but considerably larger than the Shan-men bases. The fu-p'en of the base is also treated in the same manner as that of the Shan-men.

〔E〕 Tou-kungs

There are twenty-four different kinds of tou-kung in the structure of the Kuan-yin Ke. Each kind is specially constructed to fit the position and suit the function of each particular case.

1. Exterior Tou-kungs of the Lower Story

(a) Chu-t'ou-p'u-cho, the Brackets on the Column On the column the lu-tou is placed from which extend four t'iaos of hua-kungs and the shua-t'ou. Intersecting with these are a ni-tao-kung, three tiers of chu-t'ou-fangs, and a ya-ts'ao-fang above in all five tiers. The three tiers of chu-t'ou-fang are all carved with false kungs in relief, like the Shan-men. On the ends of the second and fourth t'iaos of the hua-kung, are placed a transversal kung, in the t'ou-hsin manner. The kung on the second t'iao is called the kua-tze-kung, on which is placed a man-kung, supporting a long horizontal member, called the lo-han-fang (Figures 34, 35). Concerning constructions of this kind, it is stated in Chapter IV of the *Ying-tsao-fa-shih*, on the "Ensemble of the P'u-cho":

"...when the shu-fang is supported by the ling-kung on the end of the t'iao, it is called the single kung method.... When a man-kung is placed on the kua-tze-kung, which is on the end of the t'iao, and the shu-fang placed on the man-kung, it is called the double-kung

method."

至于上层檐柱，乃立于中层柱头栌斗之上，上中层内柱，亦立于中下层内柱柱头栌斗之上；与各拱相交，似成为斗拱之中心然者，因与各拱交置，故各柱脚竟多劈裂倾斜，亦非用木之善法也。此种作法，当于下文平坐铺作题下详论之（图46）。

至于柱之形式，上径下径相差无几，其收分平均不过1%，故其所呈现象颇长而直。所谓直柱者是。其柱头卷杀作覆盆样，亦为特征，此点于在暗层内之中层内柱，未经油饰诸部分最为明显（图33）。

柱基石料与山门同，亦当地青石造。方0.90米，亦不及柱径之倍，然比例较大于山门柱础。其上覆盆之制亦与山门同。[\[58\]](#)

〔5〕斗拱

观音阁上下内外计有斗拱二十四种，各因其地位及功用之不同，而异其形制。

下层外檐斗拱四种：

1．柱头铺作 栌斗施于柱头，斗上出华拱四跳，并耍头共计五层。与华拱耍头相交者计泥道拱一层，柱头枋四层，共计亦五层。下三层柱头枋皆雕作假拱形，如山门之制。跳头每隔一跳，上安横拱，作“偷心”之制，故华拱四跳中，唯第二跳及第四跳跳头上安横拱，拱上承枋（图34，35）。关于此部结构，《法式》卷四《总铺作次序》谓：

“……每跳令拱上只用素方一重，谓之单拱。……每跳瓜子拱上施慢拱，慢拱上用素方，谓之重拱。”

【33】 The heads of the columns in the dark parts of the mezzanine.

【34】 Exterior tou-kungs of the lower story. 观音阁下层外檐柱头及补间铺作

0 0.5 1 2 m.

【35】Chu-t'ou-p'u-cho and pu-chien-p'u-cho, exterior tou-kungs of the lower story, Kuan-yin Ke. 观音阁下层外檐柱头及补间铺作

【36】 T'i-mu of chu-t'ou-p'u-cho, exterior tou-kungs of the lower story, Kuan-yin Ke. 观音阁下层外檐柱头铺作之替木

But in an explanatory note to this passage, the following definitions are given:

"The su-fang (meaning plain fang) above the ni-tao-kung is called the chu-t'ou-fang, while the one on the t'iao is called the lo-han-fang on which is placed the che-ch'uan-pan (rafter-hiding board) in a sloping position."

Here we have on the end of the second t'iao a kua-tze-kung supporting a man-kung, on which is placed a lo-han-fang, answering exactly to the description of the double-kung method; while on the end of the fourth t'iao, the ling-kung with the t'i-mu and eave-purlin above give an excellent example of the single kung construction (Figure 36).

It is interesting to note that the second and fourth t'iaos are slightly longer than the first and third, because in a p'u-cho of the t'ou-hsin manner, the second and fourth t'iaos, on which the transversal kungs are placed, are apparently of greater importance than the other two t'iaos.

而此段小注中则谓：

“素方在泥道拱上者谓之柱头方，在跳上者谓之罗汉方^[59]，方上斜

安遮椽板。”

第二跳跳头计瓜子拱慢拱各一层，上用罗汉枋，即所谓重拱之制。此制至清代仍沿用之。第四跳跳头上则只用单拱，唯令拱一层，与耍头相交，清代亦同此制。唯清式于令拱（清称厢拱）上散斗（清称三才升）内安挑檐枋，上承挑檐桁。宋式则无桁而用撩檐枋，辽式则以替木代挑檐枋（图36），上加撩檐榑（挑檐桁）。此节上文虽已论及，唯为清晰计，故重申述之。

至于各跳长度，亦因地位功用而稍异。第一第三两跳出跳较长，而第二第四两跳出跳较短，盖因偷心之制，二四两跳较重要于一三两跳，故使然也。

The rear of the p'u-cho (Figure 37) consists of two t'iaos of hua-kung supporting a small beam, called the ming-fu, on which is placed the rear of the fourth hua-kung, in the form of a kung, intersecting with a ling-kung. The shua-t'ou is extended at the rear right across the aisle, above and parallel to the ming-fu, known as the p'ing-ch'i-fang or the fang of the coffer ceiling.

The function of these two horizontal members is primarily for the tying together of the inner and outer peristylar columns, and not for the carrying of any load above, although the p'ing-ch'i-fang is made to carry the ceiling which is not very heavy.

The spaces between the inner and outer su-fang are covered by the che-ch'uan-pan, known as the kai-tou-pan in the Ts'ing style. As the spaces are comparatively wider than those of the later styles, the che-ch'uan-pan is supported by a number of small rafters, a treatment not seen in Ts'ing structures but quite usual in Japanese structures of the Heian and Kamakura periods, when T'ang and Sung influence were most dominant in Japan.

(b) Chuan-chiao-p'u-cho As discussed in a previous paragraph, the set that turns the corner may be analyzed as the intersection of two chu-t'ou-p'u-cho each facing a direction that makes an angle of 90 degrees with the other (Figure 38). Here on the exterior of the lower story of the Kuan-yin Ke, the lu-tou is found with intersecting hua-kungs, the rear ends of which are simultaneously the ni-tao-kungs of the adjacent side. Above each of these intersecting kungs are three t'iaos of hua-kungs, all being the extension of the ends of the chu-t'ou-fangs of the adjacent sides.

铺作后尾之结构（图37），亦殊饶趣味。最下华拱两层，与前面相同，唯长0.02米。第三跳前为华拱尾为梁，直达内柱拱头铺作上。第四跳为拱，顺安于梁上，长只如三跳，而于二跳中线上施以令拱，以承内罗汉枋。更上则为耍头后尾，直达内檐柱头铺作上。

檐柱与内柱之间，遂有联络材二件，梁枋各一。二者功用皆在平的联络，而不在上面负重者也。

各跳间素枋上皆有遮椽板，清称盖斗板者是。因枋间相距颇远，故板下以小楞木承之，为清式所无，然多见于日本，亦隋唐遗制也。

铺作正面立面为重拱两叠，令拱一层，其在柱上者，除泥道拱外，皆由柱头枋雕成假拱，第二跳跳头为重拱；第四跳跳头为令拱。其偷心之结构，特长之慢拱，及全铺作雄大之权衡，遂使建筑物全部之现象，迥异于明清建筑矣。

2. 转角铺作 转角铺作者，实两面之柱头铺作，前已述及。故仍当按此原则分析之（图38）。栌斗口中，泥道拱与华拱相列之列拱二件相交，其上华拱三跳，皆由三层柱头枋伸出，即柱头枋与华拱相列也。

【37】The rear of chu-t'ou-p'u-cho and chuan-chiao-p'u-cho, exterior tou-kungs of the lower story, Kuan-yin Ke. 观音阁下层外檐柱头铺作及转角铺作后尾

【38】 Chuan-chiao-p'u-cho and chu-t'ou-p'u-cho, exterior tou-kungs of the lower story, Kuan-yin Ke. 观音阁下层外檐转角铺作及柱头铺作

On the mitre-line are five t'iaos of chiao-kungs, corresponding to the four t'iaos of hua-kungs and the shua-t'ou on the two sides. The kua-tze-kung on the end of the second hua-kung on either side is made to intersect with that of the other side on the end of the second chiao-kung, and then carried beyond the point of intersection to become the double-kung of the corresponding level on the other side, whereon is supported the lo-han-fang. The end of the lo-han-fang, in a position similar to that of the shua-t'ou, is shaped into a wing-like curve, with no transversal kung on its end. On the end of the fourth chiao-kung are two intersecting ling-kungs, supporting two intersecting t'i-mu under the eave-purlins which also intersect at this point. On the same level as the shua-t'ou on the mitre-line is the fifth chiao-kung, on the end of which sits a pao-p'ing or "treasure bottle" to support the chiao-liangs above.

The rear of the p'u-cho consists of nothing but the rear ends of the chiao-kungs, bisecting the inner angle. The two lower t'iaos, like those of the chu-t'ou-p'u-cho, are made to support the beam above, running from the outer to the inner corner columns of the peristyle. The third chiao-kung on the exterior is extended in the rear into a diagonal beam, spanning the corner columns. The fourth tier is again a kung parallel to the beam and resting on it. The fifth and uppermost tier is a

diagonal fang, forming another tie between the corner columns. The construction of this part is identical to that of the chu-t'ou-p'u-cho, but diagonally put; the only difference being in the ling-kung under the inner lo-han-fang, the outer end of which is made to butt against the chu-t'ou-fang of the corresponding level.

This chuan-chiao-p'u-cho has the appearance of something very complicated, but a little analyzation reveals it to be an ensemble of nothing but logic and order, a natural outcome of the structural system.

(c) The Pu-chien-p'u-cho on the Front Facade

It is applied only in the three central bays. It hardly functions as a structural unit. The p'u-cho is only a composition of false kungs carved on the chu-t'ou-fangs, with the spaces between filled in with a few tous. The two lower fangs are carved with the ni-tao-kung and man-kung combination, while the upper fang is treated with a ling-kung. There are no hua-kungs extending out to support the overhanging eave like that of the Shan-men. The large t'ou under the ni-tao-kung was probably supported by a short stud or a t'o-feng which is now missing (Figure 34).

斜角线上，亦安角拱，与各华拱及耍头相埒者五层。正面及侧而华拱第二跳跳头之瓜子拱及慢拱相交于第二跳角拱跳头之上，其另一面遂成罗汉枋下之华拱第三四跳，瓜子拱或慢拱与华拱相列者也。最上一层之柱头枋，在彼一面伸出为耍头，与令拱相交于华拱第四跳跳头之上。而罗汉枋亦在彼一面伸出，与耍头并列，但上不施拱，其端则斫作翼形。角华拱第四跳跳头上则有令拱二件相交，上施散斗，斗上承长替木，达正令拱之上。而与耍头相埒之角枋，则端亦作拱形，成第五层角华拱，拱端斗上安“宝瓶”，以承大角梁。

其后尾唯角华拱二层。第三层为斜梁，达内角柱。第四层为拱，顺安梁上。第五层为斜枋，即外端上置宝瓶之最上层角华拱后尾也。此部结构与柱头铺作后尾完全相同，唯位置斜角；其唯一不同之点，乃内罗汉枋下令拱，其一端为拱，而另一端乃与第三层柱头枋相交，《法式》所谓令拱与切几头相列者是也。

此转角铺作，骤观颇似复杂不堪者，但略加分析，则有条不紊，逻辑井然，结构法所自然产生之结果也。

3. 正面补间铺作 下檐唯当心间及次间有补间铺作，而梢间无之。由结构上言，谓下檐无补间铺作可也。盖柱头铺作与柱头铺作之间，有柱头枋四层互相联络，而所谓补间铺作者，徒在枋上雕作拱形；其在下一层为泥道拱，其上为慢拱，再上为令拱，无华拱出跳，非所以承檐者也。各拱上置散斗三，以承上层之柱头枋，而最下层之下，则有一小斗及直斗，置于阑额之上。今直斗已失，其形制幸自山门东面得见之；而大斗则至今尚虚悬枋下也（图34）。

It is also applied only to the two inner bays, and the spaces between the chu-t'ou-p'u-cho and the chuan-chiao-p'u-cho are left without any p'u-cho. Although, like the pu-chien-p'u-cho of the front and the rear, the p'u-cho is nothing more than a number of carved kungs on the chu-t'ou-fangs, it is yet slightly different in the combination of kungs on account of the slightly smaller intercolumniation. The lowest fang is carved into the form of a wing-shaped kung, supported at its middle by a large tou on a short stud. The second fang is carved into a ni-tao-kung on which is the man-kung, also carved on the fang. It is to be noted here that the carved man-kung of the pu-chien-p'u-cho is connected with that of the chu-t'ou-p'u-cho on account of the narrow space. Such an arrangement is known in the *Ying-t'sao-fa-shih* as lien-kung-chiao-yin or the interlocking hidden kungs (Figure 39).

It was only after the Sung Dynasty that the pu-chien-p'u-cho began to develop into one more complicated form. Sui and T'ang examples are found mostly as the kungs or short vertical studs. The function of these earlier pu-chien kungs or studs was primarily to keep the fangs of different levels in rigid relation to each other, and had little or nothing to do with the supporting of the overhanging eave. The pu-chien-p'u-cho of the other stories of the Kuan-yin Ke and of the Shan-men are all more complicated and "modern." The simple examples like those discussed here that have in very rudimentary form the later combination while still purely Sui-T'angish in function are certainly rare examples of a transitional construction.

2. Interior Tou-kungs of the Lower Story (Figure 40)

(e) Chu-t'ou-p'u-cho Instead of being supported directly by the inner peristylar column, the chu-t'ou-p'u-cho is placed on a p'u-p'ai-fang or plate which in turn is placed on top of the column. The front of the p'u-cho is made to face the center of the building, while the rear is directed towards the exterior.

4. 山面补间铺作 亦唯内间有之，而前后间不置。虽与正面补间铺作同在枋上雕成假拱形，然因间之进深较小，故拱形亦略异。其最下层为翼形拱，上置一散斗，其上为泥道拱，再上为慢拱，与柱头铺作同层之慢拱“连拱交隐”（图39）。各层枋间，亦垫以散斗，最下则支以直斗，如正面及山门之制。

补间铺作，自宋而后始见繁杂，隋唐遗例，殆多用人字形或直斗者。人字形及直斗之功用在各层枋间上下之联络，于檐之出跳无与也。

观音阁他层及山门虽有较繁杂之补间铺作，而简单如阁之下檐，只略具后代补间铺作之雏型，而于功用上仍纯为“隋唐的”者，实罕见之过渡佳例也。

下层内檐斗拱三种：

5. 柱头铺作（图40）立于内柱柱头上平板枋上，其内向者为铺作之正面，而向外一面乃其后尾。

【39】Tou-kungs on the western side of Kuan-yin Ke. 观音阁西面各层斗拱

【40】P'ing-tso-p'u-cho, interior tou-kungs of the lower story. 观音阁
下层内檐平坐铺作

The function of these interior tou-kungs is to support the narrow balcony that is carried around the colossal figure at the mezzanine floor height. The chu-t'ou-p'u-cho consists of two t'iaos of hua-kungs, which, with the assistance of kungs, carry two shu-fangs, forming the immediate support of the overhanging portion of the balcony.

The first hua-kung carries a "double-kung" and the second hua-kung, a single ling-kung. Intersecting with the first hua-kung in the lu-tou is the ni-tao-kung, carrying three chu-t'ou-fangs above, which are also carved into kungs in relief. On the same level with the two upper fangs, and intersecting with them, are two members, the lower one being a shua-t'ou without the projecting tip, while the upper one is a small beam spanning the space between the inner and outer peristylar columns supporting the floor, and at the same time intersecting with the two shu-fangs.

The construction of this p'u-cho answers precisely to the following passage from the *Ying-tsao-fa-shih*:

"In the construction of this p'ing-tso (balcony), the p'u-cho should be one or two t'iaos less than the upper story, with double-kung and built in the chi-hsin manner. Underneath the p'u-cho a p'u-p'ai-fang should be used..."

此斗拱者，所以承中层内平坐：华拱两跳，每跳上安素枋，枋上铺地板，置栏杆，可绕佛身中段一周。而中层内柱，亦立于同柱头之上。重拱计心，与《营造法式》下列数段符合：

“造平坐之制，其铺作减上屋一跳或两跳，其铺作宜用重拱及逐跳计心造作。”

“凡平坐铺作下用普拍方，厚随材广或更加一**栿**……”

而普拍枋者，盖即清式所谓平板枋；清式凡斗拱皆置于平板枋上，无将栌斗直接置于柱头者，而此处所见于普拍枋之用，只限于平坐铺作之下，与宋式适同。

铺作后尾。第一层为拱，第二层为梁，即外檐第三跳后尾之梁也。第三跳又为拱，第四层为枋。即外檐耍头后尾伸引部分也。

铺作正面，栌斗之内，泥道拱与华拱相交，第二层为慢拱，乃由柱头枋雕成假拱形，柱头枋共计三层，第二层亦雕泥道拱形。第一跳跳头施重拱，上安素枋，第二跳跳头施令拱，上安散斗三枚，以承素枋。

The p'u-p'ai-fang or plate is called the p'ing-pan-fang in the Ts'ing style, where it is seldom missing, while here, as specified in the Sung official book, it is used only under p'u-chos of the balcony.

Besides being the support for the balcony, it is important to note that the chu-t'ou-p'u-cho here is at the same time the base for the second tier of the superposed "orders." The lower end of the column is mortised to join with the kungs and fangs of the p'u-cho of which it seems to form an integral part (Figure 41). Such construction is also specified in the *Ying-tsao-fa-shih*.

中层内柱，立于下层内柱上栌头之上，与各层拱枋相交，似成为斗拱之一部分者（图41）。《法式》卷四造平坐之制：

“凡平坐铺作，若叉柱造，即每角用栌斗一枚，其柱根叉于栌斗之上；若缠柱造，即每角于柱外普拍方上安栌斗三枚。”

平坐铺作与上层柱之不能分离，于此已可见；故上一层柱根，实已为下层平坐铺作之一部分。观音阁所见，显然非缠柱造，然是否即为叉柱造，愿以质之贤者。

【41】 Cross section of p'ing-tso chu-t'ou-p'u-cho, interior tou-kungs of the lower story. 观音阁下层内檐平坐柱头铺作侧样

(f) Chuan-chiao-p'u-cho (Figure 40) The construction of the set at the corner is different from the one on the exterior corner because the front of the p'u-cho is made to face the center of the building. The two

principal sides consist of the intersection of ni-tao-kungs and man-kungs with the corresponding members of the other side, while the rear end of the ni-tao-kung becomes the hua-kung and that of the man-kung becomes a beam. Two t'iaos of chiao-kungs bisect the right angle formed by the intersecting kungs. The intersecting ling-kungs are placed at the end of the second chiao-kung, while at its rear is the diagonal beam that spans and braces the inner and exterior corner column thus building them together. Being the point of intersection of beams from three directions, the interior chuan-chiao-p'u-cho is of vital importance in the structure.

(g) Pu-chien-p'u-cho (Figure 40) Applied only to the front and rear bays. Like the pu-chien-p'u-cho of the exterior, it consists merely of a number of carved kungs with tous filling the spaces in between. It has nothing to do with the support of the balcony. This holds true of the pu-chien-p'u-chos of the first story, whether interior or exterior.

3. Exterior Tou-kungs of the Mezzanine Story

There are five different kinds of tou-kungs on the exterior of the mezzanine. In spite of their similar function, i.e., the support of the exterior balcony, their construction varies according to the positions in which they are placed (Figures 39, 41).

(h) Chu-t'ou-p'u-cho Like those of the interior p'u-chos of the lower story, the lu-tou is placed on the p'u-p'ai-fang. There are three t'iaos of hua-kungs corbelling out from the lu-tou; the kungs are arranged in the chi-hsin, double-kung manner. The double-kung is placed on the end of the first t'iao, while the second t'iao supports only one ling-kung. The third t'iao has no kung on its end, but merely a small tou, into which the outermost su-fang is placed. The latter, together with the other two su-fangs, which are placed parallel and on the same level with it, form the immediate support for the balcony floor. Intersecting with these su-fangs on the same level is the shua-t'ou, the end of which is not beveled off like those of the lower p'u-chos. The balcony of the central bay on the southern side is widened by lengthening the shua-t'ou considerably to enable an easier view of the main tablet, the penmanship of which was attributed to Li T'ai-po, illustrious poet of the T'ang Dynasty.

To the rear of the p'u-cho, the first and third t'iaos are short hua-kungs, while the second and fourth t'iaos are lengthened into fangs, reaching the tou-kungs of the inner peristylar columns. In Chapter V of the *Ying-tso-fa-shih*, on the construction of the p'ing-tso we read:

6. 转角铺作 (图40) 其正面向内, 故其结构亦与向外之转角铺作

不同。其正侧二面各有泥道拱、慢拱，泥道拱与后尾之华拱相列，慢拱与后尾之梁相列，斜角上华拱二跳。第一跳跳头正侧二面重拱相交，重拱之后尾为切几头，接于柱头枋上。第二跳跳头为二面令拱相交，其后尾亦为切几头，与第一跳上慢拱相交于瓜子拱端斗内。斜角华拱后尾为华拱及梁，与柱头铺作同，亦为外檐转角铺作之后尾。外檐转角铺作及次梢间正面山面二柱头铺作后尾，三面梁枋会于此柱头之上，于结构上，其位置殊为重要也。

7. 补间铺作（图40）唯正面有之，山面则无。其形制似外檐山面补间铺作，只各层柱头枋间之联络，与出檐结构无关系。下层内外檐补间铺作皆如此，制度一致，非偶然也。

中层外檐铺作五种：

皆平坐铺作也；同在一平坐之下，因功用及地位之不同，而各异其结构（图39，41）。

8. 柱头铺作 栌斗安于普拍枋上。华拱三跳，计心重拱：第一跳跳头安重拱，第二跳跳头安令拱，第三跳跳头无横拱，唯安散斗以承素枋及耍头；重拱、令拱上亦施素枋，故共有素枋三道；枋上铺板，即上层外平坐也。耍头之头，不斜斫作耍头形，而南面正中一间，且将此耍头加长约0.5米，以增加平坐之深度，俾登临者可瞻李太白题额。泥道拱上为柱头枋三层，上雕假拱形。铺作后尾第一三两层锯齐无卷杀，第二层为枋，直达内檐中层柱头，铺作之上；第四层即耍头后尾，亦为枋以达内柱柱头。耍头端外即为挂落板。《法式》卷五平坐之制末条谓：

0 0.5 1 1.5 2 m.

【42】 Cross section of exterior p'ing-tso chu-t'ou-p'u-cho & pu-chien-

"Beneath the ts'ao-fu, front-and-back-wise, the ti-mien-fang are used to hold the front and rear p'u-chos in position; on the p'u-cho is placed the p'u-pan-fang, one ts'ai in size; all the way around is the yen-ch'ih-pan, twice the ts'ai in width, and four to five fen in thickness."

It is not altogether unjustifiable to call the rear of the second t'iao the ti-mien-fang and that of the fourth t'iao the p'u-pan-fang. The yen-ch'ih-pan is known in the Ts'ing style as the ti-chu-pan. (Figure 42)

(i) Chuan-chiao-p'u-cho The p'u-cho at the corner is plainly the intersection of the different fangs and kungs of the two adjacent sides. The three t'iaos of hua-kung, together with the shua-t'ou above are extended at the rear to form the ni-tao-kung and the three tiers of chu-t'ou-fangs on the other side. The kua-tze-kung, man-kung, and ling-kung are all extended to form auxiliary hua-kungs on the other side. The intersection of these is supported by three t'iaos of chiao-kungs on the mitre-line. The entire p'u-cho may be considered a very logical and "regular" ensemble (Figure 39).

“平坐之内，逐间下草袱前后安地面方，以拘前后铺作；铺作之上安铺板方，用一材；四周安雁翅板，广加材一倍，厚四分至五分。”

第二跳后尾盖即地面枋，耍头后尾盖即铺板枋耶？清式称为挂落板者，即雁翅板也。西面铺作后尾，虽在暗层，适当梯间，故第一三两层作拱形，拱端施斗。（图42）

9. 转角铺作 华拱三跳，计心，重拱，各拱平正相交相列，角拱亦三跳，绝无不规则之结构（图39）。

(j) Pu-chien-p'u-cho of the Three Central Bays on the Front and Rear Facade Like the chu-t'ou-p'u-cho, it also consists of three t'iaos of hua-kung, with double-kung and built in the chi-hsin manner. From the exterior, it appears to be identical to the chu-t'ou-p'u-cho both in appearance and construction except that it is not burdened from above with a column the foot of which is worked into the p'u-cho (Figure 31). But a careful study of its rear revealed to us that lu-tou is merely a false "applique." The real member on which the entire load of the pu-chien-p'u-cho is concentrated is not the lu-tou, but a t'o-feng or "camel's back" (Figure 43). The rear ends of the hua-kungs are left unfinished.

(k) Pu-chien-p'u-cho of the Two Inner Bays of the End Facades The short stud, standing on the p'u-p'ai-fang is the foot of the p'u-cho, which is formed by intersecting two hua-kungs with the chu-t'ou-fangs. On the

end of each t'iao of the hua-kungs is placed a su-fang. Since there are three su-fangs for the three t'iaos on the chu-t'ou-p'u-cho, and there are only two t'iaos on the pu-chien-p'u-cho, the outermost su-fang is left unsupported at the middle. But the shua-t'ou or p'u-pan-fang comes in conveniently to intersect with it, thus supporting it at the middle.

The short stud as well as the large t'ou on its top are now lost.

The pu-chien-p'u-cho of the end facade on account of the narrower space into which it is put is constructed differently from those of the front and rear facades.

(1) Pu-chien-p'u-cho of the End Bays On account of the even narrower space, the p'u-cho in the end bay is deprived of even the carved ni-tao-kung, and given a wing-shaped kung instead. The ling-kung on the end of the second hua-kung is forced to join with the man-kungs of the adjacent p'u-chos in the method called the "lien-kung-chiao-yin" (Figures 31, 39).

4. Interior Tou-kungs of the Mezzanine Story

Like the interior tou-kungs of the lower story, they are placed with the front side facing the center of the building. The rear of the tou-kungs is visible only from the dark aisle. They are, therefore, unfinished except in the aisle on the western end which is the staircase. There are also five different kinds of tou-kung in the interior of the mezzanine story. (Figure 32)

【43】The rear of tang-hsin-chien, pu-chien-p'u-cho, interior tou-kung of the mezzanine story. 观音阁中层内檐当心间补间铺作后尾

10. 正面当心间及次间补间铺作 亦华拱三跳，计心，重拱。其外形与柱头铺作相同，结构亦极相似，唯栌斗上无斗（图31）。今自外视之，其栌斗与柱头铺作栌斗同，然其背面，则次间无栌斗，而代以驼峰（图43）。其后尾唯第三跳作地面枋（？）直达内檐铺作上，“以拘前后铺作”。

11. 山面补间铺作 指山面居中两间而言。其泥道拱雕于下层柱头枋上，华拱与之相交，计二跳，第一跳跳头横施令拱，上承最内罗汉枋，第二跳无拱，唯安斗以承中罗汉枋，至于外罗汉枋则由柱头达柱头，其间无承支之者。其泥道拱上未雕慢拱形，盖单拱计心造也。下跳华拱与泥道拱之下，盖有大斗及直斗以置于普拍枋者，今皆毁无存。山面补间

铺作之必须异于正面者，盖因山面柱间距离较小，不足以容全部之阔也。

12. 梢间补间铺作 柱间距离较山面尤小，并单拱而不能容，故下层柱头枋上雕云形拱，跳头令拱则与并列之柱头铺作及转角铺作之第一跳上慢拱“连拱交隐”（图31，39）。

中层内檐铺作五种：

如下层内檐铺作，以内向一面为正面，外向一面为后尾。外向一面，即为暗层之内，故其中除抹角铺作及西面与梯相近之铺作外，其后尾皆如外檐平坐铺作之后尾，拱头概无卷杀，不加修饰。

斗拱之功用，即在承上层之结构，故此部斗拱，亦因上层特殊之布置（图32），而有特殊之形制。

(m) Chu-t'ou-p'u-cho of the Front and Rear The large hole on the upper floor through which the figure of the Kuan-yin is hexagonal in shape. The angles at the eastern and western ends are of approximately 50 degrees and those of the northern and southern sides are of 130 degrees. But the hole through the mezzanine floor is a rectangle. The hexagonal shape of the upper floor has been obtained by spanning the spaces between the front columns connecting them to the center columns of the sides. This diagonal span imposes an extra set of fangs on the chu-t'ou-p'u-chos of the front and the end sides. Therefore, besides the intersection of chu-t'ou-fangs and hua-kungs, the p'u-cho is further complicated by the introduction of intersection of the extra fang. This peculiar construction may in a sense be called a chuan-chiao-p'u-cho (Figure 44).

Judging from its function and position, it is really a p'u-cho for the support of a balcony. According to the *Ying-tsao-fa-shih*, it should have been built in the chi-hsin manner, but because of the imposition of the diagonal fangs, the t'ou-hsin manner has been employed to ensure simplicity in construction.

13. 当心间两旁柱头铺作 上层地板围绕像身之空井为六角形，东西两端成较正角略小之锐角，其余四角则成约一百三十度之钝角；然中层空井则为长方形。此六角形者，实由自当心间与次间之间之内柱上至中柱上抹角所成。而此抹角之结构，与其他部分两柱头间之结构相同，其各层枋与柱头上各层枋相交于柱头而成铺作；而铺作上除正角相交之华拱与柱头枋外，乃沿约一百三十度之钝角线上，加交各层枋，此乃中层内檐柱头铺作之特点也。谓为转角铺作亦未尝不可（图44）。

以位置及功用论，则此部实为平坐；既为平坐，则按法式之制，须用计心造；然因抹角之故，计心颇为不便——结构不便即不合理——故从权用偷心造也。

正样 facade

侧样 cross section

仰视图 upward view

【44】Chu-t'ou, interior tou-kungs of the mezzanine story. 观音阁中层内檐柱头斗拱

From the lu-t'ou, two t'iaos of hua-kung intersect with the ni-tao-kungs of both directions, on which are chu-t'ou-fangs, also from both directions. All the chu-t'ou-fangs are carved into kungs in relief exactly as those of the other p'u-chos. On the end of the second hua-kung is a ling-kung, which supports the su-fang that forms the edge of the balcony.

The rear ends of the hua-kungs are left unfinished, and the second and fourth t'iaos are extended to form the ti-mien-fang and p'u-p'ai-fang which are supported at the outer end by the exterior p'u-chos.

(n) Chu-t'ou-p'u-cho of the Chung-chu or Central-end Column The construction is identical to those of the front and rear, except that

there are two extra sets of fangs intersecting on it, one set from the front column and the other from the rear column (Figure 47).

(o) Pu-chien-p'u-cho On the p'u-p'ai-fang is the lu-tou, from which spring two t'iaos of hua-kung, built in the t'ou-hsin manner. On the end of the second hua-kung is a ling-kung, supporting the lo-han-fang, on which rests the upper floor (Figure 45). A study of the p'u-cho from the rear reveals that the set rests on a t'o-feng (camel's back) instead of what is seen in the front, a lu-tou, which therefore must have been an alteration in one of the later repairs. The t'o-fengs of the central bay are shaped differently from those of the side bays (Figures 43, 46).

(p) Chuan-chiao-p'u-cho Being in the t'ou-hsin manner, the construction is extremely simple without the transversal kungs. Besides the ni-tao-kung and the chu-t'ou-fangs of the two sides, there is only the set of three chiao-kungs or corner-kungs for the support of lo-han-fangs from three different directions that intersect on the end of the third chiao-kung (Figure 45).

其结构为华拱二跳，偷心造，跳头横施令拱，拱上置斗，斗上承罗汉枋。与华拱正角相交者为泥道拱及柱头枋三层，枋上雕假拱形，本平平无奇。乃于百三十度斜线上加普拍枋、泥道拱以及柱头枋三层，全部斜加一份，此其所以异也。

铺作后尾则锯齐如外檐平坐铺作，而第二、第四两层则伸长成地面枋及铺板枋焉。

14. 中柱柱头铺作 其结构与13同，唯各层抹角枋自两面来交（图47）。

15. 补间铺作 栌斗安于普拍枋上，华拱二跳，偷心造，第二跳跳头施令拱，拱斗上承罗汉枋，枋上为上层地板（图45）。今栌斗作斗形，然自后尾观之，则作驼峰形；当心间驼峰（图43）与次间驼峰（图46）复略异，正面所见之栌斗，恐非原物也。

16. 转角铺作 结构殊简单，角拱三跳，上承三方面之罗汉枋。第二层柱头枋上雕翼形拱，适在慢拱头散斗上，其上复置交互斗以承罗汉枋（图45）。

【45】 Side bays of pu-chien-p'u-cho and chuan-chiao-p'u-cho, interior tou-kungs of the mezzanine story. 观音阁中层内檐次间补间铺作及转角铺作

【46】 The rear of pu-chien-p'u-cho from side bays, interior tou-kungs of the mezzanine story. 观音阁中层内檐次间补间铺作后尾

It is to be noted that these chiao-kungs do not bisect the right angle into two angles of 45 degrees each, because the outer end of the su-fang is supported by the pu-chien-p'u-cho which is placed midway between the front and rear column and the chung-chu, and consequently, the line of this su-fang is one drawn from the apex of a right-angled triangle of legs of different lengths to the mid-point of its hypotenuse.

(q) Pu-chien-p'u-cho on the Diagonal Fang Structurally, this pu-chien-p'u-cho differs in no way whatsoever from any other pu-chien-p'u-cho, being placed on a p'u-p'ai-fang or lan-erh which is supported at the two ends by the columns. But, because the space under the p'u-p'ai-fang and lan-erh is left unfilled by a curtain wall, the p'u-cho gives the impression of being suspended in space instead of resting on a solid wall, and the whole effect is one of lightness and ethereal quality (Figure 47).

A t'o-feng, rather tall in proportion, is placed on the p'u-p'ai-fang. In the large tou above it intersect the chu-t'ou-fangs and the two t'iaos of hua-kung. The fangs are carved with kungs in relief as usual. The t'ou-hsin manner is again applied here, eliminating even the ling-kung which is usually used on the end of the uppermost t'iao.

5. Exterior Tou-kungs of the Upper Story

From both the structural and ornamental points of view, the tou-kungs of the upper story are undoubtedly of supreme importance. It is they that give the Kuan-yin Ke its expression and character, and bring us into a closer contact and better understanding with building and builders of the Liao Dynasty. There are three kinds of tou-kung on the exterior of the upper story.

(r) Chu-t'ou-p'u-cho Here the lu-tou is placed directly on top of the column, the p'u-p'ai-fang being eliminated. From the lu-tou spring four t'iaos for the support of the overhang, the two lower t'iaos being hua-kungs and the two upper t'iaos, ang. The whole ensemble is known in the *Ying-tsoo-fa-shih* as ch'ung-ch'ao-ch'ung-ang. The transversal kungs on these t'iaos are distributed in the t'ou-hsin, double-kung manner. On the end of the second hua-kung are a kua-tze-kung and a man-kung, on which is the lo-han-fang. Intersecting with these two kungs are two ang, which may be defined as hua-kungs set in a slanting position. On the end of the second ang is placed the ling-kung with its t'i-mu and liao-yan-ch'uan above (Figure 48).

此角拱中线，非将角平分而成四十五度者^[60]。盖角拱上素枋之彼端，乃承于抹角枋正中之铺作上，而素枋非将角平分，则角拱须随枋略偏也。

17. 抹角枋上补间铺作 自结构方面观之，各层枋皆置于柱头之上，而铺作居枋之中，与普通补间铺作无异，唯因悬空而过，下无墙壁，故其所呈现现象，殊觉玲珑精巧。驼峰置普拍枋上，上置交互斗；华拱与雕作泥道拱形之柱头枋相交于交互斗内。华拱计共两跳，偷心造，第二跳跳头置散斗，斗上承素枋，而不施横拱。结构至简（图47）。

观音阁全部结构中，除中层内外檐当心间及次间平坐补间铺作外，

其余各铺作，泥道拱皆雕于第一层柱头枋上，而于其下置直斗或驼峰；此类部分，内外上下皆毁，唯此抹角铺作上尚存，良可贵也。

上层外檐斗拱三种：

在结构上及装饰上皆占最重要位置，观音阁全部之性格，可谓由此部斗拱而充分表现可也。

18. 柱头铺作 栌斗施于柱头，其上出四跳，下两跳为华拱，上两跳为昂，即《法式》所谓“重杪重昂”^[61]者是。其跳头斗拱之分配为重拱，偷心造。第二跳华拱跳头施瓜子拱及慢拱，慢拱上为罗汉枋。与瓜子拱及慢拱相交者为下昂二层，第二层昂上施令拱，以承替木及撩檐枋。其正面立面形与下檐略同，而侧面因用昂而大异（图48）。

【47】Pu-chien-p'u-cho on the diagonal fang, interior tou-kungs of the mezzanine story. 观音阁中层内檐抹角补间铺作

【48】 Chu-t'ou-p'u-cho and pu-chien-p'u-cho of exterior tou-kungs of the upper story, Kuan-yin Ke. 观音阁上层外檐柱头铺作及补间铺作

The rear of the first t'iao is a hua-kung, and that of the second t'iao is lengthened to form a tie beam which is supported by the interior chu-t'ou-p'u-cho in exactly the same manner at both ends. Above the tie beam is another hua-kung, the outer end of which is beveled off to butt against the lower surface of the ang. On this hua-kung is placed a ling-kung, supporting the p'ing-ch'i-fang or the fang that supports the ceiling. This p'ing-ch'i-fang is in a sense a lo-han-fang, the only difference being that it is used in the interior while the

latter is used in the exterior. Intersecting with the p'ing-ch'i-fang is another su-fang which would have been the rear of the fourth hua-kung had it been placed horizontally. The exterior end of this su-fang is also beveled to against the bottom of the ang.

The lower support for the lower ang is the end of the second hua-kung, on which the ang is placed in a slanting position with the lower end pointing downward. The bottom of the ang is carried to the same level and therefore intersects with the third chu-t'ou-fang. The angle the ang makes with the ground is approximately 30 degrees. The upper or second ang is made to rest directly on the lower one, and runs parallel to it. On the end of the upper ang is the ling-kung, on exactly the same level as the man-kung of the second hua-kung, and two t'iaos further out. Thus a greater overhang is achieved without an excessive raise in height, because the outward stretch of two t'iaos is gained with a corresponding raise of one t'iao only. On the upper ang, and intersecting with the ling-kung in a horizontal direction is a small shua-t'ou, the rear end of which is beveled to rest on the sloping surface of the upper ang, while the outer is left angular and square (Figure 49).

华拱第一跳后尾为华拱；第二跳后尾伸引为梁，直达内柱柱头铺作上。梁以上又为华拱，与令拱相交；令拱上承平棊枋（井口枋），与又一素枋相交。此第三层拱之外端，长只及第二跳跳头，第四层枋则长只及柱头枋，二者背上皆斫截成斜尖，以承第一层下昂。下昂下部承于第二跳跳头交互斗内，斜向后上伸，至与柱头枋相交处，其底适与第三层柱头枋之底平，昂之斜度，与水平约略成三十度。第二层昂在第一层昂之上，而与之平行，昂端横施令拱，与第二跳跳头上之慢拱平。其向外伸出较第二跳长两跳，而向上升高，则只较之高一跳。故其出檐较远而不致太高；盖伸出如华拱两跳之远，而上升只华拱一层之高也。与令拱相交者为耍头，与华拱平行，虽平出在第四跳之上，而高下则与第四跳平。其后斫斜，平置昂上（图49）。

【49】Chu-t'ou-p'u-cho of exterior tou-kungs of the upper story, Kuan-yin Ke. 观音阁上层外檐柱头铺作侧样

The rear end of the ang is really the most important as well as the most interesting part of the chu-t'ou-p'u-cho. After intersecting with the third and fourth chu-t'ou-fang, the two ang are carried straight back until the rear ends hit again the bottom of the beam which the p'u-cho is carrying. The ang are also beveled here to butt against the bottom of the beam. Thus the ang acts as a lever arm, supported at the middle by the chu-t'ou-fang, loaded at the outer end with the liao-yen-ch'uan and the eave above, and held in equilibrium by the beam and its heavy load from above. This enables the eave overhang to become much greater than otherwise. This is also in accordance with the specification in Chapter IV of the *Ying-tsao-fa-shih* on "the making of the ang": "that when it is on the column, it is to be held down by the ts'ao-fu or ting-fu." Before the Sung Dynasty, the ang had always been a structural member, but in Ming and Ts'ing examples, although the term "ang" was still used to designate a certain member of the tou-kung, it was no longer the lever arm that it had been hitherto, but a horizontal hua-kung with the end shaped into the beak form of the ang. The organic function of the original ang was thus totally lost.

As to the exterior finish of the ang-chui or beak of the ang, we find later examples to be universally curved. In the same section of the *Ying-tsao-fa-shih* we read that the face of the beak should be concaved two fen, and all Ming and Ts'ing ang-chuis are shaped in this fashion. But the ang-chui of the Kuan-yin Ke is a pure, simple bevel, making an angle of approximately 35 degrees with the ang itself, giving an

appearance much like those represented in the Tun-huang cave paintings. This style was still used in the Sung period as is found in one of the small notes in the same section, that "there is also the method of cutting diagonally from the bottom of the tou to the end (of the ang), so that the face of the ang will be a straight even surface, called the p'ei-chu-ang." This is precisely the method employed in making the ang-chui of the Kuan-yin Ke. The ang-chui of the wooden pagoda of Ying Hsien, Shansi Province is also shaped in the same manner, and it is undoubtedly usual during the T'ang and Liao periods. The gradual softening of the straight, vigorous p'ei-chu-ang of the Liao to the dainty, delicate curvature of the ang-chui of later times is merely a natural evolution so inevitable that it seems that no mature art can escape from this beaten track.

(s) Chuan-chiao-p'u-cho This again may be analyzed as the intersection of chu-t'ou-p'u-cho from two sides (Figure 38). On the lu-tou, there are four hua-kungs intersecting each other, forming a figure in plan. The second t'iao consists of hua-kungs extended from the lowest chu-t'ou-fang, a corner kung and a diagonal kung. The third and fourth t'iaos on the center-line consist of the two ang, while on the corresponding level, the ends of the corner kung and the diagonal kung are each accentuated by two more t'iaos of hua-kungs. The two that intersect at the end of the corner kungs are the extension of the double-kungs at the end of the second t'iao of the front and side hua-kungs, while those on the diagonal kungs are extended from the interior p'ing-ch'i-fang.

昂之后尾，实为上层柱头铺作最有趣部分。上下二昂，伸过柱头枋后，斜上直达草袱（清称“三架梁”）之下。昂之外端，受檐部重量下压，其尾端因之上升，而赖草袱重量之下压而保持其均衡。利用杠杆作用，使出跳远出，以补平出华拱之不逮。《法式》卷四《造昂之制》有“如当柱头，即以草袱或丁袱压之”之句，盖即指此。宋代建筑用昂之制，尚以结构为前提。明清以后，斗拱虽尚有昂，而徒具其形而失其用，只平置华拱（翘）而将其外端斫成昂嘴状，非如辽宋昂之具“有机性”矣。

昂嘴部分，宋以后多为曲线的。《法式》卷四谓：

“……昂面中□二分，令□势圆和。”

清式亦如此。然观音阁昂嘴，则为与昂底成三十五度之斜直线，其所呈现现象，颇似敦煌壁画所见。此式宋代殆尚有之，见于《造昂之制》文内小注中：

“……亦有自斗外斜杀至尖者，其昂面平直，谓之‘批竹昂’。”

适与此处所见符合。应县佛宫寺塔亦如此，其为唐辽盛行之式无疑。其后刚强之直线，受年代磋磨，日渐曲柔，至明仲之世，已成“亦

有”之一种，退居小注之中；此固所有艺术蜕变之途径，希腊之成罗马，乔托之成拉斐尔，^[62] 顾虎头之成仇十洲，其起伏之势，如出一辙，非独唐宋建筑之独循此道也。

【50】Interior tou-kungs of the upper story, Kuan-yin Ke. 观音阁上层内檐斗拱

But on the mitre-line, there are three ang's on the corner kungs, the lower two stretching out to receive the intersection of the t'i-mu and liao-yen-ch'uan or eave-purlin, while the third is extended further, with the "cushioning" of the pao-p'ing, to support the two corner rafters. It is to be noticed that these three corner ang's or chiao-ang's are so placed that their horizontal projection makes the same angle with the ground as that of the front and side ang's, while the true angle is considerably smaller. Consequently the slope of these corner members is gentler than that of the front and side, and, with the further raise of the chiao-liang's or corner beams, the gentle upward curve at the corners is the natural result.

It is interesting to note that the second t'iaos of the hua-kung, corner kung and the diagonal kung, are each, theoretically, provided on their ends with a hua-tze-kung to support the man-kung above. But since they are fitted into each other in such a way that there would not be room enough for each of them to have their separate kua-tze-kung, the latter are combined into one through the carving of three

false kungs out of one piece of timber. At the point where they combine, the two kungs are made to share one tou (Figure 50). This is what is called the yuan-yang-chiao-shou-kung in the *Ying-tso-fa-shih*.

This entire chuan-chiao-p'u-cho is a gigantic motif, decorative and complicated in appearance, but structural, simple and logical in function, designed and constructed to take care of the important corners of this edifice.

(t) Pu-chien-p'u-cho Used in the inner bays, and omitted in the end bays. Two t'iaos of hua-kung intersecting with the two tower chu-t'ou-fangs are arranged in the t'ou-hsin manner with a ling-kung on the end of the second t'iao to receive the lo-han-fang. The lowest chu-t'ou-fang is carved into a wing-shaped kung. The intersection of the hua-kung and chu-t'ou-fangs is put on a chiao-hu-tou which was supported by a short stud that is now missing. The second and third chu-t'ou-fangs are carved with a double kung in relief. The rear of the p'u-cho is merely a hua-kung with a ling-kung to support the p'ing-ch'i-fang (Figure 51).

19. 转角铺作 在柱头中线上，正侧二面各层拱昂之结构与程次与柱头铺作者同，所异者唯第二跳跳头重拱与同层他拱相列（图38）。角线上角拱二跳，角昂二跳，其上更有“由昂”，上置宝瓶，以承角梁。此三重角昂，在正面及侧面之投影，与正昂投影之角度相同，然其与地面所成之真角，度数实较小，而斜度较缓和，宜注意也。第二跳角拱之上，有正侧二面第二跳上之重拱伸出而成华拱二跳，与角昂相交；上跳跳头置散斗以承替木。第二层角昂之上，置令拱两件相交，与由昂相交；令拱上置散斗，以承其上相交之正侧二面替木。此外尚有斜华拱两层，与角拱成正角而与正拱成四十五度角，相交于栌斗口内（图50）；其上又置拱两跳，与角拱上之两拱夹衬于正昂之两旁。与此拱相交者重拱，其外一端与角拱上之华拱相列，其内一端则慢拱与柱头铺作上相埒之慢拱“连拱交隐”。

此转角铺作之全部，殊为雄大，似繁而实简，结构毕现焉。

20. 补间铺作 正面当心间次间及山面居中两间用之。华拱两跳，偷心造，跳头横施令拱，以承罗汉枋。下层华拱与下层柱头枋交于交互斗内，枋雕作翼形拱。二层枋以上则雕重拱，铺作后尾唯拱一跳，上施令拱，以承平棊枋（图51）。交互斗下，原有直斗，今已无存。

【51】 The rear of chu-t'ou-p'u-cho and pu-chien-p'u-cho, interior and exterior tou-kungs of the upper story. 观音阁上层内外檐柱头及补间铺作后尾

With the exception of the central bay to the northern side, all the pu-chien-p'u-cho in the interior of the upper story is similar to those of the exterior. But there is a slight modification in those of the east and the west because of the narrow space accommodating them, thus eaving the ling-kung and the man-kung to be combined with those of the adjacent chuan-chiao-p'u-cho (Figure 51).

6. Interior Tou-kung of the Upper Story

There are four different kinds of tou-kungs in the interior of the upper story.

(u) Chu-t'ou-p'u-cho The front of the p'u-cho, facing the inside of the building, is identical to the exterior chu-t'ou-p'u-cho of the lower story, being composed of four t'iaos of hua-kung, double-kung and t'ou-hsin (Figure 52). The rear of the chu-t'ou-p'u-cho is identical to those of the exterior chu-t'ou-p'u-cho with the exception of the ang (Figure 51). The distribution of kung, the extension of hua-kungs into beams or fangs are all identical.

(v) Chu-t'ou-p'u-cho on the Two Columns that Form the Central Bays On account of the position of Eleven-headed Kuan-yin which is towards the rear of the hall, the octagonal pyramidal "baldachin," which is really a part of the ceiling, is forced slightly northward. This throws the "baldachin" off the longitudinal center-line so that it rests on the p'ing-ch'i-fang on the southern side and on lo-han-fang on the northern side where the p'ing-ch'i-fang is interrupted. This causes the ling-kung on the fourth t'iao, the outer end of which is supporting the lo-han-fang, to have its inner end cut off at the angle of 45 degrees to support the side of the octagon above (Figure 53).

上层内檐补间铺作，除当心间北面一朵结构特殊外，其余皆与外檐补间铺作相同。其中略异之一朵，乃内檐山面补间铺作，因地位狭窄，其令拱、慢拱皆与两旁铺作连拱交隐（图51）。

上层内檐斗拱四种：

21．柱头铺作 正面与下层外檐柱头铺作完全相同，为华拱四跳，重拱，偷心造（图52）。后尾则与上层外檐柱头铺作完全相同（图51）。上层内檐柱头铺作之特殊者为当心间北面柱头铺作。

22．当心间北面柱头铺作 因观音像之位置不在阁之正中，而略偏北，故像顶上之斗八藻井亦随之北偏；因是之故，藻井之南面承于平棊枋上。而北面乃承于罗汉枋上，而平棊枋至当心间而中断。于是华拱第四跳跳头之令拱，在次间内之一端承平棊枋，而在当心间内之一端则斫作四十五度角，以承藻井下之抹角枋。而罗汉枋遂为抹角枋与藻井下北面枋相交点之承支者，遂在其相交点之下，承之以斗，而斗下雕作拱形（图53）。

【52】 Different exterior kungs on the lu-tou, chuan-chiao-p'u-cho of the upper story, Kuan-yin Ke. 观音阁上层外檐转角铺作栌斗上各拱

【53】 Chu-t'ou-p'u-cho of the central bays, interior tou-kung of the upper story, Kuan-yin Ke. 观音阁上层内檐北面柱头及当心间补间铺作

(w) Chuan-chiao-p'u-cho On the mitre-line bisecting the right-angle formed by the interior chu-t'ou-fangs of its adjacent sides are four t'iaos of chiao-kungs in the t'ou-hsin manner. On account of the very narrow space which renders the application of the double-kung impossible, the end of the second t'iao is treated with two short intersecting wing-shaped kungs, and the end of the fourth t'iao has two short intersecting ling-kungs to support the p'ing-ch'i-fang (Figure 52).

The rear of this chuan-chiao-p'u-cho is similar to that of the one on the lower story. The second t'iao is extended in the form of beams, supported at the outer ends by the p'u-chos of the exterior. The fourth t'iao is extended as the su-fang described in article r.

(x) Pu-chien-p'u-cho of the Northern Central Bay It is different from the other pu-chien-p'u-chos because the ling-kung of the second hua-kung is raised into a carved relief on the lo-han-fang, and replaced by a short wing-shaped kung (Figure 53).

In the structure of the Kuan-yin Ke, we find a grand exhibition of tou-kungs, in all 24 varieties, each designed to fulfill a particular function. In seeming complication, the underlying principals are logical and simple. To permeate a structure with such a sense of logic and organic being could only have been achieved by artists of the highest order.

[F] Ceiling Construction

The ceilings of both stories of the Kuan-yin Ke are built in caisson, known in the *Ying-tsao-fa-shih* as the p'ing-ch'i. The p'ing-ch'i is supported on the side parallel to the facade by the p'ing-ch'i-fang, and perpendicular to it, by the shuan-ch'eng-fang which runs parallel and above the ming-fu or exposed beam. The p'ing-an-ch'uans which form the check square of the caisson are arranged rather close to each other, forming very small caissons of about 28 cm. square, much smaller than and therefore totally different in appearance from those more commonly seen today (about 70 cm. square) (Figures 45, 51). The *Ying-tsao-fa-shih* specifies only that the p'ing-ch'i should be evenly and squarely distributed, without reference to its actual size. Japanese structures of the Kamakura period, which were undoubtedly the result of direct Sung influence, have caissons of precisely the same proportion as those of the Kuan-yin Ke, still with the original paintings preserved. The ceiling of the Kuan-yin Ke shows sufficient similarities for us to draw the conclusion that the present caisson ceiling was built on the model of the original if it is not the original itself.

23. 转角铺作 角拱四跳，偷心造，因地位狭小，其势不能容重拱之交列，故第二跳跳头之上，唯短小之翼形拱与第三跳相交。翼形拱与切几头相列，交于柱头枋上。其上则施短令拱与第四跳相交，而在山面，则短令拱与补间铺作上之令拱连拱交隐。第四跳上则短令拱二件相交，以承平棊枋（图52）。

正侧二面，则泥道拱相交，其上慢拱之后尾及第二层华拱之后尾皆为梁，第三层柱头枋之后尾则为枋，皆三面分达角柱及其旁二柱，于结构上至为重要焉。

24. 当心间北面补间铺作 与他间略同，所异者乃华拱跳头只置翼形小拱，更上则于罗汉枋上雕令拱形，上置三散斗，以承藻井下枋（图53）。

全阁斗拱共计二十四种，各以功用而异其结构，条理井然，种类虽多而不杂，构造似繁而实简，以建筑物而如此充满理智及机能，艺术之极品也。

〔6〕天花

观音阁上下二层顶部皆施天花。天花宋称“平棊”^[63]，其主要干架即斗拱上之素枋名“平棊枋”者，及与之成正角而施于明袱（梁）上之“算程枋”（？）也。支条（宋称平闇椽）纵横交置枋上，其分布颇密，而井口亦甚小。约0.28米见方，与今所见约二尺（0.70米）见方之天花，其现象迥异（图45，51）。《法式》于平棊之大小，并无规定，只曰“分布方正”，其是否如此，尚待考。今天花板泰半已供年前驻军炊焚，油饰亦非旧观，然日本镰仓时代之兴福寺北圆堂及三重塔内天花，皆与此处所见大致同一权衡，且彩画尚存，与《营造法式》彩画极相类似，可相鉴较也。

Most of the sheathing of the ceilings of the Kuan-yin Ke has been destroyed, leaving only the squares formed by the p'ing-an-ch'uan. The octagonal "baldachin" in the central bay is formed by a number of triangles. It is totally different in scale to the other parts of the ceiling, and whether it is a part of the original design or not is subject to dispute.

The spaces between the p'ing-ch'i-fang and the lo-han-fang, and between the latter and the chu-t'ou-fang are all covered by a "cove," formed by putting p'ing-an-ch'uans over the fangs, and covered with sheathing from above. Such examples are still to be seen in many Japanese buildings of the Kamakura period or earlier.

〔G〕 The Liangs and Fangs

In the Shan-men, all structural framing members are exposed and

visible from below. But in the Kuan-yin Ke, there is the p'ing-ch'i or caisson ceiling, all structural members hidden above which are invisible to the spectator below, and therefore, left undressed. In Chapter II of the *Ying-t'sao-fa-shih*, under the general definition of p'ing-ch'i, there is a note as follows:

"In palaces of today, the members above the ceiling, such as the beam and purlins that are loaded with the weight of the roof, or members for tying and bracing in all directions, are all left undressed..."

The ts'ao-fu mentioned in previous paragraphs is the general term for all these hidden beams, in contrast to the ming-fu or exposed beams.

On the chu-t'ou-p'u-chos of the Kuan-yin Ke, the rear ends of the second or third t'iaos are all extended to become the ming-fu, above and parallel to which is the shuan-ch'eng-fang (Figure 51), as has already been discussed in previous paragraphs. But the function of the ming-fu and the shuan-ch'eng-fang is to tie and brace the interior and exterior p'u-chos, and receive the p'ing-ch'i, while the load of the roof is supported entirely by the liangs and fangs which are undressed and hidden above the p'ing-ch'i.

The general principle in the construction and arrangement of the liang-chia or "truss" here is similar to that of the Ts'ing Dynasty. It is not a "truss" in the real sense that exerts a thrust among its different members, but a series of posts and lintels superposed one on top of the other. The aisle around the entire building is spanned by beams supported by the inner and exterior columns, called the ju-fu, (or shuang-pu-liang in the Ts'ing style). The distance between the front and rear inner peristylar columns, which is equivalent to two bays' width, is spanned by the yen-fu (or wu-chia-liang in the Ts'ing style). On this yen-fu, at points half a bay's distance from either end are placed t'o-tuns or beam-blocks, which supported the p'ing-liang (or san-chia-liang in the Ts'ing style). On the p'ing-liang stands the chu-ju-chu, the dwarf column (or chi-kua-chu in the Ts'ing style). The difference between the liang-chia of the Kuan-yin Ke and that of today lies, therefore, not in the methods of ensemble of the different members, but in the size and proportion of the beams.

天花与柱头枋间，亦用平闇椽斜置，上遮以板，日本遗物，尚多如此。

当心间像顶之上，作“斗八藻井”，其“椽”尤小，交作三角小格，与他部颇不调谐。是否原形尚待考。

〔7〕梁枋

山门屋内上部，用“彻上露明造”之制，一切梁枋椽桁，自下皆见。观音阁则上施平棊。平棊以上之梁枋等等，自下不见，故其做法，亦较粗糙。《法式》卷二《总释》平棊下小注云：

“今宫殿中，其上悉用草架梁枋承屋盖之重，如攀额……方榑之类，及纵横固济之物，皆不施斤斧。……”

其后常用之“草架”，即指此不施斤斧之梁枋而言；而与之对称者，即“明架”是也。

观音阁各柱头斗拱上，第二或第三跳华拱之后尾，皆伸引为“明架”，明架背上架“算程枋”（图51），已于斗拱题下论及。然明架及算程枋之功用在于拘前后铺作，及承平棊；屋盖之重，及纵横固济之责，悉在平棊以上不施斤斧之梁枋之上焉。

此处用梁之制，与清式大同小异。檐柱与内柱之上施“双步梁”（宋称“乳枋”），内柱与内柱之上施“五架梁”（“檐枋”），五架梁之上置柁橼，上施“三架梁”（“平梁”），三架梁上立“脊瓜柱”（“侏儒柱”），其上承脊榑。其与今日习见所不同者，厥为其大小比例及其与柱之关系。

According to the Ts'ing regulations, the liang (beam) is invariably two ch'un (Chinese inch) wider than the diameter of the column, and the depth of the beam is set at either five-quarters or six-fifths of its width, regardless of the length of the span or the load it has to carry. The proportion of the width to the depth of the beam is, therefore, either 8:10 or 10:12, evidently ignoring the fact that the strength of the beam lies more in the depth than in the width. The Sung builders seemed to have a better understanding of the mechanics of the material they employed and specified that the ratio of width to depth should be 2:3. This is clearly showed in the *Ying-tsao-fa-shih*.

The following calculation of the two principal yen-fu of the Kuan-yin Ke will bring out an interesting fact in the comparison of the sizes of the beams of the Liao and Ts'ing styles:

清式造梁之制，其大梁不论长短及荷重如何，悉较柱宽二寸，而梁高则为宽之四分之五或五分之六。就此即有二问题须加注意者：一，梁对荷重之比例；二，梁宽与梁高之比例。关于第一问题，当于下文另述。横梁载重之力，在其高度而不在其宽度；宋人有见于此，故其高与宽为三与二之比。载于《法式》，奉为定例。清人亦知此原则，故高亦较大于宽，然其比例已近方形。岂七八百载之经验，反使其对力学之了解退而无进耶？

至于梁之大小，兹亦加以分析，并与清式比较：

每架 16. of each chia
 当心间面积 central bay
 每脊 16. of ridge from beam
 斜挑 16. of slope
 当心间顶面积 over central bay
 梁顶面积 16.5 of beam
 Dead load 静荷载
 7109. (Tiao-tun, p'ing-liang, chu-ju-chu, tous, fangs, purlins, rafters, sheathing, etc. included.)
 木料 (柁檁, 三架梁, 侏儒柱, 斗座, 襻间, 搏, 椽, 望板均在内) 体积
 516. 筒瓦板瓦体积 (late tiles)
 筒瓦板瓦体积 (late tiles)
 总静荷载 (load for tiles)
 Weight of timber 木料重量
 静荷载 16.5
 体积 9 cu. m.
 静荷载 16.520 = 5,100 kg.
 Weight of tiles (brick) 砖瓦重量
 静荷载 16.5
 体积 9 cu. m.
 静荷载 16.520 = 10,520 kg.
 Weight of earth 土背重量
 静荷载 16.5
 体积 9 cu. m.
 静荷载 16.520 = 5,000 kg.
 5,100 dead load + 5,200 总静荷载 20,620 kg.

Weight of yen-fu (五架梁自身重) :

$$0.585 \times 0.305 \times 7.43 \times 720 = 954 \text{ kg.}$$

From the above dead load (用上得之静荷载, 则) :

The maximum bending moment of the yen-fu is (五架梁所受之最大挠曲弯矩为) :

$$10,310 \times 1.86 + 954 \times \frac{7.43}{8} = 20,100 \text{ kg. m.}$$

The maximum vertical shear is (其所受最大之竖切力为) :

$$10,310 + \frac{954}{2} = 10,800 \text{ kg.}$$

And the maximum bending stress on the yen-fu is (则五架梁中之最大挠曲应力为) :

$$\frac{6 \times 20,100}{0.305 \times 0.585^2} = 1,160,000 \text{ kg./sq.m.}$$

And the maximum shearing stress is (其最大切应力为) :

$$\frac{10,800}{0.305 \times 0.585} \times \frac{3}{2} = 91,000 \text{ kg./sq.m.}$$

Live load (活荷载) :

The live load on the roof includes both snow and wind pressure, assumed at 195 kg. per sq.m. Being a beam supported at two ends, the total live load is (屋顶之活荷载包括屋顶所受之雪压及风力等数。此项荷载,通常可假定为195公斤/平方米,然其重量之四分之一,已由梁之两端,直下内柱之上。由梁身转达柱上者,只其余四分之三。故其活荷载总量为) :

$$195 \times 41.7 \times \frac{3}{4} = 6,100 \text{ kg.}$$

The maximum bending moment is (其最大挠曲弯矩为):

$$3,050 \times 1.86 = 5,670 \text{ kg.m.}$$

The maximum vertical shear is (其最大竖切力为) :

$$3,050 \text{ kg.}$$

And its maximum bending stress is (其最大挠曲应力为) :

$$\frac{6 \times 5,670}{0.305 \times 0.585^2} = 326,000 \text{ kg./sq.m.}$$

And the maximum shearing stress is (其最大切应力为) :

$$\frac{3,050}{0.305 \times 0.585} \times \frac{3}{2} = 25,600 \text{ kg./sq.m.}$$

Since the strength of timber varies greatly according to its age and the climatic conditions to which it is subject, it is difficult to decide with any accuracy the strength of the wood of the Kuan-yin Ke without testing it. But as the maximum bending strength of timber varies between 3,000,000 kg. to 4,600,000 kg., and the maximum shearing strength between 120,000 kg. to 230,000 kg., it is fairly safe to assume the medium, i.e., 3,800,000 kg. for its bending strength and 180,000 kg. for shear. The factors of safety of the yen-fu are:

木料之强度,至不一律,且因年龄与气候而异。观音阁梁枋木料之最大强度果为若干,未经试验,殊难臆断,但木料之最大挠曲强度约在3,000,000—4,600,000公斤/平方米间;而其最大切强度约在120,000—230,000公斤/平方米。若以上述之平均数为此阁木料之最大强度,则其挠曲强度为3,800,000公斤/平方米,而切强度为180,000公斤/平方米,

则此五架梁之安全率约如下表：

Shading 挠曲

安全率应力

(kg./sq.m.)

240000 静荷载独计

240000 live load 静活荷载并计

The above figures show that the factor of safety was slightly smaller than the most desirable, but still within the allowable limit of good practice, and the existence of the building for a thousand years is surely a sufficient test of its stability.

The same beam, when designed in accordance to Ts'ing regulations, is 74 by 59 cm., as large as two Liao beams. The Ts'ing builders were apparently far behind the Liaos in both knowledge of strength of material and economics! Figure 54 is a comparison of the widths of beams of the Liao, Sung and Ts'ing periods, all the beams being of the same depth.

It should be noted here that the yen-fu and the columns are not joined directly to each other, but interposed by the inner ends of the ju-fu, which unlike the ming-fu of the lower story, are merely placed on top instead of being incorporated into, and becoming an integral part of, the chu-t'ou-p'u-cho.

兹安全率，虽微嫌其小，然仍在普通设计许可范围之内，且各部体积，如瓦之厚度，乃按白板瓦底至筒瓦上作实厚许，未除沟陇之体积；脊本空心，亦当实心计算，故静荷载所假定，实远过实在重量。且历时千载，梁犹健直，更足以证其大小至为适当，宛如曾经精密计算而造者。今若按清式定例计算，则其高当为0.74米，宽为0.59米，辟为二梁，尚绰有余裕，清人于力学与经济学，岂竟皆不如辽宋时代耶？（图54）。

至于梁与柱安置之关系，则五架梁并非直接置于柱或斗拱之上者。五架梁之下，尚有双步梁，在檐柱及内柱柱头铺作之上；然双架梁亦非如明栿之与铺作合构而成其一部，而只置于其上者。双架梁之内端上，复垫以檁，上置五架梁，结构似嫌松懈。然统和以来，千岁于兹，尚完整不歇，吾侪亦何所责于辽代梓人哉！

【54】 Comparison of the widths of beams of Liao, Sung and Ts'ing.
辽、宋、清梁横断面比较

Many of the auxiliary parts of the "truss" were made of old materials. The t'o-tun of the yen-fu are of special interest as they are nothing but enormous old kungs, two at each end, one piled on top of the other. They are much larger than the kungs on the Ke, and must have been either parts of the original building which is now substituted by the present Kuan-yin Ke, or of other buildings, and cannot be of a later date than the glorious T'ang period!

Purlins, round in cross section, are placed at regular distances, four on each side of the slope and one at the ridge. At points where they are supported, t'i-mu is invariably used, apparently to reduce the shearing force. Beneath the t'i-mu, and interposed by tous, are the p'an-chien or fang, of which the one on the chu-ju-chu or under the ridge-purlin is specially large and interesting because short struts are used between the t'i-mu and p'an-chien causing the three to act somewhat like a single member.

From either side of the principal p'an-chien is a hsieh-chu ("slanting column"), like the principal rafters of a truss with the chu-ju-chu as the king post (Figure 55). This is not found in structural systems of later periods. The hsieh-chu is also used in the surrounding aisle of the mezzanine floor as a bracing to the framework. It may or may not be a part of the original construction. Though the use of diagonal bracing is seldom found elsewhere in China, it may be too hasty to conclude that those of the Kuan-yin Ke were put in after the building had begun to show signs of incline. Besides, if the hsieh-chu is applicable to the sides of the purlins, there is no reason to deny the

possibility of its being used elsewhere in the building.

The most important discovery in the study of the structural side of the Liao architecture of the Tu-lo Ssu is the high degree of standardization of structural members. The regulation of the Ts'ing style sets the tou-kou (or mortise on the tou to receive the kung) as the standard unit measure, involving a very complicated process in both designing and execution of the work. But here in the gigantic structure of the Ke, the structural members are of only six different sizes, an amazingly high degree of standardization.

The opening paragraph of Chapter IV of the *Ying-tsao-fa-shih* may be quoted here, on the construction of framing carpentry:

"In constructions of all kinds, the ts'ai is always the first consideration. There are eight different sizes of ts'ai, and they are to be used according to the size of the building.... The depth of the ts'ai is to be divided into 15 fen, and its width will be equal to 10 fen. It is with this fen as a unit that the height and breadth of the building, the length of different parts, the curve of the roof, and everything else governed by the compass, the square and the plumb are determined."

【55】Hsieh-chu in the interior of the mezzanine floor, Kuan-yin Ke.
观音阁中层内部斜柱

草袱之附属部分，多用旧料，其中如垫五架梁之柁檁，皆由雄大旧拱二件垒成，较今存拱尤大；是必统和重葺以前原建筑物或他处拆下之旧拱，赫然唐木，乃尚得见于兹，惜顶中黑暗，未得摄影为憾耳。

三架梁及五架梁头，并双步梁上柁檁及三架梁上侏儒柱上皆置榑（桁），榑与梁或檁间，皆垫以替木；替木之下，复有欂间（枋），长随间广，与梁相交。侏儒柱上欂间尤大。欂间与替木间，复支以短柱；

使搏、替木、襻间三者合成一“复梁”作用焉。

脊襻间之左右，有斜柱支撑于平梁之上。以下每搏之下，皆有斜柱支撑，此为清式所无，而于坚固上，固有绝大之关系也。

斜柱之制，不唯用于梁架之上，于中层暗部亦用之（图55）。此部或为后世修葺所加；然当初若知用于梁上以支撑，则将此同一原则转用于此处，亦非不可能也。

此次独乐寺辽物研究中，因梁枋斗拱分析而获得之最大结果，则木材尺寸之标准化是也。清式用材，其尺寸以“斗口”为单位，制至繁而计算难。而观音阁全部结构，梁枋千百，其结构用材，则只六种，其标准化可谓已达极点。《营造法式》卷四，大木作制度，辟头第一句即谓：

“凡构屋之制，皆以材为祖。材有八等，度屋之大小，因而用之。……各以其材之广，分为十五分，以十分为其厚。凡屋宇之高深，名物之短长，曲直举折之势，规矩绳墨之宜，皆以所用材之分以为制度焉。”

After giving the dimensions of the eight standard sizes, it continues:

"The ch'i is 6 fen wide and 4 fen thick. When a ch'i is added to the ts'ai, it is called a chu-ts'ai."

These are undoubtedly the standard measures of the Sung style of architecture. But since the ts'ai and ch'i are not properly defined, it is difficult to know their proper mode of application, though the dimensions and proportions are given. It is only after a study of the structural members of the Tu-lo Ssu that we know to what an extent the system is applicable, and how much convenience it brings to the designing and execution of the work as well as saving of material and labor.

Since the ts'ai and ch'i are standard measures for construction, every part of the building is expressed in terms of either the ts'ai or the ch'i, or a multiple of either or both of them. It is necessary therefore to define the ts'ai. Firstly, it may be described as a unit measure, where the depth of a kung is called a ts'ai. Secondly, it is a standard member, the cross section of which is that of the kung, regardless of its length. The ni-tao-kung, man-kung, chu-t'ou-fang, etc., are, for instance, all of the same size in cross section, and are, therefore, each a ts'ai.

在八等材尺寸比例之后，复谓：

契
"契广六分，厚四分。材上加契者谓之足材。"

此乃宋式营造之标准单位，固极明显。然而“材”、“契”之定义，并未见于书中；虽知其大小比例，而难知其应用法，及其应用之可能

度。今见独乐寺，然后知其应用及其对于设计及施工所予之便利及经济。

契
“材”、“**契**”既为营造单位，则全建筑物每部尺寸，皆为“材”、“**契**”之倍数或分数；故先考何为一“材”。“材”者：（一）为一种度量单位；以拱之广（高度），谓之“一材”。（二）为一种标准木材之称，指木材之横断面言，长则无限制。例如泥道拱、慢拱、柱头枋等，其长虽异，而横断面则同，皆一材也。

The ch'i is 6 fen in width and 4 fen in thick, where 6 fen is $\frac{6}{15}$ of a ts'ai, and its height (thickness) is that of the space or void between two kungs or fangs. It is, therefore, also a term used both for a unit measure as well as a standard member.

Measurements show that the depth of the kungs and fangs of the Kuan-yin Ke vary from 24.1 to 25 cm. The variation may be due to either inaccuracy in workmanship or the climatic effect of nearly a thousand years. However, the average depth is about 24.5 cm., which is the ts'ai of both the Hall and the Shan-men. The average ch'i is about 10 cm., approximately $\frac{2}{5}$ of a ts'ai, which is fairly close to $\frac{6}{15}$ of it. It is then clear that the use of the ts'ai as a unit measure is a system common to both the Liao and Sung regulations of construction, and consequently indicates a common origin, probably from the T'ang Dynasty or even earlier.

契
“**契**广六分，厚四分”：其“广”即散斗之“平”（升腰）及“欹”（斗底）之总高度，即两层拱间之空隙；六分者，“材”之广之十五分之六也。
契
也。“**契**”为“材”之辅，亦为度量单位名称；用作木材时，则以补拱间之隙，非主要结构木材也。材**契**二者，用为度量单位时，皆用其“广”（高度）。**契**“厚四分”者，材之广之十五分之四也。“厚”从不用作度量单位，只是标准木材之固定大小而已。

观音阁山门各部拱枋之高，自0.241米至0.25米不等。工匠斧锯之不准确，及千年气候之影响，皆足为此种差异之原因，其平均尺度则为

0.244或0.245米，此即阁及门“材”之尺寸也。其**契**“**契**”则平均合0.10米，约合“材”之五分之二强（虽略有出入，合所谓“六分”——十五分之六）。然则以材**契**为度量之制，辽宋已符，其为唐代所遗旧制必可无疑。

The solution of the ts'ai and ch'i riddle precedes that of a number of hitherto perplexing problems. The ni-tao-kung, man-kung, kua-tze-kung, ling-kung and all other kungs; chu-t'ou-fang, lo-han-fang, p'ing-ch'i-fang, and most other fangs; the angs, are all ts'ai, or more

specifically tan-ts'ai as distinguished from the chu-ts'ai which is the combination of a ts'ai and a ch'i. Chu-ts'ai members of the Ke are the lan-erh, p'u-p'ai-fang, hua-kung, etc. The ming-fu is one ts'ai & one ch'i; ta-ch'ian, about two ts'ai; p'ing-liang, two ts'ai; yen-fu, two ts'ai & one ch'i. There are only these six different dimensions for the thousands of structural pieces in the building. The high degree of standardization is certainly amazing, and the statement in the *Ying-tso-fa-shih* that "in construction of all kinds, the ts'ai is always the first consideration" is certainly a principle that no student of Liao or Sung architecture can afford to overlook.

[H] Chiao-liang

The chiao-liang or hip-rafter is similar to that of the Shan-men in construction. The yin-chiao-liang or "hidden corner beam" is not used in the Kuan-yin Ke, as neither the top nor the lower roof necessitates the extension of the "corner beam." The upper story hip-rafter terminates where the gable roof starts, and the one of the lower story is not carried beyond the mezzanine corner column. The end of the lao-chiao-liang is shaped into two convexed surfaces for the lower story and three similar curvatures for the upper. The curvature is a simple curve, severe and dignified, rather Greek in feeling, unlike the wriggling pa-wang-ch'uan used for ta-chiao-liang of later periods. The tze-chiao-liang is on the lao-chiao-liang, extending further out but slender in proportion, with a t'ao-shou, a dragon head tile cap on its tip. Copper bells are hung from underneath the chiao-liangs.

[I] Chü-che

The pitch and curve of the roof is worked out exactly according to the same method as described in the *Ying-tso-fa-shih*. The distance between the front and rear liao-yen-ch'uan is 17.42 m. with an altitude of 4.76 m., measuring from the top of the liao-yen-ch'uan to the top of the ridge-purlin. One-quarter of the distance is 4.36 m., the basic raise, 8% of which is nearly 0.35 m. making 4.71 m. as the total raise according to the method described in the *Fa-shih*. Here the measurement of the Kuan-yin Ke is 4.76 m., about 1% more than the specified proportion which may be due to settlement or the effect of age and weathering. It is, therefore, the best existing example of the raise in the Sung manner.

The curve, it is slightly straighter than that laid down in the *Fa-shih*. The dotted line of figure shows the regulation curve as compared with the existing specimen (in black line); the difference between the

two being very slight. The general contour is, however, radically different from that of the Ts'ing buildings.

契
材**契**之义及用既定，若干问题即迎刃而解。例如：泥道、慢、瓜子、令诸拱；柱头、罗汉、平棊等枋；昂，皆“单材”也（其广一材，其厚为广三分之二）。阑额、普拍枋、华拱皆“足材”也（其广一材一**契**，其厚为一材之三分之二）。明袱广一材一**契**；割牵（双步梁）^[64]广约二材弱；平梁（三架梁）广二材，檐袱（五架梁）^[65]广二材一**契**。共计凡六种，此外其他部分亦莫不如是，其标准化可谓已达最高点。《法式》谓“构屋之制，以材为祖”信不诬也。

〔8〕角梁

下层大角梁卷杀作两瓣，而上层则作三瓣；其卷杀之曲线严厉，颇具希腊风味。下层角梁后尾安于中层角柱之上。而上层后尾与角昂、由昂，皆置上层内角柱之上。仔角梁较大角梁短小，头戴套兽。大小角梁下皆悬铜铎，每当微风，辄吟东坡“东风当断渡”句，不知蓊在山麓，无渡可断也。

〔9〕举折

观音阁前后檐檐枋相距17.42米，举高为4.76米，适为五五举弱。较山门举度（五举）略甚。按《法式》之制，殿阁楼台，三分举一分，而筒瓦厅堂则四分举一分又加百分之八，五五举弱适与此算法相符，是非偶然，盖以厅堂举法而施于殿阁也。

至于其折高，则第一举为三二五举，第二举为五举弱，第三举为六举强，第四举为六五举弱，第五举为七五举，其折法不如《法式》之制，与清制亦异。

〔J〕The Rafter and the Eave

The rafters, or ch'uan, are made of round posts, about 14 cm. in diameter, and above them are the fei-tze or flying rafters. Like the rafters of the Shan-men, they are tapered slightly at the tips, in exactly the same manner.

As we have noted before, the overhang of the eave buildings is much greater than that of the Ts'ing style. The height from the top of the t'ai-chi (base) to the top of the liao-yen-ch'uan is 6.57 m., and the horizontal distance between the center-line of the columns and the tip of the fei-tze is 3.28 m., just one-half of the height. The overhang of

the upper eave is about the same as the lower one, but the height of the top story columns is much shorter. The general impression one gets of these two decks of far overhanging roofs is, therefore, that of vigor and free, quite unlike the timid elaboration of the later styles (Figure 31).

[K] Gables

The roof of the Kuan-yin Ke is in the hsieh-shan manner, a peculiar roof construction characteristic of the Chinese architecture. A gable is made to intersect with the sloping roof of the end of the building, thus geometrically it is just the reverse of the roof, in which the gable is interrupted by the slope. The shan-hua as the gable is called by the Ts'ing builders, is known in the Sung Book as liang-chi (Figure 56).

The liang-chi of the Kuan-yin Ke is constructed by extending the purlins about 1.45 m. beyond the "truss" between the intermediate and end bays, to allow an overhang of the roof. The cantilever of the purlin is taken care of by a t'i-mu and a kung, which is shaped out of the end of the p'an-chien underneath each purlin. The three central bays are, therefore, under the front and rear slopes while the two end bays are under the side slopes of the roof. Onto the ends of the purlins is attached the po-feng-pan which may be called a "gable plate."

The hsieh-shan roof that is common in China today is somewhat different both in appearance and construction from the liang-chi of the Sung style. The recess of the vertical triangle of the gable from the end facade in the Ts'ing style is smaller than in the Sung style. It is due to the extraordinarily long cantilever of the purlin-ends which almost reaches the entire width of the end bay. The result is that the triangular space of the gable is much enlarged and the main ridge of the roof lengthened. But, on account of the heavy overhang, the later architects found that the cantilever was not strong enough to support the weight of the roof, so that an extra set of framework was necessary to hold the gable in place. As this addition is illogical and unsightly, a board, the shan-hua-pan, is nailed on to hide the ugliness behind.

【56】 The construction of liang-chi, Kuan-yin Ke. 观音阁两际结构

〔10〕 椽及檐

椽皆以径约0.14米之杉木造。椽头略加卷杀，飞子亦然，如山门所见。

清式檐出为高三分之一。观音阁下层自椽檐搏背至地高6.57米，而

自檐柱中至飞头平出檐为3.28米，适为高之半。上檐出与下檐出大略相同，因童柱之移入及侧脚之故，故较下檐退入约0.33米。然吾侪平日所习见之明清建筑，上檐多造于内柱之上，故似退垒而呈坚稳之状；而观音阁巍然两层远出如翼，其态度至为豪放（图31）。

椽檐搏及罗汉枋间，罗汉枋及柱头枋间，皆有似乎闇椽之斜椽，上安遮椽板。

〔11〕两际

屋顶为歇山式，其两际之结构，与清式颇异。清式收山少，山花几与檐柱上下成一垂直线。收山少则悬出多，其重量非自梁上伸出之桁（搏）所能胜，故须在山花之内，用种种方法——如踢脚木、草架柱子等——以支撑之；而此种方法，因不甚合理，故不美观，于是用山花板以掩藏之。

The later style is decidedly degeneration as compared with the frank exposure of all structural members in the Sung method. The Kuan-yin Ke is found with shan-hua-pan at both gables. But behind them may still be seen the kung-shaped ends of the p'an-chian with tous and t'i-mu. The end of the large p'an-chien under the ridge-purlin is shaped into a simple cyma, reaching to half the length of the overhang. The two hsieh-chus that hold the ridge in position were originally also exposed, with the spaces inside them filled in with partitions to shut out the heat and cold; but now the little triangular walls have been taken away and their work is undertaken by the shan-hua-pan, which, from both structural and aesthetic points of view, is far inferior to the original construction.

Right underneath the apex of the shan-hua, there must once have been a hsüan-yü, the "hanging fish," with jeh-ts'ao on both sides. Those shown in the side elevation are drawn according to the *Ying-tso-fa-shih*.

〔L〕Roof-tiles

The grey tiles of the Kuan-yin Ke, like those of the Shan-men, are not the originals of the Liao period. The cheng-wen (ridge-end ornament), cheng-chi (main ridge), ch'ui-chi (hip), ch'ui-shou (hip beast), tsun-shou (sitting beasts), pin-chia (angel or lady-in-waiting) are probably all of the Ming Dynasty.

宋以前则不然，两际之构造，颇似清式之“悬山”；无山花板，各层梁枋搏头等构材，自下皆见。观音阁两际今则掩以山花，一望而知其非原物；及登顶细察，则原形尚在（图56），惜为劣匠遮掩，自外不得

见。

侏儒柱上大襻间，头卷杀作简洁之曲线，长及出际之半。平榑下襻间与平梁（三架梁）交，伸出长如大襻间，卷杀如拱，上置散斗，以承替木。斜柱与侏儒柱之间，其先必填以壁，以防风寒吹入，今则拆去，而于榑头博风板下，掩以山花。既不合理，又复丑恶，何清代匠人之不假思索耶？

博风板之下，原先必有悬鱼惹草等装饰，今亦无存。谨按《营造法式》所见。

〔12〕瓦

与山门瓦同，青瓦，亦非原物，其正吻、正脊、垂脊、垂兽、仙人等，殆为明代重修时所配者。

【57】Ornaments of roof-tiles, Kuan-yin Ke. 观音阁瓦饰

The cheng-wen is similar to that of the Ts'ing style, but with a much larger "tail," and its end does not turn inward in the form of a spiral. The relief of the facial features is more prominent. The top of the "back" is a slope instead of the level shelves of the Ts'ing style. The chien-pa or sword handle is very realistic in modeling, sticking on the "back" at an angle (Figure 57).

The cheng-chi or main ridge has a small pavilion in the middle,

which shelters a tablet. Inhabitants of the town told me that prior to the restoration in the Kwang-hsü period, there were inscriptions on the tablet with the date and name of the architect as follows: "Erected under the supervision of Yü-ch'ih ching-teh in the 10th Year of Cheng-kwan."

But a careful scrutiny with a telescope failed to bring out these characters. It was very probable that there were inscriptions on the tablet, but the date of Cheng-kwan and the name Yü-ch'ih Ching-teh are probably not genuine. The name especially is unreliable as it is one that has for ages been legendary to carpenters and builders. A local legend tells that the sacred lamp of the She-li Pagoda in Pan-shan descends the hill and visits the city at midnight on New Year's Eve. It lands on the little tablet first and then goes to other temples in the city. The lamp is known as one of the eight sights of Chi-chou, and is called "Tu-lo-ch'en-teng" (the Sacred Lamp of Tu-lo). The long narrow panels of the ridge are decorated with dragons playing the flaming pearl.

The ch'ui-chi or hip is decorated with floral designs. The ch'ui-shou is entirely different from the Ts'ing ch'ui-shou; it is a sort of unicorn with mouth wide open, and a little human figure riding on its back, holding onto its horns. The sitting beasts, though slightly different from those of later dates, are nothing very unusual. The pinchia is a husky warrior in helmet and armor, sitting on the end of the hip looking down proudly onto the worshipers below the sacred roof. All these tiles might be several centuries old.

The tubular and plate tiles are similar to those of the Shan-men.

[M] Walls

Except for the three central bays on the southern facade and the one central bay on the north, the spaces between the exterior peristylar columns of the lower floor are filled in with massive masonry walls, about one meter thick. The top of the wall just reaches the bottom of the lan-erh, and is about four times its own thickness. There is a slight decrease in thickness towards the top, and a sharp inward turn near the lan-erh. The ch'ün-chien or base of the wall is only about one-seventh of the height, much lower than the regulation proportion of one-third as specified in the Ts'ing style, and therefore still further from the Ming proportion which is even higher. The base of the wall of the Wooden Pagoda of Fo-kung Ssu is also of a similar proportion. It might have been a Liao characteristic.

正吻颇似清式，然尾翘起甚高，亦不似清式之如螺旋之卷入。须眉

口鼻皆较玲珑。吻背之上皮，斜上尾部，不若清式之平。其剑把则似真剑把，斜插于吻背之背。背兽颇瘦小（图57）。

正脊为双龙戏珠纹样。其正中作小亭。相传每届除夕夜午以后，盘山舍利塔神灯，下降蓟城，先独乐而后诸刹。神灯降临则亭中光芒射出，照耀全城，称“独乐晨灯”，为蓟州八景之一云。小亭之神话，尚不止此。蓟人告予，光绪重修以前，亭内有碑，碑刻“贞观十年尉迟敬德监修”云云。吾以望远镜仔细观察良久，未见只字。碑上原有文字当无可疑，贞观敬德，颇近无稽；尉迟敬德监修寺庙，亦成匠人神话，未必可信也。

垂脊亦有花纹，但无龙。垂兽为清式所不见。似仙童骑于独角犀牛上，双手攀犀角，颇饶谐趣。走兽虽略异，亦无奇。仙人乃甲冑武士，傲然俯视檐下众生。亦历数百寒暑矣。

筒瓦、板瓦与山门同，详见图五十七，不复赘。

〔13〕墙壁

下层除南面居中三间及北面居中一间外，皆于柱间砌砖墙。墙高至阑额下。厚约一米，计合墙高四分之一。墙收分之度，约为2%。墙顶近阑额处，斜收入为墙肩。下肩甚低，约合墙高七分之一。清式定例，下肩高为墙高三分之一。明物则下肩尤高。而观音阁及山门与应县佛宫寺塔，下肩皆特低，绝非偶然，窃疑其为辽制。

In one of the Emperor Ch'ien-lung's poems on the Tu-lo Ssu there is a line on "the faded paintings of Buddha's twelve origins," and a note attached giving the explanation that "Buddha has twelve origins, a favorite topic for mural paintings in Buddhist Temples." It is certain that the walls were originally decorated with paintings which were already faded in Ch'ien-lung's time.

The interior partitions of the mezzanine floor and the exterior walls of the upper floor are all constructed of plaster on lath. The lath is of small branches tied together, and the plaster is local clay mixed with a small proportion of lime and straw. A diagonal post is built in each of these partitions to act as bracing.

〔N〕Doors

None of the original doors are preserved. During the Ts'ing restorations, doors with geometrical floral grills were used. Traces of these are still to be seen in a few of the transoms. The movable parts have all been destroyed.

〔 O 〕 Floor

On the p'u-pan-fang (joists) that rests on the chu-t'ou-p'u-cho of the mezzanine story is placed the floor of the upper story, which is finished with a coat of plaster about 3 cm. thick. The joists are placed more than 2 m. apart, and in some places the floor sags so much under the weight of men walking on it that it actually threatens to give way.

〔 P 〕 Balustrades

On both the mezzanine and upper floors, around the wall that surrounds the figure, are wooden balustrades. Round posts are placed at points where the railing turns a corner, and short posts called shu-chu are placed at intervals in between. The head of the shu-chu is shaped into a tou, upon which is placed the hsün-chang or rail. Other horizontal members are the p'en-ch'un at the middle and the ti-fu or foot rail below. Between these two is the hua-pan, which is usually treated with different combinations of the swastika, similar to those seen in the mural paintings of Tun-huang. The pattern of the mezzanine floor balustrades is identical to the painting. The six sides of the upper story balustrade are divided into twelve panels with six kinds of designs (Figure 58). The balustrades around the exterior balcony on the upper floor are modern replacements with modified designs.

乾隆御制诗《过独乐寺戏题》有“梵宇久凋零，落色源流画”句，其夹注则曰“佛有十二源流，僧家多画于壁间”，是独乐寺本有画壁，其画题则十二源流，当时已“落色”，必明以前画也。

上层外墙及中层内墙系在柱间先用绳索系枝为篱，然后将草泥敷于篱上，似今通用之板条抹灰墙；然所用绳索枯枝，皆甚粗陋。壁内藏有斜柱，以巩固屋架之结构。

〔 14 〕 门窗

原物无丝毫痕迹。清代修葺，门窗改用菱花楞子。下层横披尚见。其活动部分，已被年前驻军拆毁。

〔 15 〕 地板

在中层各铺作上铺板枋上，敷设地板，板上敷灰泥约一寸。枋间距离，至短者亦在二米余以上，而板则厚仅一寸。人行板上，板上下弯曲

弹动，殊欠安稳。清式于“承重”梁上加“楞本”，无弹动之虞。每年旧历三月中，蓟人举行酬神盛会，登楼者辄同时百数十人，如地板不加坚实，恐惨剧难免发生。

〔16〕栏杆

中层内平坐上，绕像一周；上层内地板上，六角形空井一周，及上层外檐平坐一周，皆绕以栏杆。栏杆于转角处立望柱，其间则立短小之蜀柱。柱下为地袱，中部为盆唇，上为寻杖，蜀柱之间盆唇之下为束腰。其各部名称见于《营造法式》，而形制则较似敦煌壁画所见。中层栏杆束腰花纹，与敦煌者尤相似。上层内栏杆六面十二格，花纹六种（图58），虽各不同，而精神则一贯。上层外檐栏杆，云拱瘦项改作花瓶形，已失原意矣。

【58】 Modified designs of balustrades, interior of upper story, Kuan-yin Ke.

观音阁上层内勾栏束腰纹样

[Q] Stairway

The stairway, which is the only access to the upper floors, is located in the western end bay. The mezzanine is reached by one long flight, running upwards from south to north. It then turns back southward leading to the upper floor. The incline of the stair is rather steep, making an angle of almost 45 degrees with the ground. The

lower end of the lower flight rests on a low platform. The carriages, which are at the same time strings, are rather large in size. They are terminated at the lower end by a wang-chu or newel, in the form of a simple cylindrical post, and at the upper end by a shu-chu. There are a few more shu-chu, in between the two ends, and on them rests the hsün-chang (hand rail). The carriage acts at the same time as the ti-fu, while the hua-pan is substituted by a long post, square in cross section, and placed cornerwise (Figure 59).

The present stairway consists of one flight of twenty-eight steps and one flight of twenty. An examination of the inner face of the carriage from underneath shows that the present steps are only half as large as the original, mortises of which are still traceable, measuring 38 cm. for the rise and 43 cm. for the thread (Figure 60).

〔 17 〕 楼梯

位于西梢间居中两间内，自地北向上至中层，复折而南至上层。梯斜度颇峻，约作四十五度角。梯脚下有小方坛，梯立坛上。梯之两框，颇为长大，辅以栏杆，略如上述。其上下两端，立以望柱；望柱之间，立蜀柱数支，其间贯以盆唇寻杖，其不同者，为束腰部分，不用板而代以一方杖。梯之上端，穿地为孔，孔之三面复以小蜀柱及盆唇束腰栏杆护焉（图59）。

今梯下段分二十八级，上段分二十级。仰察梯底，乃知今每级只原阶之半，原级之大，实倍于今，下段十四而上段十级，每级高0.38米，宽0.43米，卯痕犹在，易复原状也（图60）。

【59】 Head of stairway on the upper floor of Kuan-yin Ke. 观音阁上层梯口

观音阁楼梯详样

It is customary in China to repaint all the painted ornaments. Therefore an old painted ornament is even rarer than an old building. The paintings of the Tu-lo Ssu buildings are no exceptions, having

being repaired during the Kwang-hsü restoration. The basic function of the paint is to protect the wood, and to prolongate its life, the decorative element being merely a by-product. A well applied ornament helps to give expression and proper emphasis to the structural members and thus should change according to the difference in structural systems.

The painted ornaments of the Kuan-yin Ke, like those of the Shan-men, are a forced application of the Ts'ing system onto a Liao building. The exterior paintings are especially bad. Emphasis and accentuation are almost always applied in the wrong place, such as the use of the tangent-circle motif known as the Hsiao-tze with the "panels" put so that they are half-covered by the tous. This is an arrangement so awkward that it should not be employed under any circumstance. The painters have here shown great embarrassment in dealing with this fang which is always hidden above the rows of p'u-cho in later styles, but here is entirely exposed in the Ke in the frankest manner. The paintings are not only unsuitable, but positively comical.

〔18〕彩画

我国建筑，每逢修葺，辄“油饰一新”，故古建筑之幸存者，亦只骨架，其彩画制度，鲜有百岁以上者。独乐寺彩画，亦非例外，盖光绪重修时所作也。彩画之基本功用在保护木料而延其寿命，其装饰之方面，乃其附带之结果。善施彩画，不唯保护木材，且能藉画以表现建筑物之构造精神。而每时代因其结构法之不同，故其彩画制度亦异。

观音阁及山门，皆以辽式构架，施以清式彩画。内部油饰，犹简单稍具古风，尚属可用。外檐彩画，则恶劣不堪，“大点金”也，各种“苏画”或“龙锦枋心”也，椽檐枋、阑额及斗拱上，尚因古今相似，勉强可观。而各层柱头枋及罗汉枋，在清式所占地位极不重要，在平时几不见，故无彩画，但在辽式，则皆各露，拙匠遂不知所措，亦画以“旋子（学子）”、“枋心”等等纹样。有如白发老叟、衣童子衣，又复以裤为衣、以冠为履，错置乱陈，喧哗嘈杂，滑稽莫甚焉（见外檐各图）！

〔S〕Statues and Their Platform

The colossal statue of the Eleven-headed Kuan-yin is the main subject of the Hall—or the Temple. The statue is about 16 meters in height and is the largest free-standing figure known in China. Legends told that the statue was carved out of a single piece of sandalwood, but in reality it is modeled in clay over a gigantic armature. The figure is characterized by arched brows over long, narrow eyes, wedge

shaped nose and a subtle smile. The body inclines slightly forward with a protruding belly. The drapery is fluent, with two long sashes hanging from the arms and straight down to the foot, touching the sides of the lotus-flower-pedestal. All these characteristics show the strong influence of T'ang sculpture, and there is little doubt of the statue having been remodeled in 984. The reparation and restoration of successive ages have undoubtedly caused some change to the figure, but the general characteristics are still those of the late T'ang style. The statue is sadly abused by vulgar painted ornaments of later periods (Figure 62).

To the left and right of the principal figure on the platform are two attending Bodhisattvas. Their posture and drapery are especially "T'angish" in spirit (Figure 61).

〔19〕塑像及须弥坛

十一面观音像，实为本阁——或本寺——之主人翁。像高约十六米，立须弥坛上，二菩萨侍立。相传像为檀香整木刻成，实则中空而泥塑者也。像弯眉楔鼻，长目圆颌，微带慈笑；腹部微突，身向前倾；衣褶圆和，两臂上飘带下垂，下端贴莲座上，皆为唐代特征。然历代重修，原形稍改，而近代彩画，尤为可厌（图62）。

坛上左右侍立菩萨，姿势手法，尤为精妙，疑亦唐代物也（图61）。坛上尚有像数尊，率皆明清以后供养，兹不赘。

【61】 Figure of the attending Bodhisattva in the east. 东面侍立菩萨像

【62】 Eleven-headed Kuan-yin. 十一面观世音像

There are a few other figures on the platform, probably of the Ming and Ts'ing periods, deserving no special attention. The platform, on which all the statues are placed, is of solid masonry and finished with wooden moldings and panels all the way around. A low balustrade of swastika pattern runs all the way round. The sacrificial table in front of the platform is treated with an enormous number of stringy moldings (Figure 63). These woodworks are probably of the Kwang-hsü period.

〔T〕 Pien

The principal tablet or pien under the front upper eave, with the characters "Kuan-yin-chih-ke" is also considered a treasure of the city. The calligraphy on it is attributed to Li Po, famous poet of the T'ang Dynasty. Judging from the penmanship, it is of the T'ang school, very vigorous but slightly clumsy. The signature "T'ai-po" appears under the character "ke," but there is very little doubt of its being a forgery. It is more likely that Li Tung-yang of the Ming Dynasty was the calligrapher and was later mistaken for Li Po (Figure 64).

像所立之须弥坛及坛前供桌，制作亦颇精巧。坛下龟脚、束腰，及上部之栏杆，皆极有趣。供桌叠涩太复杂，与坛似欠调谐（图63）。

〔20〕 匾

阁尚有匾额三，下层外额曰“具足圆成”，内曰“普门香界”，乾隆御书。上层外额曰“观音之阁”，匾心宽1.63米，高2.08米，每字径几1米，相传李太白书，笔法古劲而略拙，颇似唐人笔法。阁字之下署“太白”二字，其为后代所加无疑。朱桂辛先生则疑为李东阳书，而后人误为太白也（图64）。

【64】Pien of Kuan-yin Ke. 观音阁匾

陆 今后之保护

观音阁及山门，既为我国现存建筑物中已发现之最古者，且保存较佳，实为无上国宝。如在他国，则政府及社会之珍维保护，唯恐不善。而在中国则无人知其价值，虽蓟人对之有一种宗教的及感情的爱护，然实际上，蓟人既无力，亦无专门智识，数十年来，不唯任风雨之侵蚀，且不能阻止军队之毁坏。令门窗已无，顶盖已漏，若不及早修葺，则数十年乃至数年后，阁、门皆将倾圮，此千年国宝，行将与建章、阿房同其运命，而成史上陈迹。故对于阁、门之积极保护，实目前所亟不容缓

也。

保护之法，首须引起社会注意，使知建筑在文化上之价值；使知阁、门在中国文化史上及中国建筑史上之价值，是为保护之治本办法。而此种之认识及觉悟，固非朝夕所能奏效，其根本乃在人民教育程度之提高，此是另一问题，非营造师一个所能为力。故目前最重要问题，乃在保持阁、门现状，不使再加毁坏，实一技术问题也。

木架建筑法劲敌有二，水火是也。水使木朽，其破坏率缓；火则无情，一炬即成焦土。今阁及山门顶瓦已多处破裂，浸漏殊甚，椽檩已有多处呈开始腐朽状态。不数年间，则椽檩将折，大厦将颓。故目前第一急务，即在屋瓦之翻盖。他部可以缓修，而瓦则刻不容缓，此保持现状最要之第一步也。

瓦漏问题既解决，始及其他问题；而此部问题，可分为二大类，即修及复原是也。破坏部分，须修补之，如瓦之翻盖及门窗之补制。有失原状者，须恢复之，如内檐斗拱间填塞之土取出，上檐清式外栏杆之恢复辽式，两际山花板之拆去等皆是。二者之中，复原问题较为复杂，必须主其事者对于原物形制有绝对根据，方可施行；否则仍非原形，不如保存现有部分，以志建筑所受每时代影响之为愈。古建筑复原问题，已成建筑考古学中一大争点，在意大利教育部中，至今尚为悬案；而愚见则以保存现状为保存古建筑之最良方法，复原部分，非有绝对把握，不宜轻易施行。

防火问题，亦极重要。水朽犹可补救，火焰不可响尔。日本奈良法隆寺由政府以三十万巨金，特构水道，偶尔失慎，则顷刻之间，全寺可罩于雨幕之内；其设备之周，管理之善，非我国今日所敢希冀。然犹可备太平桶水枪等，以备万一之需。同时脊上装置避雷针，以免落雷。在消防方面，则寺内吸烟及佛前香火，尤须永远禁绝。阁立寺中，周无毗连之建筑物，如是则庶几可免火灾矣。

在社会方面，则政府法律之保护，为绝不可少者。军队之大规模破坏，游人题壁窃砖，皆须同样禁止。而古建筑保护法，尤须从速制定、颁布、施行；每年由国库支出若干，以为古建筑修葺及保护之用，而所用主其事者，尤须有专门智识，在美术、历史、工程各方面皆精通博学，方可胜任。日本古建筑保护法颁布施行已三十余年，支出已五百万。回视我国之尚在大举破坏，能不赧然？唯望社会及学术团体对此速加注意，共同督促政府，从速对于建筑遗物，予以保护，以免数千年文化之结晶，沦亡于大地之外。

1929年世界工程学会中，关野贞博士提出“日本古建筑物之保护”一文，实研究中国建筑保护问题之绝好参考资料。蒙北大教授吴鲁强先生盛暑中挥汗译就，赐载本期汇刊。籍资借鉴，实所至感。

[1] 本文原载于1932年《中国营造学社汇刊》第三卷第二期——莫宗江注。中英文均为梁思成先生所作——编者注。

[2] 《周礼·考工记》，*The Book of Works of the Chow Dynasty*——作者注。

[6] 《元故宫遗录》, *Recollections of the Old Yuan Palaces* by Hsiao Hsun (萧洵) of the Ming Dynasty——作者注。

[7] 此是20世纪30年代日本学界的说法。近年日本学界已公认法隆寺虽为公元607年圣德太子创建,但在公元670年焚毁。公元680年以后在原址西北重建,约在公元710年建成,即现存的法隆寺西院中门、塔、堂、回廊等筑。但再建的法隆寺西院仍保持飞鸟时代的风格特点,也仍是现存世界上最古的木构建筑——傅熹年注。

[8] 山西大同华严寺教藏,建于辽兴宗重熙七年(公元1038年)——作者注。当时中国营造学社刚开始进行调查古建筑,尚未积累足够的史料,故多参考日本学者的调查资料。如日本常盘大定、关野贞等的著作《支那佛教史迹》等,薄伽教藏是其中有确切纪年之例,故引用之。以后随着营造学社工作的开展,发现了一些更古老的建筑,最后形成一个有纪年的木建筑的排序目录。薄伽教藏现在的年代排序是第15名——傅熹年注。

[9] 施嘉炆,1902年出生,早年赴美留学,回国后在清华大学土木系任教,是清华大学土木系第一任系主任,20世纪40年代任清华工学院院长,现为清华水利系一级教授,已退休。曾长期任水利学会、水利工程学会理事长——傅熹年注。

[10] 蔡方荫,详《故宫文渊阁楼面修理计划》一文——傅熹年注。

[11] 朱启铃,(1872—1964)字桂辛,贵州紫江人,曾任清京师大学堂译学馆监督,辛亥革命后历任交通总长、内务总长、代理国务总理。退休后,于1929年发起组织中国营造学社,1930年正式成立,自任社长,聘梁思成、刘敦桢分任法式部、文献部主任,从事中国古代建筑的调查研究,影响深远。1949年后历任中央文史馆馆员,第二、三届全国政协委员——傅熹年注。

[12] First published in 1103, reprinted in 1925 by the Commercial Press, Shanghai. 初刊于1103年,1925年上海商务印书馆再版——作者注。

[13] 参阅拙著《我们所知道的唐代佛寺与宫殿》——作者注。

[14] 楼阁外周之露台,古称“平座”。斗拱之在屋角者为“转角铺作”,在柱与柱之间者为“补间铺作”——作者注。

[15] 斗拱大斗安拱之口为“斗口”——作者注。

[16] 日本古代历史时代,起自公元1185年,止于公元1333年。当中国南宋孝宗淳熙十二年至元顺帝元统元年,镰仓时代建筑受同期中国南方建筑影响较大——傅熹年注。

[17] 梁思成先生在述及中国古代与辽、金、蒙古等少数民族政权并立的汉族政权时,常使用“中国”一词。“中国”的这一用法在古代汉语中十分常见,指“我国中原地区或在中原地区华夏族建立的政权”之义。例如,《史记·孝武本纪》:“天下名山八,而三在蛮夷,五在中国。”又如,《汉书·匈奴传下》:“[伊黑居次]云常欲与中国和亲。”——吴子桐注。

[18] 即夏历,1927年以后推行公历,故称夏历为废历——傅熹年注。

[19] This passage not found in the 1872 edition of the *P'an-shan Chih*. 同治十一年李氏刻本《盘山志》方无此段——作者注。

[20] 查辽史,统和四年碑上提到的“故尚父秦王”应是韩匡嗣,而不是开泰初(公元1012—1021年)始加尚父的耶律奴瓜——莫宗江注。

[21] 《营造法式》初刊于宋崇宁二年(公元1103年)——莫宗江注。

[22] 胡国佐(Hu Kuo-tso),疑为作者笔误,见注[10]——编者注。

[23] 《蓟州志》(官秩·户部分司题名)柯维蓁,万历中任是职,王于陞之前任——作者注。

[24] 《蓟州志》(官秩·知州题名)胡国佐,三韩人、荫生。修学宫西庑戟门,有记。陞湖广德安府同知,去任之日,民攀轳号泣,送不忍舍,盖德政有以及人也——作者注。

[25] 清东陵,在蓟东遵化县境——作者注。

- [26] 建筑物之长度为面阔，深度为进深——作者注。
- [27] 如屋五间，居中者为明间或当心间，其次曰次间，两端为梢间——作者注。
- [28] 斜坡不作阶级，由一高度达另一高度之道为磴——作者注。
- [29] 屋顶各面斜坡相交成脊，如屋顶四面皆坡，则除顶上正脊外，四隅尚有四垂脊，即“四阿”是——作者注。
- [30] 在建筑物纵中线之上之柱，在明间次间之间，或次间梢间之间者为“中柱”。在最外两端者为“山柱”。在建筑物前面之柱为“檐柱”，在角者为“角柱”——作者注。
- [31] The ch'ih is the Chinese foot, and is equal to about 32 cm. A ch'ih is divided into ten ch'un (inch), a ch'un into ten fen, a fen into ten li. 尺为中国市制长度单位，约相当于32厘米。一尺等于十寸，一寸等于十分，一分等于十厘——作者注。
- [32] 由檐柱中线至台基外边为前后“台出”，由山柱中线至两旁台基外边为两山“台出”——作者注。
- [33] 长方形建筑物之两狭面为“两山”——作者注。
- [34] 罗马建筑五式之一（爱奥尼克柱式），其柱之长为径之九倍——作者注。
- [35] 柱间安窗，先将窗框安于柱旁，谓之“抱框”——作者注。
- [36] 柱下大上小，谓之“收分”——作者注。
- [37] 将木材方正之端，斫造使圆，谓之“卷杀”——作者注。
- [38] 柱下之石，谓名“柱顶石”。其上雕起作盘形部分，宋称“覆盆”，清称“古镜”，宋式繁多，而清式简单——作者注。
- [39] 清称“斗拱”，宋称“铺作”——作者注。
- [40] 用拱之制，原则上为上层材较下层伸出，层层叠出，即挑檐或悬臂之法是也。《营造法式》拱每伸出一层，谓之“一跳”，拱端谓之“跳头”——作者注。
- [41] 敦煌壁画大部为唐代遗物，初祖庵建于宋徽宗宣和七年——作者注。
- [42] 见《营造学社汇刊》三卷一期刘敦桢译《法隆寺建筑》补注，补图第十六、第十七——作者注。
- [43] 斗拱之全部称“朵”，清称“攒”——作者注。
- [44] 栌斗耳、平、欹的高应为0.11、0.08、0.13米——莫宗江注。
- [45] 1932年明用陶本《营造法式》缺慢拱条全文——莫宗江注。
- [46] 据《营造法式》卷五栋条，应称“撩风搏”，后同——傅熹年注。
- [47] 清代已无营造法式中襻间的做法——莫宗江注。
- [48] 宋代举屋之法仍应按以上所引《法式》原文，非清式之五举——莫宗江注。
- [49] 《营造法式》规定檐出按椽径定，而椽径是按殿阁或厅堂而定。如殿阁椽径九分至十分，厅堂椽径七分至八分等——莫宗江注。
- [50] 中国屋顶之结构，可分三大类：前后左右皆为斜坡者为“庑殿”，古称“四阿”；前后有斜坡而左右山墙直上者为“悬山”；四周有斜坡而左右两坡之上半截改为直上，如悬山与庑殿相合者为“歇山”——作者注。
- [51] 歇山直立部分之三角形为山花，宋式称“两际”——作者注。
- [52] 清代在外檐平坐栏杆的四角加支柱，造成类似一周檐廊的错觉，实际是平坐（下同）——莫宗江注。
- [53] 文中只有各柱脚间尺寸，无各柱头间尺寸，因此不能看出柱侧脚之度——莫宗江注。
- [54] transitional member——作者注。
- [55] 表中将上层檐柱、角柱、内柱、中柱的柱高都作2.75米，这是当时还不了解古代建筑的柱高有生起之误——莫宗江注。
- [56] 欧洲建筑有所谓superposed order者，此其真正之实例也——作者注。
- [57] shearing force——作者注。
- [58] 独乐寺的阁与门柱础上都没有覆盆——莫宗江注。
- [59] 罗汉枋长通建筑物之全长宽度或全长度，清式谓之“拽枋”；其在外者为“外拽枋”，在内者为“内拽枋”。柱头枋清式称“正心枋”——作者注。
- [60] 角拱仍是45度——莫宗江注。
- [61] “重杪重昂”清式称“重翘重昂”——作者注。
- [62] 乔托（Giotto），文艺复兴初期意大利画家，画纯朴有蕴力。拉斐尔（Raphael），文艺复兴后期画家，写实妙肖——作者注。

[63] 这里所指的是“平阁”，下同——莫宗江注。

[64] 观音阁无割牵，应是指前后乳楹——莫宗江注。

[65] 内槽柱上的五架梁，不应是檐楹——莫宗江注。

In Search of Ancient Architecture in North China

华北古建调查报告^[1]

〔1940〕

Extract 节选

With Illustrations from Photographs by the Author
插图照片由作者拍摄^[2]

For the last nine years, the Institute for Research in Chinese Architecture, of which I am a member, has been dispatching twice every year, on trips of two or three months' duration, small teams of field-workers, headed by a research fellow, to comb the country for ancient monuments. The ultimate aim is the compilation of a history of Chinese architecture, a subject that has been virtually untouched by scholars in the past. We could find little or no material in books. We have had to hunt for actual specimens.

We have, up till today, covered more than two hundred hsiens or counties in fifteen provinces and have studied more than two thousand monuments. As head of the section of technical studies, I was able to visit most of these places personally. We are very far from our goal yet, but we have found materials of great significance which may be of interest to the general reader.

过去九年间，我参加的中国营造学社经常派出野外考察小分队，由一名资深研究人员带领，在乡间探觅古代遗迹。这种考察每年两次，每次为时两到三个月。我们的最终目标是编撰一部中国建筑的历史，过去的学者们实未涉足这一课题。典籍中的材料寥寥无几，我们必须去搜寻实际遗例。

迄今为止，我们到过十五个省、二百多个县，研究过两千余处遗迹。作为技术研究部门的主管，我得以亲临这些遗迹中的大多数。我们的目标尚遥不可期。但是我们发现了一些极重要的材料，或许普通读者也会对之感兴趣。

I. Chinese Architecture, Essentially of

Wood, is at the Destructive Mercy of Nature and Man

Unlike European architecture, which uses stone as its principal material, Chinese architecture is essentially of wood, a much more easily perishable material. Even structures in masonry are mere imitations of wooden forms in brick or stone. A student must, therefore, first of all, familiarize himself with the wooden structural system. It is like learning the Vignola, a necessary step before one could proceed with the study of European architecture. In field work too, the student must pay the greatest attention to wooden structures. He is actually racing with time, for these structures are all the while undergoing a steady and uncompromising process of disintegration. Waves of new influences, stirring up the whims of a few men in a conservative town, can innocently deface a masterpiece by their efforts at so-called "modernization" of an "old-fashioned" structure. Delicate window traceries, finely carved door-panels, are always among the first to suffer such heartless outrages. Seldom does one find to one's satisfaction a real gem left in peace and beauty by nature and man alike. A stray spark from an incense stick may also reduce a whole temple to ashes.

壹 任凭自然与人类肆意毁坏的中国木建筑

欧洲建筑主要取材于石料，与此不同，中国建筑是木构的，这种材料极易受损。纵有砖石建筑，亦以砖或石材模仿木建筑的结构形式。因而，学生的首要任务便是熟悉木构体系，就像研习欧洲建筑之前必先研习维诺拉^[3]一样。同样，在野外考察时，学生必将主要精力集中于木结构上。他实际上是在与时间赛跑，因为这些建筑无时无刻不在遭受着难以挽回的损害。在较保守的城镇里，新潮激发了少数人的奇思异想，努力对某个“老式的”建筑进行所谓的“现代化”，原先的杰作随之毁于愚妄。最先蒙受如此无情蹂躏的，总是精致的窗牖、雕工俊极的门屏等物件。我们罕有机会心满意足地找到一件真正的珍品，宁静美丽，未经自然和人类的损伤。一炷香上飞溅的火星，也可能会把整座寺宇化为灰烬。

Besides, there was the threat of a Japanese war, such an uncalled-for instance of human cruelty and destructive ability. The love and preservation of antiquity are no business of the Japanese warlords, though their nationals normally should share with us the special love

and respect for our old culture from which they derived their own. Even as early as 1931 and 1932, most of my trips were abruptly disrupted by the renewed booms of Japanese guns, each time drawing nearer than the last, meaning business. It was quite evident that the days we could work in North China were limited. Before we were prevented from doing so, we decided to put our entire effort in that part of the country. The once cheerless prescience has been now, for almost three-and-half years, a painful fact. With the Institute physically removed to the far corner of China's southwest, recollections of field work over now enemy-trodden northern lands are the more vivid and dear with our ever increasing nostalgia and concern.

此外还有日本侵略战争的威胁，它是如此突如其来，例证了人类的残忍和毁灭性。日本军阀全然不知珍爱与保存古迹，尽管照理说他们的国民也应该和我们一样，对我们古老的文化特别地热爱与敬重，因为这也是他们自己的文化的源泉。早在1931、1932年，日军的炮声一天近似一天，我的旅行就多次被迫蓦然中止。显然，我们还能在华北工作的时日有限了。我们决定，抓紧最后的机会，竭尽全力考察这个地区。近三年半来，当时这令人难过的预感已成惨痛的事实。目前，营造学社的机构迁至中国西南边陲，北方的土地遭受着敌军铁蹄的践踏，我们的怀念和关注与日俱增，曾经在那里进行过的野外考察的记忆愈发鲜活而亲切。

II. Our Trips

Every season's trip was preceded by careful preparations in library research. Books on history, geography and Buddhism yielded a list of places where we hoped to find something. An itinerary was made up from the list for the team to follow in its field trips. Every item on the list must be located, identified, and, if still existing, measured and photographed.

The finds of our trips were numerous and of varied degrees of interest and significance. Often we got from literary sources wonderful visions of certain old monuments, only to find, after hundreds of miles of anticipatory pilgrimage, a heap of ruins, with perhaps a few roof-tiles and stone column-bases for reward.

Our trips themselves were also adventures full of unexpected ups and downs. With physical discomfort taken for granted, we enjoyed frequently unforgettable experiences of rare charm and delight. Generally, the journeys, like odd kinds of picnics prolonged, were

either extremely disconcerting or highly entertaining when we encountered comical but disastrous mishaps.

貳 我们的旅行

每季出行之前，我们都要在图书馆里认真进行前期研究。根据史书、地方志和佛教典籍，我们选列地点目录，盼望在那里有所发现。考察分队在野外旅行中就依此目录寻访。必须找到与验明目录上的每一条，并对尚存者进行测绘和拍照。

旅行中的寻获和发现极多，其趣味与意义各有千秋。时常，我们从文学典籍中读到某个古代遗迹的精妙景致，但满怀期望地千里朝拜后只找到一堆荒墟，或许尚余零星瓦片和雕石柱础聊充慰藉。

我们的旅途本身同样是心情沉浮不可期的探险。身体的苦楚被视作当然，我们常在无比迷人而快乐的难忘经历中锐感快意。旅途常像古怪的、拖长了的野餐，遇到滑稽而惨痛的麻烦时，或惶急无比，或乐不可支。

Unlike the highly expensive expeditions of archaeologists, big game hunters, or any tropical or arctic scientific explorers, the equipment for our trips were scanty. Besides instruments for surveying and photographing, our luggage consisted mostly of gadgets of the home-made order, designed and modified by our members as they accumulated experience. Knapsacks like an electrician's, to be carried while working perched precariously on top of any part of a building, were among our favorite treasures which include anything from a spool of string to a telescopic pole that could be extended like a long, rigid fishing-rod. We following the philosophy of the famous white knight in Alice's wonderland, believed that one never knows what will prove to be useful in case of emergency, so were willing to fall off horses' backs for our burdens.

Often we had to make camp, cook, eat and sleep under such very different circumstances each day and night and our means of transportation were so uncertain, ranging from the most ancient and quaint to the more usual and up-to-date, that what we considered essentials could not help being peculiar, resilient tin-cans of one sort or another.

Aside from architecture, we often came across subjects of artistic and ethnological interest—handicrafts of different localities, archaic dramatics of out-of-the-way towns, queer customs, picturesque fairs, etc, but economy of film often prevented me from photographing

liberally pictures of them. In most of my trips, I was accompanied by my wife, herself an architect. But being also a writer and lover of dramatic art, she, more often than I, let her attention stray and enthusiastically insisted on some subjects for the camera at any cost. I was always glad after we returned from a trip to have the valuable pictures of scenes and buildings which would otherwise have been neglected. But many interesting subjects and happenings in our trips I shall not be able to relate in detail. For economy of space I can give here only rambling and rather random accounts of some of the highlights of our searches and researches.

III. The Imperial Palaces of Peiping

My first "field work," very naturally, started with the Imperial Palaces in Peiping, in a courtyard of which the Institute's office was appropriately located. However, the work of surveying the entire Palace group as a complete project was not taken up till some years later. As the Palaces are already well known to Westerners, and our "discoveries" are mostly of a technical nature, I shall not here indulge in the discussion on them.

不比耗费巨资的考古探险队、追踪狮虎的猎人抑或任何热带与极地的科学探险队，我们的旅途装备极少。除了测绘和摄影的仪器以外，我们的行囊里，最常见的装备多由队员们根据经验在家自行设计改装而成。像电工包似的旅行背包，就是我们最心爱的宝贝。登上一座建筑物任何部位的高处工作时都可以背着它，里面什么都可以装，从一团绳子到可以变成一根刚硬的长钓竿状的伸缩竿。我们遵奉《爱丽丝漫游仙境》里著名的白骑士的哲学，深信在急难中万物皆有用，于是不惜离开马背，以便多运些装备。

日复一日，我们扎营、举炊和食宿的条件悬殊，交通方式亦全无定式，从最古旧离奇到比较现代普通的，无所不有，因此我们认为的必需品莫过于形形色色奇特的、颠簸的老式汽车。

除建筑而外，我们常会不期而遇有趣艺术品或民族用品——各地的手工艺品、偏僻小镇的古戏、奇异的风俗、五光十色的集市，诸如此类——但是，由于胶卷匮乏，我难得随心所欲地拍摄这些东西。我的多数行程都有我的妻子相伴，她也是一名建筑师。此外她更是作家，深爱戏剧艺术。因此，她比我更会转移注意力，热切地、坚持不惜代价地拍摄某些主题。归程之后，我总是庆幸获得了这些珍贵照片，其中的景色与建筑原本可能被忽略。但是，途中遇到的许多趣物趣事无法逐一细述。限于篇幅，在此我只能从我们的探索与研究当中，信手拈来若干最精彩的部分作一说明。

叁 北平的皇宫

很自然，我最早从北平的皇宫开始进行“野外考察”，营造学社的办公室就妥贴地安置在其中一角的院落里。然而，测绘整个宫殿群的完整计划直至若干年后方得施行。由于西方世界已经熟知了故宫，而且我们的“发现”主要是技术性的，在此不作详论。

IV. The Hall of Kuan-yin, Chi Hsien, a Structure of Unfamiliar Proportions

In the spring of 1932, in the walled-city of Chi Hsien, about fifty miles east of Peiping, I set my eyes for the first time on a wooden structure with proportions entirely different from the familiar Manchu Palace buildings which were mostly built according to a set of "Rules" published by an imperial mandate in 1733.

That memorable trip was my first experience of traveling away from main trunklines of communications and departure from a metropolis like Peiping or Shanghai. The old model-T that would have been, were it in America, sold long since as scrap-iron, was still made to run regularly—or rather, irregularly—between Peiping and the little town. When we were a few miles out of the East Gate of Peiping, we came to the Chien-kan River. Its main flow was reduced to less than thirty feet wide in the dry season. But the river-bed of very fine sand measures about a mile-and-half from bank to bank. After crossing the stream by ferry-boat, the bus could not move even an inch in the soft ground. We—the passengers—had to help push the old buggy the entire width of the river-bed, while the engine roared and the rear wheels turned frantically, only to blow the sand right into our eyes and noses. There were other difficult stretches where we had to get off and on the bus many times. It took more than three hours to cover the fifty-mile ride. But it was excitement and fun. I did not know then that for the next few years to come, I was to get used to rides like that and think nothing unusual about them.

The Hall and the Statue

The Kuan-yin Ke, or the Hall of Avalokitesvara, of Tu-lo Ssu, the Temple of Solitary Joy, was the objective of my trip. It stands high

above the city-wall and could be seen from a great distance. From afar, one gets an impression of a building of great vigor and suavity. That was the first time I opened my eyes to a building of real archaeological interest.

The Hall was built in 984 AD. That was the beginning of the Sung Dynasty, but the land was then held by the Liao Tartars. The Hall is a two-storied building with a mezzanine floor. The "brackets," a characteristic system of construction of Chinese architecture, composed of a series of super-imposed cantilevers to enable a far overhang of the eave, are large and simple (Figure 1). They are supported by slightly entasised columns and crowned by deep, overhanging eaves. The balcony around the upper floor is likewise supported by such "brackets." Thus they form three decorative bands which are basically structural. These present a marked contrast to the straight columns and small, crowded "brackets" of later periods. To those who are familiar with the T'ang Dynasty paintings of the Tun-huang Caves, it shows a striking resemblance to the architecture therein depicted.

肆 蓟县观音阁

由城墙拱卫着的蓟县去北平东约五十英里^[4]。1932年春，我首次目睹此地的一座木构，其比例迥异于清代宫殿，后者建造时所依据的主要是1733年敕令发布的一整套“法式”。

那次难忘的旅程是我第一次体验远离主要交通干线，远离北平和上海这类大都市。如果是在美国，老式的福特T型车早就只能卖作废铁了，而在北平和小城之间，它还被用作定期的——毋宁说是不定期的——交通工具。出北平东门数英里以外，我们来到了箭杆河。河水的宽度在旱季萎缩至不足三十英尺。但是，细沙的河床大约宽达一英里半。乘船渡过河流以后，汽车陷入松软的地面寸步难行。我们这些旅客只得帮着把这辆老破车推过整个河床，同时引擎轰鸣，后轮疯转，把细河沙掀得我们满眼满鼻。此后尚有其他崎岖路段，我们不得不反复地从汽车里跳上跳下。五十英里的路程耗时三个小时不止。但那真是刺激有趣。那时我尚懵然不知，今后数年我会习于这样的奔波且安之若素。

观音阁与塑像

我此行的目标是独乐寺的观音阁。它高耸于城墙之上，遐迩可见，远观时益觉其活力与祥和。那是我首次看见一座真正古趣盎然的建筑。

观音阁建于公元984年。彼时宋朝初立，而此地尚为辽所踞。观音

阁分两层，其间夹有平坐一层。中国建筑用独有的结构体系斗拱支撑出檐，在此为一系列巨大而简洁的双下昂（图1）。其下支柱中段微凸，顶上是深远的屋檐。环绕上层的平坐同样由这种斗拱支承。于是，它们构成了三条基本上是结构性的饰带。这些与后来的直柱、细小密集的斗拱形成了鲜明对照。凡熟悉敦煌石窟中唐代壁画者，均感觉它与那些壁画中的殿宇惊人地相似。

【1】 Hall of Kuan-yin, Chi Hsien, second oldest wooden structure in China. Built in 984 AD, the Hall was the oldest wooden structure known in China till July 1937, when a ninth-century building was found. The use of brackets to support the overhanging eaves is a characteristic of all formal Chinese architecture. 蓟县观音阁，中国第二古老木构。观音阁建于公元984年，至1937年7月发现一处9世纪建筑之前，一直是中国已知的最古木构。运用斗拱支撑出檐是中国所有正规建筑的一大特征。

The Hall houses a colossal clay statue of an Eleven-headed Kuan-yin, sixty feet in height. The upper two floors had to be built with an opening in the center to form on each a sort of gallery at the levels of the waist and chest of the statue (Figure 2). It is the largest clay figure known to exist in China today.

Incidentally, this Hall, together with the Gate House in front of it, my two very first finds, remained for long the oldest wooden structures in the Institute's record, and were not antedated until I

came across a T'ang Dynasty building early in July, 1937, just a few days before the outbreak of the present Sino-Japanese war.

观音阁中有一庞大泥塑，为高达六十英尺的十一面观音。靠上的两层阁板只得在中央留出空腔，在像腰及像胸的高度上形成展廊状空间（图2）。这是迄今中国已知的现存最大泥塑像。

顺便提及，这座观音阁和它前面的山门——我最早的两个发现——在营造学社的记录中长期保持为最古的木构，且其年代记录一直未被打破，直到1937年7月初我偶遇一座唐代建筑。数日后，现正进行的中日战争就爆发了。

V. A Seventy-foot Bronze Statue

At Chengting, on the Peiping-Hankow railway, is the magnificent Buddhist temple of Lung-hsing Ssu. Founded in the sixth century, the temple has undergone in turn a series of destructions and reconstructions during the last thirteen centuries. There are still preserved in the temple-compound several buildings of the Sung Dynasty (960-1127). Alongside these ancient buildings is a catholic Mission and its Gothic-like cathedral which had sprung up sometime in the last century at the place where Emperor Ch'ien-lung's "travel palace" once stood.

伍 一座七十英尺高的铜像

宏伟的隆兴寺位于北平—汉口铁路线上的正定。此处寺宇建于6世纪，在以往十三个世纪里，它曾相继经历过多次的倾圮与重建。群殿之间，几座北宋（公元960—1127年）的建筑至今犹存。一个天主教的传教团住在这群古建筑旁，上世纪时哥特式天主教堂赫然拔地而起，替代了一度坐落于此的乾隆皇帝的行宫。

【2】 The Eleven-headed Kuan-yin of Chi Hsien, largest clay figure in

China. The upper floors of the Hall are opened in the center to form galleries at the waist and chest heights of the figure. Brackets are used to support the galleries as well as the ceiling above. 蓟县十一面观音，中国最大的泥塑像。观音阁上层中央留空，以在像腰及像胸高度处形成展廊。展廊与头顶藻井一样以斗拱支承。

【3】At Lung-hsing Ssu, Chengting, is the 10th-century seventy-foot bronze statue of Kuan-yin. Existing buildings in the temple are mostly of the 10th and 11th centuries, extensively repaired in the 18th. The tower to the right was recently constructed to protect the colossal figure which was left standing in the open for nearly 200 years. 正定隆兴寺的10世纪七十英尺观音铜像。寺内现存遗构多为10世纪与11世纪之物，曾于18世纪广为修葺。右侧高塔新建不久，以蔽露天站立近二百年的巨像。

The dominating feature of Lung-hsing Ssu is the colossal bronze statue of a forty-two-armed Kuan-yin, about seventy feet high, standing on a beautifully carved marble platform (Figure 3). It was originally sheltered by a three-storied Hall which was extensively repaired in the eighteenth century, but is now again in such dilapidated condition that the upper portions are all gone, leaving the Bodhisattva standing in the open, with all the forty "extra arms" missing.

A stone tablet in the Temple tells the dramatic story of the casting of the statue. When Emperor T'ai-tsu, founder of the Sung Dynasty, came to Chengting during one of his campaigns, he enquired after the famous bronze statue there which was said to be forty feet high.

Being a devout Buddhist, he was grieved to hear of its destruction a few years before. Then in the garden of the Temple, "the earth shone with rays of light at night that could be seen by priests and laymen alike." Furthermore, torrential rains brought down by way of the Fu-t'o River "thousands of timbers which were clogged by a huge log" at Chengting. "Manjusri, Bodhisattva of Wu-t'ai Shan, has sent down the timber for the construction of Kuan-yin's Palace" was the enthusiastic conclusion.

隆兴寺最醒目处是它巨大的四十二臂青铜观音像，约七十英尺高，立于雕工精美的大理石宝座上（图3）。其上原覆有一座三层阁，曾在18世纪大举修葺过，但目前已复倾颓，阁上部消失得无影无踪，露天而立的菩萨像上四十只“多余的手臂”都不见了。

庙中一座石碑记载了铸造铜像的传奇^[5]。宋朝的开国之君太祖皇帝在一次征战中驾临正定，欲拜谒此处著名的铜像，据说该像高达四十英尺。

太祖是一个虔诚的佛教徒，听说铜像已于几年前被毁，他深感痛心。此后，庙后菜园夜间“有祥光出其上”，时人皆见。随后，暴雨大作，沿滹沱河^[6]“浮栋梁材千万计，自五台山而下”，直至被一大木拦住，停在了正定。狂热的信徒得出的结论是，“五台山文殊菩萨送下木植与镇府大悲菩萨盖阁也！”

The Emperor was much pleased with the miracles and ordered a new statue to be cast. An imperial architect and the chief of the Imperial Mint were dispatched to take charge of the building of the Hall and the casting of the statue. Three thousand workmen and soldiers were detailed to the task.

The stele also tells of a foundation of seven cast-iron piles, "supporting a cast-iron platform forty feet square and six feet thick, the top of which is flush with the ground." The design of the Bodhisattva "had to be drawn three times before it met the great Emperor's approval." The casting was done in seven sections. When completed, the statue "measured seventy-three feet high." It was commenced on "the twentieth day of the seventh month of the fourth year of K'ai-pao," (971 AD) but the date of completion was not mentioned on the stele.

When I visited the Temple last time, we still saw some original portions of the three-storied Hall mixed with later repairs. The Kuan-yin was subsequently "renovated" by the devout but ignorant abbot. The beautiful patina I so loved was covered by coats of paint in bright primal colours, giving the Bodhisattva the appearance of an ugly giant doll. I had to comfort myself by thinking that the paint will not last very long, perhaps not more than a century! A niche as high as the Niche of the Pine Cone in the Vatican was built to shelter the newly dollied-up deity. The new structure, a happy accident, looking like a slender, graceful tower, crowned by a Chinese roof, could be seen miles away.

In the fall of 1937, Chengting was subjected to heavy bombardments by the Japanese who later occupied the city. The fate of the Statue is yet to be ascertained.

VI. A Sixth-Century Open-spandrel Bridge

The most astonishing piece of bridge engineering among China's relics is the "Great Stone Bridge" of Chao Hsien, about forty miles southeast of Chengting where the colossal bronze statue stands. I found this magnificent bridge not through studious research in books, but was led to it by a popular folk-song. I thought it was going to be merely another of those arched bridges so common in China. But when I came confronting the single arch of nearly 120-foot-span, with two smaller arches resting on it at each end, I could hardly believe my eyes (Figure 4). It was nothing short of what is today called in

engineering an "open-spandrel bridge"!

皇帝见此奇迹龙颜大悦，敕令新铸铜像。宣派八作司十将及铸钱监内差负责建阁铸像。下军三千工役于阁下。

碑上记载亦提及，“留六尺深海子自方四十尺，海子内栽七条熟铁柱，……海子内生铁水铸满六尺”。菩萨像的设计“三度画相仪进呈方得圆满”。铸造分七段而成。完工后的塑像“举高七十三尺”。工程至开宝四年七月二十日下手修铸（公元971年），但是完工的日期在石碑上未见提及。

我们上次探访此地时，犹见三层阁的零星遗构，混于后世修葺部分之间。后来，虔诚而愚妄的住持“翻新”了观音像。我所心爱的铜绿被覆以一层艳丽的原色油漆，菩萨像变成了丑陋不堪的巨偶。见此唯有自我开解，油漆不耐光阴，也许熬不过一个世纪！为遮蔽这座装点一新的神像，建造了一座佛龕，高度类于梵蒂冈的大松球龕。新建的这一佛龕可谓意外之喜，它看上去像个细高而优雅的高塔，而又给添了个中国式的屋顶，数里远之外都清晰可辨。

1937年秋，正定遭日军猛烈炮轰，随即沦陷。塑像的命运存疑。

陆 6世纪的开拱桥

青铜巨像所在的正定县城外，去城西南四十英里许，是中国古迹中最惊人的桥梁工程作品——赵县的“大石桥”^[7]。我不是通过精研典籍，而是由一首妇孺皆知的民歌指引，发现了这座精妙绝伦的桥梁。我以为它只是又一座在中国俯拾皆是的普通拱桥。但是，它的单拱跨度将近一百二十英尺，两端各有两个比较小的空撞券^[8]。面对此桥，我几乎不敢相信自己的眼睛（图4）。它完全相仿于当代工程里所谓的“开拱桥”！

【4】 This modern looking open-spandrel bridge was not built in America today but in China during the sixth century. Built sometime

between 591 AD and 599 AD by Li Ch'un, the master builder, the main arch has a span of 116 feet, with two smaller arches resting on it at each end. Such construction did not come into general practice in the West until the beginning of the present century. 这座现代外观的开拱桥并非建于今日之美国，而是6世纪的中国。由建筑大师李春建于公元591年至599年间，主拱跨度116英尺，两侧各有两个小空撞券。如此建造方法直至本世纪方才普遍运用于西方。

In the West, such methods of construction did not come into general use until the present century, though it once made its appearance in France in the 14th. But this Chinese bridge was built in the beginning of the Sui Dynasty, sometime between 591 AD and 599 AD. According to an old book on archaeology, one of the abutments once bore the signature of the builder, Li Ch'un, which had since weathered off. But we still could see numerous names of admiring passers-by from the T'ang Dynasty (619-906 AD) till today. A citation, by a prime minister of the T'ang Dynasty, specially mentioned the unusual small arches at the two ends and also the name of the builder. Since it is unusual to give credit to an architect or engineer in ancient China, such special mention may be taken as a proof that the bridge is not a product following the general mode of construction of the time, but the creation of an ingenious and great mind.

如此建造方法直至本世纪方才普遍运用于西方，尽管法国曾在14世纪出现过例子。但是，这座中国桥建于隋代之初，即公元591年至599年之间。据一本考古典籍记载，其中一个桥墩上一度镌刻着建桥者李春的签名，后为时光剥蚀。但我们依旧可以看见自唐（公元619—906年）^[9]以降心怀崇敬的无数过客的名号。有一段铭文引用了唐时一位中书令的话，特地提及了两端非凡的小券和建桥者的名字。中国古代很少会有建筑师或工匠得获荣名，因此这样特地的提及多少可以证实，这座桥的造法与式样不是沿袭当时的定式，而是天才的独创。

In spite of its thirteen-and-half centuries, the noble structure has the streamlined appearance of an ultra-modern bridge. Had it not been for the inscriptions of different ages, it would be difficult to believe its very early date. So far as I know, it is the oldest bridge existing in China.

In the same city is another bridge of identical design but much smaller dimensions, called the "Little Stone Bridge." Built during the Chin Tartar Dynasty (late 12th century) by a Tartar builder, Pao ch'ien, it was evidently an imitation of the "Great" one. Even then, it is older than the French bridge by more than a hundred years.

VII. Honan Province, the Ancient "Central Land"

The Province of Honan has been known in China as the "Central Land" and has been the heart of Chinese civilization and culture for thousands of years. It is the key to the domination of China, a trophy that a champion must necessarily acquire. It has been a favourite arena for most of the important battles in Chinese history. It was at Loyang, many times capital of the Empire and one of the principal cities of the province, that the first Buddhist temple in China was built a century before the Christian era began. Along the rivers and up on the mountains of Honan we have some of the most noble monuments of Buddhism.

An Ancient Observatory

At Kao-ch'eng, not far from Sung Shan, is one of the few old observatories in China (Figure 5). It is the Chou-kung's Tower for the Measurement of the Shadow of the Sun, one of the several built by Kuo Shou-ching of the Yuan Dynasty (1280–1376).

By setting up a vertical at the end of a horizontal to measure the shadow of the sun, the exact duration of the solar year was calculated. The purpose of the Tower, with a "slit" on the northern side, is to erect the vertical which was 40 Yuan feet high. The horizontal, 128 Yuan feet long, is a long stone bench or platform with a channel on the top-side over the entire length, so that a perfect level could be obtained by filling it with water. With the exception of the small house on top of the tower, which is a later addition that has nothing to do with the original purpose, this structure answers exactly to the descriptions in the chapter on Astronomy, the *History of the Yuan Dynasty*.

This curious monument that looks like a city-gate, standing on a wide, flat plain, was restored in 1936 by order of Generalissimo Chiang Kai-shek and under the technical supervision of the Institute.

虽已历时十三个半世纪，这高贵的建筑物看去犹如最新型的超级摩登桥梁。若非上面那些不同年代的铭记，它极其古老的年代简直令人难以置信。据我所知，它是中国尚存最古老的桥梁。

同一县城里尚有另外一座桥，设计相仿而尺寸远逊，名为“小石桥”，由一位名为褰钱的女真人建于女真族的金朝（12世纪末）。它显然是“大石桥”的摹本。即以那时论，它也比法国的单拱桥提早百年不止。

柒 古老的“中原”河南省

河南省在中国向以“中原”闻名，几千年来，它是中国文明与文化的中心。得天下关键处即在中原，乃兵家必争之地。中国历史上，大多数重要战役都在这个著名的舞台上演。早在公元纪年开始之前一个世纪，河南的重镇、历朝故都洛阳，就建起了中国的第一座寺庙。溯河上行至河南群山间，我们发现了一些最恢弘的佛教遗迹。

古观星台^[10]

去嵩山不远的告成镇有中国少数古观星台之一（图5）。此处周公测景台为元代（公元1280—1376年）^[11]郭守敬所建。

在水平面上立起一根垂直的立表，通过测量日影可以算出太阳年的确切时间。建此台的目的是立起高达40元尺^[12]的立表。此台北侧，有一直槽。圭面长128元尺，为一长条石或石台，上有通长水渠，注水其中则可获完美的水平面。台顶有一小屋，为后世加建，与其原本用途毫无关系。除此而外，这座观星台完全符合《元史·天文志》中的描述。

这座珍贵的遗迹形似城门，立于广阔平坦的原野上。1936年，蒋介石总司令下令修复，营造学社担任了技术监理。

【5】Chou-kung's Tower for the Measurement of the Shadow of the Sun. Built in the 13th century, the slit on the side of the tower is for holding up a vertical which makes a right angle with the long horizontal bench at its foot. By the shadow of the vertical the exact duration of the solar year was calculated. 周公测景台。建于13世纪。

台边直槽用于立表，垂直于足下水平长石条。据立表投影可以计算太阳年的确切时间。

VIII. Sian, Two-thousand-Year Capital of the Chinese Empire

Sian, the provincial capital of Shansi, and "Ch'ang-an" of ancient times, was the capital of the Chinese Empire from 1132 BC to 906 AD almost continually. The province, especially in the neighborhood of Sian, is immensely rich in historic remains. Being the capital, it became the objective of every dynasty founder and was seldom spared from wars; its destruction at every dynastic change became almost a matter of course. Consequently, no wooden structure of any appreciable date has been left to posterity. Other remains of historical significance—ruined sites of Han palaces, tombs of even earlier dates—of interest to the student of architectural history are, however, numerous.

A 1500-square-mile Graveyard

Among the profusion of historical sites may be mentioned the tombs of the Chou, Han and T'ang Dynasties. To the west of Sian, in the counties of Hsien-yang, Hsing-p'ing and Wu-kung, over an area measuring about thirty to fifty miles in length and width, are innumerable immense earthen mounds. They are tombs of emperors, princes, ministers and generals during the two thousand years. Mostly square in plan, they have a trapezoid elevation, resembling huge mastabas. Some are attributed to a certain historical figures, but most of them are yet to be identified.

One of the most interesting is the tomb of the great general Huo Ch'ü-ping, conqueror of the Huns in the Han Dynasty (2nd century BC). After his death, Emperor Wu-ti ordered his tomb be made to resemble the Ch'i-lien Mountains, where he had one of his greatest victories. This is the only tomb that is decorated with rocks. At this tomb were found several stone sculptural pieces in granite, portraying the warrior's career. "A Horse Treading on a Hun" is the best known and has already been introduced to the West. Recent excavations revealed a few more. The sculptors seemed to have taken good advantage of the natural shaped of the big rocks and turned them into human figures of great vigour, strangely resembling to the Menhirs

(Figure 6). But with the beasts, the artist seemed to have a totally different, and more intimate, understanding, such as is shown in the bull with big, round eyes (Figure 7).

About fifteen miles from Huo Ch'ü-ping's tomb is the pretentious tomb of the father of Empress Wu of the T'ang Dynasty. The approach to the tomb is an avenue flanked on both sides by chimeras, lions, horses, as well as civil and military attendants (Figures 8,9). Such arrangements are to be found in imperial tombs of later ages. In grandeur and workmanship the T'ang Dynasty is unequalled. But in these figures, one feels the lack of the deep understanding of animals found in the animal sculpture of the Han Dynasty.

捌 中国的两千年皇城西安

西安是陕西省的省会，古代的“长安”。从公元前1132年至公元906年，中国的皇都几乎毫无间断地设在此地。尤其毗邻西安一带，该省的历史遗迹极其丰富。每个朝代的开国君主都视此都城为必得之物，因此它罕有机会逃脱战祸；每逢改朝换代，它似乎理所当然地要遭受灭顶之灾。因而，后人已经见不到任何有年代可考的木构建筑。然而尚存无数有历史意义的残迹，如更早期的汉代宫殿与陵墓的废墟等，当令研习建筑历史的学生深感兴趣。

方圆一千五百英里的陵墓区

在丰富的历史遗址当中，周、汉、唐诸代的陵墓值得一提。它们位于西安的西侧，咸阳、兴平和武功县境内，在方圆达三四十英里的区域，隆起无数庞然土堆。这些帝王、国君、文臣武将的陵墓陆续建于这两千年间。其平面多为方形，立面多为梯形，像似巨型石室坟墓。可以确知有些墓主是历史上某个人物，但是大多数陵墓的主人尚待考证。

最有趣的一座陵墓属于汉代远征匈奴的征服者——大将军霍去病（公元前2世纪）。在他身后，汉武帝敕令建陵如祁连山形，他曾在那里赢得最伟大的胜利。这是唯一饰以岩石的陵墓。在此发现的几件花岗岩石雕，描摹着这位武士的征战生涯。最著名的一件是“马踏匈奴”，已经介绍给了西方世界。最近的挖掘又有新的发现。看来雕刻家善于利用大石材的天然形状，以此雕作栩栩如生的人像，出奇地相似于史前巨石阵（图6）。而对动物，艺术家的认识似乎更加深刻且有所不同，例如大环眼的牛像所示（图7）。

距霍去病墓约十五英里外，是唐代的武后之父顾盼自雄的陵墓。神道两侧俱为麒麟、狮子、马和军民侍役（图8，9）。此类布置亦见于后世皇家陵墓。唐代的雄浑和工艺无与伦比。但是此地的雕像似觉对动物

缺乏深刻认识，逊于汉代的动物雕刻。

【6】"The Giant Devouring a Hog" at Huo Ch'ü-ping's tomb is strangely like the Menhirs. The ancient Chinese seemed to have less understanding of the human form than the animal. This Giant was carved out from the natural shape of the stone and has an appealing sense of humor. 霍去病墓的“野人抱熊”与史前巨石阵出奇地相似。古代中国人对人的认识似乎不及对动物的认识深刻。巨人形得之于石材的天然形状，颇为风趣。

【7】 The bull at Huo Ch'ü-ping's tomb reveals the perfect understanding of the animal by the Han sculptor. Up till the discovery by the Academia Sinica of some Shang Dynasty stone figures at Anyang a few years ago, this and a few other stone sculpture at the tomb of the great conqueror of the 2nd century BC were the oldest stone sculpture known in China. 霍去病墓的牛像显示了汉代雕刻家对动物的深刻理解。直到几年前中央研究院在安阳发现商朝石刻，出土于这位公元前2世纪伟大征服者陵墓的此件石刻及另外几件是中国已知最古的石刻。

【8】【9】 The tomb of Empress Wu's father has an avenue flanked by colossal stone animals and men. These monolithic giants measure about 13 feet in height. Compared with the animal sculpture of the Han Dynasty, the perfected craftsmanship is of little significance when the basic understanding of the animal is lost. 武后之父的陵墓，神道两侧皆为巨大的石人石兽。这些整石巨像高十三英尺许。形诸汉代动物刻像，由于缺乏对动物的基本理解，此处精良的雕工甚无意义。

IX. The Holy Land of China

The Province of Shantung was in the Chou Dynasty the principalities of Ch'i and Lu, the latter being the native land of Confucius. In the city of Ch'ü-fu today is the temple of the Sage. Perhaps no other building-project in the world can boast of a longer history. Immediately after the death of Confucius in 479 BC, a few of his disciples kept the Master's house as in his living days and paid regular homage there. The simple abode of three rooms gradually became the symbol of reverence in later ages. From the Han Dynasty downward it became the affair of the State not only to have the sacred place kept in proper order, but also to raise the Sage's descendants to a hereditary peerage with the title of duke. During the last two thousand years the Temple continued to grow in size and complexity, till today it covers one-third of the entire area of the walled-city of

玖 中国的圣地

山东省在周朝时是齐国和鲁国的封地，后者是孔夫子的故乡。今曲阜城内有孔庙。也许举世再无另一建筑工程能够夸口其历史更为久远。孔夫子逝于公元前479年，一些门生在他身后维持乃师的居处如其生前状况，在此定时拜祭。三间屋的简朴住处在后世逐渐演变为尊严的象征。自汉代以降，有序地维护圣地，并封圣人后裔为世袭贵族“公”，则成为国事之一。两千年来，孔庙日益扩大，日渐复杂，直至今日，它覆盖了曲阜城内三分之一的区域。

【10】 The library building of the Temple of Confucius. On the site of an older building which was destroyed by fire, the present structure was built at the end of the 15th century when an extensive restoration was carried out on the Temple. 孔庙书楼。15世纪末大举修缮孔庙时建于旧楼遗址，原楼被大火烧毁。

【11】 The carved marble columns of the Temple of Confucius at Ch'ü-fu are familiar to many Westerners. From a simple abode of three rooms, the Sage's home "grew" in 24 centuries' time into this magnificent hall, with surrounding buildings and courtyards covering a third of the city of Ch'ü-fu. In the side buildings are also enshrined Confucius' 72 disciples and other deserving scholars of later ages. 曲阜孔庙的大理石雕石柱为许多西方人熟知。24个世纪里，圣人的住处由陋室三间“长”成这个堂皇大殿，周遭殿宇群及天井覆盖了曲阜城的三分之一。偏殿内配享孔子的七十二门徒及后世硕儒。

In the Temple compound are numerous stele from the Han Dynasty downward, recording the more important happenings in the House of K'ung and in the Temple ground. However, of the existing structures, the oldest is a stele-pavilion dating only from the Tartar Dynasty of Chin, 1195. Most of the buildings were built in the reign of Emperor Hung-chih (about 1500) of the Ming Dynasty, the K'uei-wen Ke or Library being the most important representative (Figure 10). The Ta-ch'eng Tien, or Hall of Supreme Perfection where a large statue of Confucius is enshrined, may not be unfamiliar to Westerners for its beautifully carved marble columns (Figure 11). However, to the student of Chinese architectural history, this 1730 building is of no special significance, except as a good example of the execution of the "Rules" of 1733.

在孔庙建筑群中有无数汉代以降的石碑，记录了孔府和孔庙发生的大事。然现存建筑物中，最古老的碑亭，其纪年亦只及女真族的金朝（公元1195年）。楼宇多建于明弘治年间（约公元1500年），最重要

的代表是奎文阁，或称“书楼”（图10）。祭祀孔夫子巨像处为大成殿，它的大理石雕刻石柱美丽精致，西方人因此对它很熟悉（图11）。而在研习中国建筑历史的学生目中，这座建于公元1730年的大殿并没有独到的意义，只是实施1733年“法式”的一个佳例。

In this Temple is worshipped not Confucius alone. He is "attended" by his 72 disciples. In the side buildings on both sides of the courtyard in front of the Ta-ch'eng Tien are a great number of "spirit-tablets," each bearing the name of a distinguished scholar or a deserving official of the last two thousand years. The chosen ones were solemnly admitted by imperial decrees dynasty after dynasty. It is the highest possible posthumous honour that could be conferred upon a Confucian scholar.

In the courtyards to the left are halls to house Confucius' ancestors of five generations back while to the right are his parents' quarters. His wife is enshrined in a special hall behind the Hall of Supreme Perfection. There are also in the Temple compound halls for different ceremonial purpose. The entire compound is preceded in front by a series of courtyards and gateways which make the entrance to the temple ground most impressive.

As a whole, the Temple of Confucius is a magnificent example of Chinese planning, and historically there is perhaps no other building in the world comparable to it in its continuity of development.

In 1935, the Chinese Government planned another grand-scale repair of the sacred Temple, and I was honoured to be chosen as the architect for its restoration. But the plan was frustrated when the Japanese started to press their way into North China. Today the city of Ch'ü-fu, with the Temple in it, has fallen under Japanese control. "Duke" K'ung Te-ch'eng, 77th-generation-grandson of the Sage, whose present republican title is "High Commissioner in Charge of the Worship of the Sage," has fled to Chungking so that he, true to his ancestor's teachings on Loyalty, would not be taken by the Japanese and made a political tool.

X. The Province of Shansi, Rich Conservatory of Old Wooden Structures

The Province of Shansi, shielded on the east by the T'ai-hang Mountains, bounded on the west and south by the majestic Yellow River, and protected on the north by the Great Wall and Mongolian

deserts beyond, has been spared the destruction of wars when other provinces have had to build up new cities on top of ruins over and over again since the beginning of the Sung Dynasty (960 AD). Until the Japanese came in the autumn of 1937, Shansi had enjoyed an uninterrupted peace for almost a thousand years. Consequently it became the rich conservatory of a great number of old wooden structures. Between 1931 and 1937, I took altogether six trips to that province, three to the northern part, and another three to the middle and south.

殿内享祀者除孔夫子外，尚有七十二门徒“配享”在侧。大成殿前，于天井两侧厢房供奉大量灵位，其上神主均为两千年间的硕儒或良臣。历年历代，由皇帝敕令庄严地批准这些人选。一位儒者身后的哀荣莫过于此。

左跨院内大殿祭祀孔夫子上五代先祖，右跨院内祭祀夫子考妣。大成殿后设一殿专供其妻。孔庙建筑群另有其他多种仪式功能。整个建筑群前面，层层天井与重门使得孔庙的入口无比庄严。

作为一个整体，孔庙出色地例证了中国规划思想，而且，在世界历史上，可能亦无他处能与它的持续发展相提并论。

1935年，中国政府计划再次大规模修缮孔庙，我有幸入选为负责修缮的建筑师。但是，日军开始入侵华北，计划被迫搁置。如今，曲阜城和孔庙一起落入了日军掌中。现由民国政府授职“大成至圣先师奉祀官”的圣人七十七世孙、衍圣公孔德成飞去了重庆，他恪守先祖尽忠国家的教诲，不愿落入日本人手中，成为政治工具。

拾 木质古构的富饶温床山西省

山西省东倚太行山，西、南临壮丽的黄河，北有长城和蒙古沙漠拱卫，因此有宋（公元960年）以来一直远离战祸，而其他省份却于改朝换代之际反复地在层层焦土之上重建新城。直至1937年秋日军入侵，山西安享太平几近千年。于是这富饶的温床孕育了大量的木质古构。在1931年至1937年之间，我六度赴晋，三次访晋北，其余三次访晋中与晋南。

In almost every town or walled-city, or in the mountains, one could hardly fail to come across some ancient looking buildings, Buddhist or Taoist temples of the 12th and 13th centuries, or even earlier dates. It was in Shansi Province, totally unexpectedly, that we found, on our way to T'ai-yuan, near Yü-tz'u, dangerously missing the railway track by only 20 yards, a small structure, most neatly constructed, bearing the date corresponding to 1008, the third oldest

wooden building so far known; at T'ai-ku, three temples of the Sung and Chin periods in perfect state of preservation; at Tsin-tz'u, the Garden-temple to the Goddess of the Spring, built sometime between 1023 and 1031, a most beautiful grouping of landscape and architecture; and such odd little subjects as the residence with a 100-foot retaining-wall as foundation, overlooking the Fen River at Ling-shih; or the cast iron Buddhist seated among the ruins of the huge temple of Ling-yen Ssu off the highway near Fen-yang (Figure 12); etc. It would be impossible for me to go over all the important finds in Shansi one by one. I can only choose a few of the most outstanding.

An Early 11th-century Library Building

Ta-t'ung is famous not only for the great Wei caves at Yun-kang but also for the Liao (937-1125) and Chin (1125-1234) temples within the city itself. The Upper and Lower Hua-yen Ssu were originally one temple, covering a large area with a grouping of a hundred buildings. But in nearly a thousand years, much of the temple ground was encroached upon by the profane. The library was thus separated from the Temple proper and became known as the Lower Temple; it is a structure of particular interest (Figure 13). The purpose of the building was housing the Buddhist scriptures which were kept in wall cabinets built along the three sides of the Hall. The cabinets, rare examples of their kind, are surmounted with miniature temple buildings symbolizing the Heavenly Palaces (Figure 14). In the center of the Hall and arranged on a large platform, is one of the finest groups of clay figures in China. Three Buddhas are seated on their thrones, attended by Arhats and Bodhisattvas and guarded by Lokapalas. Unlike most of the ancient figures in China, this group graceful and with mellowed, tarnished tint is not spoiled by later "renovations." Under one of the beams, written in black Chinese ink, is the date corresponding to 1038, giving the time of the construction of the Library building. This is an age-old custom in China, but this is one of the very few of the early dates that have been thus preserved.

几乎在每座小城镇里，或在群山之间，总会遇到一些外观古旧的楼宇、佛寺或道观，其年代早至12、13世纪或更久远。正是在山西省，在我们赴太原中途，位于榆次附近离火车铁轨不到二十码处，一座小建筑与我们不期而遇。它极为匀称，纪年为公元1008年，是迄今已知的第三古老的木构建筑^[13]；在太谷，三座宋、金时期的庙宇保存完好；祭祀清泉圣母的花园寺庙晋祠，建于公元1023年至1031年间，是最美丽的并坛名胜；奇特的小建筑如俯瞰汾河的灵石民房，地基为高达一百英尺的挡土墙；汾阳附近大路边，铸铁佛像趺坐于灵岩寺堂皇残址的瓦砾间（图12）；如此等等不一而足。我不可能逐一讲述在山西省的所有重要

发现，只能挑选一些最出色的例子。

11世纪早期的薄伽教藏

大同之盛名不仅得之于云冈伟大的北魏石窟，亦得之于城中辽（公元937—1125年）^[14]、金（公元1125—1234年）时期的寺宇。上下华严寺原为一体，占地辽阔，楼阁有上百之数。然近千年内，大多庙产逐渐为世俗用途所蚕食。从此薄伽教藏彻底脱离上寺，开始以下寺而知名；它是一座特别有趣的建筑（图13）。建殿意在收藏佛经，沿大殿三面墙上置壁柜式经橱藏之。这些经橱极罕见，橱顶有微缩楼阁以象征天宫（图14）。殿心大坛上为中国最精美的泥塑佛像群之一。三本尊趺坐于宝座，胁侍尊者、菩萨、金刚护卫。这组群像外形秀丽，色泽柔美黯淡，所幸没像中国众多古老造像那样遭后世“翻新”之厄。在一根梁下用墨汁写有建殿年代，为公元1038年。这种做法在中国虽然由来以久，但这一年代是以这种方式保存下来的极少数早期年代之一。

【12】How the divine bears a human wound. Among the ruins of Ling-yen Ssu near Fen-yang are three seated iron Buddhas of the 15th century. One, bearing a wound on the neck, bends slightly in an unusually benevolent repose. 神佛蒙受人间伤痛。汾阳附近的灵岩寺废墟上，三座15世纪的铁佛趺坐。其一颈上带伤，以非凡的仁静微微倾欹。

【13】 The oldest library building existing in China, built in 1038 to house Buddhist scriptures. This was once part of Hua-yen Ssu, a large temple of a hundred buildings in Ta-t'ung. In 900 years, the temple lost much of its ground and the Library, thus separated from the main-group, is now known as the Lower Temple. 中国最古老的藏书楼薄迦教藏，为藏佛经建于公元1038年。它原为大同殿宇过百的华严大寺的一部分。九百年间，大寺失去了许多地界，而薄迦教藏则脱离了主寺，现以下寺知名。

【14】 Heavenly Palaces decorate the cabinets in the library of Hua-yen Ssu. Arranged along walls of the three sides of the Library, the cabinets, rare examples of their kind, are surmounted by miniature temple buildings symbolizing the Heavenly Palaces. 华严寺薄迦教藏经橱上的装饰天宫。沿薄迦教藏三面墙布置的经橱顶有微缩楼阁象征天宫，为类中罕例。

XI. Kuang-sheng Ssu, Huo Shan, Unusual Construction and Unusual Mural-painting

The discovery, in 1933, of a complete set of Chin (1149) edition *Tripitaka* at Kuang-sheng Ssu was a great event to students of Chinese Buddhist bibliography. It was the discovery of the scriptures that led to our visit to the Temple.

About fifteen miles east of Chao-ch'eng, at the southern spur of the Huo Mountains, are the Upper and Lower Temples of Kuang-sheng Ssu. There we found two groups of buildings, probably all of the Yuan Dynasty (1280–1376) of most unusual construction. The external appearance of the buildings conforms well with that of the usual Chinese structure. But the framing of beams for the support of the roof is anything but orthodox. Slanting members with long cantilevers are freely employed, showing a good deal of originality and ingenuity on the part of the designer (Figure 15). Such organic use of the wooden frame has not been found in other places in our trips.

拾壹 霍山广胜寺，非凡的建筑与非凡的壁画

1933年，在广胜寺发现一整套金代版（公元1149年）《三藏经》，这是中国佛教典籍研究界的一件大事。正是经书的发现把我们引向了这里。

上下广胜寺位于赵城以东约十五英里的霍山南脉山头。我们在那里发现了两组建筑，可能俱为元代的罕贵遗构（公元1280—1376年）。建筑外形与常见的中国建筑很吻合，但支撑屋顶的梁枋体系却绝非正统，而是自由运用了出挑深远的斜昂，展示出设计师的极大原创力和才智（图15）。对木结构如此灵活有机的运用在我们的旅途中尚属初见。

【15】 The free use of slanting members and cantilevers is uncommon. The 14th-century buildings of Kuang-sheng Ssu, Chao-ch'eng, have peculiar, unorthodox constructions. The beams and purlins are organically held in equilibrium by the slanting cantilevers. 斜昂的自由运用不同凡响。14世纪遗构赵城广胜寺的建造方法独出心裁。梁、檩俱由斜昂灵活有机地平稳支撑。

Alongside the Lower Temple is the Temple of the Dragon King, god of the great spring that gushes from under the hill (Figure 16). The temple itself, rebuilt in 1319, is nothing extraordinary. It is some of the mural paintings on its walls that attracted our attention. In our past trips, we have only come across mural paintings of religious subjects, and it was here that we, for the first time, saw secular scenes thus depicted. Most interesting among these is a scene of a theatrical performance. The actors are seen with either Sung (Chinese) or Mongolian costumes. The conventionalized facial make-up shows a prototype of the elaborate designs used on the stage in later periods. This painting is most important for the study of both Chinese painting and drama of the Yuan Dynasty. It is the more valuable for its inscription and date, corresponding to 1326. [15]

下寺旁边是拜祭山麓泉水的龙王庙（图16）。龙王庙重建于公元1319年，本身并无特别之处。但其壁上有一些壁画吸引了我们的注意。在以往的旅途中，我们所遇壁画均取宗教题材，而在这里，我们首次目睹了如此描绘的世俗场面。其中最有趣的是一个演戏的场景。演员们的

服饰宋（汉）、蒙互见。程式化的面部化妆显为后世精研的舞台化妆的原型。这幅壁画对研究中国绘画和元剧都至为重要。更珍贵的是，它的铭文纪年为公元1326年。

（林鹤 译 李道增 校）

【16】 Temple of the Dragon King at Kuang-sheng Ssu. Rebuilt in 1319, wooden structures like this is nothing unusual in Shansi Province. It is the mural paintings in this building that are of particular interest. 广胜寺龙王庙。此木构重建于公元1319年，在山西省不足为奇。此寺特别有趣处在其壁画。

[1] 本文是梁思成为北京大学和清华大学所作关于建筑历史的英文演讲稿，未曾发表，打字稿现存清华大学建筑学院档案。根据文章内容推断，应写于1940年，当时梁家随中央研究院正住在昆明。另据费正清夫人费慰梅女士所著《梁思成与林徽因》一书第11章的注释，费慰梅亦保存有本文打字稿，并注明该文1940年写于昆明（Wilma Fairbank: Liang and Lin, University of Pennsylvania Press, Philadelphia, 1994, P. 199）。本文的部分内容后来整理成《中国最古老的木构建筑》及《五座中国古塔》两篇文章，分别发表于英文《亚洲杂志》1941年7月号 and 8月号——林鹤、李道增注。本篇节选内容未包括《中国最古老的木构建筑》与《五座中国古塔》（单篇见后），另《佛教石窟造像》一节因内容相对独立，亦在本书单独成篇（见后）——编者补注。

Buddhist Cave Sculpture

佛教石窟造像^[1]

〔1940〕

Buddhist cave sculpture on cliffs in China is a most important phase of Chinese art that has been sadly overlooked by the Chinese during the past. Such monuments were often given brief mention in old books on geography and in travelers' diaries, sometimes even with contempt by Confucianists. Buddhist sculpture, or rather sculpture of any kind, has never been regarded by the Chinese as an art, or anything worth a gentleman's attention. It is only in recent years that the Chinese began to realize the greatness of these monuments and give the art of the sculptor its due recognition.

I. The Yun-kang Caves

Perhaps no name is more inspiring than Yun-kang to one who is interested in Chinese sculpture. Located on the bank of the Wu-chou River about ten miles from Ta-t'ung, once capital of the Northern Wei Dynasty (386–534 AD), the place was made, in 1935, easily accessible to tourists from Peiping by bus connections provided by the Railway. But my first few visits were still made during those mule-cart days. When nearing Yun-kang, the springless vehicle had to bump over miles of saw-toothed, slanting rock strata. It is an experience to remember a lifetime.

The vertical sandstone cliff, about 150 feet high and a mile long, is hollowed by numerous caves and niches which are covered with thousands of images of the Buddhist pantheon. Among them, the five colossal figures, about 70 feet high, are well known to many travelers who have been to Peiping and Yun-kang. The village at the foot of the cliff has a present day population of about two hundred. Some of the caves are even occupied by villagers as convenient, ready-made homes. But from old records we could easily visualize the grandeur and pop of the temples at the height of their glory.

We stayed in the Temple for several days during our first visit there. To our great dismay, we found that we could not get even the simplest kind of food. A lieutenant of the small army detachment stationed there finally helped us with a few ounces of sesame oil and two cabbages in exchange for half-a-dozen thumb-tacks!

The creation of the Yun-kang caves was started in the reign of Emperor Hsiao-wu-ti of the Wei Dynasty, 454 AD. The group of rock-out images is the most important example of early Buddhist art in China. The caves and niches were placed at random on the face of the cliff. Emperors and commoners alike, to seek blessings for their beloved, could have images caved according to whatever size and position they wished. The iconographic activities at Yun-kang lasted exactly half a century, and ended abruptly when the Wei capital was moved south to Loyang in 494 AD.

中国崖壁间的佛教石窟造像是中国艺术里最重要的一章，惜乎曩日为国人所忽视。古人的方志和游记对此类遗迹常一笔带过，儒者有时竟至于轻藐以对。佛教造像，或毋宁说任何种类的雕塑，从未被国人目为艺术，士大夫辈不齿为此花费心思。直到近年，国人才开始发现这些遗迹之伟大，并且还雕塑艺术以应有的重视。

壹 云冈石窟

关心中国雕塑艺术的人，或以云冈为最令人激动之地。它位于武周河岸，去大同十英里许。1935年，铁路局由北平通汽车至大同，旅行者辄易于抵此北魏国都（公元386—534年）。但是，我的头几次探访尚在此前的骡车年代里。接近云冈的时候，艰涩的车行不得不颠簸于一里又一里犬牙交错的倾斜石面上。这种经历终生难忘。

垂直的砂石质崖壁高约一百五十英尺，一英里长，被无数石窟和佛龕镂空，里面有数以千计的佛教诸神之像。其中，五座巨型塑像高约七十英尺，为履及北平和云冈的旅客所熟知。崖壁脚下的村落目前约有人口二百。一些石窟竟至于被村民占据，成为方便现成的居家。但是，依据旧时记载，我们很容易想见当日寺宇鼎盛时何其宏伟壮丽。

我们第一次探访期间，在庙里住了几天。我们极其沮丧地发现，连最简单的食物亦无处可觅。最终，我们用了半打大头钉，从派驻此地的一支小部队的排长手里换得几盎司芝麻油和两棵卷心菜！

云冈石窟始建于北魏文成帝时期（公元454年）^[2]。石刻群像是中国早期佛教艺术最重要的遗例。石崖表面随机散布石窟与佛龕。上自帝王下至庶民，均可随意各择尺寸位置，凿龕造像为至爱祝祷。云冈的造像活动持续了半个世纪，至公元494年魏室南迁定都洛阳时，方兀然中

止。

【1】 Niches of some caves at Yun-kang are architecturally treated, complete with columns, brackets and roof. In decorative motifs, there is an unmistakable "Greco-Buddhist" influence. The "egg-and-dart" is Greek. But most interesting is the translation of the Persian "double-bull" capital into the Chinese bracket. 云冈石窟某些佛龛得到了艺术处理，配以柱、斗拱及屋顶。装饰母题无疑表现出“希腊—佛教”的影响。“卵箭饰”为希腊式。但最有趣的是波斯“双牛”柱头被移植为中国的斗拱。

【1】 The Yun-kang caves are melting pots of Chinese, Greek and Indian decorative elements. In niches like this, the "Greco-Indian" influence dominates. The "angels" may be a mixture of Han and Indian prototypes. The trapezoidal arch is not Chinese. The Ionic-esque scrolls on capitals deserve special attention of the student. 云冈石窟汇了中国、希腊与印度的装饰元素。在这类佛龕中，明显有“希腊—印度”的影响，“飞天”或许混杂了汉与印度的原型。五边拱并非中国式样。柱头爱奥尼克式的涡卷特别值得注意。

A number of the caves in Yun-kang are large and spacious. Some are preceded by an antechamber. The sanctuary has usually a core in the center in the form of a pagoda, a Chinese version of the Indian chaitya, after which the Chinese caves were modeled. Here we find a

jumble of "Greco-Buddhist" elements. Some columns even have capitals like Ionic scrolls, and the original Chinese "bracket" was ingeniously translated into the Persian "double-bull" capital motif (Figures 1, 2). But, in spite of all that, the architecture remains fundamentally Chinese. From these caves we gathered a good deal of information about the wooden architecture of the Wei Dynasty of which we have, so far, found no actual specimen. Of the large number of caves of later periods in different parts of China, with the exception of the T'ien-lung Shan caves near T'ai-yuan, none is quite as rich in architectural treatment as these early ones.

云冈的石窟有若干庞大卓异者。有些带有前廊。窟殿中心通常有一中央塔柱，是印度“支提”的中式翻版，为中国石窟模仿的蓝本。我们在此发现了“希腊—佛教”的元素相互掺杂。有些柱上坐斗甚至如同爱奥尼克式卷纹的柱头，而中国本土的斗拱灵活地变形为波斯“双牛”的兽形柱头母题（图1，2）。然建筑物大体仍为中式。我们从这些石窟里采得北魏木构建筑的大量资料，这段时期迄今尚无实际遗例。中国各地后世出现了大量石窟，除了太原附近的天龙山石窟以外，无一如这些早期石窟般具有如此丰富的建筑处理细节。

II. The Lung-men Caves

To students of Chinese sculpture, the caves of Lung-men, about ten miles south of Loyang, are equally as important as the caves of Yun-kang. When the Wei Tartars moved their capital here from Ta-t'ung, the iconographic artists came with them. The miles of limestone cliffs on both banks of the Yi River offered an excellent base for sculptural work. The activity started there in 495 AD, and lasted over a period of more than 250 years.

The earlier caves have figures executed with an archaic feeling similar to the Yun-kang carvings—the cylindrical form dominates. The facial expressions of the figures are singularly tranquil and enchanting. In recent years, these figures became victims of the vandalism of curio-dealers and several of the best examples found their way in museums in Europe and America.

The most monumental group of statues at Lung-men did not appear until Empress Wu had the colossal *vairochana* hewn in 676 AD. An inscription tells how her Imperial Majesty ordered all the court ladies to donate their "powder-and-rouge-allowance" towards the fund for the carving of the eighty-foot seated statue, complete with attendants: Arhats, Bodhisattvas and Lokapalas. The entire group was originally sheltered by a wooden hall of nine bays that has disappeared long since. But holes and grooves on the cliff still indicate clearly the position and curvature of the roof as well as the location of many beams.

The walls of the hundreds of grottoes of Yun-kang bear innumerable inscriptions, giving the names of donors and dates of their donations, making the dating of most of the images easy. From the point of view of an architectural archaeologist, however, the Lung-men caves are of far less importance than the Yun-kang caves.

Besides Lung-men, there are a number of other places in Honan Province where are cave images of early date, notably at Tz'u Hsien, Chun Hsien and Kung Hsien. As groups they are all smaller and of less importance than the Yun-kang and Lung-men caves.

In 676 AD Empress Wu ordered all her court ladies to donate their cosmetic allowance for the caving of this colossal vairochana group at Lung-men. The entire group was sheltered by a wooden hall that has disappeared. Holes and grooves on the cliff still indicate clearly the position and curvature of the roof and the location of many beams. 公元676年，武后颁旨所有宫娥捐献脂粉钱在龙门开凿这组卢舍那巨型群像。群像原覆有木构寺阁，现已不存，崖上龕壁处仍有卯孔与凹槽清楚指示屋顶刻槽位置及梁柱位置。

貳 龙门石窟

在研习中国雕塑者目中，洛阳南面十英里的龙门石窟当与云冈石窟同等重要。当北魏鲜卑族从大同迁都至此时，造像艺术家亦随之而来。伊河两岸连绵的石灰石崖壁为雕刻作品之上佳基址。造像活动始于公元495年，持续时间逾二百五十年而不止。

早期石窟造像具有和云冈相似的古雅感觉——主要形式为圆雕。雕像的表情异常静谧而迷人。近年来，这些雕像遭到古董商的恶意毁坏，最杰出的作品流落到了欧美的博物馆中。

龙门最不朽的雕像群成于武后时，即公元676年开凿卢舍那龕。据一处铭文记载，皇后陛下颁旨所有宫人捐献“脂粉钱”为基金，雕刻八十英尺高的坐佛、胁侍尊者、菩萨及金刚神王。群像原覆以面阔九楹的木构寺阁，惜早已不存。但崖上龕壁处尚有卯孔和凹槽历历在目，明确指

示出屋顶刻槽的位置和许多梁楣的位置。

与云冈不同，逾百龕壁上铭文无数，记录了功德主的名字与捐献日期，便于确认大多数雕像的年代。然而，从建筑考古的角度来看，龙门石窟的重要性远逊于云冈石窟。

除龙门石窟以外，河南境内尚有其他早期石窟，较大者有磁县、浚县及巩县各处。作为组群，其规模与重要性都不如龙门石窟和云冈石窟。

Statues of Buddha and Lotus in Lung-men Caves 龙门石窟中的佛像及莲花洞

III. The T'ien-lung Shan Caves

For studying the architecture of the Ch'i and Sui Dynasties, the caves at T'ien-lung Shan, some forty miles southwest of T'ai-yuan, in the Province of Shansi, offer some most valuable material. Unlike Yun-kang and Lung-men, where the caves are carved out of rock-cliffs on

river banks, the T'ien-lung Shan caves are high and dry up on the mountain. The group here is comparatively small, only about twenty caves in all. The largest figure, about thirty feet high, is a dwarf compared with the giants of either Yun-kang or Lung-men. The other caves have mostly figures about life-size. They represent a period of high accomplishment in Chinese sculpture. Unfortunately, almost every one of them, except the largest, were ruthlessly cut down and removed by curio-dealers. The stolen pieces are now scattered in museums all over the world. Some of them are objects of admiration in the Winthrop Collection in New York. Some others, characteristically, found their way to a certain private collection in Japan.

Architecturally, these caves are of the greatest importance. Some of them are preceded by a porch, executed in most faithful imitation of the wooden construction of the time. Though merely facades, we could get from them not only a general idea of the parti, but even the exact proportions and the delicate shades of refinement.

叁 天龙山石窟

山西省会太原西北四十英里许，有天龙山石窟，它为研究北齐与隋朝的建筑提供了许多珍贵资料。云冈石窟和龙门石窟开凿于岸边崖壁，而天龙山石窟则高踞于群山之上的旱地。这里的组群相对较小，统共仅约二十窟。最大的佛像高约三十英尺，与云冈或龙门的巨像相比，简直是侏儒。其他诸窟的塑像多为真人尺寸。它们代表着中国雕塑史上造诣高超的一段时期。不幸的是，除最大的一尊外，几乎所有塑像都被无情地凿下，流落于古董商手中。失窃的残片现在散见于世界各地的博物馆里。其中一些在纽约的温思罗普藏品中为人称美，另外若干照例落入了某些日本私人收藏家之手。

这些石窟在建筑意义上极其重要。其中一些前有柱廊，极为忠实地模仿当时的木构建筑。尽管只有立面，我们从中不仅大致认识到了总体组合的思路，甚至于还认识到了具体的比例和细部的阴影。

（林鹤 译 李道增 校）

The thirty-foot Buddha of T'ien-lung Shan is a dwarf compared with the giants of Yun-kang and Lung-men. This statue, though started at the later part of the 6th century, was not completed until the 7th. With its attending Bodhisattvas, it is the only group at T'ien-lung Shan that had escaped the vandalism of curio-dealers. 天龙山的三十英尺高的佛像与云冈及龙门的巨佛相比简直为侏儒。此像始造于6世纪末期，但直至7世纪方得完成，旁立胁侍菩萨。这是天龙山逃脱古董商掠毁之厄的唯一群像。

The T'ien-lung Shan caves are the most architecturally treated. Some of them are preceded by a porch, executed in most faithful imitation of the wooden construction of the time, even the exact proportions and the delicate shades of refinement. 天龙山石窟最富建筑处理之功。类似的一些石窟前有柱廊，精工细做，忠实模仿木构，连细部的微妙光影也不放过。

[2] 此处原文“孝武帝”(Hsiao-wu-ti)，然梁著《中国建筑史》等各处均为“文成帝”(Wen-ch'eng-ti)，疑为当年笔误，据诸本改——林鹤、李道增注。

Five Early Chinese Pagodas

五座中国古塔^[1]

〔1941〕

In Sung Shan, the Central Holy Mountain, in Teng-feng Hsien, Honan Province, is the ancient Buddhist temple, Sung-yueh Ssu. Within its compound stands a most unusual pagoda, one of five early pagodas of North China visited by me and my fellow workers of the Institute for Research in Chinese Architecture in the process of collecting material for a history of Chinese architecture from study of actual specimens. Built in 523 AD, this is the oldest brick pagoda existing in China today.

The temple was originally the summer villa of Emperor Hsiao-ming of the Eastern Wei Dynasty. The pagoda was built for the salvation of the Emperor's deceased mother, the Empress Dowager. It has brought her blessing through fourteen hundred years. The pagoda, entasised to give a silhouette like that of a modern artillery shell, has both grace and grandeur. Its twelve-sided plan is unique. Pagoda contemporary with this one are usually square in plan, whereas those of later periods are octagonal.

在河南省登丰县的中岳嵩山，有一座古代佛寺——嵩岳寺，寺内矗立着一座非同寻常的古塔，它是我和我在中国建筑营造学社的同仁们从实例研究开始进行中国建筑史史料收集过程中所造访的中国北方五座古塔之一。该塔建于公元523年，是中国现存最古老的一座砖塔。

嵩岳寺最初是北魏孝明帝^[2]的夏宫，嵩岳寺塔则是为其母灵太后禳病所建，此后该塔带着太后的恩泽一直延存了1400年。嵩岳寺塔的整体轮廓向上逐渐收分，像是一个现代的炮弹壳，优美而秀丽。塔的十二边形平面形式也很独特，因同时期的塔常为四边形平面，而此后塔的平面又多为八角形。

【1】 The oldest brick pagoda in China is in the compound of the ancient Buddhist temple of Sung-yueh Ssu at Sung shan, Honan. The pagoda, built in 523 AD, is very unusual in style having, as it does, twelve sides and fifteen stories. 这座中国现存最早的砖塔位于河南嵩山嵩岳寺院内。该塔建于公元523年，其十二边形和十五层的形制极为罕见。

The fifteen stories of the pagoda also constitute an uncommon feature. On a very high base is the tall first-story, above which are fifteen decks of cornices of roof-eaves. Though regarded as fifteen-stories, a pagoda with such arrangement may perhaps be more

appropriately described as one-storied, fifteen-deck-roofed. The first story is embellished at the corners with polygonal engaged columns with lotus-blossom capitals. Each of the doorways on the four sides facing the cardinal points is arched, the extrados of the arch being shaped like a lotus petal and ending in volutes at the spring-line. The other eight sides each has a niche in the form of a Ssu-men T'a or one-storied, four-doored, square pagoda. Undoubtedly these niches were once occupied by statues which were lost long ago. The architectural motifs show unmistakable Indian influences. The general part of the edifice is the primogenitor of a pagoda-form that later became very popular in China. (Figure 1)

Such a Ssu-men T'a as I have mentioned is to be found at Shen-t'ung Ssu in the mountains thirty miles south of Tsinan, in Shantung Province. These thirty miles we covered on our visit to the pagoda in a whole day's pleasant travel along rocky paths, in the date-flower-scented breeze of early summer, watching the ever-changing silhouette of rugged mountains against the sky, until we reached the seldom visited region lying at the back of T'ai Shan, the Eastern Holy Mountain, which was our destination.

The small, one-storied stone pagoda bearing the date corresponding to 544 AD on one of the marble statues it shelters, is the oldest of its kind in China. Short and stubby on first observation, the structure may be described as a pavilion square in plan, with a core in the center and an arched doorway on each facade. The roof is a stepped pyramid, surmounted by a "pinnacle" which in essence is a miniature Indianesque stupa. (Figure 2)

该塔的外观亦不同一般。在高大的第一层塔身上，叠涩出15层的密檐。虽然被视为15层，但像这种类型的塔也许称其为一层塔身、15层密檐顶更为恰当。一层塔身各隅砌有角柱，柱头呈莲花样式。塔身东西南北四个主面上设有拱门，拱背形如莲瓣并在起拱线处呈涡卷饰。塔身其余八面各设佛龕一座，状似四门塔样式，即一层四门的方形塔。无疑，龕内原曾有佛像，但早已佚失。塔的建筑风格显然深受印度影响，其整体设计样式成为后来盛行于中国的一种塔的形式之始祖。（图1）

在山东济南城南30英里的群山之中的神通寺，就有一座上文提及的四门塔。我们花了一整天的时间才走完30英里的路途，找到该塔。这是一段愉快的旅途：行走在山岩间的小径上，我们一边呼吸着早夏时节风中的花香，一边浏览着蓝天下步移景异的山峦起伏，最后来到了旅途的终点——位于东岳泰山之阴的一处人迹罕见之地。

这座单层的小石塔内的石像上有公元544年的题刻^[3]，它是国内该类型塔中最古老的一座。这个初看短粗的结构实际上是一个方形平面的亭子，亭中心为塔心柱，四面设拱门。屋顶是一个阶梯形的金字塔，上覆以一个缩小的印度窣堵坡样式的尖顶。（图2）

【2】 China's oldest stone pagoda, erected at the back of T'ai Shan, probably in 544 AD, is a simple structure, a single-storied pavilion unlike what is generally known as a pagoda. Its doorways are arched; its roof is a stepped pyramid with a stupa. 神通寺四门塔——中国现存最早的石塔，大约建于公元544年，位于泰山之阴。它是一个与一般概念的塔不同的单层简单结构。塔门呈拱状，塔顶为窣堵坡样式的金字塔。

My study of a large number of pagodas in China led me to the conclusion that the Chinese pagoda is an interesting combination of an original multiple-storied Chinese structure and an Indian stupa which crowns the former. The Ssu-men T'a of Shen-tung Ssu is one of the earliest and simplest examples of this combination and should be given a most prominent position in the evolution of the Chinese pagoda.

The two pagodas described above date from the period of the Six Dynasties. When we come to the T'ang period, it is no surprise to find two important pagodas among the innumerable Buddhist remains of this period in the Sian area, in Shensi. These are the Ta-yen T'a and Hsiao-yen T'a, the Great and Little Gander Pagodas. Rising high above the vast plain, they stand about two miles to the south of the Celestial City and are themselves about two miles apart. The "great" one, a little earlier in date, is the more important. It stands in the temple grounds of Tz'u-en Ssu, where it was built to house the Buddhist scriptures.

The present structure represents a rebuilding of an even earlier pagoda. The original was only five stories high, and was founded by the great monk Hsüan-tsang, in 652 AD. It was said that the Master, after his return from his nineteen-year pilgrimage to India, obtained the Emperor's permission to build this pagoda to house the scriptures he brought back. On the day when the ground was broken at the building site, he carried on his own shoulder the first shovels of earth and encircled the site three times in prayer. Unfortunately this original pagoda was badly damaged in war shortly after completion. It was completely rebuilt between 701 AD and 705 AD and made seven stories high. (Figure 3)

The plan of the pagoda is square, the construction entirely of brick. The exterior of each story is treated with pilasters and architraves in delicate relief, and a corbelled "cornice." The general silhouette of the Ta-yen is not often seen elsewhere in China. Instead of the usual graceful entasis, its upper stories diminish in an uncompromising incline. Sturdy and dignified, it stands as a most fitting monument to the great Buddhist pilgrim and scholar who was its founder.

西安慈恩寺大雁塔平面圖
The plan of the "Great Gander" Pagoda of Sian

【3】The "Great Gander" Pagoda, Sian, is one of the most sacred monuments of Buddhist China. The present pagoda replaced in the 8th century one erected by the great 7th-century monk Hsüan-tsang but soon war-damaged.

西安大雁塔是中国最重要的佛教纪念性建筑物之一。现存的大雁塔是公元8世纪重建的，原塔由7世纪的名僧玄奘所建，但不久便毁于战火。

对大量中国古塔的研究使我得出了这样一个结论：中国古塔是在其传统多层结构之上覆以印度窣堵坡样式的有趣结合。神通寺四门塔是这种融合样式最早和最简洁的实例之一，它在中国古塔的演进过程中具有极其重要的地位。

上述两塔都建于六朝时期。当我们转向研究唐朝时，在陕西西安地区众多的佛教建筑遗迹中发现的两座佛塔无疑是最重要的，这就是大雁塔和小雁塔。这两座塔高高耸立于西安古城以南约两英里的开阔平原地带，两塔间相距也约两英里。相较之下，稍早建成的大雁塔更为重要，它立于慈恩寺内，为存放佛经而建。

现存的大雁塔是由一座更早的古塔重建而成。最初它只有五层高，是由著名的唐僧玄奘于公元652年所建。据说玄奘西行印度17年^[4] 朝圣归来后，经皇帝恩准建造此塔以珍藏其带回的佛经。在该塔破土动工之日，玄奘曾亲自执锹铲土并绕行场址三周行祷告礼。遗憾的是，最初的

佛塔建成不久就因战乱而遭严重毁坏。它于公元701至705年间彻底重建并加高到七层。（图3）

大雁塔平面呈方形，全部由砖建造。外部各层设有壁柱，带有精美浮雕的柱顶过梁和出挑的“檐口”。其外廓在中国其他地方实属罕见，它并非通常的逐渐收分，而是每上一层都有明显的向内收退。坚定而庄严的性格，使大雁塔成为最恰当地纪念其缔造者——那位伟大的佛教学者和朝圣者——所矗立的一座丰碑。

The only wooden pagoda existing in China today dates from the Sung period. It stands about fifty miles south of Ta-t'ung, Shansi, not far outside the inner stretch of the great wall in the town of Ying Hsien.

This miserable town, on alkaline soil, poverty-stricken, with only a few hundred mud houses and barely a dozen trees within the city enclosure, is about twenty-five miles away from the nearest highway bus station. This distance I traveled by mule-cart on my trip to the pagoda, suffering six hours of bumpy ride. It was sunset time when I reached a point about five miles west of the town. Most unexpectedly I saw ahead of me, at the far end of the almost straight trail, a sparking jewel on a dark purplish background: the red and white pagoda, reflecting the golden setting sun, against the mountain beyond. Rising about two hundred feet above the surrounding plain, the five-storied tower is visible, in good weather, from places nearly twenty miles away. (Figure 4)

It was dark when I reached the walled city. The bulk of the pagoda towered over the whole town like a black giant. But on the southern side of the top story was visible a light, a spark that penetrated the enveloping darkness. That, I found out later, was the "ten-thousand-year lamp" that had been burning there day and night for nearly nine hundred years.

中国现存的唯一一座木塔建于宋代^[5]，它位于山西大同以南约50英里处的应县城内。

在我们考察时，应县是一个建在盐碱地上的贫困小镇。它距离最近的公路汽车站约25英里，城内只有百来栋土坯房，树木稀少。我坐在骡车上，经过六个小时的颠簸后才从车站来到木塔前。当我到达镇西约5英里处时，正是日落时分，出乎意料之外，我看见在几乎笔直的小路尽头暗紫色的天空背景下一个熠熠闪光的宝石：红白相间的古塔，在其后群山的衬托下，披上了金黄色的落日余辉。木塔在平原上耸起约200英尺高，在晴朗的天气下，大约20英里以外都能看到这座古塔。（图4）

当我抵达小镇时，夜色已深。古塔像个怪物般耸立在小镇的上空。不过在塔的顶部南侧可以看到一丝闪亮，它穿透了漆黑的夜空。我后来才知道，那是一盏“万年灯”，它已经历了近九百年的日日夜夜而长明不

熄。

【14】A poverty-stricken Shansi town, Ying Hsien, boasts the only wooden pagoda known to exist in China, built in 1056 AD. Its eaves and stories are supported by a system of brackets. 山西穷镇应县以中国目前现存唯一木塔而自豪。木塔建于公元1056年。各层出檐及平坐各有斗拱支撑。

The pagoda was built in 1056 AD. Octagonal in plan and constructed entirely of wood, its structure is essentially the super imposition, in five tiers, of single-storied Chinese buildings. The first story has double-decked eaves, supported by huge brackets, stylistically identical with those of the Kuan-yin Ke in Chi Hsien, Hopeh. Each of the four upper stories has a surrounding balcony and an overhanging eave, supported by its own system of brackets. On each story, doors are opened on the four sides facing the cardinal points, the other four sides being walled-in with plaster on lath, decorated with paintings of Arhats and Bodhisattvas.

On the ground floor, seated in the center of the octagonal sanctuary, is a colossal clay statue of Sakyamuni, while on the upper floors are different Buddhas, usually attended by Arhats and Bodhisattvas.

The top of the pagoda is finished with an elaborate spire of wrought iron, secured to the corners of the uppermost roof by eight iron chains. I was up on that spire one sunny, clear afternoon, absorbed in measuring and photographing, when the clouds closed in rapidly but unnoticed. Suddenly a terrific thunderbolt struck nearby. Taken by surprise, I nearly lost my hold on the icy-cold chain two hundred feet above the ground. My only other experience at all similar to this was when, without the usual alarm, some Japanese planes dropped several 250-pound bombs around my house, the nearest one only twenty feet away.

This pagoda, generously spared by nature, is entering its last century of a thousand-year cycle. We wonder, here in the Southwest, whether it has survived the fortunes of war. The Japanese besieged and took the town of Ying Hsien in the fall of 1937.

The last and latest of these five pagodas is the Hua T'a, or "Flowery Pagoda" of Chengting, on the Peiping-Hankow Railway, in Hopeh Province. It is a brick structure of the Chin Dynasty, twelfth century AD. Its name is a tribute to its very complicated shape. Though it is octagonal in plan, with doors on the four sides facing the cardinal points of the compass, the other four sides each have a hexagonal chamber attached on the outside. The exterior finish in stucco is modeled to represent columns, beam and brackets of wood. The "pinnacle" is profusely decorated with high reliefs of elephants, lions and small, one-storied stupas. It is a chaotic but not too unhappy mixture of the Indian stupa and the Chinese pagoda, a compact presentation of the "five-pagoda" composition. In all my later trips I never came across another similar structure. (Figure 5)

应县木塔建于公元1056年。其平面为八角形，是一个全部为木构的

五层结构^[6]。首层由巨型的斗拱托起重檐，风格与河北蓟县（独乐寺）观音阁相类似。上部四层各有回廊平坐与挑檐，由自身的斗拱系统支撑。塔各层东西南北向设门，其他四面由壁柱和板墙围合，木板隔墙上饰有阿罗汉和菩萨像。

底层八角形圣坛中央，设有巨大的泥塑释迦牟尼像，上部每层均有各种佛像，多为阿罗汉与菩萨像。

塔顶为一精美的铁制塔刹，固定在屋顶八角尽端的铁件上。在一个阳光明媚的下午，我攀上塔刹去测量和拍照，由于全神贯注，我竟然没有注意到浮云的迅速掩近。突然，不远处炸起一个闪电，惊吓之中，我险些在离地200英尺的高空中松开握住冰冷铁链的双手。我唯一与此类似的一次经历，是在没有任何警报下，日军的飞机在我住所周围投下了几枚250磅的炸弹，其中最近的一颗距我只有20英尺。

大自然宽厚赦免的这座木塔，行将步入它千年周期的最后一个世纪。在日军于1937年秋季攻占了应县后，我们不知道这座位于城西南的古塔，是否在战火中幸免于难。

五座古塔中的最后一座、也是年代最近的，是位于河北省北平—汉口铁路线上的正定花塔（亦称华塔）。这座砖塔是公元12世纪的金代遗物。花塔的名称源于其繁复的造型。虽然其塔身平面为八角形，在东西南北四面设有塔门，但在其他四个面上又有附建的六角形小塔。塔的外部用灰泥仿制出木构的柱、梁和斗拱样式。塔刹大量地饰以象、狮和小的一层窠堵坡高浮雕。它是印度的窠堵坡和中国佛塔混杂但并不太令人厌烦的结合，是一种集中而小巧的“五塔样式”^[7]。在我此后的考察途中，再未遇见过另一个类似的塔的实例。（图5）

（单军 译 高亦兰 校）

河北正定縣廣惠寺華塔平面圖

比例尺 1:1000

【5】The "Flowery Pagoda" of Chengting was so named for its complicated shape: to four sides of the octagonal plan are attached hexagonal chambers. The brick structure is finished in stucco; its upper part is profusely embellished with stupas, elephants and lions in high relief. 正定花塔（华塔）因其繁复的形状而得名：在其八角形主塔的四面又有四个六角形小塔依附其上。砖结构的表面装饰以灰泥。塔的顶部有高浮雕的窣堵坡、大象和狮子等装饰。

[1] 本文原载《亚洲杂志》（*Asia Magazine*）1941年8月号——单军、高亦兰注。

[2] 孝明帝为北魏时期的帝王，在梁思成其他文稿中亦为“北魏”（见《梁思成文集》）

(三) P. 51)，故原文称Eastern Wei Dynasty（东魏），应为英文稿笔误——单军、高亦兰注。

[3] 此塔建于隋炀帝大业七年，即公元611年；年代更早的题刻可能是后来搬入塔内的——单军、高亦兰注。

[4] 玄奘西行印度朝觐，按史书记载共历时17年，即贞观二年至贞观十九年（公元629—645年），所以原文称其为19年（nineteen-year pilgrimage），在时间上有误——单军、高亦兰注。

[5] 应县木塔一般文献多称其建于辽清宁二年，年代上即宋仁宗嘉祐元年，梁思成在其所著的《中国建筑史》中也如是说，见《梁思成文集》（三）P. 135——单军、高亦兰注。

[6] 应县木塔实际为五个明层和四个平坐暗层——单军、高亦兰注。

[7] 五塔式形制源于印度，如佛陀伽耶的大菩提塔（Mahabodhi Stupa），在中国称为金刚宝座塔。正定铁塔因为有四个小的扁平六角形佛塔依附主塔上，所以与五塔式类似——单军、高亦兰注。

China's Oldest Wooden Structure

中国最古老的木构建筑^[1]

〔1941〕

Panorama of Fo-kuang Ssu, Wu-t'ai Shan, Shansi 山西五台山佛光寺全景

Wu-t'ai Shan, the sacred mountain of the Bodhisattva Manjusri, whom the Chinese call Wen-shu P'u-sa, has been holy to Chinese Buddhists since even before the T'ang Dynasty. For over a thousand years its wealthy temples have been constantly being rebuilt and kept in shining gilt and glaring paints for the pilgrims. But around the outskirts of the Mountain, where the fashionable did not care to go, and the poverty-stricken monks could not afford to undertake large building measures, here, if anywhere, ancient buildings might remain for centuries intact.

The Institute for Research in Chinese Architecture, of which I am a member, has for the past nine years been combing the country for ancient monuments. Our ultimate aim is the compilation of a history on Chinese architecture, a subject which has been virtually untouched by scholars in the past. Since little or no material existed in books, we have to hunt out the actual specimens. This search has, to date, taken

us to fifteen provinces, where we have studied more than two thousand monuments. But from 1932 the earliest structure we had found of wood, that highly perishable material, dated from the early Sung Dynasty, 984 AD. In June of 1937, our search for a wooden building of the still earlier T'ang Dynasty led us to the Wu-t'ai Shan, where it was at last rewarded.

I set off from Peiping with my architect-wife, Lin Hui-yin, and a small group of field workers, for Tai-yuan and thence, by automobile, eighty miles to Tung-yeh. At Tung-yeh we changed to mule-litters to enter the Wu-t'ai Shan by the uncustomary route, along which, unknown to us, lay the temple we sought. Outside the South T'ai, about three miles beyond the town of Tou-ts'un, we entered the gateway of Fo-kuang Ssu, the Temple of Buddha's Light.

The temple stands on a high terrace on the mountain-side, facing a large courtyard in front, framed by twenty or thirty very old pines. It is a majestic building. Only one story in height, it has large, strong, simple brackets and a far overhanging eave which, at a casual glance, at once tell its very old date. But could it be older than the oldest wooden structure we had yet found?

山西省五台山，是中国称为文殊菩萨的文殊师利菩提萨埵的神山，该处对中国佛教徒而言，在唐代甚至以前就已经成为圣地了。千余年来，其中大量寺庙曾不断重修，并为朝拜者保持着灿烂的外观和耀眼的彩画。但是在山岭的周边外围则讲时髦的人不爱去，贫穷的僧人也无力从事大规模的修建工程。如果有什么地方的古代建筑经过若干世纪仍然保持原状，可能就在这里。

我作为成员之一的研究中国建筑的营造学社，在过去九年里，已经在全国到处搜寻古代建筑遗迹。我们的最终目标是编纂一部中国建筑历史，它是过去学者们从没有真正接触过的一个课题。由于在文献中极少或者缺乏材料，我们不得不寻找实例。迄今为止，这项调查已经使我们走遍了十五个省，研究了两千多处建筑遗迹。不过自1932年以后，我们发现年代最早的极易腐朽的木构建筑是宋代早期的（公元984年）。1937年6月，为了寻找年代更早的唐代木构建筑，我们去了五台山，在那里最终得偿所愿。

我和我的妻子林徽因建筑师以及几位工作人员，从北平去了太原，再坐汽车到80英里外的东冶。从东冶我们改乘骡车走很少有人走的土路进五台山，当时并不知道沿路就有我们要寻找的庙宇。在南台外围，大约过豆村三英里，我们走进了佛光寺大门。

这座庙宇位于山坡的一处高台上，面对一座大院，周围有二三十棵古松环绕。它是一个雄伟的建筑物，仅一层高的大殿，有着巨大、宏伟、简洁的斗拱和深远的出檐，一眼望去，立即表明了它远古的年代。但是，它能比我们以前发现的最古老的木结构更古老吗？

The Main Hall of Fo-kuang Ssu—a T'ang temple, built in 857 AD—near Wu-t'ai Shan, is the oldest wooden structure now known in China. Associated with it are examples of T'ang sculpture, painting and calligraphy, a unique combination. 佛光寺大殿——唐代庙宇，建于公元857年，位于五台山附近，是现知中国最古老的木构建筑。同一大殿中尚有唐代的雕塑、绘画及书法，汇成无双的组合。

The huge doors were at once thrown open for us. The interior, seven bays in width, was more than impressive in the twilight. On a large platform, seated statues of Buddha, a P'u-hsien and a Wen-shu and numerous attending Arhats, Bodhisattvas and Lokapalas rose before us like an enchanted deified forest. At the extreme left end of the platform was a seated figure of a woman in secular dress, a life-size statue, but very small and humble amidst the group of deities (Figure 1). She was, the monks told us, the wicked Empress Wu. The entire group, though glaring with fresh color from a recent renovation, was without doubt of the late T'ang period. But, if these were the original T'ang clay figures unharmed, the building that covered them could not but be the original T'ang structure. Obviously any rebuilding would have damaged everything under it.

巨大的殿门立即被我们用力地推开了。面宽七开间的室内，在昏暗之中非常动人。在太平坛上，坐着佛陀像，两边是普贤和文殊以及众多随侍的罗汉、胁侍菩萨及金刚神王等，像迷人的众神之林出现在我们面前。在坛上最左边是一个真人尺度的、穿着世俗服装的妇女坐像，在诸神之间显得十分渺小和谦恭（图1）。僧人告诉我们，她是邪恶的“武后”。整个塑像群虽然经过近来的重修显得色彩光鲜，但毫无疑问是晚唐

时期的作品。但是，如果这些是未经破坏的原来唐代泥塑，那么覆盖它们的建筑物也只可能是原来唐代的结构。显而易见，任何房屋重建都会破坏下面的所有东西。

【1】 At the very end of the platform bearing the great clay figures of deities is the life-size figure of a woman, obscure, in secular dress. Named "Empress Wu" by the monks, she proved instead to be Lady Ning Kung-yü, donor of the temple. 承载着巨型塑像的坛台的最边上，

是一座真人大小的妇女像，她姿态谦恭，身着世俗服装。僧人称之为“武后”，她实际却是佛殿的捐献者宁公遇夫人。

In Fo-kuang Ssu is a magnificent group of T'ang Dynasty clay figures, perhaps the only remaining group in China proper, aside from those found at Tun-huang. In spite of the recent "renovation," the figures reveal unmistakable late T'ang characteristics. 佛光寺中精妙的泥塑群像。除敦煌雕塑以外，此处或许是中国境内迄今所存唯一唐代泥塑群像。虽经新近“翻修”，塑像特点无疑为晚唐风格。

Next day we started a careful investigation. The brackets, the beams, the checkered ceiling, the carved stone bases of the columns were all anxiously examined. One and all yielded to us their

unmistakable late T'ang characteristics. But my greatest surprise came when we climbed into the dark space above the ceiling; there I found roof trusses (Figure 2) built in a way I knew only from T'ang paintings. The use of two "main-rafters" (to borrow the terms of a modern truss) without the "king-post," just the reverse of later methods of Chinese construction, was overwhelmingly unexpected.

This "attic" was inhabited by thousands of bats which clustered around the ridge-purlin like a thick spread of caviar, thus preventing me from finding a possible date written thereon. In addition, the timbers were infested with millions of bed-bugs that live on the bats. The upper side of ceiling, on which we stood, was covered with a thick layer of fine dust, deposited there perhaps during the last few centuries and strewn with little corpses of dead bats here and there. In complete darkness and amid the vile odor, hardly breathing with a thick mask over our noses and mouths, we measured, drew and photographed with flashlights for several hours. When at last we came out from under the eaves to take a breath of fresh air, we found hundreds of bed-bugs in our knapsack. We ourselves had been badly bitten. Yet the importance and unexpectedness of our find made those the happiest hours of my years of hunting for ancient architecture.

次日，我们开始细心的调研。对于斗拱、梁枋、棋盘式天花板、石刻的柱础，我们全部急切地加以考察，每项都告诉我们其明确的晚唐时代特征。而当我们爬到天花板上的黑暗空间时，则令我大感惊奇；我发现屋顶桁架的构造方式（图2）以前只是在唐代绘画中见过。它使用两根“主椽”（借用现代桁架用语）而没有“中腹杆”，这与中国较后的结构正好相反，令人感到莫大的意外。

这个“阁楼”里住着成千上万只蝙蝠，它们群集在脊檩周围，像是涂了一层厚厚的鱼子酱，因而我难以发现可能写在梁上的年代。另外，木料上布满了靠蝙蝠为生的千百万只臭虫。我们所站的天花板上，是一层厚厚的尘土，大概是过去若干世纪所沉积的，并且到处散布着蝙蝠的尸体。在完全黑暗和恶臭之中，在戴着遮住口鼻的厚口罩而令人难以呼吸的情况下，我们一连测量、绘图和用闪光灯拍照了数个小时。当我们最后从屋檐下出来，呼吸到新鲜空气的时候，发现背包里竟有数百只臭虫。我们自己也已经被咬得伤痕累累了。然而，我们这次发现的重要和意外收获，却成了我搜寻古代建筑时期中最愉快的时光。

【2】The truss without the king post was used in T'ang architecture—this is the only known specimen. The underside of the ridge-purlin was covered with the innumerable bats that inhabited the attic and made its study difficult. 应用在唐代建筑的没有中腹杆的桁架——这是唯一已知的实例。脊檩下面布满无数蝙蝠，它们栖息在阁楼里，造成研究上的困难。

Frescoes must originally have decorated the walls of the Hall. But the only frescoes parts preserved today are the "frieze," the plastered portions above the lintel and between the brackets. Different sections of the frieze have paintings of very different standards of draftsmanship and evidently of different dates. There is a section, painted with Buddhas in medallions, which bears the date corresponding to 1122 AD. Alongside it is a section painted with Buddha and attending Bodhisattvas, definitely older in date and superior in artistic merit. The analogy of this section of mural painting to those of the Tun-huang caves is most striking. It can be of no other date than the T'ang Dynasty. Though merely a "strip" of wall occupying a position of minor importance, it is the only T'ang mural painting I know of in China proper besides those of the Tun-huang caves.

大殿的墙壁一定曾经饰以壁画。但仅存至今的壁画部分只有“檐壁”，即梁上面和斗拱之间的抹灰部位。檐壁的不同部分具有极为不同的绘画标准，并且显然是不同时期的。有一处绘有团花中的佛陀像，标明的日期相当于公元1122年。旁边一处画有佛陀和胁侍的菩萨像，肯定时期要更早并且艺术价值更高。将这部分壁画与敦煌石窟的壁画加以对比，结果极为明显。它不可能不是唐代的。虽然只是墙上一条，又非重要位置，而据我所知，却是中国在敦煌石窟以外唯一的真正唐代壁画。

On the third day of our work in the Main Hall, my wife noticed on the bottom of one of the beams very faint indications of calligraphy in Chinese ink. The effect of the discovery on our party was electrifying. There is nothing we like better than the dates of a building actually written on its beams or carved in stone beside it. Here was this glorious T'ang structure, the first we had found—but how was I to report its date? The T'ang Dynasty had lasted from 618 AD to 906 AD. Now the timbers that bore the faint traces of calligraphy would soon give me the much desired answer. While the rest of us were busy with the problem of arranging for a scaffolding to be erected between the valuable statues for the purpose of cleaning

the beams and studying the inscription close at hand, my wife went directly to work. Straining her head back, she tried her eager eyes on the beams from various angles below. After some time of such strenuous efforts she was able to read a number of dubious names with long, official titles of the T'ang Dynasty. Of these the most important was on the beam to the extreme right, only partly readable then: "Donor of the Hall of Buddha, Sung-kung of Shang-tu, Woman Disciple of Buddha, Ning Kung-yü."

我们在大殿工作的第三天，我的妻子觉察到在一根梁底上有非常模糊的毛笔字迹。这个发现使我们大家极为兴奋，没有比将建筑的年代实际写在其梁下或刻在旁边的石头上更令我们高兴的。这里是我们第一次发现的极好的唐代建筑，但是我将如何报告其年代呢？唐朝从公元618年延续到906年。现在这块带有模糊字迹的木材，不久将给我极为渴望的答案。当我们为了清洗木梁和研究近在手边的题词正忙于在有价值的塑像之间搭脚手架时，我的妻子直接投入了这一工作。她仰起头，努力从梁下不同的角度，用热切的目光观察。经过一段时间的这种紧张的努力以后，她已经能够读出许多带有冗长唐代官衔的、不清楚的人名。其中最重要的是在大梁最右边的、部分清晰的文字，即“佛殿主上都送供女弟子宁公遇”。

Donated by a woman! That this young architect, a woman, should be the first to discover the donor of China's rarest old temple to have been a woman, seemed too unlikely a coincidence. She feared she might have misread some of the less decipherable characters by too lively an imagination. But she remembered having seen similar names with official titles on the stone dhanari column (Figure 3) which stood on the terrace outside. She left the Hall in the hope of verifying her reading from the column inscription. There, to her great delight, she found, apart from the long list of imposing officials' names, the same phrase clear and distinct: "Donor of the Hall of Buddha, Woman Disciple Ning Kung-yü." The column bore the date "The 11th year of Ta-chung, T'ang Dynasty," which corresponds to 857 AD.

佛殿是由一位妇女捐献的！而我们这个年轻建筑师，一位妇女，却是第一个发现这座中国最难得古庙的捐献者也曾是一位妇女，这似乎未必是巧合吧。她怕自己由于想象力太活跃而误读了些难辨认的字，但她记起在外面平台上的石经幢（图3）上面好像见过有类似官衔的一些名字。她离开大殿，希望从石柱的刻字上去核实自己的解读。这回，她大为高兴，因为发现除去一连串显赫官员的名单外，同样的词句赫然在目，即“佛殿主女弟子宁公遇”。这颗石经幢带有纪年为“唐大中十一年”，相当于公元857年。

【3】A "dhanari" column in front of the Main Hall confirmed the inscription on a beam naming Lady Ning Kung-yü as donor. The inscription on the column, erected contemporaneously with the Hall or soon afterward, established a date. 大殿前面的“经幢”柱上确认了写在一根梁上的捐献者宁公遇夫人的名字。柱子是与大殿同时或稍后建立

的（上面文字中有年代记载）。根据这个可以证实大殿的年代。

Then it dawned upon us that the small figure of a woman in secular dress, sitting humbly at the end of the platform, whom the monks called "Empress Wu," was none other than the donor Lady Ning Kung-yü herself.

Assuming that the dhanari column was erected soon after the completion of the Hall, the date of the building can be closely ascertained. It is earlier by 127 years than the oldest wooden structure previously found. It is the only wooden building of T'ang date we have yet encountered in these years of search. Moreover, in that one Hall, we have T'ang painting, T'ang calligraphy, T'ang sculpture and T'ang architecture. Individually they are extremely rare but, collectively, unique.

Our investigations were cut short by the news, already a week old, that the war had begun. We left our T'ang temple for the devious journey back to Peiping and thence, with the other educational institutions, to the Southwest. In the ensuing years Shansi has been an important battleground, and the site of the temple, Tou-ts'un, from its previous obscurity has appeared again and again in the papers, sometimes as the base used by the Japanese for an offensive into the Wu-t'ai Shan, sometimes as the objective of Chinese counter-attacks. Whether there will be anything left of the T'ang building after the war is highly questionable. Already my photographs and drawings may be—I hope not—the only records of it now left.

于是它使我们理解到：那位身着世俗服装、在坛末谦恭地坐着的妇女塑像，僧侣们称之为“武后”的，原来就是宁公遇夫人本人。

假定石经幢是大殿完成后不久所立，建筑物的年代也就可以大致肯定。它比过去发现的最古老的木构建筑还早127年。它是在这些年的寻访中所遇到的唯一唐代木结构。而且在一座殿堂中，我们拥有唐代绘画、唐代书法、唐代雕塑和唐代建筑。从每项来说，它们已属难得，何况集中一起，则更是罕见。

“战争已经开始”这个迟到一周的消息，立即打断了我们的调查。我们离开了我们的唐代庙宇，迂回地回到北平，以后又随其他教育机构到了西南。在以后的几年中，山西已成为重要的战场，而唐宇所在的豆村，则从原先的默默无闻转而一次又一次地出现在报纸上，有时成为日本人进攻五台山的基地，有时成为中国人反攻的目标。战后该唐代建筑还能剩下什么是很成问题的。我不希望我的照片与图纸竟为它唯一现存的记录。

Architectural floor plan of the main hall (大殿) of the Shuangfeng Temple. The plan shows a rectangular hall with a central area for the altar (祭坛) and a smaller area for the entrance (门). Dimensions are given in meters (m). The plan includes labels for various structural elements and their positions.

Dimensions (m):

- Overall width: 426
- Overall depth: 446
- Inner width: 467
- Inner depth: 478

Labels and Notes:

- 角柱 (Corner Column)
- 山柱 (Mountain Column)
- 内额屋架长三间之广 (Inner beam span length of three bays)
- 四椽抵完全由前后由额承托 (Four rafters fully supported by front and back beams)
- 四椽抵后由后内额承托 (Four rafters supported by the rear inner beam)
- 后内柱在次间壁上 (Rear inner column on the side bay wall)
- 后加柱 (Rear added column)
- 柱径 62 (Column diameter 62)
- 支脉像 (Branching vein image)
- 内额长三间之广 (Inner beam span length of three bays)
- 前内柱在次栊间壁上 (Front inner column on the side bay wall)
- 柱径 79 (Column diameter 79)
- 四椽抵前由前由额承托 (Four rafters supported by the front beam)
- 柱径 56 (Column diameter 56)

Art and Architecture China: Arts, Language, and Mass Media 中国的艺术与建筑^[1]

〔1947〕

I. Architecture

Although the ancient Chinese never considered architecture a fine art, in China as in the West it has been the mother of the fine arts. It was through the medium of architectural decoration that painting and sculpture matured and gained recognition as independent arts.

〔 A 〕 Technique and Forms

The architecture of China is an indigenous system of construction which was conceived in the dawn of Chinese civilization and has been developing ever since. Its characteristic form is a timber skeleton or framework standing on a masonry platform and covered by a pitched roof with overhanging eaves. The spaces between the posts and lintels of the framework may be filled in with curtain walls whose sole function is to separate one portion of the building from another, or the interior from the exterior. The walls of the Chinese building, unlike those of the conventional European building, are free from the weight of the upper floors and the roof, and may be installed or omitted as required. By adjusting the proportion of the open and walled-in spaces, the architect may admit or exclude just the amount of light and air appropriate to any purpose and to any climate. This high degree of adaptability has enabled Chinese architecture to follow Chinese civilization wherever it has spread.

As the Chinese system of construction evolved and matured, rules like the orders of classical European architecture were developed to govern the proportion of the different members of the building. In buildings of a monumental character the order is enriched by *tou-kung*, sets of brackets on top of the columns supporting the beams

within and roof eaves without. Each set consists of tiers of outstretching arms called kung, cushioned with trapezoidal blocks called tou. The tou-kung are functional members of the structure, carrying the beams and permitting the deep overhang of the eaves. As they evolved, they assumed different shapes and proportions. In earlier periods they were simple and large in proportion to the size of the building; later they became smaller and smaller and more complicated. Hence they serve as a convenient index to the date of construction.

The planning problem of the Chinese architect is not that of partitioning a single building, since the framing system makes the interior partition mere screens, but of placing the various buildings of which a Chinese house is composed.

壹 建筑

中国人从未把建筑当成一种艺术，但像在西方一样，建筑一直是艺术之母。正是通过作为建筑装饰，绘画与雕塑走向成熟，并被认作是独立的艺术。

〔1〕技术与形式

中国建筑是一种土生土长的构筑系统，它在中国文明萌生时期即已出现，其后不断得到发展。它的特征性形式是立在砖石基座上的木骨架即木框架，上面有带挑檐的坡屋顶。木框架的梁与柱之间，可以筑幕墙，幕墙的唯一功能是划分内部空间及区别内外。中国建筑的墙与欧洲传统房屋中的墙不同，它不承受屋顶或上面楼层的重量，因而可随需要而设或不设。建筑设计者通过调节开敞与封闭的比例，控制光线和空气的流入量，一切全看需要及气候而定。高度的适应性使中国建筑随着中国文明的传播而扩散。

当中国的构筑系统演进和成熟后，像欧洲古典建筑柱式那样的规则产生出来，它们控制建筑物各部分的比例。在纪念性的建筑上，建筑规范由于采用斗拱而得到丰富。斗拱由一系列置于柱顶的托木组成，在内部它承托木梁，在外部它支承屋檐。一攒斗拱中包括几层横向伸出的臂，叫“拱”，梯形的垫木叫“斗”。斗拱本是结构中有功能作用的部件，它承托木梁又使屋檐伸出得远一些。在演进过程中，斗拱有多种多样的形式和比例。早期的斗拱形式简单，在房屋尺寸中占的比例较大；后来斗拱变得小而复杂。因此，斗拱可作为房屋建造时代的方便的指示物。

由于框架结构使内墙变为隔断，所以中国建筑的平面布置不在于单幢房屋之内部划分，而在于多座不同房屋的布局安排，中国的住宅是由

这些房屋组成的。

These are usually grouped around courtyards, and a house may consist of an indefinite number of such courtyards. The principal buildings are usually oriented toward the south, so that a maximum amount of sunlight can be admitted in winter, while the summer sun is cut off by the overhanging eaves. Apart from the variations required by special topographical conditions, the same general principles apply to all domestic, official, and religious architecture.

[B] Historical Development

The oldest architectural remains in China are some tombs of the Han Dynasty. Both the burial chamber and the ch'üeh, or gate piers, include translations into stone of timber construction, showing a highly accomplished carpenter's art rendered by an equally masterful touch of the sculptor's chisel. The important role played by the tou-kung is seen even in that early period.

No timber structure built during the long interval up to the middle of the 8th century AD has as yet been found standing in China. Yet glimpses of the outward appearance of such structures may be gathered from the details of construction in some of the cave temples and from the paintings on their walls. In the caves of Yun-kang, near Ta-t'ung, Shansi, constructed about 452–494 AD, and in those of Hsiangtang Shan, on the border of Honan and Hopeh Provinces, and T'ien-lung Shan, near Yanku (Tai-yuan), Shansi, which were built about 550–618 AD, the facades and interiors are treated architecturally, carved from the rock cliffs to emulate the contemporary timber structures. On the tympanum of the west portal of the Tz'u-en Ssu pagoda (701–704 AD), in Sian (Chang'an), Shensi, is an engraving showing in accurate detail a Buddhist temple hall. The frescoes on the walls of the 6th to 11th centuries caves at Tun-huang, Kansu, are paradise scenes with elaborate architectural backgrounds. These relics are graphic records of the architecture of a period that has left us no standing specimens. Here, too, we notice the importance of the tou-kung, whose evolution may be clearly traced.

Such indirect evidence of the character of early Chinese architecture is well supported by groups of buildings still standing in Japan. They were erected in the Suiko (Asuka), Hakuho, Tempyo, and Konin (Jogan) periods, corresponding to the Sui and T'ang Dynasties in China. In fact, until the middle of the 19th century the architecture of Japan reflected as in a mirror the changing styles of continental builders. The early Japanese structures may justifiably be called

colonial Chinese, and some are actually known to have been erected by continental architects.

房屋通常围绕院子安排。一所住宅可以包含数量不定的多个院子。主房大都朝南，冬季可射入最多的太阳光，在夏天阳光为挑檐所阻挡。除了因地形导致的变体，这个原则适用于所有的住宅、官府和宗教建筑物。

〔2〕历史的演变

中国最古的建筑遗存是一些汉代的坟墓。墓室及墓前的门墩——阙，虽是石造的，形式却是仿木结构，高起的石雕显现着同样高超的木匠技艺。斗拱在如此早期的建筑中已具有重要作用。

在中国至今没有发现存在公元8世纪中叶以前漫长时期里所造的木构建筑。但从一些石窟寺的构造细部和它们墙上的壁画我们可以大略知晓8世纪中期以前木构建筑的外貌。山西大同附近的云冈石窟建于公元452年至494年；河南、河北交界处的响堂山石窟和山西太原的天龙山石窟建于公元550年至618年间，它们是在石崖上凿成的佛国净土，外观和内部都当作建筑物来处理，模仿当时的木构建筑。陕西西安慈恩寺大雁塔西门门楣石刻（公元701年至704年）准确地显示出一座佛寺大殿。甘肃敦煌公元6世纪到11世纪的洞窟的壁画中画的佛国净土，建筑背景极其精致。这些遗迹是未留下实物的时代的建筑状况的图像记录。在这样的图像中，我们也看到斗拱的重要性，并且可以从中追踪到斗拱的演变轨迹。

这些中国早期建筑特点的间接证据可从日本现存的建筑群得到支持。它们造于推古（飞鸟）、白凤、天平 and 弘仁（贞观）时期，^[2] 相当于中国隋朝和唐朝。事实上，到19世纪中期为止，日本的建筑像镜子一样映射着中国建筑不断变化着的风格。早先的日本建筑可以被称之为中国殖民式建筑，而且那里有一些建筑物还真是出于中国匠人之手。

Earliest of these is the Horyuji group, near Nara, which was constructed by Korean builders and completed in 607 AD. Another is the Kondo of the Todaiji, Nara, built by the Chinese monk Ganjin (Chien-chen, died 763 AD) in 759 AD.

The oldest extant wooden structure in China itself is the main hall of the Buddhist temple Fo-kuang Ssu, Wu-t'ai Shan, Shansi. It is a one-story building of seven bays, with tou-kung of gigantic size, showing an unparalleled vigor and dignity in proportion and design. The temple was built in 857 AD, shortly after the nationwide Buddhist persecution of 845 AD. It is the only wooden structure known to date from the T'ang Dynasty, the golden age of Chinese art. The hall houses specimens of sculpture and calligraphy and a fresco frieze, all of the same period. The congregation in one spot of all the major arts of

T'ang date makes this temple and its contents a unique treasure in China.

Wooden structures of later periods are found in increasing numbers. A few of the more outstanding monuments may be chosen to represent the Sung Dynasty, together with the contemporaneous Liao and Chin Dynasties.

The Hall of Kuan-yin (Goddess of Mercy) of the Tu-lo Ssu, Chi Hsien, Hopeh, was built in 984 AD. It is a two-story structure containing an eleven-headed Kuan-yin, standing upright. A mezzanine story is inserted between the two main stories, so that the structure is actually built of three superposed "orders." Here the function of the tou-kung is shown to best advantage.

The group of buildings at Tsin-tz'u, near Yanku, was built about 1025. The two principal buildings are each one story in height, but the main hall has double-decked eaves. The main hall of the Hua-yen Ssu, Ta-t'ung, is a huge single-story structure with single-decked eaves. Built about 1090, it is one of the largest Buddhist structures in China. Of considerably later date (1260) is the main hall of the Pei-yueh Miao, Chuyang, Hopeh. The inner structural members supporting the upper part of the roof have been extensively rebuilt, but the lower part and the outward appearance of the building as a whole are essentially unaltered.

A comparative study of these few examples reveals that the tou-kung tends to become smaller and smaller in proportion to the building. Another common characteristic is an increase in the height of the columns toward the corners of the building. This latter refinement brings about a gentle curvature of the eave line (with the exception of the Hua-yen Ssu hall), and of the roof ridge, giving an appearance of elegance.

最早的是奈良附近的法隆寺建筑群，由朝鲜工匠建造，公元607年建成。奈良唐招提寺金堂是中国鉴真和尚（公元763年去世）于公元759年建造的^[3]。

中国现存最早的木构建筑是山西省五台山佛光寺大殿。它单层七间，斗拱雄大，比例和设计无比地雄健庄严。大殿建于公元857年，在公元845年全国性灭法后数年。佛光寺大殿是唯一留存下来的唐代建筑，而唐代是中国艺术史上的黄金时代。寺内的雕塑、壁画饰带和书法都是当时的作品，这些唐代艺术品聚集在一起，使这座建筑物成为中国独一无二的艺术珍品。

唐朝以后的木构建筑保留的数量逐渐增多。一些很杰出的建筑物可以作为宋代和同时期的辽代与金代的代表。

河北省蓟县独乐寺观音阁建于公元984年。这是一座两层建筑，当

中立着一座十一面观音像。两个楼层之间又有一个暗层，实际是三层。在观音阁上，斗拱的作用发挥到极致。

太原附近晋祠的建筑群建于公元1025年，两座主要建筑物都是单层，但主殿为重檐。大同华严寺大殿是一座巨大的单层单檐建筑，建于公元1090年，是中国最大的佛教建筑物之一。许多年后的公元1260年，河北曲阳的北岳庙建成，它的屋顶上部构件经过大量改建，但其下部及外观整体基本未变。

对上述这些建筑物的比较研究表明，斗拱与建筑物整体的比例越来越小。另一共同特点是越往建筑物的两边柱子越高。这一细致的处理使檐口呈现为轻缓的曲线（华严寺大殿是个例外），屋脊也如此，于是建筑物外观变得柔和了。

With the coming of the Ming Dynasty, the subtle refinements disappeared. This trend is especially noticeable in the monuments built under imperial patronage, and is best exemplified in the sacrificial hall at the tomb of Emperor Yung Lo, built in 1425 at Changping, Hopeh, 25 miles (40 km) north of Peking. Here the tou-kung has shrunk to insignificance; its presence can be detected only at close view.

Despite the retrogressive features of individual building of the Ming and Ts'ing Dynasties, we have in the imperial palaces of Peking a superb example of planning on the grandest scale, showing the aptitude of the Chinese for conceiving and executing a design of colossal proportions. The hundreds of audience halls and apartments within the Forbidden City, a walled enclosure measuring about 3350 feet (1020 meters) by 2490 feet (760 meters), are mainly structures of the late Ming and the Ts'ing Dynasties. The entire area was conceived as a single architectural unit, with one main axis dominating the Forbidden City and the entire Imperial City surrounding it. The halls, pavilions, verandas, and gates are grouped in innumerable courtyards connected by colonnades. The buildings themselves are raised on white marble terraces. Columns and walls are generally painted red, while the tou-kung are decorated with intricate designs in blue, green, and gold, forming a cool belt which accentuates the deep shady overhang of the eaves. The whole structure is crowned by a roof of glazed yellow or green tiles. The ingenuity of the Chinese in applying color to architecture on an all-inclusive scale has never been equaled.

〔C〕 Multi-storied Timber Structures

Because of the limitations of the material, high structures in timber are rare. The best known is the Ch'i-nien Tien of the Temple of Heaven, Peking. It is a building of circular plan, standing on three

tiers of white marble terraces and crowned by three tiers of blue glazed tile roofs, the uppermost of which converges into a cone whose apex is about 108 feet (33 meters) above the ground.

The finest example of multi-storied timber construction in China is the little-known wooden pagoda of Ying Hsien, Shansi. Erected in 1056, it is a five-story structure with four additional mezzanine stories, built on an octagonal plan. Each of its main and mezzanine stories is a complete "order" in itself. The pagoda as a whole therefore comprises nine superposed "orders." Scarcely any of its members is idle: every timber has its part in supporting the building. The top roof, which is an octagonal cone, is surmounted by a wrought iron spire whose tip is 215 feet (65 meters) above the ground. Although most of the early pagodas were of wood, this is the only one of its kind still standing in China.

到了明朝，精巧的处理消失。这个趋势在皇家的纪念性建筑中尤其明显。建于公元1425年、北平以北40公里的河北省昌平区明朝永乐皇帝陵墓的大殿是突出的例子。它的斗拱退缩到无足轻重的地步，非近观无法看见。

虽然明、清两代的个体建筑退步，但北平故宫是宏伟的大尺度布局的佳例，显示了中国人构想和实现大范围规划的才能。紫禁城用大墙包围，面积为3350英尺×2490英尺（1020米×760米），其中有数百座殿堂和居住房屋。它们主要是明、清两代的建筑。紫禁城是一个整体。一条中轴线贯穿紫禁城和围绕它的都城。殿堂、亭、轩和门围着数不清的院子布置，并用廊子连接起来。建筑物立在数层白色大理石台基上。柱子和墙面一般是刷成红色的。斗拱用蓝、绿和金色的复杂图案装饰起来，由此形成冷色的圈带，使檐下更为幽暗，显得檐部挑出益加深远。整个房屋覆在黄色或绿色的琉璃瓦顶之下。中国人对房屋整体所作的颜色处理，其精致与独创性举世无双。

〔3〕多层木构建筑

因为材料的限制，高层木构建筑很少。北京天坛祈年殿是著名的高大木构建筑。这是一座圆形建筑，立在三层白色大理石基座上，上部为三层蓝色琉璃瓦顶，最高层束成圆锥形。顶尖高于地面108英尺（33米）。

最好的一个多层木构建筑是山西应县木塔，但不那么有名。它建于公元1056年，有五个明层和四个暗层，平面为八角形。木塔的每一层，不论明暗，都有完整的木构架。因此全塔由九个构架累积而成。其中每一构件都起支承作用，没有多余之物。塔顶屋面为八角锥体。最上为铁铸塔刹，最高点距地面215英尺（65米）。虽然早期大多数塔为木塔，但应县木塔是该类型的塔的唯一留存者。

[D] Masonry Pagodas

The early wooden pagodas have disappeared, but many of their counterparts in brick—or, in rare cases, stone—have survived the destructive forces of man and nature. Contrary to the general assumption, the design of the Chinese pagoda was not imported from India; rather, it is a cross between the architectural ideas of the two civilizations. The body is entirely Chinese, the Indian element finding expression only in the spire, which is derived, often in much modified form, from the stupa. Many of the pagodas are brick and stone translations of wooden prototypes embodying the traditional Chinese architectural conceptions.

Chinese masonry pagodas may be divided into five principal types:

1. One-story Pagodas

A stupa is a monument marking the site where some Buddhist relic is buried; the tomb stupa of a deceased monk may properly be called a pagoda. Most of the bomb stupas of the 6th to the 12th centuries are small, square pavilion-like structures, one story high, with one or two strings of cornices. The earliest examples of the one-story form is the Ssu-men T'a (which is not a tomb), built in 544 AD near Tsinan, Shantung. More typical is the tomb of Hui-ch'ung at Ling-yen Ssu (mid-7th century), Changching, Shantung.

2. Multi-storied Pagodas

The multi-storied pagoda retains most of the characteristics of the indigenous multi-storied building. Counterparts in wood are still extant in Japan, but only brick structures of this type remain in China. One of the earliest and best examples is the Hsiangchi Ssu pagoda, built in 681 AD, near Sian. It is a square pagoda of 13 stories, 11 of which are intact. The stories are marked by strings of corbelled cornices; and the exterior walls of each story, in addition to their doorways and windows, have delicate reliefs of simple pilasters and architraves supporting tou.

In the Sung Dynasty the octagonal plan became general. Representation of columns or pilasters on the walls is often omitted, but the cornices are in most cases supported by numerous tou-kung. In some instances, such as the twin pagodas of Tso Hsieh, Hopeh (about 1090), the outward appearance of the wooden pagoda has been faithfully reproduced in brick.

3. Multi-eaved Pagodas

The multi-eaved type seems to be a mutation of the single-story pagoda, produced through increasing the number of cornices. In appearance, it presents a high main story crowned by a great number of closely decked eaves. The earliest example is the 12-sided, 15-story pagoda of Sung-yueh Ssu, built about 520 AD, on Sung Shan, a sacred mountain in Honan. During the T'ang Dynasty the square plan was the only one chosen for this type of pagoda. The pagoda of Fa-wang Ssu (about 750 AD), also on Sung Shan, is an excellent example.

〔4〕 砖石塔

早期木塔大都消失了，留存下来的多是砖塔，也有少数石塔，它们经受了人为的和自然的损害。与一般人的看法相反，中国塔的设计并不是从印度传入的，它们是中国与印度两种文明交会的产物。塔身完全是中国的，印度因素只在塔刹部分可以见到，它来自窣堵坡（stupa），但已大大改变。许多的砖塔或石塔演绎着木塔原型，木塔才是中国传统建筑观念的体现。

中国砖石塔有五大类型：

1. 单层塔 印度的窣堵坡是浮屠遗骸埋葬地的标志，而死去的僧人坟墓窣堵坡就叫“巴高大”(pagoda)^[4]。6世纪到12世纪的坟墓窣堵坡大都做成单层小亭子似的建筑，上面有单檐或重檐。山东济南附近的四门塔建于公元544年，是最早的单层塔的例子（它不是坟墓）。更典型的例子是山东长清灵岩寺的慧崇禅师塔墓。

2. 多层塔 多层塔保持中国土生土长多层建筑的许多特点。日本尚有多层木塔屹立至今，中国只保存了此种类型的砖塔。西安附近的香积寺塔，建于公元681年，是最早和最好的例子。那是十三层的方塔，其中十一层保存完好。楼层用叠涩砖檐分划，各层外墙上用浅浮雕显示门洞、窗子之外，尚有简单而精细的浮雕壁柱和额枋，上承大斗。

宋代多八角形塔。墙上的壁柱常被省去。砖檐常由许多斗拱支承。有些例子，如河北涿县的双塔（约公元1090年），是在砖塔上忠实地复制出木塔的外貌。

3. 密檐塔 密檐塔似乎是单层塔而上面有多重檐口所形成的变体。外观上看，它有一个很高的主层，其上为密密的多重檐口。公元520年建的河南佛教圣地嵩山嵩岳寺塔，十二边形，十五层，是最早的实例。在唐代，这种塔全采用四方形。最杰出的一例是法王寺塔（约公元750年），也在河南嵩山。

The octagonal plan was introduced about the middle of the 9th century and after the 11th century became accepted as the standard shape for a pagoda. A great number of pagodas of this type, enriched

by tou-kung under the eaves, were built in North China from the 10th to the 12th centuries. The best-known example is the pagoda of the T'ien-ning Ssu, Peking, a structure of the 11th century which has been much repaired.

4. Stupas

The stupa in its original Indian form, though known in China through the early Buddhist missionaries, was never transplanted there. When the stupa finally did become established in China, in much modified form, it arrived through Tibet in conjunction with the spread of Lamaism. The Tibetan stupa is generally bottle-shaped and raised on a high base. The best example is the stupa of Miao-ying Ssu, Peking, which was built in 1260 by Kublai Khan. Later the bottle became more slender, particularly the neck. This part, which originally resembled a truncated cone, came to resemble a smokestack. Typical of the later stupas of the Tibetan type is the one in North Sea Park, Peking, built in 1651.

5. Diamond-based Pagodas

The chin-kang pao-tso t'a, or diamond-based pagoda, consists of a group of pagodas on a common base. Its development was foreshadowed as early as the 8th century in the pagoda group of Yun-chu Ssu, Fangshan, Hopeh, which is composed of a large pagoda and four small ones on a single, very low platform. The form did not reach full architectural maturity until the Ming Dynasty. An excellent example is the Wu-t'a Ssu (Five Pagoda Temple), built in 1473 outside one of the west gates of Peking. This structure reminds the observer in various ways of the 8th-century Borobudur in Java.

[E] P'ai-lou

In most of the towns and on many of the country roads of China are found monumental archways called p'ai-lou. Although the p'ai-lou is considered a purely Chinese architectural concept, one cannot fail to notice an analogy between this form and the gateways of the railings surrounding certain Indian stupas, such as those of Sanchi. In South China stone p'ai-lou are common; in northern cities the street scene is often enlivened by gaily painted timber ones.

9世纪中有了八角塔，到11世纪以后，这已经成了塔的标准型式。从10世纪到12世纪，在中国北方建造了大量的这种塔，檐下用斗拱装饰。最出名的一个例子是北平的天宁寺塔，建于11世纪，经过多次重修。

4. 喇嘛塔（窣堵坡） 印度窣堵坡的原貌，通过早期的佛教传布者，在中国早已为人所知，但其长期未移植于此。后来，随着喇嘛教的传播，终于通过西藏植根于中原，其形貌发生了较大的改变。西藏喇嘛塔一般做成壶形，立在高高的基座上面。公元1260年由忽必烈下令建造的北平妙应寺窣堵坡是最好一例。后来它的壶状身躯变得细巧了，塔的颈部尤其如此。这个颈部原先像截了一段的锥形，后来渐渐像烟筒。这种后出的西藏式窣堵坡的一个典型例子是北平北海公园里的白塔，建于公元1651年。

5. 金刚宝座塔 在一个基座上耸立数个塔，称金刚宝座塔。早在8世纪建造的河北省房山县云居寺塔是这种塔型的先兆。云居寺塔有一个宽阔的低台，上面立着一座大塔和四座小塔。到明代此种形制始臻于成熟。公元1473年建的北平西郊的五塔寺是一个绝好的作品，它在很多方面使人联想起公元8世纪爪哇的婆罗浮屠。

〔5〕牌楼

在中国大多数城镇和不少乡村道路上，都可见到称为牌楼的纪念性的大门。虽然牌楼纯粹是中国的建筑，但可以看到与印度桑契的窣堵坡围栏上的门有某种相似之处。中国南方多石牌楼，北方城镇的街道常有华丽的木牌楼。

〔F〕Bridges

The building of bridges is an ancient art in China. Early examples were either simple timber structures or pontoon bridges, and it was not until the middle of the 4th century AD that the arch was used to span a water barrier. The most notable example of Chinese bridge building is the Great Stone Bridge, Chao Hsien, Hopeh. This is an open-spandrel bridge (one with small arches piercing the triangular space between the roadway and the ends of the main arch) whose principal arch has a span of 123 feet (37 meters). Built in the Sui Dynasty, it is a feat of engineering to amaze even a modern engineer. The more common type of bridge, exemplified by the celebrated Marco Polo Bridge near Peking, uses intermediate piers. Suspension bridges are often employed in the mountainous regions of Southwestern China, and bridges with huge stone lintels, sometimes measuring 70 feet (20 meters) or more, are not uncommon in Fukien.

〔6〕桥梁

造桥在中国是一种古老的技艺。早期的例子是简单的木桥或是浮桥。直到4世纪中期以后开始用拱券跨过水流。中国桥梁建造最有名的

一个例子是河北赵县的大石桥。它是一座敞肩拱桥（在主拱两头桥面以下的三角形部位，又开着小拱洞）。赵州桥的主拱跨度为123英尺（37米）。赵州桥建于中国隋代，是使现代工程师感到惊讶的工程奇迹。较常见的一种拱桥可以北平著名的马可波罗桥^[5]为例，有许多桥墩。中国西南部的山区常用悬索桥。福建有许多用长长的石梁和石墩造的桥，有的总长度^[6]可达70英尺（20米）。

II. Painting

Painting as an art first appeared in China in the form of decorations on banners, dresses, gates, walls, and other surfaces. The aesthetic appeal and suggestive power of this medium were utilized by kings and emperors of the earliest days as a convenient means of teaching and governing the people.

〔A〕Pre-T'ang Painting

In the Han Dynasty the art of painting reached technical maturity, and murals were used to decorate the interiors of halls and palaces. In 51 BC, Emperor Hsuan-ti (reigned 73 BC–49 BC) ordered portraits of 11 of his ablest generals and ministers, who had brought about the surrender of the shan-yu (king) of the barbarian Hsiung-nu, painted on the walls of Ch'i-lin Ke—an indication that portrait painting had already become a recognized art. Paintings were executed on walls and on silk. A considerable number of paintings on silk are reported to have been included in the imperial collections of the T'ang Dynasty, but these have disappeared.

贰 绘画

作为艺术的绘画，在中国首先作为装饰出现在旗帜、服装、门、墙及其他东西的表面上。早先的帝王们利用这种媒介的审美感染力和权势暗示力得心应手地教化和统治人民。

〔1〕唐以前的绘画

在汉代，绘画技术已趋成熟，壁画被用来装饰宫殿内部。公元前51年，汉宣帝（公元前73—公元前49年在位）命令为十一名在降服匈奴首

领单于过程中立功的大臣和将军画像于麒麟阁内墙上。这件事表明画像在当时已被承认为一种艺术。当时的绘画不是画在墙壁上便是画在绢上。据记载，唐朝宫廷收藏了大批绢画，但实物没有留下来。

A painted brick discovered in a tomb at Naknang (Lolang), Korea, which was the capital of a Chinese province from 108 BC to 313 AD, is in the Museum of Fine Arts, Boston. It affords a glimpse of painting in a frontier province of the great Han Empire. Numerous stone slabs with designs engraved or in relief also provide indirect but valuable evidence of the character of Han mural painting.

The oldest existing Chinese scroll painting, attributed to Ku K'ai-chih (344 ?–406 ? AD), is treasured in the British Museum in London. Ku K'ai-chih was a celebrated painter of the Chin (Tsin) Dynasty. The scroll, probably a T'ang copy, is labeled Admonitions of the Instructress to the Court Ladies and depicts scenes illustrating a series of proverbs or morals. The figures are painted with a brush on silk, in lines of great accuracy and dexterity, but no attempt was made to set them against a background. The painting shows conceptions of the human form and of space which still adhere to some extent to the archaic methods of presentation on the Han relief stone slabs. Yet it also contains the essential characteristics of the 5th- and 6th-century Buddhist sculpture.

[B] Painting of the T'ang Dynasty

Painting, like other branches of art, blossomed into its full glory during the T'ang Dynasty. Yen Li-teh and his brother Yen Li-pen (about 600–673 AD) are the first of a long list of great T'ang painters. Li-teh was also an architect, while Li-pen was the greater painter. Attributed to the latter is the scroll Portrait of Emperors and Kings, in the Museum of Fine Arts, Boston, in which many of the characteristics of the Ku K'ai-chih scroll are traceable.

Wu Tao-tzu (about 700–760 AD) became the most celebrated Chinese painter. The first to make full use of the flexible of the brush, he employed undulating lines varying in thickness, with third-dimensional effects. This was a radical departure from the wirelike lines of the earlier painters and gave him greater freedom of expression. "Wu's wind-blown draperies" became a phrase familiar to every student of Chinese painting, and succeeding painters depicted movement ever more vividly. Wu, with his free and masterly brush, excelled in painting subjects of all kinds, sacred and secular—figures, animals and plants, landscape, and architecture. The number of his murals recorded in the *Li-tai Ming-hua Chi* (*Famous Paintings of All*

Ages) by Chang Yen-yuan (late T'ang) totals more than 300. Most have been destroyed.

朝鲜的乐浪在公元前108年至公元313年是中国的一个郡，^[7] 那里的一处坟墓中出土一块有绘画的砖，现藏于美国波士顿美术馆。它让我们看到了当时汉帝国边疆省份的绘画作品。大批带有线刻和平浮雕的石板是汉朝壁画的特点的间接然而有价值的证物。

现存最早的中国画卷被认为是顾恺之（公元344—406年）的作品，现在珍藏于伦敦大英博物馆。顾恺之是东晋时的著名画家。那卷画可能是唐代的摹本，题名《女史箴》，画的内容是图解一系列道德箴言。人物用毛笔在绢上画成，线条精确流畅，但不画背景。人物形象和空间的表现现在相当程度上保持汉朝画像石的古拙风格，但同时显露出5世纪至6世纪佛教雕塑的主要特征。

〔2〕唐代的绘画

绘画和别的艺术门类一样，在唐代进入繁盛期。阎立德和阎立本（约公元600—673年）兄弟二人名列一大串唐代大画家名单之首。立德兼作建筑家，立本是更大的画家。阎立本的《历代帝王图卷》现藏波士顿美术馆，其中许多笔意可追溯到顾恺之的画卷中去。

吴道子（约公元700—760年）是最有名的中国画家，他第一个把毛笔的灵活性发挥至极致。他运用深浅不同的波动的线条表现三度空间的效果。摆脱早期线条的僵硬性，表现极为自由。每一个学中国画的学生都知道“吴带当风”之说，后继的画家因而更鲜活地表现运动。吴道子以他自由而纯熟的笔，在画中精妙地画出各式各样的题材——神和人，动物和植物，风景和建筑。据晚唐张彦远《历代名画记》记载，吴道子的壁画作品有三百件之多，多已损毁。

By the T'ang Dynasty, decorating temple walls with paintings had become almost a universal practice. Several hundred items are recorded in the *Li-tai Ming-hua Chi*: scenes of paradise and hell, images of Buddha, Bodhisattvas, Lokapalas, demons, and other legendary beings. And these were from collections in the two capitals only—from Sian and Loyang (Honan). There were also many paintings by lesser artists in other cities and on the sacred mountains. Almost no works of this kind have been preserved in the central provinces, but the caves of Tun-huang on the Silk Road are a rich source of information on Buddhist mural painting in a frontier province.

By the beginning of the 8th-century landscape, which was to become the noblest form of Chinese painting, had freed itself from its role as a mere background to figure painting. Li Ssu-hsun, who was born about 651 AD and died in 716 AD, and his son, Li Chao-tao, are generally recognized as the liberators of landscape painting. Known as

the Two Li Generals, they founded the Li or northern school of painting. The work of this school is characterized by careful, wirelike drawings colored with bright blue and green and accented with specks of gold and vermillion. It is highly decorative but somewhat stiff, with every detail minutely and laboriously depicted. While the Two Li Generals were perfecting this style, Wu Tao-tzu painted on the walls of the Ta-t'ung palace, in one day, in ink and only faintly tinted with colors, the panoramic Three Hundred Li on the Chialing River—a work widely different in technique and style from the products of the Li school.

About a half century later, the poet-painter Wang Wei (699–759 AD) was to be hailed as the master of ink landscape. His work, in contrast to the rigid draftsmanship of the Li school, is characterized by boldness and freedom. Wang Wei excelled in depicting mist and water and was the first to succeed in capturing atmosphere in nature. It is said of him that there are pictures in his poetry and poetry in his pictures. He, too, had his followers, and was hailed by Ming critics as the founder of the southern school of landscape painting, just as the Li Generals were called the founders of the northern school.

Among other great T'ang painters were Ts'ao Pa and Han Kan (about 750 AD), both celebrated for their pictures of horses, and Chou Fang and Chang Hsuan (late 8th century), who depicted domestic and feminine scenes. A copy of one of Chang's scrolls, made by Emperor Hui-tsung (reigned 1101–1125 AD) of the Sung Dynasty, is in the Museum of Fine Arts, Boston.

在唐代，用壁画装饰寺庙墙壁蔚然成风。《历代名画记》记载了数百幅，其中有佛国净土和地狱，佛陀、菩萨、护世天王、恶魔及其他神话人物。而这只是对长安和洛阳两个首都的寺庙壁画的记录。在其他城镇和名山圣地还有众多二流画家的作品。在中原省份这些壁画几乎早消失了。但是在丝绸古道上的敦煌石窟是有关边陲佛教壁画信息的富源。

到8世纪初左右，山水从人物画的背景独立出来，将要成为中国画中最高尚的一个品类。李思训约生于公元651年，歿于公元716年，他和他的儿子李昭道被普遍认为是山水画的解放者。他们被称为“大小李将军”，创立了“北派”或称“李派”山水画。其特点是采用精致而挺拔的线条、鲜艳的青色和绿色，重点的地方加上金或朱红色点。这种画极富装饰性，笔触细致入微，不免流于匠气。当大小李将军在完善他们的风格时，吴道子在大同宫的墙壁上用墨和淡色作画，一天就完成了《嘉陵江三百里山水》，其技法与风格与“二李”作品迥异。

又过了大约半个世纪，诗人画家王维（公元699—759年）被认为是水墨山水画大家。他的作品的特点是自由而大胆，也与“二李”僵化的匠气风格成鲜明对照。王维善于表现雾和水，是成功地描绘大自然神韵的第一人。他被认为是“画中有诗，诗中有画”。他也有追随者。明代的评

论家指出，王维是“南派”山水画的始祖，正如“二李”是“北派”的创立者。

唐代大画家还有曹霸与韩干（约公元750年），两人以画马著称。周昉和张萱（8世纪晚期）擅长画家庭生活及妇女。宋朝皇帝徽宗（公元1101—1125年在位）临摹张萱的一个画卷的摹本现藏波士顿美术馆。

〔C〕 Five Dynasties and Sung

During the chaotic Five Dynasties period there flourished a number of artists who heralded the great Sung painters. Ching Hao, who lived at the end of T'ang and the beginning of this period, was the master of the great landscapist Kuan T'ung who exerted a tremendous influence on the landscape painting of the Sung Dynasty. The monk Kuan-hsiu, who was active about 920 AD, was famous for his figures, particularly lohans. Hsü Hsi and Huang Ch'üan were painters of birds and flowers.

Mural painting, though less popular than it had been in the T'ang period, was still common during the Northern Sung Dynasty, and a few Sung murals have escaped destruction and survived for posterity. In the Tun-huang caves are examples of the work done in a frontier province.

Working at the court academy under imperial patronage were such great painters as Kuo Hsi (1020–1090), the landscapist, and Huang Chü-ts'ai, son of Huang Ch'üan, who like his father painted birds and flowers but was a finer artist.

Among the scholar painters of the early Sung period, Li Ch'eng and Tung Yüan (late 10th century) are generally recognized as the greatest landscapists. Another painter, Fan K'uan, often covered his hilltops with heavy vegetation, and placed high, rugged cliffs along riverbanks. Mi Fei (1051–1107) filled his scenes with heavy mists and clouds, and rendered his protruding hilltops with the horizontal, broad, short "egg-plant" strokes so much imitated by later painters. Li Lung-mien (Li Kung-lin, 1040–1106) is well known to the Western world. His line drawings of figures and horses, executed with extreme facility and dexterity, are examples of the highest achievement in draftsmanship.

Toward the end of the Northern Sung Dynasty, Emperor Hui-tsung, himself an accomplished artist who aimed at extreme naturalism, became a great patron of art. Nevertheless, though he devoted far more attention to the academy than had earlier emperors,

it did not produce any outstanding artist.

While painting in general flourished in the Southern Sung Dynasty, Buddhist painting receded into almost complete obscurity. By this time Buddhism had died out in the land of its origin. Confucian scholars launched merciless attacks on it, and the Buddhists themselves, now dominated by the Ch'an (Zen) sect, while not entirely iconoclastic, substituted meditation for image worship. Buddhist painters of this period preferred such themes as "Kuan-yin in White Dress by the Moonlit Pool," "Meditating Sages," or "Sixteen Lohans"—themes which were not bound by rigid rules calling for dignity and symmetry, as were the religious paintings of earlier periods.

〔3〕五代和宋朝的绘画

在混乱的五代，有一批艺术家风华正茂，他们是宋朝画家的先驱者。荆浩生活于唐末和五代之初，是大山水画家关仝的老师，他对宋代山水画有重大影响。贯休和尚活跃于公元920年前后^[8]，擅长人物，尤善画罗汉。徐熙和黄筌是花鸟画家。

这一时期壁画虽不若唐代兴盛，但在北宋仍是常见。少数宋代壁画逃过劫难，留至后世，敦煌石窟有宋代壁画，是边陲的作品。

宋代宫廷画院中聚集了许多著名画家。如山水画家郭熙（约公元1020—1090年），黄筌的儿子、同为花鸟画家但略胜一筹的黄居寀。

宋代初年的文人画家有李成和董源（10世纪末），是山水画大家。范宽画山覆有厚厚的植被，河流两旁岩峰峥嵘。米芾（公元1051—1107年）的山水画云雾缭绕，高耸的山顶散落着短、平、宽的墨点，后世画者多有仿效。李龙眠（李公麟，公元1040—1106年）的作品现在西方很著名。他用线条画人和马，极其娴熟流畅，为笔墨技法的最高成就。

北宋末期，徽宗皇帝本人在艺术上有很高的造诣，他追求极端的自然主义。徽宗醉心于书画，对宋代画院的兴盛起到推动作用。不过尽管他比先前的君王更重视画院，画院却没有再出现伟大的画家。

南宋的画风仍盛，但佛教绘画却由盛转衰，日渐湮没。其时佛教在其发源地印度近于消失。中国儒家学者无情地攻击佛教。佛教徒中禅宗成为主流，他们虽然不是彻底的偶像破坏者，但注重冥想而不重偶像崇拜。这时佛教画家偏爱的题材多是“月下湖畔的白衣观音”、“沉思中的贤者”或“十六罗汉”之类。这一类作品脱出了早期佛教绘画要求庄严、对称的严格规矩的束缚。

In a world dominated by neo-Confucianism and Ch'an Buddhism, painters turned to landscape as their preferred medium of expression. In the late 12th and early 13th centuries the academy numbered a

host of great landscape painters, including Liu Sung-nien, Liang K'ai (about 1203), Hsia Kuei (about 1195–1224), and Ma Yüan (about 1190–1225). Liu Sung-nien excelled in landscape of the blue-and-green (Li) style, and Liang K'ai was a master of the technique of line drawing of human figures against a landscape background, also in line. But the two great figures in ink landscape of the Southern Sung Dynasty were Hsia Kuei and Ma Yüan. Hsia Kuei's strength and boldness are best seen in his famous *Ten Thousand Li of the Yangtze River*. Ma Yüan, who placed his horizons rather low, is more readily appreciated by Westerners. His landscapes, in contrast to those of Hsia Kuei, are marked by tranquility and delicate atmosphere, best illustrated by a pine tree silhouetted against a misty background, a motif familiar to every student of Chinese painting. Up to his time, Chinese landscape painters had tried to include all they saw. Ma Yüan's compositions show merely a few rocks and one or two trees. This pattern—simple in construction and sparse in detail—is perhaps closer to the Western conception of landscape painting than the all-inclusive of the Yüan Dynasty.

[D] Yüan Painting

The comparatively short Yüan period had a number of great painters. Chao Meng-fu (1254–1322), best known as a painter of human figures and horses, was equally at home with landscape. He was also calligrapher of the first rank. His best-known work is the *Horse with Groom*. Among the scholars who avoided Mongol officialdom was Ch'ien Hsüan (1235–about 1290), renowned as a painter of flowers, birds and insects.

Wu Chen (1280–1354), Huang Kung-wang (1261–1354), Ni Tsan (1301–1374), and Wang Meng (died 1385) are honored as the Four Great Masters of Yüan. They were all landscape painters. Wu Chen treats his material somewhat heavily, but he has a keen sense of space. He is also well known for his bamboos. In striking contrast are the airy scenes of Huang Kung-wang and Ni Tsan, who used washes very sparingly, obtaining their effects with lines consisting mainly of dry brush strokes. This is particularly true of Ni Tsan, who emphasized this style through his choice of extremely simple subjects. Wang Meng painted his scenes heavily, building them up laboriously with individual strokes.

在新理学和禅宗佛教统治之下，山水画成了画家们最喜爱的表现媒介。12世纪末到13世纪初，画院又产生一批著名的山水画家，其中有刘松年、梁楷（约公元1203年）、夏珪（约公元1195—1224年）和马远（约公元1190—1225年）。刘松年的青绿山水超过“二李”。梁楷善用线

条画人物，背景中的山水也用线条画。但是南宋时期水墨山水画大家首推夏珪和马远二人。夏珪的《长江万里图》充分表现出他的大胆和力度。马远画作中地平线安排得靠下，更受西方人的赏爱。马远的山水画与夏珪不同，他表现一种静寂精致的情调，如云雾背景中的松树。每个学中国画的学生对此题材都极谙熟。在马远以前，画家总是把看见的东西都收入画内。马远的画只有几处山石和一二株树。构图简洁，细部略省，比元代包罗万象的作品更接近西方人对于风景画的观念。

〔4〕元代绘画

年代较短的元朝有很多大画家。赵孟頫（公元1254—1322年）以画人物和马著称，但亦擅长山水，同时又是第一流的书法家。他的最著名的画是《鞍马图》。在元朝避官不仕的知识分子中，钱选（公元1235—约1290年）^[9]是著名的花鸟画家。

吴镇（公元1280—1354年）、黄公望（公元1261—1354年）^[10]、倪瓒（公元1301—1374年）和王蒙（公元1385年卒）被推崇为元代四大家。他们都是山水画家。吴镇下笔厚重，但富有空间感，他也擅长画竹。与吴镇鲜明对照的是黄公望及倪瓒，此二人很少用渲染，多用枯笔。倪瓒尤其如此，他常画简单的对象以突出他的风格。王蒙风景画浓墨重笔，一笔一画极为工整。

〔E〕Ming and Ts'ing Dynasties

The Ming Dynasty, relatively recent, has left us many paintings. Mural painting became rare, but some examples which have come down to us, such as those in the Fa-hai Ssu, near Peking, show superlative craftsmanship. Yet connoisseurs and critics do not classify these murals as art, looking to the scrolls alone for the work of the great masters. Early Ming academicians strove to emulate T'ang and Sung paintings, but the spirit of their work is entirely different. Wu Wei, the landscape painter, who modeled himself on Ma Yüan, became the founder of the so-called Che (Chekiang) school. Pien Wen-chin (Pien Ching-chao, about 1430) and Lü Chi (about 1500) were well known for their flowers and birds in the manner of Huang Ch'üan and Huang Chü-ts'ai; Lin Liang founded a school in which the same subjects were treated in an extremely facile and sketchy manner. The leading exponent of the Che school is Tai Chin (Tai Wen-chin, about 1430-1450), originally an academician, but expelled from the academy through the intrigues of jealous colleagues. Like all painters of the period, he modeled himself upon Sung masters—specifically, on Ma Yüan—but created a style of his own, simple and articulate in stroke, light in rendering.

〔5〕明清绘画

明代离我们不远，留下较多的画作。壁画很少了，但有些留传至今，如北平附近的法海寺就有明代壁画，技艺相当不错。可是鉴赏家和评论者不把那些壁画看作艺术品，他们只把卷轴画看作艺术家的作品。明代初期士人们努力仿效唐宋的绘画，但他们的作品的气质与唐宋大不相同。山水画家吴伟追学马远，却创立了“浙派”。边文进（边景昭，约公元1430年）和吕纪（约公元1500年）以花鸟画著称，风格接近黄筌和黄居寀。林良创立一个画派，作花鸟画特别流畅，类似速写。“浙派”的最重要的诠释者是戴进（字文进，约公元1430—1450年）^[11]，本是画院画家，后受人嫉害被逐出画院。像当时所有的人那样，他追从宋代大师，尤重马远，结果却创立了自己的画派，画风简洁清新。

Both the academic and the Che schools gradually died out, the latter being reincarnated in the "literary man's style," best represented by the Four Masters of Ming: Shen Chou (1427-1509), T'ang Yin (1470-1523), Wen Cheng-ming (1470-1559), and Tung Ch'i-ch'ang (1554-1636). Ch'iu Ying (about 1522-1560), who learned his craft as a lacquer painter, was a master of detail. In his paintings we see the pleasures of everyday life exquisitely and faithfully recorded. A salient characteristic of Ming painters is their masterly manipulation of the brush. It does not merely make a line or a wash; it conveys tone, strength, and spirit. In this dynasty the technique of the brush attained perfection.

Ts'ing Dynasty art is a continuation of the Ming tradition. Early in this period the southern school of landscape painting, best represented by the four Wangs—Wang shih-min (1592-1680), Wang Chien (1598-1677), Wang Hui (1632-1717), and Wang Yüan-ch'i (1642-1715)—came into prominence.

学院派和“浙派”都渐渐消失了。后者演变成所谓的“文人画”风格。明代“文人画”的四大代表者是沈周（公元1427—1509年）、唐寅（公元1470—1523年）、文征明（公元1470—1559年）和董其昌（公元1554—1636年）。仇英（约公元1522—1560年）^[12]原来学习漆画，是工笔画大师，他的作品细致忠实地记录下当时日常生活的乐趣。明代画家有一个突出的共同点，即毛笔的运用极为熟练，笔画出不止是一根线或一小片油墨，还表达出风格、力度和气韵。明代毛笔的运用达到完美的程度。

清代艺术承继了明代的传统。清初“南派”山水画的代表是“四王”，他们是王时敏（公元1592—1680年），王鉴（公元1598—1677年），王翬（公元1632—1717年），王原祁（公元1642—1715年）。

Wang Shih-min and Wang Chien, who took Tung Yüan and Huang

Kung-wang as their masters, formed the vanguard of Ts'ing painting. The former is known for his bold brush strokes. Wang Hui was a disciple of Wang Shih-min, and excelled him in control of the medium. He is said to have combined the northern and southern schools, and was proclaimed by his masters the Sage of Painting. Wang Yüan-ch'i, grandson of Wang Shih-min and the most learned of the four, best caught the spirit of Huang Kung-wang. He is known for his landscapes with light tinges of color.

Ch'en Hung-shou (1599–1652) originated a style in which, despite an appearance of carelessness, each stroke is skillfully conceived and precisely executed. He had many imitators. Shih T'ao was another "careless" painter of landscapes and bamboos. Both men reached maturity in the Ming Dynasty, but they lived into the early years of Ts'ing and their influence on later painters places them as artists of the later rather than of the earlier dynasty.

王时敏和王鉴师法董源和黄公望，是清代画家的先驱。王时敏以粗大笔触闻名。王翬是王时敏的弟子，在运笔上超越乃师。据认为他把“南派”和“北派”风格加以融合，他的老师称他为“画圣”。王原祁是王时敏的孙子，是“四王”中学问最大者，他最得黄公望的意境。王原祁以淡彩山水画著称。

陈洪绶（公元1599—1652年）创立一种绘画风格，看似无意，实则每笔均精心考虑、精心落墨。仿效陈洪绶的人颇多。石涛善画山水及竹，也是一位看似“随意”的画家。这两人的画技在明代末年已经纯熟，他们活到清初。由于他们对后人的影响大，陈洪绶与石涛被视作清代画家。

III. Sculpture

Sculpture, like architecture, was not accorded due recognition by the Chinese. While we know the great painters, the sculptors are anonymous.

[A] Early Sculpture

The oldest specimens of Chinese sculpture were found in the Shang Dynasty tombs at Anyang. The owl, tiger, and turtle are favorite motifs, and the human figure also appears occasionally. These marble pieces are in the round, some of them being architectural elements. Their surfaces are decorated with patterns like those found on the contemporary bronzes. In decorative pattern, in basic concepts

of form and mass, and in spirit, the sculpture and the bronzes are one. Bronze masks have also been found, some of the t'ao-t'ieh, some of human beings. They are often well modeled.

Human figures and animals in the round began to be used as decorative motifs on the bronzes around 500 BC. The human figures were first carved in the kneeling position molded in strict conformity with the law of frontality, but the art soon freed itself to portray action. In general, the human figures are short and stubby, rendered with little feeling for modeling, but the animal forms show keen and subtle touches of the chisel, based on careful observation of nature.

叁 雕塑

像建筑一样，雕塑在中国也未获得应有的承认。我们知道大画家的名字，但雕塑家都默默无闻。

〔1〕早期的雕塑

最早的雕塑是在安阳商朝的墓葬中发现的。猫头鹰、老虎和乌龟是常见的雕刻母题，也偶有人的形象。那些大理石作品都是圆雕，有些就是建筑部件。表面装饰同那个时代的青铜器的纹样相同。石雕和青铜器在装饰纹样、基本形体和气质方面是一致的。出土的铜面具具有的是饕餮，有的是人形。它们都铸造得很好。

公元前500年前后，青铜器开始以人和动物形体的圆雕做装饰题材。初时人像是正画跪姿，严格按照“正面律”制作。不久，艺术摆脱束缚去表现动作。总的来看，人物造型矮而且呆板，而动物造型显现出刀凿的运作精准有致，这是基于对自然的准确观察。

〔B〕Han, Three Kingdoms, Six Dynasties

In the Han Dynasty sculpture gained importance in conjunction with architecture. Reliefs decorate interior wall surfaces, such as those found in a number of tomb shrines, notably the tombs of the Wu family at Chiahsiang, Shantung. Human figures and animals (lions, lambs, and chimeras) in the round stand in pairs flanking the avenues leading to tombs, temples, and palaces. At Ch'üfu, Shantung, the human figures are typically rigid, lumpy, and ill-modeled, bearing only a vague resemblance to the human form. Yet the animals are in general well modeled, robust, vigorous, and animated. The lions and chimeras are usually winged. (Since figure sculpture, animal or

human, had never been employed by the Chinese of earlier times as guardian monuments to an architectural approach, it is possible that the idea was imported from the Occident through contact with the barbarian tribes of the west and north.) On some of the contemporary ch'üeh in Szechwan are found reliefs of birds, dragons, and tigers that rank with the best decorative sculpture.

With the spread of Buddhism during the period of the Northern and Southern Dynasties, an anthropomorphic sculpture assumed an important role. A few small images of the early 5th century have come down to us. The first important monuments are in the caves of Yunkang, near Ta-t'ung, first capital of the Northern Wei Dynasty (386–535 AD). These are undoubtedly Chinese versions of Buddhist caves in India. Yet, aside from decorative motifs (the acanthus leaf, the frets, the beads, and even the Ionic and Corinthian capitals) and the basic conception of the caves themselves, there seems to be no traceable Indian influence to give the sculpture an Indian or otherwise un-Chinese character. There are a few characteristically Indian figures, but the group remains essentially Chinese.

The work on the caves near Ta-t'ung was begun by imperial order in 452 AD and stopped abruptly in 494 AD, when the capital was moved south to Loyang. The plan of some of the caves is fairly similar to the chaitya caves of India, with the chaitya, or stupa, in the center. The architecture and sculpture, however, are basically Chinese.

The earliest, and larger, figures, some measuring over 70 feet (21 meters) in height, are heavy and sturdy. The pleated draperies cling to the body. Later the figures grew more slender, and the head and neck became almost tubular. The eyebrows are arched and join with the bridge of the nose. The wide forehead is almost flat, turning sharply back at the temples. The eyes are mere slits; the lips, thin, forever smiling. The chin is often sharply pointed—a feature especially noticeable in some bronze statuettes of the period.

〔2〕汉、三国、六朝

到汉代，雕塑在建筑上的重要性增加了。室内墙壁上有浮雕装饰，这可以从许多汉墓祭室中得到印证。尤如山东嘉祥武氏墓群，人和动物（狮、羊、吐火兽）的圆雕成对地排列在通往墓室、宫庙的大路两旁。山东曲阜的人像非常呆拙、粗糙、模糊一团，只大致有点像人形。面兽像则造型优美、雄壮，栩栩如生。狮子和吐火兽常常有翼（考虑到中国早期建筑不用人像和兽雕保卫大门，这一做法很可能是在与北方和西方蛮族接触中从西亚传入的）。四川发现的汉阙常有鸟、龙、虎的浮雕，它们是装饰雕刻的上品。

南北朝时，佛教盛行，人像雕刻多起来。有一些5世纪早期的小佛像留传下来。第一批重要的纪念性雕像见于大同云冈，大同（时称平城）是北魏（公元386—535年）第一个首都。云冈石窟是印度石窟的中国翻版。除了一些装饰题材（叶饰、回文饰、念珠，甚至爱奥尼克或科林斯柱头）和洞窟的基本形制外，看不出在雕刻上有什么印度或其他非中国的特点。固然有少数典型的印度式佛像，但群体还是中国的。

云冈石窟由皇帝下令于公元452年开始建造，但因首都南迁洛阳，而于公元494年突然停止。云冈的一部分石窟与印度的“支提”十分相似。中间是圣坛或窣堵坡。建筑与雕塑则基本是中国式的。

早期的较大的雕像有的高度超过70英尺（21米），粗壮结实，身上紧裹着有褶的服装。后来佛像变得苗条些，而头及颈部却几乎是圆柱形的。眉毛弯弯，与鼻梁相接。前额宽而平，在太阳穴处突然后折。眼是细长缝，薄唇，永远微笑。下巴尖尖的，这一特征多在同时期的小型铜佛像上见到。

The draperies no longer cling to the body, but hang from it, often flaring out at ankle level, and are arranged symmetrically on the right and left, with the pointed, almost knife-like, ends of the folds spread out like a bird's wings. (It is not by accident that pointed ends are also characteristic of the strokes of the calligraphy of the period.) The Bodhisattvas of these statuary groups, whose Indian counterparts wear princely attire, are stripped of most of their ornaments. They wear a simple tiara and a heart-shaped necklace, and from the shoulder of each figure hangs a long sash, the ends crossing through a ring hung in front of the thighs.

A project similar to that at Ta-t'ung was begun by the Wei emperors about 495 AD at Lung-men, near Loyang, on the cliffs of the I (Yi) River. Here the heads are less tubular and more rounded, and the draperies less pointed and more fluent, though still symmetrically arranged, achieving a superb decorative effect. The walls of some of the caves are decorated with reliefs representing the emperor on one wall and the empress on the opposite one, each attended by an entourage, forming compositions of the highest order. The activity of the cliff sculptors at Lung-men continued until the latter part of the 9th century.

The Northern Ch'i (550-577 AD) rulers were devout but extravagant Buddhists, yet it was not until nearly the end of their brief dynasty that they began the caves at T' ien-lung Shan. Most of the figures of these caves assume a standing posture. Their heads are almost round. The forehead is markedly lower; the eyes, though still very narrow, are wider. The nose and lips are fuller, with the enchanting smile of earlier periods almost completely suppressed. The draperies are simpler, hanging vertically.

〔C〕 Sculpture of the Sui and T'ang Dynasties

In the Sui Dynasty the standing figures begin to show a peculiar protrusion of the abdomen. The head has become smaller in proportion to the body, and the jaws and nose are fuller. The eyes, though still narrow, show some convexity in the upper lids, emphasizing the presence of the eyeballs. The slightly convex surface intersects the curved plane under the brow in a gentle "valley." The line of intersection appears as a wide arc, repeating the rhythm of the brow and the eye. The subdued smile is produced by more fully modeled lips, and the mouth is smaller. The neck has assumed the peculiar shape of a truncated cone, protruding sharply from the chest and joining the head with similar abruptness. The cone is circumscribed about halfway up by a groove-like fold. The drapery is shown in more natural folds, and the hem rarely flares. In contrast to the costume of Buddha, which is austere and draped in all periods, that of the Bodhisattvas has become more gaudy. The tiara and the necklace are now bedecked with jewel-like ornaments. Strings of beads, hanging from the shoulders and interrupted at intervals with pendants, reach far below the knees.

衣服不再紧贴，而是披挂在身上，在脚踝处张开，左右对称，衣褶尖挺如刀，像鸟翼似地张开（这并非偶然，这时期中国书法常有尖锋）。佛像组群中有菩萨像，在印度菩萨作公主般打扮，在中国则几乎取消全部装饰，只戴简单的头巾和一个心形项圈，有长长的肩带，穿过在大腿前的环。

公元495年，在洛阳附近的龙门，在伊川河的山岩上开始开凿龙门石窟，情形与大同云冈近似。这里的佛像头部更圆润而较少圆柱形，衣褶不那么尖了，仍然对称，但更流畅，富有高雅的装饰性。有些洞窟的墙面上有浮雕，一面是皇帝像，对面是皇后像，各有随从侍候，表现着最高级的构图。龙门的雕凿工作持续到9世纪后期。

北齐（公元550—577年）统治者笃信佛教而奢靡。但在其统治的末期，方才开始开凿天龙山石窟，这些石窟里的大部分佛像站立着，头部是浑圆的，额头明显较低，眼睛虽然仍细但比较长，鼻与唇比较饱满。先前时期那种迷人的微笑几乎不见了，衣褶简单，直上直下。

〔3〕 隋与唐的雕塑

隋代立像的腹部独特地挺出。头占全身的比例变小，鼻子和下颚较以前丰满。眼睛仍细，但上眼皮凸出一些，显出其下的眼珠。这微微凸出的眼皮与眉毛下面的弧形平面相交形成柔和的凹沟。这交线像一张弓，重复了眉和眼睛的韵律。嘴变小了，造型精致的双唇使雕像微带笑意。颈子如截去尖端的圆锥体，从胸部突然伸出，与头部生硬相接。颈

部中段横一道深深的皱褶。衣服上的衣褶自然，卷边精致，很少展开，如来佛的服饰永远保持朴素，与之相反，菩萨的服饰变得华丽。头巾和项链上嵌着宝石般的装饰。珠链从肩上垂下，间隔地挂着饰物，抵至膝部以下。

Sculpture, especially Buddhist sculpture, reached its zenith in China in the T'ang Dynasty. The work begun at Lung-men by the Wei Tatars attained new heights, and the creation of Buddhist images was advanced with similar zeal throughout the empire. About the end of the 9th century, however, cave sculpture seemed to lose the interest of the worshipers of central China. It was continued at Tun-huang, but the center for China proper shifted to Szechwan, which contains many late T'ang caves. The activity in that province continued through the Sung and Yüan periods into the Ming Dynasty.

It is difficult to differentiate sharply between the Sui and early T'ang styles, but toward the middle of the 7th-century T'ang characteristics definitely emerged. The figures have become more naturalistic. The S-curve appears in most of the standing figures, which are balanced on one leg, with the hip of the relaxed leg and the shoulder on the same side slightly lowered. To maintain equilibrium, the head is tilted slightly toward the side of the supporting leg. The body is more fleshy, although the waist remains slim. The face, especially that of the Bodhisattva, is pleasingly plump. The gracefully arched eyebrow is not carried quite so far as in the previous periods, but curves naturally, clearly defining the temple. The ridge of the eyebrow is now seldom incised with a groove. The area of the upper eyelid extends farther up, and the curved plane below the brow is narrower. The nose is shorter and less sharply ridged. The lips are definitely sensuous, and the distance of the upper lip from the nose is markedly shortened. The hair is now carried very low, reducing the height of the forehead. The Bodhisattvas of this period are less garishly ornamented. The tiara is often simplified, but the hair is drawn into an enormous knot on top of the head. The garments are modeled to conform closely to the body, and the beads, though still often worn, are bare of most of their former pendants.

About the beginning of the 8th century a very earthly type of Buddha was introduced. He is represented as a complacent, fat creature of this world, with a flabby chin, scarcely any neck, and a full, protruding abdomen—a most unusual conception of the ascetic who wandered the woods of Buddha Gaya. Not many figures of this type have been found, but all are evidence of superlative achievement in the plastic representation of the human form.

Toward the end of the T'ang Dynasty, in the caves of the seclude

Szechwan area, there appeared a type of sculpture characterized by the iconographic tributes and fantastic physiology of the newly popular mi-tsung or mi-chiao (secret sect or religion). In its treatment of the human form and of the draperies, however, it shows no perceptible break with T'ang tradition. An entire wall area is often used for a single subject. The paradise scene, which is pictured over and over again in the contemporary mural painting at Tun-huang, is here executed in relief, forming a single composition—a plastic conception never found in cave sculpture of earlier periods.

中国的雕塑，尤其是佛教雕塑，在唐代直抵顶峰。北魏开始的龙门石窟达到新的高度。在唐帝国版图之内，到处都热情地雕凿佛像。大约在9世纪末，中原的信徒们对石窟失去了兴趣。敦煌石窟仍在继续，而在中国中部，石窟开凿转移到四川，那儿有一些晚唐的石窟。这一活动在四川历经宋、元，延续到明代。

唐初与隋代的风格接近，很难明确区分。到7世纪中期，唐代自己的风格出现了。雕像更加自然主义了。大多数立像呈S形姿势，由一条腿平衡，放松的那条腿的臀部和同侧的肩部略向前倾。头部稍稍偏向另一边。躯体丰满，腰部仍细。菩萨的脸部饱满，眉毛优雅地弯曲，不像前一时期的那样过分，很自然地呈弧形勾画出天庭。眉弓下也不再凹。眼睛上皮更宽，眉下的曲面减窄。鼻子稍短，鼻梁稍短也稍低。鼻端与嘴稍近，嘴唇更有表情。发际下移，额头高度稍减。这时期的菩萨像的装饰不那么华丽了。头巾简化，头发在头顶上堆成高髻。服装更合身；仍然戴着珠串，但挂着的饰物减少了。

到8世纪初，出现一种非常人性化的如来佛像。他被雕凿成一个自我满足的、心宽体胖的俗世之人，下巴松弛，看不见颈子，大腹便便。这是一种关于在菩提伽耶森林中漫步的苦行者的极不寻常的观念。这样的佛像不多见，但就人体形象的雕凿而言是十分高超的。

唐末，在四川人迹罕至的地区的石窟中出现由新传播的密宗（或密教，意为秘密教派）搞的反映奇幻心理的偶像。不过人和服饰的处理与唐代传统相似。那里，一整片墙只描绘一个题材。同时期在敦煌一再出现的描绘净土的壁画，此处则用堆塑来表现，形成单一的构图。这在先前的石窟雕塑从未见过。

T'ang sculptors were extremely skillful in portraying animal forms, many examples of which have been preserved in the grounds of the T'ang imperial tombs. Some smaller pieces are on view in museums of the United States and European countries.

[D] Sung Sculpture

With the fall of the T'ang Dynasty the creation of Buddhist images in stone almost ceased. Statues in Sung temples were carved in wood,

modeled in clay, or, rarely, cast in bronze. The only exceptions are found in the caves of Szechwan. Few of the bronze images escaped melting down in later periods. One notable exception is the 70-foot statue of Kuan-yin in Chengting, Hopeh, cast by order of the first Sung emperor, T'ai-tsu (reigned 960–976 AD). Clay figures are numerous. A superb example of this work is the altar group in the Hua-yen Ssu, Ta-t'ung. The eleven-headed Kuan-yin of the Tu-lo Ssu, Chi Hsien, closely follows the T'ang tradition; it measures about 60 feet (18 meters) in height and is the largest clay figure in China. Many wooden statues of the Sung period have found their way to the museums of the West.

The most noticeable characteristic of Sung statues is the rounding of the face. The forehead is broader than in previous periods. The nose is short and almost bulbous. The eyebrows are less arched, and the convex surface above the upper lid is ever wider, reducing to a narrow strip the concave plane under the eyebrow. The lips are thicker, and the mouth is very small. The smile has almost vanished. The neck is rendered naturally, emerging above the chest and supporting the head without any demarcation.

The S-curve of the T'ang Bodhisattvas seems to have been forgotten. Even when the figures are not completely rigid, the ease with which T'ang figures carry their weight, and the consequent lowering the relaxed side of the body, seem beyond the grasp of the Sung sculptors. The Ch'an Buddhists introduced a new pose for the Kuan-yin, showing the goddess seated on a rock with one leg hanging down and the other foot resting on the rock. This complicated pose presented the sculptor with new problems of arrangement of the body and the draperies.

Szechwan cave sculptured of the Southern Sung period shows evidence of a decline in the sculptor's art. This is especially noticeable in some of the Bodhisattvas. By this time they have taken on an unmistakably feminine appearance. They are gaudily dressed and overburdened with jewelry and ornaments. The pose is rigid, almost frigid; the expression is blank. The best example of this work is the group of young, matron-like Bodhisattvas in Tatsu.

唐代雕刻家雕刻动物的技艺特别高超，许多作品藏在唐代帝王陵墓中的地下。欧洲和美国博物馆展出了小件作品。

〔4〕宋代雕塑

唐朝之后，石造佛像几乎停止了。宋代庙宇中供奉的佛像是木刻的或泥塑的，偶尔也有用铜铸的。只有四川地区的石窟例外。几乎没有铜佛像能逃避被熔化之祸。最有名的例外是河北正定的70英尺高的铜观

音，它由宋太祖（公元960—976年在位）下令铸造。泥塑佛像不计其数。极精美的一组在大同华严寺祭台上。河北蓟县独乐寺十一面泥塑观音像高60英尺（18米），风格十分接近唐代传统，是中国最高大的泥塑佛像。许多宋代木雕佛像流入西方博物馆。

宋代雕塑最突出之点是脸部浑圆，额头比以前宽，短鼻，几乎圆鼓；眉毛孤形不显，眼上皮更宽，而致与眉下方凹进处间距缩窄；嘴唇较厚，口小，笑容几乎消失；颈部处理自然，自胸部伸出，支持头颅，与头胸之间没有分明的界线。

唐朝菩萨那种S形曲线姿势不见了。宋代雕塑虽然并不僵硬，但唐代那种轻松地支持体重并降低放松的身体一侧的安闲相不是宋代雕刻者所能掌握的。禅宗搞出另一种观音像，她坐在石头上，一脚踏石，一脚垂下。这种复杂的姿势向雕刻家提出了处理身躯和衣褶的新问题。

南宋时期，四川石窟雕刻艺术衰落，尤其是菩萨像，此时日益显现为女身。服装过分华丽，珠宝、装饰太多。姿势僵硬拘谨，表情空漠。四川最好的作品是大足石刻中少女般的菩萨群像。

〔E〕Yüan, Ming, and Ts'ing Sculpture

During the Yüan Dynasty, Lamaist Buddhism was introduced from Tibet. With it came sculptors whose influence was to last through the Ming and Ts'ing periods. Most of their figures are shown sitting cross-legged. The waist is almost wasp-like, the chest is broad, and the shoulders are square. The head has become more squat, but the rhythm of the torso is repeated in the broadening of the forehead. The top of the head is flattened and surmounted by a grossly elongated ushnisha, the hump characteristic of the sculptured heads of Buddha.

The Ming and Ts'ing Dynasties were a sad period for sculpture in China. The statuary of these periods shows neither the robust vigor of Han, nor the archaic charm of the Six Dynasties, nor the mature self-assurance of T'ang, nor even the rococo elegance of Sung. The sculptor's art had degenerated into uninspired manual labor.

〔5〕元、明、清雕塑

元代，喇嘛教从西藏传入中原，该教派的雕塑匠人也来了，他们影响了明、清的雕塑。他们的塑像大都交腿而坐，胸宽，腰细如蜂，肩方。头部短胖，而宽宽的前额重现全身的韵律。头顶是平的，上面有浓密的螺髻，是如来佛头顶上特有的疙瘩形式。

明、清两代是中国雕塑史上可悲的时期。这个时期的雕像一没有汉代的粗犷；二没有六朝的古典妩媚；三没有唐代的成熟自信；四没有宋代的洛可可式优雅。雕塑者的技艺蜕变为没有灵气的手工劳动。

附录

Letter to Alfred Bendiner (CV Included)

1037 Yale Station

April 26, 1947

Dear Al:

Thank you for the note. You & Betty must think me the most ungrateful animal in the world not to have written a word after the wonderful & warm reception given me. However, I know you both will understand and forgive me since I am living the life of slave that is perpetually driven by an invisible whip.

Recently there had been frequent enquiries about my work since I left America last. Once I made a list in answer to an exhaustive questionnaire. I am enclosing a copy for your reference.

My best to you & Betty,

Yours

Ssu-ch'eng

致阿尔弗雷德·班迪纳的信（内附履历）^[1]

亲爱的阿尔：

谢谢你的信。你和佩蒂一定觉得我是世界上最忘恩负义的动物——我受到了你们美好热情的招待，之后却没有给你们寄去只言片语。不管怎样，我知道你们一定会理解我、原谅我，因为我正过着奴隶般的生活，总是被无形的鞭子所驱使。

最近，经常有人问到我上次离开美国后的工作情况。我曾列了一张简历表来回答一份详尽的问卷，随信寄给你一份，供参考。^[2]

向你和佩蒂致以最美好的问候。

你的

思成

耶鲁车站1037号

一九四七年四月二十六日

LIANG SSU-CH'ENG

Scholarship in Colleges

Graduate, Tsinghua College, Peiping, 1923;

B. Arch., University of Pennsylvania, 1927 (February);

M. Arch., University of Pennsylvania, 1927 (June);

Harvard Grad. School (Fine Arts), 1927–28;

Spayd Brook Gold Medal for merit in architectural design, 1927;

Litt. D. (Hon.) Princeton, 1947;

Honorary fraternities: Sigma Associate, Tau Sigma Delta,
Architectural Association of the University of Pennsylvania.

Research & Teaching

Research Fellow & Director of Research, Institute for Research in
Chinese Architecture, 1931– (reorganized and introduced scientific
approach to its studies);

Assistant Professor in Charge, Department of Architecture
Northeastern University, 1928–30 (founded this department);

Professor in Charge, Department of Architecture, North-eastern
University, 1930–31;

Lecturer of History of Architecture, National Peking University, Peiping, 1932-33;

Lecturer of History of Architecture, National Tsinghua University, Peiping, 1932-34;

Professor & Chairman, Department of Architecture, National Tsinghua University, Peiping, 1946– (founded this department);

Director, Institute of Architectural Research, National Tsinghua University, 1946– (founder);

Visiting Professor of Fine Arts, Yale University, 1946–47.

梁思成

学校教育

清华学校毕业，北平，1923；

宾夕法尼亚大学，建筑学学士，1927（2月）；

宾夕法尼亚大学，建筑学硕士，1927（6月）；

哈佛研究生院（艺术学院），1927—1928；

因建筑设计成绩获得斯拜德·布鲁克金奖，1927；

普林斯顿文学荣誉博士，1947；

西格玛协会荣誉会员，宾夕法尼亚大学建筑协会。

研究与教学

中国营造学社研究员及研究主任，1931—（对研究工作用科学的方法进行重组和阐释）；

东北大学建筑系助理教授，1928—1930（建立该系）；

东北大学建筑系教授，1930—1931；

建筑历史讲师，国立北京大学，北平，1932—1933；

建筑学讲师，国立清华大学，北平，1932—1934；

教授及系主任，国立清华大学建筑系，北平，1946—（建立该系）；

主任，建筑研究所，国立清华大学，北平，1946—（创立者）；

艺术学院访问教授，耶鲁大学，1946—1947。

Membership and Services to Cultural and Professional Institutions

Fellow Member, Academia Sinica, 1933–；

Member, National Academy of Peiping, 1934–；

Member, Association of Chinese Architects, 1928– ;

Member & Specialist on Architecture, Central Commission for the Conservation of Antiquities, 1934– ;

Member, Provincial Commission for the Conservation of Antiquities of Szechwan, 1939– ;

Member & Technical Expert, National Commission for the Restoration of Historical Monuments of the Ancient Capital (Peiping), 1934– ;

Architectural Advisor, National Central Museum, 1936– ;

Architectural Advisor, National Central Library, 1937– ;

Chairman, Committee for Compilation of Historical Materials On Chinese Architecture, National Central Museum, 1939– (founder);

Vice-Chairman, Chinese Commission for the Preservation of Cultural Objects in War Areas (counter-part of the "Robert Commission" of U.S.A.O., 1945–46);

Technical advisor, National Palace Museum, Peiping, 1934;

Correspondence Member, Ostasiatische Kunstgeschichte
Something (I forget)

1936 (?)– , Frankfurt or Berlin (I also forget);

Chinese Architect to Board of Design Consultants, UN Planning Board, 1947.

Publications

Official Regulations for Architectural Design in Ts'ing Dynasty Style, 1933;

The Liao Dynasty 984, Structure of the Hall of Avalokitesvara at Tule Ssu (Chi Hsien), 1932;

The Architecture of the Temple of Confucius, Ch'üfu, and Plans for Its Restoration, 1935;

Wen-yuan Ke (a report on the architecture of the famous library of Emperor Ch'ien-lung and plans for its restoration) 1932, (in collaboration with Cai Fang-yin & Liu

Tun-tseng);

A Report on the Ancient Architecture of Ta-t'ung, 1933 (in collaboration with Liu

Tun-tseng);

文化与专业研究机构成员或工作经历

通讯研究员，中央研究院，1933—；

研究员，北平国立研究院，1934—；

会员，中国建筑师协会，1928—；

委员及建筑专家，中央古物保存委员会，1934—；

委员，四川省古物保存委员会，1939—；

委员、技术专家，国家古都历史建筑保护委员会（北平），1934—；

建筑顾问，国立中央博物院，1936—；

建筑顾问，国立中央图书馆，1937—；

主任，国立中央博物院中国建筑史料编纂委员会，1939—（创立者）；

副主任，战区文物保护中国委员会（美国罗伯特委员会的国家分委员会，1945—1946）；

技术顾问，故宫博物院，北平，1934—；

通讯成员，东亚艺术史的什么机构（我记不清了），1936（？），在法兰克福或柏林（我也记不清了）；

联合国总部设计顾问团中国建筑师，1947。

出版物

《清式营造则例》，1933；

《蓟县独乐寺观音阁山门考》，1932；

《曲阜孔庙之建筑及其修葺计划》，1935；

《故宫文渊阁楼面修理计划》（关于清代乾隆皇帝的这一著名藏书建筑的报告和修复方案），1932（与蔡方荫、刘敦桢合著）；

《大同古建筑调查报告》，1933（与刘敦桢合著）；

A Pictorial History of Chinese Architecture (text in both English and Chinese), to be published, possibly in U.S.A.;

A Modern Interpretation of Ying-tsoo-fa-shih (a treatise on architecture by Li Chieh, architect to Emperor Hui-tsung, Sung Dynasty, first published in 1100), to be published;

A Grammar of Chinese Architecture, English & Chinese editions, in preparation.

Articles:

What We Know of the Buddhist Temples and Palaces of the T'ang Dynasty, 1932;

The Hall of Three Bodhisattvas of Kuang-tsi Ssu, Pao-ti, 1932;

Plans for the Restoration of the Liu-ho Pagoda, Hang-chou, 1935;

Preliminary Report on the Ancient Architecture, Fen River Valley, Shansi, 1935 (in collaboration with Lin Hui-yin / Mrs. Liang);

The Architecture of the Northern Wei Dynasty found Represented in Yun-kang Caves, 1933 (in collaboration with Liu Tung-tseng & Lin Hui-yin);

《云冈石窟中表现的北魏建筑》，1933（与刘敦桢、林徽因合著）；

《汉代的建筑式样与装饰》，1934（与刘敦桢、鲍鼎合著）；

《正定调查纪略》，1933；

《赵县大石桥》，1934；

《两座中国古代的拱券桥》（即上文的英文简写稿），发表于《铅笔尖》杂志，1938年1月号和3月号；

《中国的五座古塔》，发表于《亚洲杂志》，1941；

《记五台山佛光寺的唐代建筑（857）》，1945；

《中国最古老的木结构建筑》（即上文的英文简写稿），发表于《亚洲杂志》，1941；

“中国建筑”条目，为新版《大英百科全书》所写；

“中国的建筑与艺术”条目，为新版《大美百科全书》所写；

等等，等等，等等。

Field Trips

In search of architecture in this virgin field of study, field trips were taken by members of the Institute for Research in Chinese Architecture regularly twice every year from 1932 to 1937. Less regularly from 1935 to 1945. Covering more than 200 hsien (counties) in 15 provinces in China. More than 2200 "units" studies (photographed & measured). Mostly conducted personally by L. S. C. Less than one-tenths of materials thus collected were able to be published.

Creative Work in Architecture

The University of Chi-lin Group, Chi-lin Province, 1930 (in collaboration with Ch'en Chih and T'ung Chun, and Cai Fang-yin);

The University of Communication Group, Chin-chou, 1930 (destroyed in war) (in collaboration with Phyllis Lin);

The Geology Building, National Peking University, Peiping, 1934 (in collaboration with Phyllis Lin);

Women's Dormitory, National Peking University, Peiping, 1935 (in collaboration with Phyllis Lin);

National Central Museum, Nanking (as consulting architect),

1937 (work interrupted by war, resumed in 1946);

And a number of residences and shops, etc., with Phyllis Lin.

Restoration Work

The Temples, Pagodas & Palaces of Peiping, as technical expert to the Ancient Capital Commission (work started in 1934, still going on);

The Temple of Confucius Group, Ch'üfu (interrupted by war);

The Pagoda of Liu-ho T'a, Hang-chou (prevented by war);

The Great Stone Bridge, Chao Hsien (interrupted by war);

The "Little Geese Pagoda," Sian (did not start on account of war);

The Main Hall of Yen-fu Ssu, Hsuan-p'ing (did not start on account of war);

The Yun-kang Caves, Ta-t'ung (plan did not realize on account of prohibitively high expense).

实地考察

在这块研究的处女地中，为找寻建筑，从1932年到1937年中国营造学社的成员每年固定进行两次调查，从1935年到1945年则不十分规律，旅行地区覆盖了中国15个省的200多个县。进行了2200多个实例的研究（摄影和测量）。大部分由梁思成指导，将近十分之一已收集到的资料将能出版。

建筑创作

吉林大学，吉林省，1930，与陈植、童寯和蔡方荫合作；

交通大学，锦州，1930（战争中被毁），与林徽因合作；

地质馆，国立北京大学，北平，1934，与林徽因合作；

女生宿舍，国立北京大学，北平，1935，与林徽因合作；

国立中央博物院，南京（顾问建筑师），1937（工作因战争中断，1946年恢复）；

其他一些住宅和商店等，与林徽因合作。

复原保护工作

作为故都文物整理委员会技术专家，参与北平的寺庙、塔和宫殿的保护（工作开始于1935年，现仍在进行）；

曲阜孔庙（因战争而中断）；

六和塔，杭州（因战争而停止）；

大石桥，赵县（因战争而中断）；

小雁塔，西安（因战争而未能开始）；

延福寺大殿，宣平（因战争而未能开始）；

云冈石窟，大同（由于造价限制，计划未能实现）。

（吕舟 译 高亦兰 校）

Letter to Wilma Fairbank

Tsing Hua, Peking

December 30, 1956

Dear Wilma:

It is a pleasant surprise to hear from you again after all these long years. I was away in Poland and Germany when T. S. came back with your warm letter which reached me only after my return to Peking a few days ago.

Yes, Wilma, I know that you will share with me my grief over P.'s death and I am deeply touched by your sympathy and condolence. It is more than a year and a half now. She fought most courageously against her poor health and was undaunted till the last moment. It may console you a little to know that she was never so happy over life and work as in her last 6½ years. Like all the intelligentsia in China today, she had already seen with unshakable conviction and absolute self-confidence a picture of the great and bright future for her country and her people. In spite of her very poor health, she proudly shares with other architects the responsibility and burden of reconstructing the country and the training of future generations of architects. She was appointed a top-rank architect of the Municipality of Peking and a member of the City Planning Commission, concurrently teaching in Tsing Hua, and was elected a representative of the People's Representatives' Congress of Peking. She even found opportunities in improving the designs of cloisonné (remember how ugly they could be?!) and "soaked" herself in the workshops for days on a stretch, working together with the artisans and created articles of exquisite beauty.

She was still bending over her drawing board, sitting in bed, against the advice of doctors and disregarding the protests of the family and friends, till a few days before she was taken to the hospital on Feb. 12, '55. She was 50, and ill, but her enthusiasm was as high as ever, as you knew her years ago. She was confident that she would recover soon and be back to work again. But in spite of all the efforts of the doctors, she lost her last battle on April 1st. Perhaps her only regret is that she did not live to see the radiant future for which she contributed every ounce of strength of her last few years' life.

致费慰梅的信

亲爱的威尔玛：

多年以后再次收到你的来信，真令我感到惊喜。（钱）端升带回来你热情洋溢的信件的时候，我正在波兰和德国。几天前，我刚结束访问回到北京，就收到了你的来信。

是的，威尔玛，我对徽因的病逝痛不欲生，我想你也会和我一样悲伤。你的同情和慰问让我非常感动。徽因的离去已经超过一年半时间了。她非常勇敢地同病魔战斗，直到最后一刻也没有畏缩。她从来没有像生命中最后六年半时间里那样，为生活和工作而如此幸福——我想这会令你感到稍许宽慰。像今天中国的知识精英一样，徽因对她的祖国和人民伟大光明的前途有着坚定不移的自信。她拖着病体，与其他建筑师一起非常自豪地承担重建国家和培养下一代建筑师的责任和重担。她被任命为北京市高级建筑师和北京市都市计划委员会委员，被推选为北京市人大代表；同时，她一边还在清华教课。她甚至觅得良机去改进景泰蓝的设计（你还记得它们是多么地不堪入目么?!），整天绷紧了弦泡在车间里，与工匠们一起工作，创造精美的款式。

她不听从医生的忠告和家人朋友的反对，即使卧病在床仍然离不开画板，直到1955年2月12日被送往医院的前几天。她当时已经有50岁了，病魔缠身，但是她的激情与你多年前认识她的时候一样高昂。她相信自己将会很快康复，并重新投入工作。尽管医生们竭尽全力，她还是在4月1日结束了人生的这场战斗。她在最后几年光阴里耗尽精力为之奋斗的事业，其未来是如何地光辉，这个她没有亲眼见到，也许是她唯一的遗憾。

Ever since 1949, she was given the best medical care by the Government (all free of charge, of course) and, after her death, in recognition of her service to the people, was buried in the People's Revolutionary Cemetery near 八宝山. Only if she had such case a few years earlier, she would have a much better chance to recover, and would be able to do much much more.

Yes, Wilma, P.'s death is a terrible blow to me and an irretrievable loss to many of our friends, Lao Chin, Hsi-jo and T. S. especially, and to many younger members of the teaching staff in Tsing Hua. I found work difficult without her cooperation to which I was so accustomed for nearly 30 years. It took me considerable length of time to pull myself together again and proceed with work. But, you can well imagine, how limped I am without her guiding wisdom and never failing encouragement on which I was almost completely dependent.

As to myself, I can only tell you that, like every architect, no, like almost everybody in China today, I have been very, very busy for the last eight years. In 1949, architects were transformed overnight from a mere social ornament to the post of vanguard of the country's reconstruction. Ever since 1949, I have been working on the planning of Peking, but did comparatively little in the designing of individual buildings. If you come today, you will find Peking very much changed. Hundreds of new buildings have sprung up, most of them in the suburbs—enormous cotton mills with their workers' dormitories in the East suburbs where you used to go riding with P.; the North and N.W. suburbs covered with numerous new buildings of new institutions of higher education. All these connected by miles and miles of new roads. And by the way, talking about roads, the road from 西直门 to the Summer Palace is now a double driveway, and on Sundays and holidays, when the Summer Palace (usually) gets as crowded as the Tung-an Shih-chang (unimaginable?), the traffic flow on the driveway presents a sight unthinkable a few years ago, and of course the parking problem in front of the entrance to the Summer Palace duely becomes a headache for the city planner. The area around the former race-course and 八宝山 is now almost completely urbanized. In short, you will find Peking very much different from what you know of it from your memories.

1949年以来，她一直受到政府最好的医疗护理（当然一切都是免费的）；在她去世以后，为肯定徽因对人民的贡献，她被葬在八宝山附近的人民革命公墓。哪怕更早几年是这种情况，她将会有更好的机会康复，也将会做更多的事情。

是的，威尔玛，徽因的死对我是一个重大的打击，对我们的许多朋友以及清华大学的许多年轻教师而言也意味着不可挽回的损失，特别是老金（金岳霖）、（张）奚若和（钱）端升。近30年来，我早已习惯了她的协作，失之犹感寸步难行。我过了很长时间才使自己恢复平静、重新振作起来投入工作。但是，你能想象得到，她的睿智引导和从未间断的鼓励，是我所完全依赖的；缺少了这个，我就如同跛行夜路一般。

至于我自己，我只能告诉你，像每一个建筑师，不，像今天的大多数中国人一样，我在这八年里非常繁忙。1949年，建筑师从仅仅是社会的装饰品，一夜之间转变为国家重建的急先锋。1949年以来，我一直在忙于北京城市的规划，在单体建筑的设计上所作相对甚少。如果你今天来到北京，会发现北京发生了翻天覆地的变化。成百上千的新建筑如雨后春笋般出现，它们大部分在郊区。在你从前经常和徽因一起骑马的东郊建起了大片的棉纺厂和工人的宿舍。北郊和西北郊满是新建高校的新建筑。穿连其中的则是一条条长长的新公路。说到公路，从西直门到颐和园的公路现在是双向车道。在周日和节日，颐和园（常）像东安市场一般拥挤（不能想象吧？），车流之繁忙为几年前所无法想象；当然，颐和园入口处停车的问题令城市的规划者颇为头疼。过去的赛马场和八

宝山附近的区域现在已经几乎完全城市化了。简而言之，北京与你记忆中的印象大为不同了。

It may also interest you to know that the architectural department in Tsing Hua has grown to more than ten times its original size and by 1958, it will be expanded to about 600 undergraduate (plus about 50-60 graduate students). These boys and girls are all so eager to learn and so confident and aware of their responsibilities in the future that it is a joy to teach them. In spite of these vast expansions, but still, how they clamour for more and more architects.

Engaged principally in planning and teaching, I did comparatively little field work in Chinese architecture since 1949. But many of my former colleagues, who are now working in the Ministry of Culture, had done a great, great deal. Besides many important discoveries, they also did much in repair and restorations of ancient edifices, including the Sui Dynasty bridge at Chao-chou. Batches of archaeological workers from all over the country were given courses in Chinese architecture in successive summer training classes in which I gave series of lectures almost every summer. But recently, the Government decided to establish an Institute of Research in the History and Theory of Architecture, starting with a staff much bigger than that of the Ying-tsao Hsüeh-shê and I expect to devote at least half of my time to it. Perhaps you've already read about it in the Kuang-ming Jih-pao.

Perhaps it will be a surprise (or no surprise?) to you if I tell you that P. was already a grandma before she died, and that now I have already three grandchildren!! Tsai-ping (Bao-bao) has a son and a daughter and Chung-chieh (Hsiao-ti), a son. Chung-chieh's wife is Chou Ru-mei (May), Pei-yuan's daughter. Enclosed are a few snapshots introducing the new members of the family.

还有一个消息也许会令你感兴趣：清华大学建筑系的规模已相当于初建之时的十多倍，到1958年它将扩展到拥有600名本科生（以及五六十名研究生）。这些孩子们都非常好学，非常清楚他们未来的责任，并且信心十足；所以，给他们教课是一件令人愉快的事。尽管建筑系扩展得很快，但我们仍然需要越来越多的建筑师。

1949年以后，我主要精力放在城市规划和教学工作上，对中国建筑的实地调查所作相较而言极少。但是我之前的很多同事现在在文化部工作，他们在这方面做了很多很多。除了一些重大的发现，他们在修复包括隋代赵州桥在内的古建筑方面也贡献颇多。连续几个暑期的训练班上，全国各地的考古工作者分批接受中国建筑方面的课程培训，几乎每个暑期我都为此作了一系列讲座。而就在最近，政府决定重新建立建筑历史与理论研究室，人员的数量要比营造学社大很多。我希望能把至少一半的时间投入其中。也许你已经在《光明日报》上看到了这一消息。

如果我告诉你徽因在去世之前已经成为祖母，而且我现在也已经有了三个孙辈孩子了，你也许会感到惊讶（或者不惊讶？）。再冰（宝宝）生了一儿一女，从诚（小弟）有了一个儿子。从诚的妻子是周如枚，是（周）培源的女儿。信里附上几张我家新成员的照片。

About your old friends, all I need to tell you is that they are all well and happy. They are happy in their work and very busy. I hope you and John will come and pay us a visit. (The door of New China is always wide open and many Americans have already been here.) You'll find great changes here. They are worthwhile seeing. And of your old friends, with the single exception of myself, the most noticeable change in their appearance is perhaps in their hair, especially Lao Chin and Hsi-jo, who are now almost completely white, but in spirit, as young as ever. In health, the only one who should be ashamed of himself is myself. I had a rather bad relapse of T.B. last year and was in the hospital for six months and later in the Summer Palace rest-curing for five months. But I have only myself to blame because I still insisted on working with such gusto as I did in the young days, a little too disproportionate to my age and present state of health. Now I have learnt to be wiser and promise to go slow and to apply my brake more diligently. I am determined to keep on going, moderate but conspirito, for at least another 25 years, because New China needs every architect—every single person's strength, no matter how meager his contribution.

In closing—One request and three wishes:

Request:—Will it be too much trouble for you to mail the drawings and photographs of Chinese architecture which I left with you back in '47 to "Miss Chen Lau 刘蕙真, Methodist International House, 76, Osborne Rd., Newcastle-on-Tyne, 2, England"? I wish to make many revisions and additions to those drawings.

Wishes:—(1) that you will write again; (2) that you and J. will come and pay us a visit soon; (3) [much belated] A very Merry X'mas and a Happy New Year!

Yours,

Ssu-ch'eng

关于你的老朋友们，我要告诉你的是，他们都身体很好，也都非常幸福。他们非常开心地投入工作，也非常繁忙。我希望你和约翰（译者注：即费正清）能来看看我们。（新中国的大门永远是打开的，很多美国人已经来过这里。）你将会发现这里发生了巨大的变化。这些都值得看看。除了我以外，你的老朋友们在外貌上最显著的变化就是他们的头发，特别是老金和奚若，头发几乎全白了，但是精气神儿仍旧跟年轻时一样。在健康上，只有我自惭不已。去年，我因为肺结核复发住院六个

月，尔后在颐和园疗养了五个月。这只能怨我自己，因为我仍然坚持像年轻时候一样干劲十足地去工作，这与我现在的年纪和健康状况有点不太相称。现在我学聪明了，答应会放慢脚步，勤踩刹车。我决定平和而精神饱满地至少再工作25年，因为新中国需要每一个建筑师、每一个人贡献力量，无论他的力量是多么微薄。

最后，一个请求和三个心愿：

请求——可否麻烦你将我1947年留在你那儿的中国建筑的绘图和照片邮寄给刘蕙真小姐？她的地址是 Methodist International House, 76, Osborne Rd., Newcastle-on-Tyne, 2, England。我想对那些绘图作多处修订和补充。

心愿——（一）你将会再写信过来；（二）你和约翰很快会来看望我们；（三）迟到的祝福：圣诞快乐！新年快乐！

思成

一九五六年十二月三十日

于北京清华大学

（吴子桐 译）

[1] 阿尔弗雷德·班迪纳（Alfred Bendiner），已故美国建筑师，宾夕法尼亚大学建筑学院校友。1947年时是费城房地产信托公司的建筑师。梁思成在耶鲁大学艺术学院访问讲学期间，他邀请梁思成到费城出席校友会和晚餐会并发表演说。这封信件即为梁思成与班迪纳在此期间的通信。原信由班迪纳夫人保存，1982年费慰梅女士写作《梁思成与林徽因》期间，应费慰梅要求，班迪纳夫人把丈夫和梁思成当时来往的信件提供给宾夕法尼亚大学建筑学院，并转费慰梅。出版使用的复印件得之于宾夕法尼亚大学建筑学院档案室——左川注。

“博雅双语名家名作”出版说明

1840年鸦片战争以降，在深重的民族危机面前，中华民族精英“放眼世界”，向世界寻求古老中国走向现代、走向世界的灵丹妙药，涌现出一大批中国主题的经典著述。我们今天阅读这些中文著述的时候，仍然深为字里行间所蕴藏的缜密的考据、深刻的学理、世界的视野和济世的情怀所感动，但往往会忽略：这些著述最初是用英文写就，我们耳熟能详的中文文本是原初英文文本的译本，这些英文作品在海外学术界和文化界同样享有崇高的声誉。

比如，林语堂的*My Country and My People*（《吾国与吾民》）以幽默风趣的笔调和睿智流畅的语言，将中国人的道德精神、生活情趣和中国社会文化的方方面面娓娓道来，在美国引起巨大反响——林语堂也以其中国主题系列作品赢得世界文坛的尊重，并获得诺贝尔文学奖的提名。再比如，梁思成在抗战的烽火中写就的英文版《图像中国建筑史》文稿（*A Pictorial History of Chinese Architecture*），经其挚友费慰梅女士（Wilma C. Fairbank）等人多年的奔走和努力，于1984年由麻省理工学院出版社（MIT Press）出版，并获得美国出版联合会颁发的“专业暨学术书籍金奖”。又比如，1939年，费孝通在伦敦政治经济学院的博士论文以*Peasant Life in China—A Field Study of Country Life in the Yangtze Valley*为名在英国劳特利奇书局（Routledge）出版，后以《江村经济》作为中译本书名——《江村经济》使得靠桑蚕为生的“开弦弓村”获得了世界性的声誉，成为国际社会学界研究中国农村的首选之地。

此外，一些中国主题的经典人文社科作品经海外汉学家和中国学者的如椽译笔，在英语世界也深受读者喜爱。比如，艾恺（Guy S. Alitto）将他1980年用中文访问梁漱溟的《这个世界会好吗——梁漱溟晚年口述》一书译成英文（*Has Man a Future? —Dialogues with the Last Confucian*），备受海内外读者关注；此类作品还有徐中约英译的梁启超著作《清代学术概论》（*Intellectual Trends in the Ch'ing Period*）、狄百瑞（W. T. de Bary）英译的黄宗羲著作《明夷待访录》（*Waiting for the Dawn: A Plan for the Prince*），等等。

有鉴于此，外研社人文社科出版分社推出“博雅双语名家名作”系列。

博雅，乃是该系列的出版立意。博雅教育（Liberal Education）早在古希腊时代就得以提倡，旨在培养具有广博知识和优雅气质的人，提高人文素质，培养健康人格，中国儒家六艺“礼、乐、射、御、书、数”亦有此功用。

双语，乃是该系列的出版形式。英汉双语对照的形式，既同时满足了英语学习者和汉语学习者通过阅读中国主题博雅读物提高英语和汉语能力的需求，又以中英双语思维、构架和写作的形式予后世学人以启迪——维特根斯坦有云：“语言的边界，乃是世界的边界”，诚哉斯言。

名家，乃是该系列的作者群体。涵盖文学、史学、哲学、政治学、经济学、考古学、人类学、建筑学等领域，皆海内外名家一时之选。

名作，乃是该系列的入选标准。系列中的各部作品都是经过时间的积淀、市场的检验和读者的鉴别而呈现的经典，正如卡尔维诺对“经典”的定义：经典并非你正在读的书，而是你正在重读的书。

胡适在《新思潮的意义》（1919年12月1日，《新青年》第7卷第1号）一文中提出了“研究问题、输入学理、整理国故、再造文明”的范式。秉着“记载人类文明、沟通世界文化”的出版理念，我们推出“博雅双语名家名作”系列，既希望能够在中国人创作的和以中国为主题的博雅英文文献领域“整理国故”，亦希望在和平发展、改革开放的新时代为“再造文明”、为“向世界说明中国”略尽绵薄之力。

编者说明

孙中山于1918年11月开始用英文写作《实业计划》。1919年8月起，《实业计划》的中译稿在《建设》杂志连载。1920年，上海商务印书馆出版英文本。1921年10月，上海民智书局出版中文本。《实业计划》后作为“物质建设”与《孙文学说》（“心理建设”）、《民权初步》（“社会建设”）一起合编为《建国方略》。

此英汉对照版的英文部分以美国G. P. Putnam's Sons旗下The Knickerbocker Press 1929年第二版为底本，附有孙科1928年10月为第二版所作的序言；中文部分依据华夏出版社2002年版《建国方略》，以民智书局本作为底本。

本书作于民国初年，彼时也是中国国内政局不稳、社会经济亟待发展的时期，作品无可避免地带有其所处时代的背景与印记。举例来说，当时对一些地名、译名、朝代称谓、民族关系、世界政治的表述等与当前的通行用法不尽一致，亦有部分词语已不再使用，因而不为读者所熟悉——对于此类情况，均作注说明于书后，供读者参阅。除部分编者注外，承蒙张小莉、申学锋为中译文部分词语作注，王希教授、李典蓉博士对编辑工作给予了热心指导，特此一并感谢。

PREFACE TO SECOND EDITION

During the eve of the Manchu Régime^[1], the first spark of industrialization took place in China in the forms of various state and quasi-state enterprises; railways and steamship lines, iron and steel works and coal mines, arsenals and docks all began to bedeck the Empire but they were soon found toiling under a corrupt and decadent political system. Then came the 1911 Revolution with its almost immediate reverses in the hands of Yuan Shi-kai and his military satellites. It has taken the Kuomintang fully seventeen years to wipe out these reactionaries and establish its undisputed political authority over the whole country. Although much to the sacrifice of our economic progress, we have, in these long years of bitter struggles, achieved a great political revolution; and a new, healthy political order is necessary for proper economic development.

How would Nationalist China carry out her program of economic reconstruction and development? This is necessarily a question of world interest.

In 1921 my father, the late Dr. Sun Yat-sen, wrote this "International Development of China." It was then his desire that international capital should come to China to develop railroads and highways, river conservancy and irrigation, new ports and modern cities, basic industries and public utilities.

The nature of the whole plan, in the words of my father, is a "rough sketch—from a layman's thought with very limited materials at his disposal; alterations and changes will have to be made after scientific investigations and detailed survey." It shows the stupendous requirements to modernize China. It will be the acme of economic rationalization when fully carried out. In its policies of reconstruction and economic development, the Nationalist Government will essentially follow this plan as its supreme guidance.

Naturally, working schedules will have to be carefully mapped out in order of the importance and urgency of these different projects. As means of communication are a prime mover to drag a country out of its economic stagnation, construction of sufficient trunk lines of railways with highways serving as their feeders should engage our

serious attention at present. In my father's plan, seven great systems of railways are to traverse the whole of China. As North China is comparatively better served with railways at present than South China, special preference should be given to regions in the latter, especially to those places where even proper means of water transportation are lacking. In this respect, some trunk lines of the Southwestern System, which is to cover Kwangsi, Kweichow, Yunnan, southeastern Szechuen, southwestern Hunan and the western half of Kwangtung, should be constructed to tap the rich mineral resources in these regions and to provide rapid means of transport in place of the present tedious travel requiring weeks to reach these inner provinces. Turning back to the north, the Northwestern System is all important to open up Mongolia and Sinkiang and to release the population pressure in China Proper by colonization of these grazing lands and irrigable tracts. As to the existing railways, the completion of the unfinished section of the Canton-Hankow Line and the extension of the Lunghai Line to Lanchow should merit special attention.

Then the improvement of the present telegraph system and the extensive introduction of long-distance telephones and wireless service should contribute much in promoting greater efficiency and stronger unity of the national life. Some of the projects have the great advantage of being immediately very profitable.

Concerning other parts of my father's plan, that which will directly help agriculture and promote industry should form the complement to the communication program and should be as equally urgent. River conservancy and land irrigation to add more acreage to agriculture, better mobilization of coal resources and proper harnessing of water power to provide cheap motive power for industry; these are the agencies through which national production will be stimulated and increased. Past studies have shown the Hwaiho regulation and Sikiang regulation to be immensely profitable. Possibilities of the North River of Kwangtung for hydroelectric development have also been carefully studied and found to be very attractive. Incidentally, increased national production means greater purchasing power, and that in turn means bigger international trade.

Enough have been mentioned to indicate the vast opportunities of profitable investment. To show our readiness to accept foreign capital upon equitable and businesslike terms, we can do no better than to refer again to the words of my father. He tells us that "the Chinese people will welcome the development of our country's resources provided that it can be kept out of Mandarin corruption and ensure the mutual benefit of China and the countries cooperating with us." He further says that "international cooperation of this kind cannot but

help to strengthen the Brotherhood of Man." For the realization of the worthy objects of such financing, all necessary safeguards will be granted to the lenders, who should provide us with "organizers, administrators and experts." In other words, we welcome sound business arrangements.

Looking over the activities of the international capital market in recent years, we find it has been principally absorbed in the herculean task of the reconstruction of post-war Europe. Capital did not merely flow passively to openings already safe and lucrative, but, on account of preponderant interests involved, it actually went to put things to order. Now Europe has fully revived, and in some quarters there is even an alarm against American financial imperialism. But New York and London will keep on busy finding outlets for the immense accumulation of wealth in America and England. Hand in hand with financiers, there are also producers of industrial equipments who constantly seek wider and greater markets. As to the China market, what is mostly needed at present is information. Always more *Information*, better collected and more widely distributed.

Finally, let us consider the economic development of China as a world problem. Commenting on the purpose of his book, my father tells us that it is his desire "to contribute my (his) humble part in the realization of the world peace—for the good of the world in general and the Chinese people in particular." The mere thought of the size of China and her population will prompt one to the correct appreciation of the question. I have no doubt that far-sighted and well-meaning statesmen will actively help in solving it.

Sun Fo.

NANKING, Oct. 6, 1928.

[1] Manchu Régime : 指清朝。——编者注

自序

欧战甫完之夕，作者始从事于研究国际共同发展中国实业，而成此六种计划。盖欲利用战时宏大规模之机器，及完全组织之人工，以助长中国实业之发达，而成我国民一突飞之进步；且以助各国战后工人问题之解决。无如各国人民久苦战争，朝闻和议，夕则懈志，立欲复战前原状，不独战地兵员陆续解散，而后路工厂亦同时休息。大势所趋，无可如何。故虽有三数之明达政治家，欲赞成吾之计划，亦无从保留其战时之工业，以为中国效劳也。我国失一速进之良机，而彼则竟陷于经济之恐慌，至今未已。其所受痛苦，较之战时尤甚。将来各国欲恢复其战前经济之原状，尤非发展中国之富源，以补救各国之穷困不可也。然则中国富源之发展，已成为今日世界人类之至大问题，不独为中国之利害而已也。惟发展之权，操之在我则存，操之在人则亡，此后中国存亡之关键，则在此实业发展之一事也。吾欲操此发展之权，则非有此知识不可。吾国人欲有此知识，则当读此书，尤当熟读此书。从此触类旁通，举一反三，以推求众理。庶几操纵在我，不致因噎废食，方能泛应曲当[1]，驰骤于今日世界经济之场，以化彼族竞争之性，而达我大同之治也。

此书为实业计划之大方针，为国家经济之大政策而已。至其实施之细密计划，必当再经一度专门名家之调查，科学实验之审定，乃可从事。故所举之计划，当有种种之变更改良，读者幸毋以此书为一成不易之论，庶乎可。

此书原稿为英文，其篇首及第二、第三计划及第四之大部分为朱执信所译，其第一计划为廖仲恺所译，其第四之一部分及第六计划及结论为林云陔[2]所译，其第五计划为马君武所译。特此志之。

民国十年十月十日 孙文序于粤京[3]

[1] 泛应曲当：广泛应用于各种情况，到处都很恰当。

[2] 林云陔：1883—1948年，广东人。同盟会会员，朱执信的学生，曾赴美留学，回国后，任《建设》杂志编辑。

[3] 粤京：指广东省省会广州。

PREFACE

As soon as Armistice was declared in the recent World War, I began to take up the study of the International Development of China, and to form programs accordingly. I was prompted to do so by the desire to contribute my humble part in the realization of world peace. China, a country possessing a territory of 4,289,000 square miles, a population of 400,000,000 people, and the richest mineral and agricultural resources in the world, is now a prey of militaristic and capitalistic powers—a greater bone of contention than the Balkan Peninsula. Unless the Chinese question can be settled peacefully, another world war greater and more terrible than the one just past will be inevitable. In order to solve the Chinese question, I suggest that the vast resources of China be developed internationally under a socialistic scheme, for the good of the world in general and the Chinese people in particular. It is my hope that as a result of this, the present spheres of influence can be abolished; the international commercial war can be done away with; the internecine capitalistic competition can be got rid of, and last, but not least, the class struggle between capital and labor can be avoided. Thus the root of war will be forever exterminated so far as China is concerned.

Each part of the different programs in this International Scheme, is but a rough sketch or a general policy produced from a layman's thought with very limited materials at his disposal. So alterations and changes will have to be made after scientific investigation and detailed survey. For instance, in regard to the projected Great Northern Port, which is to be situated between the mouths of the Tsingho and the Lwanho, the writer thought that the entrance of the harbor should be at the eastern side of the port but from actual survey by technical engineers, it is found that the entrance of the harbor should be at the western side of the port instead. So I crave great indulgence on the part of experts and specialists.

I wish to thank Dr. Monlin Chiang^[1] , Mr. David Yui^[2] , Dr. Y. Y. Tsu^[3] , Mr. T. Z. Koo^[4] , and Dr. John Y. Lee^[5] , who have given me great assistance in reading over the manuscripts with me.

CANTON, April 25, 1921.

——编者注

THE INTERNATIONAL DEVELOPMENT OF CHINA—A PROJECT TO ASSIST THE READJUSTMENT OF POST-BELLUM INDUSTRIES

It is estimated that during the last year of the World War the daily expenses of the various fighting nations amounted to two hundred and forty millions of dollars gold. It is accepted by even the most conservative, that only one half of this sum was spent on munitions and other direct war supplies, that is, one hundred and twenty millions of dollars gold. Let us consider these war supplies from a commercial point of view. The battlefield is the market for these new industries, the consumers of which are the soldiers. Various industries had to be enlisted and many new ones created for the supplies. In order to increase the production of these war commodities day by day, people of the warring countries and even those of the neutral states had to be content with the barest necessities of life and had to give up all former comforts and luxuries.

Now the war is ended and the sole market of these war supplies has closed, let us hope, forever, for the good of humanity. So, from now on we are concerned with the problem as to how a readjustment may be brought about. What must be considered first is the reconstruction of the various countries, and next the supply of comforts and luxuries that will have to be resumed. We remember that one hundred and twenty million dollars were spent every day on direct war supplies. Let us then suppose that the two items mentioned will take up one half of this sum, that is, sixty millions of dollars a day which will still leave us a balance of sixty million dollars a day. Besides, the many millions of soldiers who were once consumers will from now on become producers again. Furthermore, the unification and nationalization of all the industries, which I might call the Second Industrial Revolution, will be more far-reaching than that of the first one in which Manual Labor was displaced by Machinery. This second industrial revolution will increase the productive power of man many times more than the first one. Consequently, this unification and

nationalization of industries on account of the World War will further complicate the readjustment of the post-war industries. Just imagine sixty million dollars a day or twenty-one billions and nine hundred millions of dollars a year of new trade created by the war suddenly have to stop when peace is concluded! Where in this world can Europe and America look for a market to consume this enormous saving from the war?

国际共同发展中国实业计划书——补助世界战后整顿实业之方法

世界大战最后之一年中，各国战费每日须美金二万四千万元。此中以极俭计，必有一半费于药弹及其他直接供给战争之品，此已当美金一万二千万美元矣。如以商业眼光观察此种战争用品，则此新工业乃以战场为其销场，以兵士为其消费者，改变种种现存之他种实业，以为此供给，而又新建以益之。各交战国国民，乃至各中立国民，日夕缩减其生活所需至于极度，而储其向日所费诸繁华及安适者，以增加生产此种战争货品之力。

今者战事告终，诚可为人道庆。顾此战争用品之销场同时闭锁，吾人当图善后之策。故首当谋各交战国之再造，次则恢复其繁华与安适。此两项事业，若以日费六千万美元计之，只占此战争市场所生余剩之半额，而所余者每日仍有六千万美元，尚无所用之地。且此千数百万军人，向从事于消费者，今又一转而事生产，则其结果必致生产过多。不特此也，各国自推行工业统一与国有后，其生产力大增，与前此易手工用机器之工业革命相较，其影响更深。吾人欲命以第二工业革命之名，似甚正确。若以其增加生产力而言，此次革命之结果，实较前增加数倍。然则以世界战争而成此工业统一与国有之现象者，于战后之整理，必多纠纷。今夫一日六千万，则一年二百一十九万万也，贸易如是其巨也，以战争而起者，乃忽以和平而止。试问欧美于此世界中，将向何处觅销场，以消纳战争时储节所赢之如许物产乎？

If the billions of dollars worth of war industries can find no place in the post-bellum readjustment, then they will be a pure economic waste. The result will not only disturb the economic condition of the producing countries, but will also be a great loss to the world at large.

All the commercial nations are looking to China as the only "dumping ground" for their over-production. The pre-war condition of trade was unfavorable to China. The balance of imports over exports was something over one hundred million dollars gold annually. The market of China under this condition could not expand much for soon after there will be no more money or commodities left for exchanging goods with foreign countries. Fortunately, the natural resources of China are great and their proper development would create an unlimited market for the whole world and would utilize the greater

part, if not all of the billions of dollars worth of war industries soon to be turned into peace industries.

China is the land that still employs manual labor for production and has not yet entered the first stage of industrial evolution, while in Europe and America the second stage is already reached. So China has to begin the two stages of industrial evolution at once by adopting the machinery as well as the nationalization of production. In this case China will require machinery for her vast agriculture, machinery for her rich mines, machinery for the building of her innumerable factories, machinery for her extensive transportation systems and machinery for all her public utilities. Let us see how this new demand for machinery will help in the readjustment of war industries. The workshops that turn out cannon can easily be made to turn out steam rollers for the construction of roads in China. The workshops that turn out tanks can be made to turn out trucks for the transportation of the raw materials that are lying everywhere in China. And all sorts of warring machinery can be converted into peaceful tools for the general development of China's latent wealth. The Chinese people will welcome the development of our country's resources provided that it can be kept out of Mandarin corruption and ensure the mutual benefit of China and of the countries coöperating with us.

It might be feared by some people in Europe and America that the development of China by war machinery, war organization and technical experts might create unfavorable competition to foreign industries. I, therefore, propose a scheme to develop a new market in China big enough both for her own products and for products from foreign countries. The scheme will be along the following lines:

I. The Development of a Communications System.

(a) 100,000 miles of Railways.

如当整理战后工业之际，无处可容此一年二百一十九万万之贸易，则其工业必停，而投于是之资本乃等于虚掷，其结果不惟有损此诸生产国之经济状况，即于世界所失亦已多矣。

凡商业国，无不觅中国市场，以为消纳各国余货之地。然战前贸易状态，太不利于中国，输入超过输出，年逾美金一万万。循此以往，中国市场不久将不复能销容大宗外货，以其金钱、货物俱已枯竭，无复可持与外国市易也。所幸中国天然财源极富，如能有相当开发，则可成为世界中无尽藏之市场；即使不能全消费此一年二百一十九万万之战争生产剩余，亦必能消费其大半无疑。

中国今尚用手工为生产，未入工业革命之第一步，比之欧美已临第二革命者有殊。故于中国两种革命必须同时并举，既废手工采机器，又统一而国有之。于斯际中国正需机器，以营其巨大之农业，以出其丰富

之矿产，以建其无数之工厂，以扩张其运输，以发展其公用事业。然而消纳机器之市场，又正战后贸易之要者也。造巨炮之机器厂，可以改制蒸汽轱压，以治中国之道路；制装甲自动车之厂，可制货车以输送中国各地之生货；凡诸战争机器，一一可变成平和器具，以开发中国潜在地中之富。此种开辟利源之办法，如不令官吏从中舞弊，则中外利益均沾，中国人民必欢迎之。

欧美人或有未之深思者，恐以战争时之机器、战争时之组织与熟练之技工开辟中国利源，将更引起外国工业之竞争。故予今陈一策，可使中国开一新市场，既以销其自产之货，又能销外国所产，两不相妨。其策如下：

甲 交通之开发。

子 铁路一十万英里。

(b) 1,000,000 miles of Macadam Roads.

(c) Improvement of Existing Canals.

(1) Hangchow-Tientsin Canals.

(2) Sikiang-Yangtze Canals.

(d) Construction of New Canals.

(1) Liaoho-Sunghwakiang Canal.

(2) Others to be projected.

(e) River Conservancy.

(1) To regulate the Embankments and Channel of the Yangtze River from Hankow to the Sea thus facilitating Ocean-going Ships to reach that port at all seasons.

(2) To regulate the Hoangho Embankments and Channel to prevent floods.

(3) To regulate the Sikiang.

(4) To regulate the Hwaiho.

(5) To regulate various other rivers.

(f) The Construction of more Telegraph Lines and Telephone and Wireless Systems all over the Country.

II. The Development of Commercial Harbors.

(a) Three largest Ocean Ports with future capacity equalling New York Harbor to be constructed in North, Central and South China.

(b) Various small Commercial and Fishing Harbors to be constructed along the Coast.

(c) Commercial Docks to be constructed along all navigable rivers.

III. Modern Cities with public utilities to be constructed in all Railway Centers, Termini and alongside Harbors.

IV. Water Power Development.

V. Iron and Steel Works and Cement Works on the largest scale in order to supply the above needs.

VI. Mineral Development.

VII. Agricultural Development.

VIII. Irrigational Work on the largest scale in Mongolia and Sinkiang.

IX. Reforestation in Central and North China.

X. Colonization^[1] in Manchuria^[2] , Mongolia, Sinkiang, Kokonor^[3] , and Tibet.

丑 碎石路一百万英里。

寅 修浚现有运河：

（一）杭州、天津间运河。

（二）西江、扬子江间运河。

卯 新开运河：

（一）辽河、松花江间运河。

（二）其他运河。

辰 治河：

（一）扬子江筑堤浚水路，起汉口，迄于海，以便航洋船直达该港，无间冬、夏。

（二）黄河筑堤，浚水路，以免洪水。

（三）导西江。

（四）导淮。

（五）导其他河流。

巳 增设电报线路、电话及无线电等，使遍布于全国。

乙 商港之开辟。

子 于中国中部、北部、南部各建一大洋港口，如纽约港者。

丑 沿海岸建种种之商业港及渔业港。

寅 于通航河流沿岸建商场船埠。

丙 铁路中心及终点并商港地设新式市街，各具公用设备。

丁 水力之发展。

戊 设冶铁、制钢并造土敏土^[4]之大工厂，以供上列各项之需。

己 矿业之发展。

庚 农业之发展。

辛 蒙古、新疆之灌溉。

壬 于中国北部及中部建造森林。

癸 移民于东三省、蒙古、新疆、青海、西藏。

If the above program could be carried out gradually, China will not only be the "Dumping Ground" for foreign goods but actually will be the "Economic Ocean" capable of absorbing all the surplus capital as quickly as the Industrial Nations can possibly produce by the coming Industrial Revolution of Nationalized Productive Machinery. Then there will be no more competition and commercial struggles in China as well as in the world.

The recent World War has proved to Mankind that war is ruinous to both the Conqueror and the Conquered, and worse for the Aggressor. What is true in military warfare is more so in trade warfare. Since President Wilson has proposed a League of Nations to end military war in the future, I desire to propose to end the trade war by coöperation and mutual help in the Development of China. This will root out probably the greatest cause of future wars.

The world has been greatly benefited by the development of America as an industrial and a commercial Nation. So a developed China with her four hundred millions of population, will be another New World in the economic sense. The nations which will take part in this development will reap immense advantages. Furthermore, international coöperation of this kind cannot but help to strengthen the Brotherhood of Man. Ultimately, I am sure, this will culminate to be the keystone in the arch of the League of Nations.

In order to carry out this project successfully I suggest that three necessary steps must be taken: First, that the various Governments of the Capital-supplying Powers must agree to joint action and a unified policy to form an International Organization with their war work organizers, administrators and experts of various lines to formulate plans and to standardize materials in order to prevent waste and to facilitate work. Second, the confidence of the Chinese people must be secured in order to gain their coöperation and enthusiastic support. If

the above two steps are accomplished, then the third step is to open formal negotiation for the final contract of the project with the Chinese Government. For which I suggest that it be on the same basis as the contract I once concluded with the Pauling Company of London, for the construction of the Canton-Chungking Railway, since it was the fairest to both parties and the one most welcomed by the Chinese people, of all contracts that were ever made between China and the foreign countries.

如使上述规划果能逐渐举行，则中国不特可为各国余货消纳之地，实可为吸收经济之大洋海，凡诸工业国其资本有余者，中国能尽数吸收之。不论在中国抑在全世界，所谓竞争、所谓商战者，可永不复见矣。

近时世界战争，已证明人类之于战争不论或胜或负，均受其殃，而始祸者受害弥重。此理于以武力战者固真，于以贸易争者尤确也。威尔逊总统^[5]今既以国际同盟防止将来之武力战争，吾更欲以国际共助中国之发展，以免将来之贸易战争。则将来战争之最大原因，庶可从根本绝去矣。

自美国工商发达以来，世界已大受其益。此四万万人之中国一旦发达工商，以经济的眼光视之，何啻新辟一世界？而参与此开发之役者，亦必获超越寻常之利益，可无疑也。且此种国际协助，可使人类博爱之情益加巩固，而国际同盟亦得借此以巩固其基础，此又予所确信者也。

欲使此计划举行顺利，余以为必分三步以进：第一，投资之各政府，务须共同行动，统一政策，组成一国际团，用其战争时任组织、管理等人材及种种熟练之技师，令其设计有统系，用物有准度，以免浪费，以便作工。第二，必须设法得中国人民之信仰，使其热心匡助此举。如使上述两层，已经办到，则第三步，即为中国政府开正式会议，以议此计划之最后契约。而此种契约，吾以为应取法于曩者吾与伦敦波令公司所立建筑广州重庆铁路合同，以其为于两方最得宜，而于向来中国与外国所结契约中为人民所最欢迎者也。

And last but not least, a warning must be given that mistakes such as the notorious Sheng Shun Hwai's nationalized Railway Scheme in 1911 must not be committed again. In those days foreign bankers entirely disregarded the will of the Chinese people, and thought that they could do everything with the Chinese Government alone. But to their regret, they found that the contracts which they had concluded with the Government, by heavy bribery, were only to be blocked by the people later on. Had the foreign bankers gone in the right way of first securing the confidence of the Chinese people, and then approaching the Government for a contract, many things might have been accomplished without a hitch. Therefore, in this International Project we must pay more attention to the people's will than ever before.

If my proposition is acceptable to the Capital-supplying Powers, I will furnish further details.

吾人更有不能不预为戒告者，即往日盛宣怀^[6] 铁路国有之覆辙，不可复蹈也。当时外国银行家不顾中国之民意，以为但与中国政府商妥，即无事不可为；及后乃始悔其以贿成之契约，终受阻于人民也。假使外国银行先遵正当之途，得中国人民之信仰，然后与政府订契约，则事易行，岂复有留滞之忧？然则于此国际计划，吾人不可不重视民意也。

如资本团以吾说为然，吾更当继此有所详说。

[1] colonization：殖民。

colonization的词根是colonize，主要的意思是“种植”（plant）、“移居到偏远地区”（migrate）、“将居民、住民等送往另外一个地方长期居住”（settle）、“建立殖民地”。此词从1622年开始使用，开始并无后来语境中的贬义，而更多地是指“移居”、“移植”等。到了19世纪，当英国开始征服非洲和亚洲其他地区并建立殖民地（colony）时，因为这些地区已经拥有比较“成熟”的文明社会，此刻英国或欧洲人的“殖民”内容和目的就有了较殖民美洲时不同的变化，征服和建立控制成为建立殖民地的主要内容，尤其是在早期。这样，所谓colonialism（殖民主义）或colonization（殖民化，建立殖民地）在20世纪也就逐渐变成了一种贬义词。

具体到孙中山先生《实业计划》的用语，孙先生是一位反清的民族主义者，他写作的时代正是“帝国主义”盛行、民族主义在殖民地国家和其他非西方国家开始兴起的时代，他无疑同时受到反帝国主义、社会达尔文主义、民族主义的影响，强调建立一个有实力的、强大的中国，应对西方和俄国。他提出开发蒙古和新疆，显然将这两个地区视为中国的一部分；提出用colonization的方式来开发，更多的可能是指将汉民族的人移居到这些地方去定居，建立商业或永久定居点，目的是将这些地方纳入为中国国家的一部分。这里使用的colonization，与早期英国人殖民美洲的用法非常相似，而不是后来19世纪和20世纪使用的“征服”性colonization的意思。——王希注

[2] Manchuria：满洲，旧指我国东北一带。——编者注

[3] Kokonor：青海，蒙语称“库库诺尔”，“库库”意为“青色”，“诺尔”意为“海子”。——编者注

[4] 土敏土：即英文“cement”的音译，指水泥、混凝土。

[5] 威尔逊总统：1856—1924年，美国第28届总统，民主党人。其总统任内促成美国参加“一战”，战后倡议建立国际联盟，提出所谓“十四点”和平纲领。

[6] 盛宣怀：1844—1916年，江苏武进人。大力兴办洋务，后因奏请“铁路国有”，激起铁路风潮。

PROGRAM I

The industrial development of China should be carried out along two lines: (1) by private enterprise and (2) by national undertaking. All matters that can be and are better carried out by private enterprise should be left to private hands which should be encouraged and fully protected by liberal laws. And in order to facilitate the industrial development by private enterprise in China, the hitherto suicidal internal taxes must be abolished, the cumbersome currency must be reformed, the various kinds of official obstacles must be removed, and transportation facilities must be provided. All matters that cannot be taken up by private concerns and those that possess monopolistic character should be taken up as national undertakings. It is for this latter line of development that we are here endeavoring to deal with. In this national undertaking, foreign capital have to be invited, foreign experts and organizers have to be enlisted, and gigantic methods have to be adopted. The property thus created will be state owned and will be managed for the benefit of the whole nation. During the construction and the operation of each of these national undertakings, before its capital and interest are fully repaid, it will be managed and supervised by foreign experts under Chinese employment. As one of their obligations, these foreign experts have to undertake the training of Chinese assistants to take their places in the future. When the capital and interest of each undertaking are paid off, the Chinese Government will have the option to employ either foreigners or Chinese to manage the concern as it thinks fit.

Before entering into the details of this International development scheme, four principles have to be considered:

- (1) The most remunerative field must be selected in order to attract foreign capital.
- (2) The most urgent needs of the nation must be met.
- (3) The lines of least resistance must be followed.
- (4) The most suitable positions must be chosen.

In conformity with the above principles, I formulate PROGRAM I as follows:

I. The construction of a great Northern Port on the Gulf of Pechihli.

II. The building of a system of railways from the Great Northern Port to the Northwestern extremity of China.

III. The Colonization of Mongolia and Sinkiang (Chinese Turkestan^[1]).

壹 第一计划

中国实业之开发，应分两路进行。（一）个人企业，（二）国家经营是也。凡夫事物之可以委诸个人，或其较国家经营为适宜者，应任个人为之，由国家奖励，而以法律保护之。今欲利便个人企业之发达于中国，则从来所行之自杀的税制应即废止，紊乱之货币立需改良，而各种官吏的障碍必当排去；尤须辅之以利便交通。至其不能委诸个人及有独占性质者，应由国家经营之。今兹所论，后者之事属焉。此类国家经营之事业，必待外资之吸集、外人之熟练而有组织才具者之雇佣、宏大计划之建设，然后能举。以其财产属之国有，而为全国人民利益计以经理之。关于事业之建设运用，其在母财、子利^[2] 尚未完付期前，应由中华民国国家所雇专门练达之外人任经营监督之责；而其条件，必以教授训练中国之佐役，俾能将来继承其乏，为受雇于中国之外人必尽义务之一。及乎本利清偿而后，中华民国政府对于所雇外人当可随意用舍矣。

于详议国家经营事业开发计划之先，有四原则必当留意：

一、必选最有利之途以吸外资。

二、必应国民之所最需要。

三、必期抵抗之至少。

四、必择地位之适宜。

今据上列之原则，举其计划如下：

一、筑北方大港于直隶湾^[3]。

二、建铁路统系，起北方大港，迄中国西北极端。

三、殖民蒙古、新疆。

IV. The construction of canals to connect the inland waterway systems of North and Central China with the Great Northern Port.

V. The development of the Iron and Coal fields in Shansi and the construction of an Iron and Steel Works.

These five projects will be worked out as one program, for each of them will assist and accelerate the development of the others. The Great Northern Port will serve as a base of operation of this International Development Scheme, as well as a connecting link of transportation and communication between China and the outer

world. The other four projects will be centered around it.

Part I The Great Northern Port

I propose that a great deep water and ice free port be constructed on the Gulf of Pechihli. The need of such a port in that part of China has been keenly felt for a long time. Several projects have been proposed such as the deepening of the Taku Bar, the construction of a harbor in the Chiho estuary, the Chinwangtao Harbor which has actually been carried out on a small scale and the Hulutao Harbor which is on the point of being constructed. But the site of my projected port is in none of these places for the first two are too far from the deep water line and too near to fresh water which freezes in winter. So it is impossible to make them into deep water and ice free ports, while the last two are too far away from the center of population and are unprofitable as commercial ports. The locality of my projected port is just at midway between Taku and Chinwangtao and at a point between the mouths of the Tsingho and Lwanho, on the cape of the coast line between Taku and Chinwangtao. This is one of the points nearest to deep water in this Gulf. With the fresh water of the Tsingho and Lwanho diverted away, it can be made a deep water and ice free port without much difficulty. Its distance to Tientsin is about seventy or eighty miles less than that of Chinwangtao to Tientsin. Moreover, this port can be connected with the inland waterway systems of North and Central China by canal, whereas in the case of Chinwangtao and Hulutao this could not be done. So this port is far superior as a commercial harbor than Hulutao or Chinwangtao which at present is the only ice free port in the Gulf of Pechihli.

From a commercial standpoint this port will be a paying proposition from the very beginning of its construction, owing to the fact that it is situated at the center of the greatest salt industry in China. The cheapest salt is produced here by sun evaporation only. If modern methods could be added, also utilizing the cheap coal near by, the production could increase many times more and the cost could thus be made cheaper. Then it can supply the whole of China with much cheaper salt. By this industry alone it is quite sufficient to support a moderate sized harbor which must be the first step of this great project. Besides, there is in the immediate neighborhood the greatest coal mine that has yet been developed in China, the Kailan Mining Company. The output of its colliery is about four million tons a year. At present the company uses its own harbor, Chinwangtao, for shipping its exports. But our projected port is much nearer to its

colliery than Chinwangtao. It can be connected with the mine by canal thus providing it with a much cheaper carriage than by rail to Chinwangtao. Furthermore, our projected port will in future consume much of the Kailan coal. Thus eventually the Company must use our port as a shipping stage for its exports. Tientsin, the largest commercial center in North China, has no deep harbor and is ice bound several months a year in winter, and so has to use our projected port entirely as an outlet for its world trade. This is the local need only but for this alone it is quite sufficient to make our projected port a paying proposition.

四、开浚运河，以联络中国北部、中部通渠及北方大港。

五、开发山西煤铁矿源，设立制铁、炼钢工厂。

上列五部，为一计划，盖彼此互相关联，举其一有以利其余也。北方大港之筑，用为国际发展实业计划之策源地。中国与世界交通运输之关键，亦系夫此。此为中枢，其余四事旁属焉。

第一部 北方大港

兹拟建筑不封冻之深水大港于直隶湾中。中国该部必需此港，国人宿昔^[4]感之，无时或忘。向者屡经设计浚渫^[5]大沽口沙，又议筑港于岐河口。秦皇岛港已见小规模之实行，而葫芦岛港亦经筹商兴筑。今余所策，皆在上举诸地以外。盖前两者距深水线过远而淡水过近，隆冬即行结冰，不堪作深水不冻商港用；后两者与户口集中地辽隔，用为商港，不能见利。兹所计划之港，为大沽口、秦皇岛两地之中途，青河、滦河两口之间，沿大沽口、秦皇岛间海岸岬角上。该地为直隶湾中最近深水之一点，若将青河、滦河两淡水远引他去，免就近结冰，使为深水不冻大港，绝非至难之事。此处与天津相去，方诸天津、秦皇岛间少差七、八十哩^[6]。且此港能借运河以与北部、中部内地水路相连，而秦皇、葫芦两岛则否。以商港论，现时直隶湾中唯一不冻之港，惟有秦皇岛耳。而此港则远胜秦皇、葫芦两岛矣。

由营业上观察，此港筑成，立可获利，以地居中国最大产盐区域之中央故也。在此地所产至廉价之盐，只以日晒法产出；倘能加以近代制盐新法，且可利用附近廉价之煤，则其产额必将大增，而产费必将大减，如此中华全国所用之盐价可更廉。今以本计划遂行之始，仅能成中等商港计之，只此一项实业，已足支持此港而有余。此外直接附近地域，尚有中国现时已开最大之煤矿（开滦矿务公司），计其产额，年约四百万吨。该公司现用自有之港（秦皇岛），借为输出之路。顾吾人所计划之港，距其矿场较近，倘能以运河与矿区相联，则其运费，方诸陆运至秦皇岛者廉省多矣。不特此也，兹港将来必畅销开滦产煤，则该公司势必仰资此港为其运输出口之所。今天津一处在北方为最大商业之中枢，既无深水海港可言，每岁冬期，封冻数月，亦必全赖此港以为世界贸易之通路。此虽局部需要，然仅以此计，已足为此港之利矣。

But my idea is to develop this port as large as New York in a reasonable limit of time. Now, let us survey the hinterland to see whether the possibility justifies my ideal or not. To the southwest are the provinces of Chihli and Shansi, and the Hoangho valley with a population of nearly a hundred millions. To the northwest are the undeveloped Jehol district and the vast Mongolian Prairie with their virgin soil waiting for development, Chihli with its dense population and Shansi with its rich mineral resources have to depend upon this port as their only outlet to the sea. And if the future Dolon Nor and Urga Railway is completed with connection to the Siberian line then Central Siberia will also have to use this as its nearest seaport. Thus its contributing or rather distributing area will be larger than that of New York. Finally, this port will become the true terminus of the future Eurasian Railway System, which will connect the two continents. The

land which we select to be the site of our projected port is now almost worth next to nothing. Let us say two or three hundred square miles be taken up as national property absolutely for our future city building. If within forty years we could develop a city as large as Philadelphia, not to say New York, the land value alone will be sufficient to pay off the capital invested in its development.

顾吾人之理想，将欲于有限时期中发达此港，使与纽约等大。试观此港所襟带^[7] 控负之地，即足证明吾人之理想能否实现矣。此地西南为直隶、山西两省与夫黄河流域，人口之众约一万万。西北为热河特别区域及蒙古游牧之原，土旷人稀，急待开发。夫以直隶生齿^[8] 之繁，山西矿源之富，必赖此港为其唯一输出之途。倘将来多伦诺尔、库伦间铁路完成，以与西伯利亚铁路联络，则中央西伯利亚一带皆视此为最近之海港。由是言之，其供给分配区域，当较纽约为大。穷其究竟，必成将来欧亚路线之确实终点，而两大陆于以连为一气。今余所计划之地，现时毫无价值可言。假令于此选地二三百方咪置诸国有，以为建筑将来都市之用，而四十年后，发达程度即令不如纽约，仅等于美国费府^[9]，吾敢信地值所涨，已足偿所投建筑资金矣。

The need of such a port in this part of China goes without saying. For the provinces of Chihli, Shansi, Western Shantung, Northern Honan, a part of Fengtien and the greater part of Shensi and Kansu with a population of about 100 million are lacking of a seaport of this kind. Mongolia and Sinkiang as well as the rich coal and iron fields of Shansi will also have to depend on the Chihli coast as their only outlet to the sea. And the millions of congested population of the coast and the Yangtze Valley need an entrance to the virgin soil of the Mongolian Prairie and the Tianshan Valley. The port will be the shortest doorway and the cheapest passage to these regions.

The locality of our projected port is nearest to deep water line, and far away from any large river which might carry silt to fill up the approach of the harbor like those of the Hoangho entrance and the Yangtze estuary which cause great trouble to conservancy work. So it has no great natural obstacle to be overcome. Moreover, it is situated in an arid plain with few people living on it, so it has no artificial hindrance to be overcome. We can do whatever we please in the process of construction.

As regards the planning and estimation of the work of the harbor construction and city building, I must leave them to experts who have to make extensive surveys and soundings before detailed plan and proper estimation could be made. Whereas for rough reference see Map I, and figures 1 and 2.^[10]

中国该部地方，必需如是海港，自不待论。盖直隶、山西、山东西部、河南北部、奉天^[11]之一半、陕甘两省之泰半，约一万万之人口，皆未尝有此种海港。蒙古、新疆与夫煤铁至富之山西，亦将全恃直隶海岸，为其出海通衢。若乎沿海、沿江各地稠聚人民，必需移实蒙古、天山一带从事垦殖者，此港实为最近门户，且以由此行旅为最廉矣。

兹港所在，距深水至近，去大河至远，而无河流滞淤，填积港口，有如黄河口、扬子江口时需浚渫之患。自然之障碍，于焉可免。又为干燥平原，民居极鲜，人为障碍丝毫不存，建筑工事，尽堪如我所欲。至于海港、都市两者之工程预算，当有待于专门技士之测勘，而后详细计划可定。（参观第一图，并观详图一、二）

详图之说明：自第一计划寄到北京公使馆之后，美使芮恩诗^[12]博士即派专门技师，往作者所指定之北方大港地点实行测量，果发见此地确为直隶沿海最适宜于建筑一世界港之地。惟其不同之点，只有港口当位于西边耳。因作者当时无精确之图也。读者一观此两详细图，便可一目了然矣。

详图一、二

Figures 1 and 2

Part II The Northwestern Railway System

Our projected Railway will start at the Great Northern Port and follow the Lwan Valley to the prairie city of Dolon Nor, a distance of three hundred miles. This railway should be built in double tracks at the commencement. As our projected Port is a starting point to the sea, so Dolon Nor is a gate to the vast prairie which our projected Railway System is going to tap. It is from Dolon Nor our Northwestern Railway System is going to radiate. First, a line N. N. E. will run parallel to the Khingan Range to Khailar, and thence to Moho, the gold district on the right bank of the Amur River. This line is about eight hundred miles in length. Second, a line N. N. W. to Kurelun, and thence to the frontier to join the Siberian line near Chita. This line has a distance of about six hundred miles. Third, a trunk line northwest, west, and southwest, skirting off the northern edge of the desert proper, to Urumochi at the western end of China, a distance of about one thousand six hundred miles all on level land. Fourth, a line from Urumochi westward to Ili, a distance of about four hundred miles. Fifth, a line from Urumochi southeast across the Tienshan gap into the Darim basin, then turning southwest running along the fertile zone between the southern watershed of the Tienshan and the northern edge of the Darim Desert, to Kashgar, and thence turning southeast to another fertile zone between the eastern watershed of the Pamir, the northern watershed of the Kuenlum Mountain and the southern edge of the Darim Desert, to the city of Iden or Keria, a distance of about one thousand two hundred miles all on level land. Sixth, a branch from the Dolon Nor Urumochi Trunk Line, which I shall call Junction A, to Urga and thence to the frontier city Kiakata, a distance of about three hundred and fifty miles. Seventh, a branch from Junction B to Uliassutai and beyond N. N. W. up to the frontier, a distance of about six hundred miles. And eighth, a branch from Junction C northwest to the frontier, a distance of about four hundred and fifty miles. See Map II.

第二部 西北铁路系统

吾人所计划之铁路，由北方大港起，经滦河谷地，以达多伦诺尔，凡三百咪。经始之初，即筑双轨，以海港为出发点，以多伦诺尔为门户，以吸收广漠平原之物产，而由多伦诺尔进展于西北。第一线，向北偏东北走，与兴安岭山脉平行，经海拉尔，以赴漠河。漠河者，产金区域，而黑龙江右岸地也。计其延长，约八百咪。第二线，向北偏西北走，经克鲁伦，以达中俄边境，以与赤塔城附近之西伯利亚铁路相接，长约六百咪。第三线，以一干线向西北，转正西，又转西南，沿沙漠北境，以至国境西端之迪化城^[13]，长约一千六百咪。地皆平坦，无崇山峻岭。第四线，由迪化迤西以达伊犁，约四百咪。第五线，由迪化东南，超出天山山峡，以入戈壁边境，转而西南走，经天山以南沼地与戈壁沙漠北偏之间一带腴沃之地，以至喀什噶尔；由是更转而东南走，经帕米尔高原以东，昆仑以北，与沙漠南边之间一带沃土，以至于阆，即克里雅河岸。延长约一千二百咪，地亦平坦。第六线，于多伦诺尔、迪化间干线，开一支线，由甲接合点出发，经库伦，以至恰克图，约长三百五十咪。第七线，由干线乙接合点出发，经乌里雅苏台，倾北偏西北走，以至边境，约六百咪。第八线，由干线丙接合点出发，西北走，达边境，约四百咪。（参观第二图）

Regarded from the principle of "following the line of least resistance" our projected railways in this program is the most ideal one. For most of the seven thousand miles of lines under this project

are on perfectly level land. For instance, the Trunk Line from Dolon Nor to Kashgar and beyond, about a distance of three thousand miles right along is on the most fertile plain and encounters no natural obstacles, neither high mountains nor great rivers.

Regarded from the principle of "the most suitable position," our projected railways will command the most dominating position of world importance. It will form a part of the trunk line of the Eurasian system which will connect the two populous centers, Europe and China, together. It will be the shortest line from the Pacific Coast to Europe. Its branch from Ili will connect with the future Indo-European line, and through Bagdad, Damascus and Cairo, will link up also with the future African system. Then there will be a through route from our projected port to Capetown. There is no existing railway commanding such a world important position as this.

兹所计划之铁路，证以“抵抗至少”之原则，实为最与理想相符合者。盖以七千余哩之路线为吾人计划所定者，皆在坦途。例如多伦诺尔至喀什噶尔之间，且由斯更进之路线，延袤三千余哩，所经均肥沃之平野，并无高山大河自然之梗阻横贯其中也。

以“地位适宜”之原则言之，则此种铁路，实居支配世界的重要位置。盖将为欧亚铁路系统之主干，而中、欧两陆人口之中心，因以联结。由太平洋岸前往欧洲者，以经此路线为最近；而由伊犁发出之支线，将与未来之印度、欧洲线路（即行经伯达^[14]，以通达马斯加斯^[15]及海楼^[16]府者）联络，成一连锁。将来由吾人所计划之港，可以直达好望角城。综观现在铁路，于世界位置上无较此重要者矣。

Regarded from the principle of the "most urgent need of the Nation," this railway system becomes the first in importance, for the territories traversed by it are larger than the eighteen provinces of China Proper. Owing to the lack of means of transportation and communication at present these rich territories are left undeveloped and millions of laborers in the congested provinces along the Coast and in the Yangtze Valley are without work. What a great waste of natural and human energies. If there is a railway connecting these vast territories, the waste labor of the congested provinces can go and develop these rich soils for the good not only of China but also of the whole commercial world. So a system of railways to the northwestern part of the country is the most urgent need both politically and economically for China to-day.

I have intentionally left out the first principle—"the most remunerative field must be selected"—not because I want to neglect it but because I mean to call more attention to it and treat it more fully. It is commonly known to financiers and railway men that a railway in a densely populated country from end to end is the best paying

proposition, and a railway in a thinly settled country from end to end is the least paying one. And a railway in an almost unpopulated country like our projected lines will take a long time to make it a paying business. That is why the United States Government had to grant large tracts of public lands to railway corporations to induce them to build the Transcontinental lines to the Pacific Coast, half a century ago. Whenever I talked with foreign railway men and financiers about the construction of railways to Mongolia and Sinkiang, they generally got very shy of the proposition. Undoubtedly they thought that it is for political and military reasons only that such a line as the Siberian Railway was built, which traversed through a thinly populated land. But they could not grasp the fact which might be entirely new to them, that a railway between a densely populated country and a sparsely settled country will pay far better than one that runs from end to end in a densely populated land. The reason is that in economic conditions the two ends of a well populated country are not so different as that between a thickly populated country and a newly opened country. At the two ends of a well populated country, in many respects, the local people are self-supplying, excepting a few special articles which they depend upon the other end of the road to supply. So the demand and supply between the two places are not very great, thus the trade between the two ends of the railway could not be very lucrative. While the difference of the economic condition between a well populated country and an unpopulated country is very great. The workers of the new land have to depend upon the supplies of the thickly populated country almost in everything excepting foodstuffs and raw materials which they have in abundance and for disposal of which they have to depend upon the demand of the well populated district. Thus the trade between the two ends of the line will be extraordinarily great. Furthermore, a railway in a thickly populated place will not affect much the masses which consist of the majority of the population. It is only the few well-to-do and the merchants and tradesmen that make use of it. While with a railway between a thickly populated country and a sparsely settled or unsettled country, as soon as it is opened to traffic for each mile, the masses of the congested country will use it and rush into the new land in a wholesale manner. Thus the railway will be employed to its utmost capacity in passenger traffic from the beginning. The comparison between the Peking-Hankow Railway and the Peking-Mukden^[17] Railway in China is a convincing proof.

以“国民需要”之原则言之，此为第一需要之铁路。盖所经地方，较诸本部十八行省^[18] 尤为广阔。现以交通运输机关缺乏之故，丰富地域，委为荒壤，而沿海沿江烟户稠密省分，麇聚^[19] 之贫民无所操作，其弃自然之惠泽而耗人力于无为者，果何如乎？倘有铁路与此等地方相

通，则稠密省区无业之游民，可资以开发此等富足之地。此不仅有利于中国，且有以利世界商业于无穷也。故中国西北部之铁路系统，由政治上、经济上言之，皆于中国今日为必要而刻不容缓者也。

吾人所以置“必选有利之途”之第一原则而未涉及者，非遗弃之也，盖将详为论列，使读者三致意焉耳。今夫铁路之设，间于人口繁盛之区者其利大，间于民居疏散之地者其利微，此为普通资本家、铁路家所恒信；今以线路横亘于荒僻无人之境，如吾人所计划者，必将久延岁月，而后有利可图。北美合众国政府于五十年前，所以给与无垠之土地于铁路公司，诱其建筑横跨大陆干路，以达太平洋岸者，职是之故。余每与外国铁路家、资本家言兴筑蒙古、新疆铁路，彼辈恒有不愿。彼将以为兹路之设，所过皆人迹稀罕，只基于政治上、军事上理由，有如西伯利亚铁路之例，而不知铁路之所布置，由人口至多以达人口至少之地者，其利较两端皆人口至多之地为大。兹之事实，盖为彼辈所未曾闻。请详言其理。夫铁路两端人口至多之所，彼此经济情况大相仿佛，不如一方人口至多、他方人口至少者，彼此相差之远。在两端皆人口至多者，舍特种物产此方仰赖彼方之供给而外，两处居民大都生活于自足经济情况之中，而彼此之需要供给不大，贸迁交易，不能得巨利。至于一方人口多而他方人口少者，彼此经济情况，大相径庭。新开土地从事劳动之人民，除富有粮食及原料品，以待人口多处之所需求而外，一切货物，皆赖他方之繁盛区域供给，以故两方贸易必臻鼎盛。不特此也，筑于两端皆人口至多之铁路，对于人民之多数无大影响，所受益者惟少数富户及商人而已；其在一方人口多而他方人口少者，每筑铁路一哩开始输运，人口多处之众必随之而合群移住于新地，是则此路建筑之始，将充其量以载行客。京奉、京汉两路比较，其明证也。

The Peking-Hankow Railway is a line of over eight hundred miles running from the capital of the country to the commercial center in the heart of China right along in an extraordinarily densely settled country from end to end. While the Peking-Mukden line is barely six hundred miles in length running from a thickly populated country to thinly populated Manchuria. The former is a well paying line but the latter pays far better. The net profit of the shorter Peking-Mukden line is sometimes three to four millions more yearly than that of the longer Peking-Hankow line.

Therefore, it is logically clear that a railway in a thickly populated country is much better than one that is in a thinly populated country in remuneration. But a railway between a very thickly populated and a very thinly populated or unpopulated country is the best paying proposition. This is a law in Railway Economics which hitherto had not been discovered by railway men and financiers.

According to this new railway economic law, our projected railway will be the best remunerative project of its kind. For at the

one end, we have our projected port which acts as a connecting link with the thickly populated coast of China and the Yangtze Valley and also the two existing lines, the Kingham and the Tsinpu, as feeders to the projected port and the Dolon Nor line. And at the other end, we have a vast and rich territory, larger than China Proper, to be developed. There is no such vast fertile field so near to a center of a population of four hundred millions to be found in any other part of the world.

京汉路线之延长八百有余哩，由北京直达中国商业聚中之腹地，铁路两端之所包括，皆户集人稠之所；京奉路线长仅六百哩耳，然由人口多处之京、津，开赴人口少处之满洲。前者虽有收益，则不若后者所得之大。以较短之京奉线，方诸较长之京汉线，每年纯利所赢，其超过之数有至三四百万者矣。

故自理则上言之，从利益之点观察，人口众多之处之铁路，远胜于人口稀少者之铁路。然由人口众多之处筑至人口稀少之处之铁路，其利尤大。此为铁路经济上之原则，而铁路家、资本家所未尝发明者也。

据此铁路经济上之新原则，而断吾人所计划之铁路，斯为有利中之最有利者。盖一方联接吾人所计划之港，以通吾国沿海沿江户口至多省分；又以现存之京汉、津浦两路，为此港暨多伦诺尔路线之给养，他方联接大逾中国本部之饶富未开之地。世界他处，欲求似此广漠腴沃之地，而邻近于四万万人口之中心者，真不可得矣。

Part III The Colonization of Mongolia and Sinkiang

The Colonization of Mongolia and Sinkiang is a complement of the Railway scheme. Each is dependent upon the other for its prosperity. The colonization scheme, besides benefiting the railway, is in itself a greatly profitable undertaking. The results of the United States, Canada, Australia, and Argentina are ample proofs of this. In the case of our project, it is simply a matter of applying waste Chinese labor and foreign machinery to a fertile land for production for which its remuneration is sure. The present Colonization of Manchuria, notwithstanding its topsy turvy way which caused great waste of land and human energy, has been wonderfully prosperous. If we would adopt scientific methods in our colonization project we could certainly obtain better results than all the others. Therefore, I propose that the whole movement be directed in a systematic way by state organization with the help of foreign experts and war organizers, for the good of the colonists particularly and the nation generally.

The land should be bought up by the state in order to prevent the speculators from creating the dog-in-the-manger system, to the detriment of the public. The land should be prepared and divided into farmsteads, then leased to colonists on perpetual term. The initial capital, seeds, implements and houses should be furnished by the state at cost price on cash or on the instalment plan. For these services, big organizations should be formed and war work measures should be adopted in order to transport, to feed, to clothe and to house every colonist on credit in his first year.

As soon as a sufficient number of colonists is settled in a district, franchise should be given for self-government and the colonists should be trained to manage their own local affairs with perfect democratic spirit.

If within ten years we can transport, let us say, ten millions of the people, from the congested provinces of China, to the Northwestern territory to develop its natural resources, the benefit to the commercial world at large will be enormous. No matter how big a capital that shall have been invested in the project it could be repaid within a very short time. So in regard to its bearing to "the principle of remuneration" there is no question about it.

Regarded from "the principle of the need of the Nation" colonization is the most urgent need of the first magnitude. At present

China has more than a million soldiers to be disbanded. Besides, the dense population will need elbow room to move in. This Colonization project is the best thing for both purposes. The soldiers have to be disbanded at great expense and hundreds of millions of dollars may be needed for disbandment alone, in paying them off with a few months' pay. If nothing more could be done for these soldiers' welfare, they will either be left to starve or to rob for a living. Then the consequences will be unimaginable. This calamity must be prevented and prevented effectively. The best way for this is the colonization scheme. I hope that the friendly foreign financiers, who have the welfare of China at heart, when requested to float a reorganization loan for the Chinese Government in the future, will persist on the point—that the money furnished must first be used to carry out the colonization scheme for the disbanded soldiers. Otherwise, their money will only work disasters to China.

第三部 蒙古、新疆之殖民

殖民蒙古、新疆，实为铁路计划之补助，盖彼此互相依倚，以为发达者也。顾殖民政策，除有益于铁路以外，其本身又为最有利之事业。例如北美合众国、加拿大、澳洲及阿尔然丁^[20]等国所行之结果，其成绩至为昭彰。至若吾人之所计划，不过取中国废弃之人力，与夫外国之机械，施于沃壤，以图利益昭著之生产。即以满洲现时殖民言之，虽于杂乱无章之中，虚耗人工地力，不知凡几，然且奇盛；假能以科学上方法行吾人之殖民政策，则其收效，将无伦比。以此之故，予议于国家机关之下，佐以外国练达之士及有军事上组织才者，用系统的方法指导其事，以特惠移民，而普利全国。

土地应由国家买收，以防专占投机之家置土地于无用，而遗毒害于社会。国家所得土地，应均为农庄，长期贷诸移民。而经始之资本、种子、器具、屋宇应由国家供给，依实在所费本钱，现款取偿，或分年摊还。而兴办此事，必当组织数大机关，行战时工场制度，以为移民运输居处衣食之备。第一年不取现值，以信用贷借法行之。

一区之移民为数已足时，应授以自治特权。每一移民，应施以训练，俾能以民主政治的精神，经营其个人局部之事业。

假定十年之内，移民之数为二千万，由人满之省徙于西北，垦发自然之富源，其普遍于商业世界之利，当极浩大。靡论所投资本庞大若何，计必能于短时期中，子偿其母^[21]。故以“有利”之原则论，别无疑问也。

以“国民需要”之原则衡之，则移民实为今日急需中之至大者。夫中国现时应裁之兵，数过百万；生齿之众，需地以养。殖民政策于斯两者，固最善之解决方法也。兵之裁也，必须给以数月恩饷，综计解散经费，必达一万万元之巨。此等散兵无以安之，非流为饿莩^[22]，则化为盗贼，穷其结果，宁可忍言。此弊不可不防，尤不可使防之无效。移民实荒，此其至善者矣。予深望友好之外国资本家，以中国福利为怀者，对于将来中国政府请求贷款以资建设，必将坚持此旨，使所借款项第一先用于裁兵之途；其不然者，则所供金钱，反以致祸于中国矣。

For the million or more of the soldiers to be disbanded, the district between our projected port and Dolon Nor is quite enough to accommodate them. This district is quite rich in mineral resources and is very sparsely settled. If a railway is to start at once from the projected port to Dolon Nor these soldiers could be utilized as a pioneer party for the work of the port, of the railway, of the developing of the adjacent land beyond the Great Wall, and of preparing Dolon Nor as a jumping ground for further colonization development of the great northern plain.

Part IV The Construction of Canals to Connect the Inland Waterway Systems of North and Central China with the Great Northern Port

This scheme will include the regulation of the Hoangho and its branches, the Weiho in Shensi, and the Fenho in Shansi and connecting canals. The Hoangho should be deepened at its mouth in order to give a good drawing to clear its bed of silt and carry the same to the sea. For this purpose, jetties should be built far out to the deep sea, as those at the mouths of the Mississippi in America. Its embankments should be parallel in order to make the width of the channel equal right along, so as to give equal velocity to the current which will prevent the deposit of silt at the bottom. By dams and locks, it could be made navigable right up to Lanchow, in the province of Kansu, and at the same time water power could be developed. The Weiho and the Fenho can also be treated in the same manner so as to make them navigable to a great extent in the provinces of Shensi and Shansi. Thus the provinces of Kansu, Shensi, and Shansi can be connected by waterway with our projected port on the Gulf of Pechihli, so that cheap carriage can be provided for the rich mineral and other products from these three hitherto secluded provinces.

对于被裁百余万之兵，只以北方大港与多伦诺尔间辽阔之地区，已足以安置之。此地矿源富而户口少，倘有铁路由该港出发以达多伦诺尔，则此等散兵可供利用，以为筑港、建路及开发长城以外沿线地方之先驱者。而多伦诺尔将为发展极北殖民政策之基矣。

第四部 开浚运河以联络中国北部、中部通渠及北方大港

此计划包含整理黄河及其支流、陕西之渭河、山西之汾河暨相连诸运河。黄河出口，应事浚渫，以畅其流，俾能驱淤积以出洋海。以此目的故，当筑长堤，远出深海，如美国密西悉比河^[23]口然。堤之两岸，须成平行线，以保河辐之划一，而均河流之速度，且防淤积于河底。加以堰闸之功用，此河可供航运，以达甘肃之兰州。同时，水力工业亦可发展。渭河、汾河亦可以同一方法处理之，使于山、陕两省中，为可航之河道。诚能如是，则甘肃与山、陕两省，当能循水道与所计划直隶湾中之商港联络，而前此偏僻三省之矿材物产，均得廉价之运输矣。

The expenses of regulating the Hoangho may be very great. As a paying project, it may not be very attractive but as a flood preventive measure, it is the most important task to the whole nation. This river has been known as "China's Sorrow" for thousands of years. By its occasional overflow and bursting of its embankments, millions of lives and billions of money have been destroyed. It is a constant source of anxiety in the minds of all China's statesmen from time immemorial. A permanent safeguard must be effected, once for all, despite the expenses that will be incurred. The whole nation must bear the burden of its expenses. To deepen its mouth, to regulate its embankments and to build extra dykes are only half of the work to prevent flood. The entire reforestation of its watershed to prevent the washing off of loess is another half of the work in the prevention of flood.

The Grand Canal, the former Great Waterway of China between the North and the South for centuries, and now being reconstructed in certain sections, should be wholly reconstructed from end to end, in order to restore the inland waterway traffic from the Yangtze Valley to the North. The reconstruction of this canal will be a great remunerative concern for it runs right along from Tientsin to Hangchow in an extremely rich and populous country.

Another new canal should be constructed from our projected port to Tientsin to link up all the inland waterway systems to the new port. This new canal should be built extra wide and deep, let us say, similar to the present size of the Peiho, for the use of the coasting and shallow-draft vessels which the Peiho now accommodates for other than the winter seasons. The banks of this canal should be prepared for factory sites so as to enable it to pay not only by its traffic but also from the land on both sides of its banks.

As for planning and estimating these river and canal works, the assistance of technical experts must be solicited.

Part V The Development of the Iron and Coal Fields in Chihli and Shansi, and the Construction of Iron and Steel Works

Since we have in hand in this program the work of the construction of the Great Northern Port, the work of the building of a system of railways from the Great Northern Port to the North Western Extremity of China, the work of the Colonization of Mongolia and Sinkiang, and the work of the construction of canals and improvement of rivers to connect with the Great Northern Port, the demand for materials will be very great. As the iron and coal resources of every industrial country are decreasing rapidly every year, and as all of them are contemplating the conservation of their natural resources for the use of future generations, if all the materials for the great development of China were to be drawn from them, the draining of the natural resources of those countries will be detrimental for their future generations. Besides, the present need of the post-bellum reconstruction of Europe has already absorbed all the iron and coal that the industrial world could supply. Therefore, new resources must be opened up to meet the extraordinary demand of the development of China.

修理黄河费用或极浩大，以获利计，亦难动人。顾防止水灾，斯为全国至重大之一事。黄河之水，实中国数千年愁苦之所寄。水决堤溃，数百万生灵、数十万万财货为之破弃净尽。旷古以来，中国政治家靡不引为深患者。以故一劳永逸之策，不可不立，用费虽巨，亦何所惜，此全国人民应有之担负也。浚渫河口，整理堤防，建筑石坝，仅防灾工事之半而已；他半工事，则植林于全河流域倾斜之地，以防河流之漂卸土壤是也。

千百年来，为中国南北交通枢纽之古大运河，其一部分现在改筑中者，应由首至尾全体整理，使北方、长江间之内河航运得以复通。此河之改筑整理，实为大利所在。盖由天津至杭州，运河所经皆富庶之区也。

另应筑一新运河，由吾人所计划之港，直达天津，以为内地诸河及新港之连锁。此河必深而且广，约与白河相类，俾供国内沿岸及浅水航船之用，如今日冬期以外之所利赖于白河者也。河之两岸，应备地以建工厂，则生利者不止运输一事，而土地价格之所得，亦其一端也。

至于建筑之计划预算，斯则专门家之责，兹付阙如。

第五部 开发直隶、山西煤铁矿源，设立制铁炼钢工厂

本计划所举诸业，如筑北方大港，建铁路统系由北方大港以达中国西北极端，殖民蒙古、新疆，与夫开浚运河、改良水道以联络北方大港，之四者所需物料当极浩大。夫煤铁矿源，在各实业国中累岁锐减，而各国亟思所以保存天惠，以遗子孙。如使为开发中国故，凡夫物料所需，取给各国，则将竭彼自为之富源，贻彼后代患。且以欧洲战后，各国再造所费，于实业界能供给之煤铁，行将吸收以尽。故开发新富源，以应中国之特别需求者，势则然也。

The unlimited iron and coal fields of Shansi and Chihli should be developed on a large scale. Let us say a capital of from five hundred to a thousand million dollars Mex. should be invested in this project. For as soon as the general development of China is started we would have created a vast market for iron and steel which the present industrial world will be unable to supply. Think of our railway construction, city building, harbor works, and various kinds of machineries and implements that will be needed! In fact, the development of China means the creation of a new need of various kinds of goods, for which, we must undertake to create the supply also, by utilizing the raw materials near by. Thus a great iron and steel works is an urgent necessity as well as a greatly profitable project.

In this FIRST PROGRAM, we have followed the four principles set forth at the outset pretty closely. As needs create new needs and profits promote more profits, so our first program will be the forerunner of the other great developments, which we will deal with shortly.

直隶、山西无尽藏之煤铁，应以大规模采取之。今假以五万万或十万万资本，投诸此事业。当中国一般的开发计划进行之始，钢铁销场立即扩大，殊非现时实业界所能供给。试思铁路、都市、商港等之建筑，与夫各种机械器具之应用，所需果当何若。质而言之，则中国开发，即所以起各种物品之新需要，而同时不得不就附近原料，谋相当之供给。故制铁、炼钢工厂者，实国家之急需，亦厚利之实业也。

此第一计划，皆依据前此所述之四原则而成。果如世论所云，“一需要即以发生更新之需要，一利益即以增进较多之利益”，则此第一计划，可视为其他更大发展中国计划之先导，后当继续论之。

[1] Chinese Turkestan：指今新疆地区。——编者注

[2] 母财、子利：资本、利息。

[3] 直隶湾：即渤海湾。在渤海西部，北起河北省乐亭县大清河口，南到山东省黄河口。

- [4] 宿昔：向来，往日。
- [5] 浚渫：疏浚、疏通。
- [6] 咪：英里，mile的英译，现已极少使用。——编者注
- [7] 襟带：如襟如带，指山川环绕，地势险要。
- [8] 生齿：语出《周礼·秋官·司民》，后借指人口、家口。
- [9] 费府：即费城，美国东北部大城。
- [10] As soon as this first program reached the American Legation in Peking, the former Minister, Dr. Paul S. Reinsch, immediately sent an expert to survey the site which the writer indicated, and found that it is really the best site on the Chihli Coast for a world harbor, excepting that the entrance of the port should be at the west side instead of the east side as the writer proposed. Detailed plans have been made as figures 1 and 2.
- [11] 奉天：指今辽宁省。其辖境古今略有不同。
- [12] 芮恩施：今译芮恩施，1869—1923年。美国外交官，1913年任美国驻华公使，1919年辞职后，受聘为北洋政府法律顾问。
- [13] 迪化城：指今新疆维吾尔自治区首府乌鲁木齐市。
- [14] 伯达：旧多译为报达，今译巴格达，今伊拉克首都。
- [15] 达马斯加斯：今译大马士革，叙利亚首都。
- [16] 海楼：今译开罗。
- [17] Mukden：沈阳，满语音为“穆克敦和屯（mukden hoton）”，意为“兴盛之京”，故称“盛京”，又名奉天。——编者注
- [18] 中国本部（China Proper）：指以汉文化为主导、汉族占人口绝大多数的地区，在本书中指清朝的“十八行省”行政区域，不包括东北、新疆、蒙古、青海、西藏等地区。此英文名词为当时的传统用法，今日主要用于历史或地理研究，现代中文已绝少使用。十八行省范围历经元、明两代变迁，最后在清康熙朝时，定为冀、苏、皖、鲁、晋、豫、陕、甘、闽、浙、赣、鄂、湘、川、粤、桂、滇、黔。——编者注
- [19] 麇聚：群聚。
- [20] 阿尔然丁：今译阿根廷。
- [21] 子偿其母：指获利甚多，利息即可偿还所投入资本。
- [22] 饿殍：亦作“饿殍”，指饿死的人。
- [23] 密西悉比河：今通译为密西西比河。

PROGRAM II

As the Great Northern Port is the center of our first program, so the Great Eastern Port will be the center of our second program. I shall formulate this program as follows:

I. The Great Eastern Port.

II. The Regulating of the Yangtze Channel and Embankments.

III. The Construction of River Ports.

IV. The Improvement of the Existing Waterways and Canals in Connection with the Yangtze.

V. The Establishment of Large Cement Works.

Part I The Great Eastern Port

Although Shanghai is already the largest port in all China, as it stands it will not meet the future needs and demands of a world harbor. Therefore there is a movement at present among the foreign merchants in China to construct a world port in Shanghai. Several plans have been proposed such as to improve the existing arrangement, to build a wet dock by closing the Whangpoo, to construct a closed harbor on the right bank of the Yangtze outside of Whangpoo, and to excavate a new basin just east of Shanghai with a shipping canal to Hangchow Bay. It is estimated that a cost of over one hundred million dollars Mex. must be spent before Shanghai can be made a first-class port.

According to the four principles I set forth in Program I, Shanghai as a world port for Eastern China is not in an ideal position. The best position for a port of that kind is at a point just south of Chapu on the Hangchow Bay. This locality is far superior to Shanghai as an eastern port for China from the standpoint of our four principles as set forth in our first program. Henceforth, in our course of discussion, we shall call this the "Projected Port" so as to distinguish it from Shanghai, the existing port of Eastern China.

The Projected Port

The "Projected Port" will be on the Bay which lies between the Chapu and the Kanpu promontories, a distance of about fifteen miles. A new sea wall should be built from one promontory to the other and a gap should be left at the Chapu end, a few hundred feet from the hill as an entrance to the harbor. The sea wall should be divided into five sections of three miles each. For the present, one section of three miles in length and one and a half miles in width should be built and a harbor of three or more square miles so formed would be sufficient. With the growth of commerce one section after another could be added to meet the needs. The front sea wall should be built of stone or concrete, while the transverse wall between the sea wall and the land side should be built of sand and bush mattress as a temporary structure to be removed in case of the extension of the harbor. Once a harbor is formed there need be no trouble regarding the future conservancy work, for there is no silt-carrying water in the vicinity by which the harbor and its approaches may be silted up afterwards. The entrance of our harbor is in the deepest part of the Hangchow Bay,

and from the entrance to the open sea there is an average depth of six to seven fathoms^[1] at low water. The largest ocean liner could therefore come into port at any hour. Thus as a first-class seaport in Central China our Projected Port is superior to Shanghai. See Map III.

貳 第二计划

东方大港之为第二计划中心，犹之北方大港之为第一计划中心也。故第二计划，亦定为五部，即：

- 一、东方大港。
- 二、整治扬子江水路及河岸。
- 三、建设内河商埠。
- 四、改良扬子江之现存水路及运河。
- 五、创建大土敏土厂。

第一部 东方大港

上海现在虽已成为全中国最大之商港，而苟长此不变，则无以适合于将来为世界商港之需用与要求。故今日在华外国商人有一运动，欲于上海建一世界商港。现经有种种计划提出，即如将现在之布置更加改良，堵塞黄浦江口及上游以建一泊船坞，于黄浦口外扬子江右岸建一锁口商港，于上海东方凿一船池，并浚一运河到杭州湾；而预算欲使上海成为一头等商港，必须费去洋银一万万元以上然后可。

据第一计划中吾所举之四原则，则上海之为中国东方世界商港也，实不可谓居于理想的位置。而此种商港最良之位置，当在杭州湾中乍浦正南之地。依上述四原则以为观察，论其为东方商港，则此地位远胜上海。是以吾等于下文将呼之为计划港，以别于现在中国东方已成之商港即上海也。

甲 计划港

计划港当位于乍浦岬与澈浦岬之间，此两点相距约十五英里。应自此岬至彼岬建一海堤，而于乍浦一端离山数百英尺之处，开一缺口，以为港之正门。此种海堤可分为五段，每段各长三英里。因现在先筑一段，长三英里，阔一英里半，已得三四方英里之港面，足供用矣。至于商务长进，则可以逐段加筑，以应其需用。前面海堤，应以石块或土敏土坚结筑之。其横于海堤与陆地间之堤，则可用沙及柴席垒成，作为暂时建造，以备扩张港面时之移动。此港一经作成，永无须为将来浚渫之计。盖此港近旁，并无挟泥之水日后能填满此港面及其通路者也。在杭州湾中，此港正门为最深之部分，由此正门出至公海，平均低潮水深三十六英尺至四十二英尺，故最大之航洋船，可以随时进出口。故以此计划港作为中国中部一等海港，远胜上海也。（参观第三图）

圖三第
MAP III

From the viewpoint of the principle of the line of least resistance, our Projected Port will be on new land which will offer absolute freedom for city planning and industrial development. All public utilities and transportation plants can be constructed according to the most up-to-date methods. This point alone is an important factor for a future city like ours which in time is bound to grow as large as New York City. If one hundred years ago human foresight could have

foreseen the present size and population of New York, much of the labor and money spent could have been saved and blunders due to shortsightedness avoided in meeting conditions of the ever growing population and commerce of that city. With this in view a great Eastern Port in China should be started on new ground to insure room for growth proportionate to its needs.

Moreover, all the natural advantages which Shanghai possesses as a central mart and Yangtze Port in Eastern China are also possessed by our Projected Port. Furthermore, our Projected Port in comparison with Shanghai is of shorter distance, by rail communication, to all the large cities south of the Yangtze. And if the existing waterway between this part of the country and Wuhu were improved then the water communication with the upper Yangtze would also be shorter from our Projected Port than from Shanghai. And all the artificial advantages possessed by Shanghai as a large city and a commercial center in this part of China can be easily attained by our Projected Port within a short time.

Comparing Shanghai with our Projected Port from a remunerative point of view in our development scheme, the former is much inferior in position to the latter, for valuable lands have to be bought and costly plants and existing arrangements have to be scrapped the cost of which alone is enough to construct a fine harbor on our projected site. Therefore, it is highly advisable to construct another first-class port for Eastern China like the one I here propose, leaving Shanghai to be an inland mart and manufacturing center as Manchester is in relation to Liverpool, Osaka to Kobe, and Tokyo to Yokohama.

Our Projected Port will be a highly remunerative proposition for the cost of construction will be many times cheaper than Shanghai and the work simpler. The land between Chapu and Kanpu and farther on will not cost more than fifty to one hundred dollars a mow. The State should take up a few hundred square miles of land in this neighborhood for the scheme of our future city development. Let us say two hundred square miles of land at the price of one hundred dollars a mow be taken up. As six mows make an acre and six hundred and forty acres a square mile, two hundred square miles would cost 76,000,000 dollars Mex. An enormous sum for a project indeed! But the land could be fixed at the present price and the State could buy only that part of land which will immediately be taken up and used. The other part of the land would remain as State land unpaid for and left to the original owners' use without the right to sell. Thus the State only takes up as much land as it could use in the development scheme at a fixed price which remains permanent. The payment then would be gradual. The State could pay for the land from its unearned

increment afterwards. So that only the first allotment of land has to be paid for from the capital fund; the rest will be paid for by its own future value. After the first section of the harbor is completed and the port developed, the price of land then would be bound to rise rapidly, and within ten years the land value within the city limits would rise to various grades from a thousand to a hundred thousand dollars per mow. Thus the land itself would be a source of profit. Besides there would also be the profit from the scheme itself, i.e., the harbor and the city. Because of its commanding position, the harbor has every possibility of becoming a city equal to New York. It would probably be the only deep-water seaport for the Yangtze Valley and beyond, an area peopled by two hundred million inhabitants, twice the population of the whole United States. The rate of growth of such a city would be in proportion to the rate of progress of the working out of the development scheme. If war work methods, that is, gigantic planning and efficient organization, were applied to the construction of the harbor and city, then an Oriental New York City would spring up in a very short time.

以“抵抗最少”之原则言，吾之计划，乃在未开辟地规划城市、发展实业皆有绝对自由，一切公共营造及交通计划均可以最新利之方法建设之。即此一层，已为我等之商港将来必须发展至大如纽约者之最重要之要素矣。如使人之远见，在百年前能预察纽约今日人口之多与其周围之广，则此空费之无数金钱劳力与无远见之失误皆可避去，而恰就此市不绝长进之人口及商务，求其适合矣。吾人既知其如此，则中国东方大港务须经始于未开辟之地，以保其每有需用，随时可以推广也。

且上海所有天然利益，如其为中国东部长江商港，为其中央市场，我之计划港亦复有之。更加以由铁路以与大江以南各大都市相交通，此港较之上海为近。抑且如将该地近旁与芜湖之间水路加以改良，则此港与长江上游水上交通，亦比上海为近。而上海所有一切人为的繁荣，所以成为一大商埠，为中国此方面商务之中心者，不待多年，此港已能追及之矣。

由吾发展计划之观察点，以比较上海与此计划港，则上海较此港恶劣^[2]。因其须购高价之土地，须毁除费用甚多之基址与现存之布置，即此一层所费，已足作成一良好港面，于我所计划之地矣。是以照我所提，别建一头等港供中国东部之用，而留上海作为内地市场与制造中心，如英国孟遮斯打^[3]之于利物浦、日本大阪之于神户、东京之于横滨，最为得策也。

以其建造将较上海廉数倍，工作亦简单数倍，故此计划港将为可获厚利之规划。乍浦、澉浦间及其附近，土地之价每亩当不过五十元至一百元，国家当划取数百英方里^[4]之地于其邻近，以供吾等将来市街发展之计划所用。假如划定为二百英方里，每亩价值百元，每六亩当一英亩，而六百四十英亩当一英方里，故二百英方里地价当费七千六百万

元。以一计划论，此诚为巨额。但政府可以先将地价照现时之额限定，而仅买取所须用之地，其余之地，则作为国有地未给价者留于原主手中，任其使用，但不许转卖耳。如此，国家但于发展计划中需用若干地，即随时取若干地，而其取之，则有永远不变之定价，而其支付地价可以徐徐，国家将来即能以其所增之利益，还付地价。如此，惟第一次所用地区之价须以资本金支付之，其余则可以其本身将来价值付之而已足。至港面第一段完成以后，此港发达，斯时地价急速腾贵，十年之内，在其市街界内地价将起自千元一亩至十万元一亩之高价，故土地自体已发生利益矣，而又益之以计划本来之港面及市街之利益。因其所挟卓越之地位，此港实有种种与纽约媲美之可能。而在扬子江流域，控有倍于美国之二万万人口之一地区，想当以此为唯一之深水海港也。此种都市长进之率，将与实行此发展计划全部之率为正比例。如使用战时工作之伟大规模、完密组织之方法，以助长此港面与市街之建造，则此时将有东方纽约崛起于极短时间之中。于是无须更虑其过度扩展与资本之误投，因有无限之富源与至大之人口，正待此港而用之也。

Shanghai as the Great Eastern Port

If only to provide a deep-water harbor for the future commerce in this part of China is our object then there is no question about the choice between Shanghai and our Projected Port. From every point of view Shanghai is doomed. However, in our scheme of development of China, Shanghai has certain claims for our consideration which may prove its salvation as an important city. The curse of Shanghai as a world port for future commerce is the silt of the Yangtze which fills up all its approaches rapidly every year. This silt, according to the estimation of Mr. Von Heidenstam, Engineer-in-chief of the Whangpoo Conservancy Board, is a hundred million tons a year and is sufficient to cover an area of forty square miles ten feet deep. So before Shanghai can be considered ever likely to become a world port this silt problem must first be solved. Fortunately, in our program, we have the regulation of the Yangtze Channels and Embankments, which will coöperate in solving the problem of Shanghai. Thus with this scheme in mind we might just as well consider that the silt question of Shanghai has been solved and let us go ahead, while leaving the regulation of the Yangtze Estuary to the next part, to deal with the improvement of the Shanghai Harbor.

乙 以上海为东方大港

如使我之计划，唯欲以一深水港面，供中国此部分将来商务之用，则必取前之计划港，而舍上海无疑。任从何点观察，上海皆为僵死之港，然而在我之中国发展计划，上海有特殊地位。由此审度之，于上海仍可求得一种救济法也。扬子江之沙泥，每年填塞上海通路，迅速异常，此实阻上海为将来商务之世界港之噩神也。据黄浦江浚渫局技师长

方希典斯坦君所推算，此种沙泥每年计有一万万吨，此数足以铺积满四十英方里之地面，至十英尺之厚。必首先解决此沙泥问题，然后可视上海为能永成为一世界商港者也。幸而在吾计划中，本有整治扬子江水道及河岸一部，将有助于上海通路之解决。故常以此计划置诸心中，即可将沙泥问题作为已解决者，而将整治长江入海口一事让之次部。现在先商上海港面改良一事。

There are many plans proposed by experts for improving the Shanghai Harbor as stated before, and some of them will necessitate the scrapping of all the work which has been done by the Whangpoo Conservancy Board for the last twelve years, at the cost of eleven million taels. Here I wish to present a layman's plan for the consideration of specialists and the public.

My project for the construction of a world harbor in Shanghai is to leave the existing arrangement intact from the mouth of the Whangpoo to the junction of Kao Chiao Creek above Gough Island. Thus all the work hitherto done by the Whangpoo Conservancy Board for the last twelve years will be saved. The plan is to cut a new canal from the junction of Kao Chiao Creek right into Pootung to prolong that part of the channel which has been completed by the Conservancy Work, and to enlarge the curve along the right side of the Whangpoo River and join it again, at the second turn above Lunghwa Railway Junction, so as to make the river from that point to a point opposite Yangtzepoo Point almost in a straight line and thence a gentle curve to Woosung. This new canal would encircle nearly thirty square miles of land which would form the civic center and the New Bund of our future Shanghai. Of course the present crooked Whangpoo right in front of Shanghai would have to be filled up to form boulevards and business lots. It goes without saying that the reclaimed lots from the Whangpoo would become State property and the land between this and the new river and beyond should be taken up by the State and put at the disposal of the International Development Organization. Thus it may be possible for Shanghai to compete with our Projected Port economically in its construction and therefore to attract foreign capital, to the improvement of Shanghai as a future world port. See Map IV.

Below Yangtzepoo Point I propose to build a wet dock. This dock should be laid between the left bank of the present Whangpoo, from Yangtzepoo Point to the turn above Gough Island and the left bank of the new river. The space of the dock should be about six square miles. A lock entrance is to be constructed at the point above Gough Island. The wet dock should be forty feet deep and the new river can also be made the same depth by flushing with the water, not as proposed by experts, from a lock canal between the Yangtze and the Taihu, at

Kiangyin, but from our improved waterway between this part of the country and Wuhu so that a much stronger current could be obtained.

现有诸专门家提出种种计划，以图上海海面改良，如前所述。其中有欲将十二年来黄浦江浚渫局用一千一百万两所作之工程，尽行毁弃者。是以吾欲献一常人之规划，以供专门家及一般公众之研究。

我之设世界港于上海之计划，即仍留存现在自黄浦江口起至江心沙上游高桥河合流点止已成之布置，如此则浚渫局十二年来所作之工程均不虚耗。于是依我计划，当更延长浚渫局所已开成之水道，又扩张黄浦江右岸之湾曲部，由高桥河合流点开一新河，直贯浦东，在龙华铁路接轨处上流第二转湾复与黄浦江正流会。如此，则由此点直到斜对杨树浦之一点，江流直几如绳，由此更以缓曲线达于吴淞。此新河将约三十英方里之地圈入，作为市宅中心，且作成一新黄浦滩；而现在上海前面缭绕滢洄之黄浦江，则填塞之以作广马路及商店地也。此所填塞之地，当然为国家所有，固不待言；且由此线以迄新开河中间之地，暨其附近，亦均当由国家收用，而授诸国际开发之机关所支配。如此，然后上海可以追及前述之计划港，其建造能为经济的，可以引致外国资本也。关于改良上海以为将来世界商港（参观第四图），在杨树浦下游，吾主张建一泊船坞。此坞应就现在黄浦江左岸自杨树浦角起，至江心沙上流转湾处止，跨旧黄浦江面及新开地，而邻于新开河之左岸以建之。坞之面积应有约六英方里，并应于江心沙上游之处建一水闸以通船坞，而坞当凿至四十英尺深。新开河之深，亦当以河流之冲刷，而使之至四十英尺。惟此冲刷之水，非如专门家所提议于江阴设一长江、太湖间之闭锁运河而引致之，乃由我计划所定之改良此部分地方与芜湖间之水道而引致之，如此乃能得较猛之水力也。

As we see that the present Whangpoo has to be reclaimed from the second turn above Lunghwa Railway Junction to Yangtzepoo Point for city planning, then the question of how to dispose of the Soochow Creek must be answered. I propose that this stream should be led alongside the right bank of the future defunct river and straight on to the upper end of the wet dock, thence joining the new canal. At the point of contact of the Creek and the wet dock a lock entrance may be provided in order to facilitate water traffic from Soochow as well as the inland water system directly with the wet dock.

我辈既已见及现在之黄浦江，须由龙华接轨处上面第二转湾起，填至杨树浦角，以供市街规划，则如何处分苏州河之问题，又须解决。吾意当导此小河，沿黄浦江故道右岸，直注泊船坞之上端，然后合于新开之河；于此小河与泊船坞之间，当设一水闸，所以便于由苏州及内地之水运系统直接与船坞联络也。

As the first principle in our program was remuneration, all our plans must strictly follow this principle. To create Pootung Point, therefore, as a civic center and to build a new Bund farther on along the left bank of the new canal in order to increase the value of the new land which would result from this scheme must be kept in mind. Only by so doing would the construction of Shanghai as a deep harbor

be worthwhile. And only by creating some new and valuable property in this fore-doomed port could Shanghai be saved from the competition of our Projected Port. After all, the most important factor for the salvation of Shanghai is the solution of the silt question of the Yangtze Estuaries. Now let us see what effect and bearing the regulating of the Yangtze Channel and Embankments have upon the question, and this we are going to deal with in the next part.

Part II The Regulating of the Yangtze River

The regulating of the Yangtze River may be divided as follows:

- a. From the deep-water line of the sea to Whangpoo Junction.
- b. From Whangpoo Junction to Kiangyin.
- c. From Kiangyin to Wuhu.
- d. From Wuhu to Tungliu.
- e. From Tungliu to Wusueh.
- f. From Wusueh to Hankow.

a. Regulating of the Estuary from Deep-water Line Up to the Junction of Whangpoo

It is a natural law that the obstruction to navigation in all rivers is begun at their mouths, therefore the improvement of any river for navigation must start from the estuary. The Yangtze River is no exception to this rule, therefore to regulate the Yangtze, we must begin by dealing with its estuaries.

The Yangtze has three estuaries, namely: The North Branch lying between the left bank and the Island of Tsungming, the North Channel lying between the Tsungming Island and the Tungsha Banks and the South Channel lying between the Tungsha Banks and the right bank. Henceforth for the sake of convenience I shall call them the North, Middle, and South Channels.

在我计划，以获利为第一原则，故凡所规划皆当严守之。故创造市宅中心于浦东，又沿新开河左岸建一新黄浦滩，以增加其由此计划圈入上海之新地之价值，皆须特为注意者也。盖惟如此办去，而后上海始值得建为深水海港。亦惟为此垂死之港，新造出有价值之土地，然后上海可以与计划港争胜也。究竟救济上海之最重要要素，为解决扬子江口沙泥问题，故整治扬子江水道及河岸一事于此沙泥问题有何影响、有何意义，吾人将于次部论之。

第二部 整治扬子江

整治扬子江一部，当分六节：

甲 由海上深水线起，至黄浦江合流点。

乙 由黄浦江合流点起，至江阴。

丙 由江阴至芜湖。

丁 由芜湖至东流。

戊 由东流至武穴。

己 由武穴至汉口。

甲 整治扬子江口自海上深水线至黄浦江合流点

凡河流航行之阻塞，必自河口始，此自然原则也。故凡改良河道以利航行，必由其河口发端，扬子江亦不能居于例外也。故吾人欲治扬子江，当先察扬子江口。

扬子江入海有三口：最北为北支流，在左岸与崇明岛间；中间为中水道，在崇明岛与铜沙坦之间；最南为南水道，在铜沙坦与右岸之间。故为便利计，以后当分别称之为北水道、中水道、南水道。

The silting up of a river's mouth is due to the loss of velocity in its current when the water gets into the wide opening at its junction with the sea and causes the silt to deposit there. The remedy is to maintain the velocity of the current by narrowing the mouth of the river so that it equals that of the upper part. In this way the silt is suspended in the water moving on into the deep sea. The narrowing process may be accomplished by walls or training jetties. And thus the silt may be carried by the water into the deepest part of the open sea and before it settles down upon the bottom a returning tide will carry it from the approach into the shallow parts on both sides of the river's mouth. The mouth of a river can be kept clear from deposit of silt by the action and reaction of the ebb and flow tide. The conservancy of an estuary of any river is accomplished by utilizing these natural forces.

In order to regulate the estuary of the Yangtze we have to study the three channels which form its mouth and to find out which of these channels is to be selected as the regulated entrance into the sea. In Mr. Von Heidenstam's proposal for the improvement of the approach of Shanghai Harbor, he recommends two alternatives, viz., either to block up the North and Middle Channels and to leave the

South Channel only for the mouth of the Yangtze, or to train the South Channel only and leave the other two alone. For the present, he thinks, perhaps for the sake of economy, the latter scheme would be enough. But the training of the South Channel alone as the approach to Shanghai would leave it in a state of perpetual anxiety as has been apprehended by Mr. Von Heidenstam and other experts, for the main volume of the water of the Yangtze may be diverted into either of the other two channels and leave the Southern one to be silted up at any time. Therefore to make the approach of Shanghai once for all safe and permanent, it is necessary to block up two of the three channels, leaving only one as an approach to the port. This is also the only feasible way of regulating the estuary of the Yangtze.

In our scheme of regulating the Yangtze Estuary I should recommend using the North Channel only and to block the other two. Because the North Channel is the shortest way to the deep-sea line and by using it as the only mouth of the Yangtze, we have on both sides of it more shallow banks to be reclaimed by its silt. Thus the expenditure would be less and the results greater. But this would leave Shanghai in the lurch. Therefore in a coöperative scheme like this I would apply the theory of killing two birds with one stone by using the Middle Channel, since it would suit both of our purposes. The reason for this is because the regulating of the Yangtze Estuary and the securing of a Shanghai approach have different purposes, hence we must consider them differently.

凡河口所以被沙泥填塞者，以河水将入海汇流，河口宽阔，湍流减其速力，而沙泥因之沉淀也。救之者，收窄其河口，令与上流无异，以保其湍流之速力；由此道，则沙泥被水裹挟，直抵深海。收窄之工程，当筑海堤以成之，或用一连之石坝。如是，其沙泥为水所混，直至深海广阔之处，未及沉淀，复遇回潮冲击，还填入河口两旁附近浅水之洼地，以潮长、潮退之动力与反动力，遂使河口常无淤积。凡疏浚一河之河口，皆以利用此天然力助成之。

欲治扬子江口，吾辈须将构成其口之三水道一一研究，又择出其一以道以为入海之口。在方希典斯坦君所提议改良上海海面通路策，列有二案：其一，闭塞北、中两水道，独留南水道，以为扬子江口；其二，独修浚南水道，而置余两水道不理。现在彼意以为用第二案已足，此或因经济上目的而然。顾惟修浚南水道，则上海通路将常见不绝提心吊胆之情形，仍如方希典斯坦君暨其他专门家现所忧虑者；因扬子江水流之大部，随时可以改灌入他两水道，而令南水道淤塞也。故为使上海通路永久安全、一劳永逸计，必须于三水道之中，闭塞其二，独留一股，以为上海通路。此又整治扬子江口唯一可得实行之路也。

在我整治扬子江口之计划，本应选用北水道，而闭塞中南二水道。因北水道为入深海最短之线，又用之以为唯一之扬子江口，则其两旁有

更多之沙坦洼地，正待沙泥填堵也。故其费用为较少，而收效为较多。但此本不为上海作计故然耳。如其统筹全局，必须以一箭双雕之行行之，而采中水道以为河口，则于治河与筑港两得其便。盖专谋治扬子江口与单谋上海之通路者，各有所志，其考察自有不同也。

In my project of regulating the Yangtze Estuary I have two aims, namely, to secure a deep channel to the open sea and to save as much silt as possible for the purpose of reclamation of land. The Middle Channel provides three ready receptacles for the deposit of the silt for the formation of new land: the Haimen, the Tsungming, and the Tungsha Banks. Besides these banks there are many hundreds of square miles of shallow bottom which in the course of ten or twenty years will also form land. As remuneration is our first principle we must consider it in every step of our progress. The reclamation of about a thousand square miles of land even in forty not to say twenty years would be ample profit. At the lowest estimate the reclaimed land would be worth twenty dollars per mow. If after ten years five hundred square miles would be ready for cultivation purposes then we would gain a profit of 38,000,000 dollars. Whereas to make an approach by the South Channel the receptacle ground will be on one side only, that is, the Tungsha Banks, while on the right of the approach is the deep Hangchow Bay which would take hundreds of years to fill up, and in the meanwhile half of the silt would be wasted. To Shanghai as a seaport the silt is a curse but to the shallow banks the silt would be a blessing.

Since it is a profitable undertaking to reclaim the above mentioned banks and the neighboring shallows, we can quite well afford to build a double stone wall from the shore end of the Yangtze right out into the deep sea far beyond Shaweishan Island which is a distance of about forty miles. A stone wall from one fathom to five fathoms in height at low-water level would likely not exceed an average cost of two hundred thousand dollars a mile as cheap stone can easily be obtained from the granite islands nearby, in the Chusan Archipelago. A wall of forty miles on each side that is eighty miles in all will cost sixteen million dollars or thereabouts. And considering that 200 or 300 square miles of Haimen, Tsungming, and the Tungsha banks could be converted into arable land within a short time, the expense of building the wall is well justified. Furthermore, the construction of this wall means that there will be a safe and permanent approach for a world port in Shanghai as well as a deep outlet for the Yangtze. See Map V.

The regulating wall on the right side should be built from the junction of the Whangpoo by prolongation of its right jetty describing a gentle curve into the depths of the South Channel and turning

toward the opposite side and cutting through the Blockhouse Island into the Middle Channel, then running eastward right into the five-fathom line southeast of Shaweishan Island. The left wall would be a continuation from that of Tsungming at Tsungpaosha Island parallel with the right wall by a distance of about two miles. This wall should curve to a point at or near Drinkwater Point at Tsungming Island, then project into the five-fathom line at the open sea passing by just at the south side of the Shaweishan Island. A glance at the map here attached would be sufficient to show how the future outlet of the Yangtze as well as the future approach of Shanghai should be. The two regulating submerged walls on both sides would be as high as low-water level so as to give a free passage of the water over the top at flood tide. This will serve the purpose of carrying back the silt from the sea when the tide comes in, thus to reclaim the shallow spaces inclosed behind the walls on both sides of the river more quickly than otherwise. The new channel formed by these two parallel walls would likely be deeper than the present South Channel outside the Whangpoo, which is forty to fifty feet deep because the velocity of the current will be greater than the present one, due to the concentration of three channels into one. Furthermore, the depth would be more uniform and stable than at present. Although the regulating walls end at the five-fathom line, the momentum of the current would continue beyond that point, and so would cut into the deep water outside. This would serve the double purpose of draining the Yangtze Estuary as well as keeping open the approach to Shanghai.

在我治扬子江口之计划，所取者有两端：其一，则求深水道以达海洋；其二，则多收其沙泥，以填海为田，惟力所及。中水道具有三堆积场，以受沙泥而成新陆地，即海门坦、崇明坦、铜沙坦是也。此外尚有渟水^[5]洼地千数百英方里，循现在之势以往，不过十年至二十年便成陆地。以我之第一原则为获利故，每一举足，不可忘之。即令二十年不能成地，姑倍之为四十年，而所填筑者有约一千英方里之多，其于利益，已不菲矣。以至贱计之，填积之地值二十元一亩，如使十年之后，五百英方里之地可备耕作之用，其所得之利已为三千八百四十万元。如使由南水道以通上海，则接受沙泥之地面只在一偏，即惟有铜沙坦在其左方，而右方则为深水之杭州湾，非数百年不能填满，在此数百年间沙泥之半数归于无用矣。夫以上海为海港，故沙泥为之噩神；至于低地，正欢迎沙泥，而以福星视之也。

此种企业，既有填筑上述海坦洼地为田之利，我等自可建一双石堤，自长江入海之处起，直达深海，至离岸四十英里之沙尾山为止。以舟山列岛附近有花冈石岛，廉价之石，不难运致。故筑一石堤，高六英尺至三十英尺，使刚与低潮面平，其平均所需，当不过每一英里费二十万元；石堤每边长四十英里，统共八十英里，其所费约在一千六百万元左右。而在海门坦、崇明坦暨铜沙坦有二三三百英方里地，转瞬之间，可

变为农田计之，则建此石堤，已非不值矣。况其建此石堤，实足以为上
海世界港得一永久通路，又为扬子江得一深水出路也耶！（参观第五
图）

右边之石堤，应从黄浦江合流点起，延长其右边石坝，画一缓曲
线，到南水道深处，然后转向对岸，横截鸭窝沙，以至中水道，又折向
东方，直筑至沙尾山东南水深三十英尺处。左边之堤，由崇宝沙起，直
至崇明角，与右堤平行，两堤中间相距约两英里。此堤当在崇明之饮水
角附近，稍作曲线，然后直达深海三十英尺深之线，恰在沙尾山南端经
过。试一览附图，当知将来上海通路当何如，扬子江出路当何如矣。此
一双水底石堤，断不容高过低潮面，以使潮涨时水流自由通过堤面，如
此则潮涨时可将沙泥夹带回两堤之旁，于是填塞两堤旁所括之低地，更
迅速矣。现在南水道在黄浦江外面，已有四五十英尺之深，而新水道以
两平行石堤夹成，料必比南水道更深，因其聚三水道入于一流，其水流
速力必较现在者为多也，而河身之深亦将较现在为确定，且一律。在石
堤，虽止于水深三十英尺处，而水流不于是遽停，必过此一点更突入较
深之外海而后止。则上海通路常开，与扬子江口无阻之两目的，可得同
时俱达矣。

b. From Whangpoo Junction to Kiangyin

This part of the channel of the Yangtze River is most irregular and changeable. The widest part is over ten miles while the Kiangyin Narrow is only but three-quarters of a mile. The depth of the channel at the open part is from five to ten fathoms while that of Kiangyin Narrow is twenty fathoms. Judging by the depth of the water at this point a width of one and a half miles must be provided for the channel in order to slow down the current and to give a uniform velocity right

along the river. So the two-mile-wide channel at Whangpoo Junction has to be tabulated into one mile and a half at Kiangyin. See Map VI.

The north or left embankment commencing at Tsungpao Sha continues with the sea wall and makes a convex curve up to Tsungming Island at a point about six miles northwest from Tsungming city. Then it follows along the shore of Tsungming right up to Mason Point and transversing across the north channel parallel to the north shore at a distance of three or four miles right up to Kinshan Point, thence it cuts across the deep channel which was formed in recent years and curves southwestward to join the shore northeast of Tsingkiang and follows the shore line for a distance of about seven or eight miles, then cuts into the land side to give this part of the river a width of one and a half miles from the fort at the Kiangyin side. This embankment from Tsungpao Sha to Tsingkiang Point opposite Kiangyin fort is about one hundred miles in length.

乙 由黄浦江合流点起至江阴

扬子江水道中，此一部分为最不规则，又最转变无常者。其江流广处，在十英里以上；至其狭处，才得四分英里之三，即江阴窄路是也。在此广阔之处，河深不过三十英尺至六十英尺；至于江阴窄路，实有一百二十英尺之深。由江阴窄路之水深以判断之，必须有一英里半阔之河身，以缓和此地方湍流之速力，令全河流速始终如一。于是在黄浦口之二英里阔河身，在江阴应阔一英里半。（参观第六图）

此段左岸即北岸筑河堤，起自崇宝沙，与海堤相连，作一凸曲线，以至崇明岛，在崇明城西北约六英里处，接于滩边。然后沿崇明滩边，直至马孙角（译音），然后转而横过北水道，离北岸约三四英里，作一平行线，直抵金山角（译音）。在此处截断近年新成之深水道，向西南，以与靖江县城东北河岸相接。沿此岸再筑七八英里，又挖开陆地，以增河身之阔。令其自江阴炮台脚下起，算至对岸，常有一英里半之距离。此自崇宝沙至江阴对面之靖江，河堤共长约一百英里。

圖六第 MAP VI

- (1) Mason Point 為孫角 (6) Actoon Shoal 蝦段暗灘
(2) Kinsan Point 金山角 (7) Plover Point 朴老花角
(3) Blonde Shoal 布蘭暗灘 (8) Langshan Crossing 狼山渡
(4) Confucius Channel 孔水道 (9) Johnson Flats 約翰遜沙洲
(5) Harvey Channel 哈維水道 (10) Pilman's Island 常陸洲

South of Tsungming Island a part of this embankment and a part of the wall that projects into the sea together inclose a shallow space of about 160 square miles good for reclamation purposes. The other part of the embankment, which runs from Mason Point at the head of Tsungming Island to Tsingkiang shore, incloses another space of about 130 square miles.

The right embankment starts at the end of the left jetty of Whangpoo Junction and, skirting along the Paoshan shore and passing the Blonde Shoal into the deep, crosses the Confucius Channel on into Actaon Shoal and follows the right side of Harvey Channel on to Plover Point. Then it turns northwest across the deep channel into Langshan Flats, thence recrosses the deep channel at Langshan crossing into Johnson Flats, then joins the Pitman King Island, and thence skirts along the shore right into the foot of the hills at Kiangyin forts. This embankment incloses two shallow spaces: one above and the other below Plover Point, together about 160 square miles. Alongside of both of these embankments there are shallow spaces amounting to about 450 square miles, a great part of which having already formed land and a part already appearing in low water. When these spaces are cut off from the moving current the process of reclamation would be made to work more rapidly so it is not extravagant to hope that within the course of twenty years the whole of these 450 square miles would be completely reclaimed and ready for cultivation. The profits from the new lands thus reclaimed would amount to about \$29,760,000 if only taken at \$20 per mow. The profits from the new lands would be netted from the beginning of the work and would increase every year up to the completion of the reclamation process.

With a profit of \$30,000,000 in the course of twenty years before us, it is a worth-while proposition to take up. Now let us see what amount of capital should be invested before the whole project of our reclamation work could be completed. In order to reclaim this 450 square miles of land two hundred miles of embankments have to be built. Part of these projected embankments will be along the shore line, a greater part will be in midstream, and a small part in deep channel. Those along the shore line need not be bothered with except that the concave surface must be protected with stone or concrete work. Those in midstream should be filled up with stone ten feet or less below low-water level just enough to give a resistance to the undercurrent in order to prevent it from running sideward. Thus the main current would follow the line of least resistance and cut the channel, as directed by the rudimental embankment, by its own force. This rudimental embankment would cost less than the sea wall which I estimated at \$200,000 per mile. Except at one point, that is, the junction of the North Channel at Mason Point, which has to be blocked up entirely, the cost for which, as has been estimated by experts, would amount to over a million dollars for a distance of two or three miles. Thus the profits accruing from the reclaimed lands would be quite sufficient to pay for the embankments. So far we see that the regulating of the Yangtze from the sea to Kiangyin is a self-

paying proposition from the reclamation of land alone, aside from the improvement of the navigation of the Yangtze River.

在崇明岛迤南，此河堤之一部及海堤，共围有浅滩约一百六十英方里，可以填为实地。其河堤之他一部，自崇明岛上头马孙角起，至靖江河岸止，另围有浅滩一百三十英方里。

右边河堤，自黄浦江口石坝尽处起，循宝山岸边，过布兰暗滩，直到深处，横过“孔夫子水道”，穿入额段暗滩（译音），随哈维水道（译音）右边，溯流筑至朴老花角（译音）。再在狼山渡，横截深水道，穿过约翰孙沙洲（译音），与常阴洲相接续。再循此岸，直筑至江阴炮台山脚下。此段河堤围有浅滩两处，一在朴老花角上游，他一则在其下游，共约有一百六十英方里。此两边河堤之所围浅滩，共约四百五十英方里，其中大部分已成陆地，亦有一部已于低潮时露出。此等地方，若令不与湍流相遇，则其填塞之进行更速。所以谓二十年之内，此四百五十英方里之地，当完全填成实地，可供耕作，亦非奢望也。如使此种新地每亩仅值二十元，则此新填地所生利益，已约有二千九百七十六万元矣。而此近三千万之利益，固从新地而生。此新地之利益，自起工以后，则每年增长，直至其填塞完成而后已者也。

以后此二十年可得三千万利益而论，此种提案，自可采供讨论。今先计须投资本若干，然后我填筑之全计划可以完成。将欲填此四百五十英方里之地，须筑二百英里之河堤。此所计划之河堤，有一部分为沿河岸线者，而大部分须在中流，更有一小部分须筑在深水道之中。沿河岸线者，惟有在凹曲线面之一部须以石建，或用土敏土坚结，以保护堤面，此外无须费力。在中流者，须用石叠起，至离低潮水面下不及十英尺为止，适足以抵抗下层水流，令不轶出正路之外。如此则大股流水，将循此抵抗最少之线，以其自力，从其初级河堤所诱导，开一水道。此种初级河堤所费，比之海堤较廉，而海堤所费，依吾前计算为二十万元一英里而已。惟有在马孙角、北水道分流点一处，须将该水道完全闭塞，其费已经专门家估算，当在百万元以外，方能填筑此二三英里之堤。是故由新填地所生利益，必足以回复其所筑河堤所费。可知即此填新地一节，已足令自海口到江阴两段导江工程不致亏本，而又有改良扬子江航路之益也。

c. From Kiangyin to Wuhu

This part of the river is quite different in nature from that below Kiangyin. Its channel is more stable and only in a few places sharp curves occur and the water has cut into the concave sides of the land, thus occasionally making new channels along the sides of the two shores. This section of the river is about 180 miles in length. See Map VII.

The regulating works here would be more complicated than those below Kiangyin. For besides the dilated parts which have to be reclaimed in the same manner as those of the lower part of the river,

the sharp curves have to be straightened and side channels have to be blocked, and midstream islands have to be removed, and narrows have to be widened to give uniform width to the river.

丙 自江阴至芜湖

此段河流，性质与江阴以下全异。其水道较为巩固，惟有三数处现出急曲线，河流蚀入凹曲线方面之陆地，因此时时于两岸另开新水道而已。此段长约一百八十英里。（参观第七图）

此处整治之工，比之江阴以下更为困难。盖其泛滥之地，应填筑者，仍与长江下游景况正同。其急曲线须修之使直，旁支水道应行闭塞，中流小岛应行削去，窄隘水路应行浚广，令全河上下游一律。

However, most of the exist- ing embankments in this part could be left as they are except some of the concave surfaces of the shores have to be protected by either stone or concrete work. The regulating works of the channel and the embankments can be done by artificial means as well as by natural processes so as to economize as much as possible. The cost of the whole works of this part of the river cannot

be accurately estimated until a detail survey is made; but in a rough guess \$400,000 per mile may not be very far from the mark. Thus 180 miles will cost \$72,000,000 exclusive of the expenses for the widening of the point between Nanking and Pukow, in which case valuable properties will have to be removed.

The Kwachow cut is to straighten the three sharp curves in front of and above Chinkiang by converting them into one. Two and a half miles of the land in the northern shore opposite Chinkiang will have to be cut into in order to form a new channel of a mile or more in width. The part of the river in front of, and above and below Chinkiang has to be reclaimed. The new land thus reclaimed would form the water front of Chinkiang city, the value of which may be sufficient to defray the cost of the work and compensate for the land taken away on the northern shore, to form the new channel. So the works of this part will be at least a self-paying proposition.

The narrow between Pukow and Hsiakwan from pier to pier is barely six cables wide. The depth of the water in this narrow from the shallowest to the deepest is six to twenty-two fathoms. The land of the Hsiakwan side had occasionally sunk away on account of the too rapid current and the depth of the water. This indicates that this part is too narrow for the volume of the Yangtze water to pass. Therefore a wider passage must be provided for. In order to do so, the whole town of Hsiakwan must be sacrificed as the river must be widened right up to the foot of the Lion Hill, so as to provide a passage of a mile wide at this point. What the cost for the compensation of this valuable property of Hsiakwan will be will have to be submitted to the experts for a careful investigation before it can be determined. This will be the most costly part of the whole project for the regulating of the Yangtze. But undoubtedly some equally valuable property can be created along the riverside near by in place of Hsiakwan, so that a balance may be realized by the work itself.

The channel below the Nanking Pukow Narrow will follow the short passage alongside of the foot of the Mofushan to Wulungshan. The loop around the island north of Nanking will have to be blocked up in order to straighten the course of the river.

然而此部分原有河堤，大抵可以听其自然，惟其河岸凹曲线面，有数处应用石或土敏土坚结以保护之耳。以力求省费之故，此段水道及河堤整治工程，可以一面用人为之工作，一面助以自然之力。此一段河流工程全部所费，不能于测量未竣以前精密计出，但粗为计算，则四十万一英里之数，总相去不远。故全段一百八十英里，应费七千二百万元。此外尚有开阔南京、浦口中间河面之费，未计有内；此处有多数高价之产业须全毁去，其费颇多也。

瓜洲开凿一事，所以令镇江前面及上下游三处急曲线改为一处，使河流较直也。此处沿江北岸约二英里半陆地，正对镇江，必须凿开，令成新水道，阔一英里有余。其旧道在镇江前面及上下游者，则须填塞之。所填之地，即成为镇江城外沿江市街，估其价值，优足以偿购取瓜洲陆地，及开凿工程之费。故此一部分，至少总可认为不亏本之提案。

浦口、下关间窄处，自此码头至彼码头，仅得五分英里之三，即一千二百码而已。而此处水深最浅处为三十六英尺，最深处为一百三十二英尺。下关一边陆地，时时以水流过急、河底过深之故而崩陷，斯即显然为此部分河道太窄，不足以容长江洪流通过也。然则非易以广路不可矣。为此之故，必以下关全市为牺牲，而容河流直洗狮子山脚，然后此处河流有一英里之阔。以赔还下关之高价财产而论，须费几何，必须提交专门家详细调查，乃能决定。要之，此为整治扬子江全计划中最耗费之部分。但亦有附近下关沿岸之地，可以成为高价财产无疑，故此工程或可望得自相弥补也。

南京、浦口间窄路下游之水道，应循其最短线路，沿幕府山脚，以至乌龙山脚。其绕过八卦洲后面之干流，应行填塞，俾水流直下无滞。

The section of the river from Nanking to Wuhu is almost in a straight line with three dilatations along its course one just above Nanking the other two just above and below the East and West pillars. To regulate the first dilatation the channel above Me-tse-chow should be blocked up and the island outside of it should be partly cut to widen the proper channel. To regulate the other two dilatations the river should be made to curve toward Taiping Fu to follow the deep channel on the right bank. The left channel should be blocked up. The islands along this curve should be partly or wholly removed. To regulate the dilatation above the Pillars, the Friends Channel should be blocked up and Friends Island be partly cut away. And the left bank below Wuhu should also be cut to give the channel a uniform width.

d. From Wuhu to Tungliu

This part of the river is about 130 miles in length. Along its course there are six dilatations, the most prominent of which is the one that lies immediately below Tungling, which extends over ten miles from side to side. In each of these dilatations there are usually two or three channels with newly formed islands between them. The deep passage often changes from one side to the other, and it is not uncommon that all of the channels are filled up at the same time, thus stopping navigation altogether for a considerable period. See Map VIII.

由南京至芜湖一段河流，殆成一直线，其中有泛滥三处，一处刚在南京上游，余二则在东西梁山之上下游。其第一泛滥之米子洲上游支

流，应行闭塞，另割该洲外面一幅，使本流河幅足用。至欲整治余二泛滥，则应循其右岸深水道作曲线，向太平府城，而将左边水道锁闭。此曲线所经各沙洲，有须全行削去者，亦有须削其一部者。而在东西梁山上游之泛滥，须将兄弟水道完全闭塞，并将陈家洲削去一部。而芜湖下游左岸，亦须稍加割削，令河流广狭上下一律。

丁 自芜湖至东流

此段大江约长一百三十英里，沿流有泛滥六处。其中最显著者，即在铜陵下之泛滥也。此泛滥，两岸相距在十英里以上。第一泛滥，常分为两三股水道，其间夹有新涨之沙洲。其深水道时时变迁，忽在此股，忽在彼股，有时竟至数股同时淤塞，逼令航行暂时停止，亦非希觊^[6]之事也。（参观第八图）

In regulating the part of the river from ten miles above Wuhu to ten miles below Tatung, I propose to cut a new channel through the midstream islands formed by the three dilatations and the sharp corners of the shore, in order to straighten as well as to shorten the river, as marked by the dotted lines in the map attached here. The cost of the cut could not be estimated until a detail survey is made. But as soon as the embankments are laid out the natural force of the river's

own current will do a great part of the dredging work, so that the expenses of the cutting for the new channel will be much less than usual. Above Tatung there are two sharp turns of the left shore to be cut. One is on the left shore at the point where the beacon now stands about twelve miles from Tatung. In this place a few miles of the left shore will have to be cut away. The other cut is just below the city of Anking hence to Kianglung beacon, a distance of about six miles. By this cut we do away with the sharp turns of the river at Chuan Kiang Kau. These cuttings would cost much more than the piling of stone at the lower reach of the river. It is quite certain that the reclamation of the side channels of this part will not cover the cost of the cuttings. Therefore this part of the regulating work will not be self-paying, but the navigation of the Yangtze, the protection it gives to both sides of the land, and the prevention of floods in the future will amply compensate for such work.

e. From Tungliu to Wusueh

This part of the river is about eighty miles in length. The land along the right bank is generally hilly while that along the left is low. Along its course there are four dilatations. In three of these dilatations the current has cut into the left or northern bank of the river and then turns back into its main course again almost at right angles. At such points the bank is very unstable. Between the channels of these dilatations islands are being formed. See Map IX.

The regulating works of this part are much easier to construct than those of the lower part. The three diverting semicircular channels have to be blocked up at the upper ends, and the lower openings left open for silt to go into at flood seasons in order to reclaim them by the natural process. The other dilatations should be narrowed in from both sides by jetties. A few places will have to be cut, the most important being the Pigeon Island and the turn above Siau Ku Shan. Some of the midstream islands will have to be removed, and a few wide places filled up in order to make the channel uniform, so as to give a regular minimum depth of six fathoms right along the whole course.

为整治此自芜湖上游十英里至大通下游十英里一段河流，吾拟凿此三泛滥中流之沙洲及岸边之突角，为一新水道，直贯其中，使成一较短较直之河身，即附图中点线所示之路是也。此项费用，亦须详细测量之后，始能算定。但若两边河堤筑定之后，则浚渫工程之大部分，将以河流之自然势力行之，故开凿新河之费，必较寻常大为减少。大通以上，左岸有急度弯曲两处，须行凿开。第一处即大通上游十二英里，现设塔灯水标处之左岸，此处左岸陆地有二三英里，须略加刊削。次一处则应

在安庆下游，凿至江龙塔灯水标，计长六英里左右。既凿此河，则免去全江口急度之转湾矣。此项开凿工程，比之下游叠石为堤之费更多。其旁支水路，虽能填为耕地，究不能补其开凿所费。是以此一部分整治之工程，不免为亏本，但以其通长江航道，与保护两岸陆地，又防止将来洪水为患，则此种工程必为有益明也。

戊 自东流至武穴

此段长约八十英里，沿右岸皆山地，左岸则大抵低地也。沿流有泛滥四处，此中有三处，以水流之蚀及左岸，成一支流，复至下游，与正流相会，其会合处殆成直角。在此等地方，河岸殊不巩固，而此泛滥各股水道之间，正在堆积，将成沙洲矣。（参观第九图）

此段整治工程，比之下游各段，施工较易。此三处成半圆形时时转变之支流，应从其分支口施以闭塞，仍留其下游会流之口，任令洪水季节之沙泥随水泛入，自然填塞之。其他一处泛滥，则须于两边筑坝，束而窄之。更有数处须行削截，而小孤山上游及粮洲两处尤为重要。江心沙洲有一部分须削去，而河幅阔处亦有须填窄者。总令水道始终一律，期于全航道常有三十六英尺以上之水深也。

f. From Wusueh to Hankow

This part of the river is about one hundred miles long. Above Wusueh we enter into the hilly country on both sides. The river here is generally about half a mile wide, with a depth of from five to twelve

fathoms or sometimes more in certain places. See Map X.

To regulate this part of the river a few wide spaces have to be reclaimed to give a uniform channel, and the side channels at three or four places closed up. Then we can make a channel with a uniform depth of from six to eight fathoms at all seasons. At Collison Island section of the river the Ayres Channel has to be closed up, leaving the winter channel alone so as to give a gentle curve above and below this island. At Willes Island and Gravenor Island point the Round Channel and the channel between these two islands must be blocked up. The river must be made to cut through Willes Island to make a shorter curve. At Bouncer Island the South channel must be blocked up and above this the Low Point turn must be cut away to form a gentler curve. From this point to Hankow the river should be made narrower first by reclaiming the right side as far as the meeting of the southwest curve with the right bank then the reclamation should start at the opposite side of the left bank and right up along the front of Hankow Settlement until the Han River Mouth is reached. Thus a depth of six to eight fathoms can be secured right up to the Bund of Hankow.

To sum up, the whole length of the regulating course of the river from the deep sea to Hankow is about 630 miles. The embankments will be twice this length; that is, 1,260 miles. I have estimated that the sea wall at the mouth of the river could be built at \$200,000 a mile, thus for both sides \$400,000 a mile will be sufficient or the 140 miles from the deep sea to Kiangyin. For, in this part we have only the two embankments to deal with, which merely requires the tumbling of stones into the water until the pile is strong enough to hold the current to a directed course. As soon as these stone ridges on both sides of the river are formed, nature will do the rest to make the channel deep. The work for this part, therefore, is simple.

But the work for certain sections of the upper part of the river is more complicated as about fifty or sixty miles of solid land of from ten to twenty feet above water level and thirty to forty feet below have to be cut in order to straighten the river's course. Of this cutting and removing work, how much will have to be done artificially and how much can be done by nature, I leave to the experts to estimate. Excepting this, the other parts of this work, I think, cannot cost much more than \$400,000 a mile. So that the whole work from the sea to Hankow, a distance of 630 miles will cost about \$252,000,000, or let us say, including the unknown part, \$300,000,000 for the completion of the entire project for the regulating of the Yangtze River. By this regulating of the Yangtze River, we secure an approach of 600 miles inland for ocean-going vessels into the very center of a continent of two hundred millions of people of which half or one hundred million

is located immediately along 600 miles of the great water highway. As regards remuneration for the work, this project will be more profitable than either the Suez or Panama Canal.

己 自武穴至汉口

此段约长一百英里，自武穴而上，夹岸皆山地，河幅常为半英里内外。水深自三十英尺至七十二英尺，有数处尚在七十二英尺以上。（参见第十图）

整理此段，须填塞其宽广之河面三数处。令水道整齐，有三四处支流须行闭塞。如此，然后冬季节俱有三十六英尺至四十八英尺水深之水道，可得而成也。在戴家洲一段河流，应将埃梨水道（译音）闭塞，独留冬季水道，则此岛上游下游曲线均较缓徐。在鸭蛋洲及罗霍洲之处，其大弯曲水道及两岛间水道均应闭塞，而另开一新水道，穿过罗霍洲以成为较短之曲线。在水母洲，其南水道务须闭塞，而此洲之上万八壠口曲处，亦须挖成较缓徐之曲线。由此处以至汉口，则须先填右岸，收窄河身，至与右岸向西南曲处相接而止。再从对面左岸填起，直过汉口租界面前，以至汉水口。则汉口堤岸面前，可以常得三十六英尺至四十八英尺深之水道矣。

总计自海中至汉口，治河长约六百三十英里，河堤之长当得其二倍，即一千二百六十英里也。在江口之堤，吾尝约计每英里费二十万元，两堤四十万。此项数目，自深海以迄江阴一百四十英里，均可适用，充足有余。因此部分惟须建两堤，此堤亦惟须于水中堆石，令其坚足以约束河流，使从其所导而行，斯已足矣。此两岸列石既成之后，水道可因于自然之力以成，所以此部工程尚为简单。

然而在上游有数处为困难，其中有五六十英里之实地，水面上有一二十英尺之高，水面下尚有三四十英尺之深，须行削去，以使河身改直。此凿开及削去之工程，有若干须用人工，有若干可借天然之力，仍须待专门家预算。除此不计外，工程全部每一英里所费不过四十万元。故自海面至汉口，相距六百三十英里，所费当不过二万五千二百万元。今姑假定整治扬子江全盘计划并未知之部分算在其内，须费三万万元。由此计划，吾人辟一通路深入内地六百英里，容航洋巨船驶至住居二万万人口之大陆中心，而此中有一万万人住居于此最大水路通衢之两旁。以工程之利益而论，此计划比之苏彝士^[7]、巴拿马两河更可获利。

Although we could not find means whereby the works above Kiangyin may be made self-paying as those of the sections below by the reclamation of land, profit from city building along the course of the river can be realized after the regulating work is completed.

In conclusion, I must say that the figures given concerning the harbor works and the Yangtze regulation are merely rough estimates which must be in the nature of the case. As regards the costs of building the rudimental dikes at the estuary of the Yangtze as well as

along the dilating parts of the river, the estimation may seem too low. But the data on which I base my estimate are as follows: First, my own observation of the private enterprise of reclamation by building dikes at the Canton delta around my native village; second, the cheap stone that can be obtained at the Chusan Archipelago; third, the estimation of Mr. Tyler, Coast Inspector of the Maritime Customs for the blocking up of the North Channel at the upper end of Tsungming Island, where the narrowest part is about three miles. He says that a million taels or more is necessary for the work. Or, let us say, in round figures, five hundred thousand dollars (Mex.) a mile. This is two and a half times my estimate. Now, let us compare the difference. The three-mile channel at the upper end of Tsungming has an average depth of twenty feet of water, while in my project the sea wall or dikes will be built in water having an average of less than two thirds of this depth. Moreover, the work of blocking up the North Channel entirely at a right angle is many times more costly than that of building a rudimental dike of the same length in a parallel line with the current. Since five hundred thousand dollars are enough to block up cross-wise a mile of river twenty feet deep, two fifths of that sum should be quite sufficient to finance the work that I have projected. While writing this, I came across an article in the *Chicago Railway Review*, May 17, 1919, dealing with the same subject, which states that steel skeleton is a better and cheaper substitute for stone or other materials for building dikes and jetties in a muddy river like ours. Thus, by this new method, we may be able to construct embankments, with cheaper material than I have hitherto known. So, although the estimate which I have made may be somewhat low, yet it is not so far from correct as it seems at first sight.

虽在江阴以上各段，吾人不能发见不亏本之方法，不如江阴下游各段可以新填之地补其所费，但在竣工之后，仍可在沿江建立商埠，由之以得利益也。此建设商埠之计划，将于次部论之。

结 论

当结论此二部，吾更须申言关于筑港及整治扬子江之工程数目，仅为粗略之预算，盖事势上自然如此也。关于在长江出海口及诸泛滥地建筑初步河堤之预算，或者有太低之迹，但吾所据之资料以为计算根源者，在下列各层：第一、为吾所亲见在广东河汊环吾本村筑堤填地之私人企业；第二、为廉价之石，可求之于舟山列岛者；第三、为海关沿岸视察员泰罗君之计算。在崇明岛上端闭塞北水道所费，该水道以此处为最狭，约计有三英里，而泰罗君谓所费约须一百万两有余，然则约五十万元一英里也；比之吾所计算，已为两倍有半，此其差异可得比较而知。盖此崇明岛上端三英里之水道，平均水深二十英尺，而我所计划之海堤江堤，建于水中者，平均比此段少三分之二，且闭塞北水道之工程

完全与河流成为直角，则其所费较之建此初步河堤与水流成平行线者，纵使长短相同，所差亦应数倍。而五十万元可以建横截深二十英尺之河，而闭塞之之一英里工程，则其五分之二之经费，亦必足以供吾所规划之工程之用矣。当吾草此文之际，《芝加高^[8] 铁路批评》五月十七日所出之报，适有一论文道及此事。彼谓用钢铁骨架以筑河堤及坝，于淤泥河流，如吾辈今所欲治者，比之用石及用其他材料较佳，而又较廉。然则若采此新法，吾等可以用吾前此未知之更廉材料，以建河堤矣。所以吾前所计算或者不免稍低，而仍离正确之数目不远，决不如骤见所觉之过低也。

Part III The Construction of River Ports

The construction of river ports along the Yangtze between Hankow and the sea will be one of the most remunerative propositions in our development scheme. For this part of the Yangtze Valley is richest in agricultural and mineral products in China and is very densely populated. With the cheap water transportation provided by the completion of the regulating work both sides of this water highway will surely become industrial beehives. And with cheap labor near by, it will not be a surprise if in the near future both banks will become two continuous cities, as it were, right along the whole extent of the river from Hankow to the sea. In the meantime a few suitable spots should be chosen for profitable city development. For this purpose I will start from the lower part of the river as follows:

- a. Chinkiang and North Side.
- b. Nanking and Pukow.
- c. Wuhu.
- d. Anking and South Side.
- e. Poyang Port.
- f. Wuhan.

a. Chinkiang and North Side

Chinkiang is situated at the junction of the Grand Canal and the Yangtze. It was an important center of inland water traffic between the north and the south before the steam age. But it will resume its former grandeur and become more important when the old inland waterway is improved, and new ones are constructed. For it is the gateway between the Hoangho and Yangtze valleys. Besides, by the southern portion of the Grand Canal, Chinkiang is connected with the Tsientang valley—the richest part of China. Thus, this city is bound to grow into a great commercial center in the near future.

第三部 建设内河商埠

在扬子江此一部建设内河商埠，将为此发展计划中最有利之部分，因此部分在中国为农矿产最富之区，而居民又极稠密也。以整治长江工程完成之后，水路运送，所费极廉，则此水路通衢两旁，定成为实业荟萃之点，而又有此两岸之廉价劳工附翼之。则即谓将来沿江两岸，转瞬之间变为两行相连之市镇，东起海边、西达汉口者，非甚奇异之事也。此际应先选最适宜者数点，以为获利的都市发展。依此目的，吾人将从下游起，溯江逐港论之如下：

甲 镇江及其北岸。

乙 南京及浦口。

丙 芜湖。

丁 安庆及其南岸。

戊 鄱阳港。

己 武汉。

甲 镇江

镇江位于运河与江会之点，在汽机未用以前，为南北内地河运中心重要之地。而若将旧日内地运河浚复，且增浚新运河，则此地必能恢复其昔日之伟观，且更加重要。因镇江为挈合黄河流域与长江流域中间之联锁，而又以运河之南端直通中国最富饶之钱塘江流域。所以此镇江一市，将来欲不成为商业中心，亦不可得也。

In our regulation work of the Yangtze, we shall add a piece of new land, over six square miles, in front of Chinkiang. This land on the south side of the river will be utilized for city-planning for our new Chinkiang. On the north side, land should also be taken up by the state to build another city. The north side will be bound to outgrow that of the south for the whole of Hoangho Valley could only emerge into the Yangtze by waterway through this point. Docks should be built between here and Yangchow for accommodation of inland vessels, and modern facilities should be provided for transshipment between inland vessels and ocean-going steamers. This port should be made as a distributing center as well as a collecting center for the salt of the eastern coast. This, with the help of modern methods, will reduce transportation expenses. Stone or concrete bunds or quays should be built on both sides of the river and tidal jetties should be provided for train ferries. In time, when commerce grows, tunnels or

bridges may be added to facilitate traffic of the two sides. The streets should be wide so as to meet modern demands. The water front and its neighborhood should be planned for industrial and commercial uses and the land beyond should be planned for residential purpose. Every modern public utility should be provided. In regard to the details of planning the city, I must leave them to the expert.

b. Nanking and Pukow

Nanking was the old capital of China before Peking, and is situated in a fine locality which comprises high mountains, deep water and a vast level plain—a rare site to be found in any part of the world. It also lies at the center of a very rich country on both sides of the lower Yangtze. At present, although ruined and desolate, it still has a population of over a quarter of a million. Once it was the home of many industries especially silk and now the finest satin and velvet are still produced here. Nanking has yet a greater future before her when the resources of the lower Yangtze Valley are properly developed.

In the regulation of the Yangtze I propose to cut away the town of Hsiakwan, so that the wharf of Nanking could be removed into the deep channel between Metsechow and the outskirt of Nanking. This channel should be blocked up, thereby a wet dock could be formed to accommodate all ocean-going vessels. This point is much nearer the inhabited parts of the city than Hsiakwan. And the land between this projected wet dock and the city could form a new commercial and industrial quarter which would be many times larger than Hsiakwan. Metsechow in time, when commerce grows, may also be developed into city lots and business quarters. For the future development of Nanking the land within and without the city should be taken up at the present price under the same principle which I have proposed for the Projected Port at Chapu.

依吾整治长江计划，则在镇江前面，吾人既以大幅余地，在六英方里以上者，加入镇江。此项大江南面新填之余地，当利用以为吾人新镇江之都市计划。而江北沿岸之地，亦当由国家收用，以再建一都市。盖以黄河流域全部，欲以水路与江通，惟恃此一口，故江北此一市当然超越江南之市也。镇江、扬州之间，须建船坞，以便内地船舶；又当加最新设备，以便内地船只与航洋船之间，盘运货物之用。此港既用以为东海岸食盐收集之中心，同时又为其分销之中心，如此则可用新式方法，以省运输之费。江之两岸须以石或土敏土坚结筑成堤岸，而更筑应潮高下之火车渡头，以便联络南北两岸铁路客车、货车之往来。至于商业发达之后，又需建桥梁于江上，且凿地道于江下，以便两岸货物来往。街道须令宽阔，以适合现代之要求。其临江街道及其附近，应预定为工商业所用。此区之后面，即为住宅，各种新式公共营造均应具备。至于此

市镇计划详细之点，吾则让之专门家。

乙 南京、浦口

南京为中国古都，在北京之前，而其位置乃在一美善之地区。其地有高山，有深水，有平原，此三种天工，钟毓一处，在世界中之大都市诚难觅如此佳境也。而又恰居长江下游两岸最丰富区域之中心，虽现在已残破荒凉，人口仍有一百万之四分之一以上。且曾为多种工业之原产地，其中丝绸特著，即在今日，最上等之绫及天鹅绒尚在此制出。当夫长江流域东区富源得有正当开发之时，南京将来之发达，未可限量也。

在整治扬子江计划内，吾尝提议削去下关全市，如是则南京码头当移至米子洲与南京外郭之间，而米子洲后面水道自应闭塞，如是则可以作成一泊船坞，以容航洋巨舶。此处比之下关，离南京市宅区域更近，而在此计划之泊船坞与南京城间旷地，又可以新设一工商业总汇之区，大于下关数倍。即在米子洲，当商业兴隆之后，亦能成为城市用地，且为商业总汇之区。此城市界内界外之土地，当照吾前在乍浦计划港所述方法，以现在价格收为国有，以备南京将来之发展。

Pukow, opposite Nanking, on the other side of the river, will be the great terminus of all the railways of the great northern plain to the Yangtze. It will be the nearest river port for the rich coal and iron fields of Shansi and Honan, giving access to the lower Yangtze district and hence to the sea. As the great transcontinental trunk line to the sea whether terminating at Shanghai or at our Projected Port, would pass through this point, the construction of a tunnel under the Yangtze to connect Nanking and Pukow by rail at the same time when the cities are being constructed, will not be at all premature. This will at once make possible a through train journey from Shanghai to Peking.

Concrete or stone embankment should be built along the shore above and below the present Pukow point many miles in each direction. Modern streets should be laid out on the land within the embankment so as to be ready for various building purposes. The land on the north side of the river should be taken up by the state for public uses of this international development scheme on the same basis as at our Projected Ports.

c. Wuhu

Wuhu is a town of 120,000 inhabitants and is the center of the rice trade in the lower part of the Yangtze. It is at this point that I propose to make an intake of the water which will go to flush the Whangpoo River at Shanghai, and which will form the upper end of a canal to the sea at Chapu. In the regulating work of the Yangtze the concave part above the junction of the Yangki Ho has to be filled up

and the convex part of the opposite side has to be cut away. The junction of the projected canal and the river will be at about a mile or so below the Lukiang junction. The projected canal will run northeast to a point between the southeast corner of Wuhu city and the foot of the hill. There it joins the Yangki Ho and, following the course as far as Paichiatien, branches off in the northeastern direction. This gives Wuhu a southeast waterfront along the left side of the canal. New bunds should be built along both sides of the canal as well as alongside the Yangtze and at the junction of the canal docks for inland vessels should be constructed with modern plants for transshipment of goods. Wide streets should be laid out from the Bund of the Yangtze far into the inland following the direction of the canal. The bund alongside the Yangtze should be reserved for commercial purposes and those alongside the canal for factories. Wuhu is in the midst of a rich iron and coal field, so it will surely become an industrial center when this iron and coal field is properly developed. Cheap materials, cheap labor, and cheap foodstuffs are abundant at the spot waiting for modern science and machinery to turn them into greater wealth for the benefit of mankind.

南京对岸之浦口，将来为大计划中长江以北一切铁路之大终点。在山西、河南煤铁最富之地，以此地为与长江下游地区交通之最近商埠，即其与海交通亦然。故浦口不能不为长江与北省间铁路载货之大中心，犹之镇江不能不为一内地河运中心也。且彼横贯大陆直达海滨之干线，不论其以上海为终点，抑以我计划港为终点，总须经过浦口。所以当建市之时，同时在长江下面穿一隧道以铁路联结此双联之市，决非躁急之计。如此，则上海、北京间直通之车，立可见矣。

现在浦口上下游之河岸，应以石建或用土敏土坚结，成为河堤，每边各数英里。河堤之内应划分为新式街道，以备种种目的建筑所需。江之此一岸陆地，应由国家收用，一如前法，以为此国际发展计划中公共之用。

丙 芜湖

芜湖为有居民十二万之市镇，且为长江下游米粮市易之中心，故吾择取此点为引水冲刷上海黄浦江底之接水口，而此口亦为通上海或乍浦之运河之上口。在整治长江工程之内，青弋河合流点上面之凹曲部分应行填塞，而对岸突出之点则应削去。此所计划之运河，起于鲁港合流点下游约一英里之外。此运河应向北东走，至芜湖城东南角，与山脚中间一点，与青弋河相合；更于濮家店，循此河之支流以行。如此，则芜湖东南循此运河左岸，得一临水之地。运河两旁，应建新堤，一如长江两岸。且建船坞于运河通大江之处，以容内地来往船只，加以近代之机械，供盘运货物过船之用。自江岸起，向内地，循运河之方向，规划广阔之街道，其近江者留以供商业之需，其沿运河者则留为制造厂用地。

芜湖居丰富铁矿区之中心，此铁矿既得相当开发之时，芜湖必能成为工业中心也。芜湖有廉价材料、廉价人工、廉价食物，且极丰裕，专待现世之学术与机器，变之以为更有价值之财物，以益人类耳。

d. Anking and South Side

Anking, the capital of Anhwei, was once a very important city but since its destruction by the Taiping war it has never recovered its former greatness. Its present population is about 40,000 only. Its immediate neighborhood is very rich in mineral and agricultural products. The great tea district of Liu-an and the rich mineral district in the southeastern corner of Honan province will have to make Anking their shipping port when railways are developed. In the Yangtze Conservancy work, the concave turn of the river in front and west of the city has to be filled up. This reclaimed land should be for the extension of a new city, where modern transportation plants should be built.

Eagle Point, on the south side opposite Anking should be cut away to make the river curve more gently and to give the channel a uniform width. A new city should be laid out at this point, for from here we command the vast tea districts of southern Anhwei and western Chekiang. The rich inland city of Hweichow, with the highly productive country around it, will have to make this port its shipping station. As Wuhu is the center of the rice trade these twin cities of Anking will be the centers of the tea trade. Like Wuhu, these twin cities are also situated in the midst of rich iron and coal fields which will assist them to become important industrial centers in the near future. So to build twin cities at this point of the river will be a very profitable undertaking.

丁 安庆及南岸

安庆者，安徽之省城，自从经太平天国战争破坏之后，昔日之盛不可复睹矣。现在人口仅有四万。其直接邻近之处，农产、矿产均富。若铁路既成，则六安大产茶区，与河南省之东南角矿区，均当以安庆为其货物出入之港。在治江工程中，安庆城前面及西边之江流曲处，应行填筑。此填筑之地，即为推扩安庆城建新市街之用。所有现代运输机械，均应于此处建之。

在安庆城对面上游江岸最突出之地角，应行削去，使江流曲度更为和缓，而全河之广亦得一律。新市街即当在此处建造，因皖南、浙西之大产茶区，将于此处指挥掌握之也。如以徽州之内地富饶市镇，又有产出极盛之乡土环绕之，则必求此地以为其载货出入之中站明矣。以芜湖为米市中心言，则此安庆之双联市将为茶市中心，而此双联市之介在丰富煤铁矿区中心，又恰与芜湖相等。此又所以助兹港使于短期之间成为

重要工业中心者也。故在长江此部建此双联市，必为大有利益之企业。

e. The Poyang Port

I propose to construct a port at a point between the Poyang Lake and the Yangtze River. This will be the sole port of the Kiangsi province. Every city of this province is connected by natural waterways which, if improved, will become a splendid water transportation system. The province of Kiangsi has a population of 30,000,000 and is extremely rich in mineral resources. A modern port acting as a commercial and industrial center for the development of this resourceful province would be a most remunerative proposition in our project.

The site of the port will be on the west side of the entrance to the Poyang Lake and the right bank of the Yangtze. It will be an entirely new city built on new ground, part of which will be reclaimed from the shallow side of the lake. In the regulating work of the Poyang Channel, a training wall should be built from the foot of the Taku Tang Hill to Swain Point opposite to Stone Bell Hill of Hukow. A closed dock should be constructed within this training wall for the accommodation of inland water vessels. The city should be laid out on the triangular space formed by the right bank of the Yangtze, the left side of the Poyang Lake and the foot hill of the Lushan Mountain. This triangle is about 10 miles on each side, excellent for city development. The porcelain industry should be established here instead of at Kingteh Chen, for great damages often occur owing to the lack of transportation facilities, and to the necessity of transshipment for the export of the finished articles from the latter place. Modern plants on a large scale should be adopted for the manufacturing of cheap wares as well as fine articles in our projected Poyang Port, for here we shall have the greater advantage of collecting raw materials than at Kingteh Chen. Thus the concentrating of the various manufactures in an advantageous center will result in quickening the growth of our new city. This Poyang Port is bound to grow into one of the great commercial and manufacturing centers in China, judging from the possibilities of Kiangsi alone. It will not only be a great shipping port of the Yangtze but will also be a railway center between North and South China. Thus to develop this port on a large scale is quite justifiable from an economic point of view.

f. Wuhan

Wuhan signifies the three cities of Wuchang, Hankow, and Hanyang. This point is the headwater of our projected ocean passage,

the pivot of the railway system of China Proper, and will become the most important commercial metropolis in the country. The population of these three cities is over a million and could be easily doubled or trebled if improvements would be made. At present, Hanyang possesses the largest iron works in China, and Hankow, many modern industries, while Wuchang is becoming a great cotton manufacturing city. Besides, Hankow is the trade center of Central and West China, and the greatest tea market we have. The provinces of Hupeh, Hunan, Szechuen, and Kweichow and a part of Honan, Shensi, and Kansu all depend upon Hankow as their only port in the outside world. When railways are developed in China, Wuhan will be still more important and will surely become one of the greatest cities in the world. So in planning the future city of Wuhan we must adopt for its development a scale as large as that of New York or London.

戊 鄱阳港

吾欲于长江与鄱阳湖之间，建设一鄱阳港，此港将成为江西富省之惟一商埠矣。江西省每县均有自然水路联络之，若更加以改良，则必成宏伟之水路运输系统。江西有人民三千万，矿源最富，如有一新式商埠以为之工商业中心，以发展此富源饶裕之省分，则必为吾计划中最获利之一部分矣。

此港位置，应在鄱阳湖入口西端，长江右岸之处。此港应为新地之上所建之新市，其中一部之地，须由填筑湖边低地成之。在鄱阳湖水道整治工程之中，应建一范堤，起自大姑塘山脚，迄于湖口石钟山对面之低沙角。此范堤之内，应建造一有闸船坞，以便内河船舶寄泊。而此港市街则应设在长江右岸、鄱阳湖左侧、庐山山麓，合成之三角地。此三角地，每边约有十英里，以供市街发展，优良已极。景德镇磁器工业应移建之于此地。盖以运输便利缺乏之故，景德之磁常因之大受损坏，而出口换船之际，尤常使制成之磁器碰损也。此地应采用最新大规模之设备，以便一面制造最精良之磁器，一面复制廉价之用具。盖此地收集材料，比之在景德镇更为便宜也。以各种制造业集中于一便利之中心，其结果不特使我计划之港长成迅速，且于所以奉给人者亦可更佳良。但以江西一省观之，鄱阳湖已必为世界商业制造之大中心。鄱阳湖非特长江中一泊船港，又为中国南北铁路之一中心。所以从经济上观之，以大规模发展此港者，全然非不合宜者也。

己 武汉

武汉者，指武昌、汉阳、汉口三市而言。此点实吾人沟通大洋计划之顶水点，中国本部铁路系统之中心，而中国最重要之商业中心也。三市居民数过百万，如其稍有改进，则二三倍之，决非难事。现在汉阳已有中国最大之铁厂，而汉口亦有多数新式工业，武昌则有大纱厂。而此外，汉口更为中国中部、西部之贸易中心，又为中国茶之大市场。湖

北、湖南、四川、贵州四省，及河南、陕西、甘肃三省之各一部，均恃汉口以为与世界交通唯一之港。至于中国铁路既经开发之日，则武汉将更形重要，确为世界最大都市中之一矣。所以为武汉将来立计划，必须定一规模，略如纽约、伦敦之大。

In the regulation of the Yangtze embankments, we have to reclaim the front of Hankow from the jetty of Lungwangmiao at the junction of the Han River right along the left bank to the point where the Yangtze turns eastward. This reclaimed space will be at an average of about 500 to 600 yards wide. This will narrow down the river at this part to give a uniform channel of 5 to 6 cables in width and to give the Hankow settlement a strip of valuable land along its waterfront. This will also help to pay a part of the expenses for city construction. The sharp bend of the Han River just before it joins the Yangtze should be straightened so as to make a gentler curve around Lungwangmiao Point and thus enable the currents of both rivers to flow in the same direction at their junction. The Hanyang embankment will follow pretty closely the present shore line but not beyond the iron works jetty. The wide space of the river above Wuchang city should be walled in to make a closed dock for inland water as well as ocean going vessels. Below Wuchang, an embankment parallel to that of the left side should be built so as to make the future city extend far below the present one. A tunnel should be constructed to connect both embankments at a point where the Kinghan railway makes its first turn when it comes to the Yangtze River. And another tunnel or bridge should be constructed between Hankow and Hanyang on one side and Wuchang on the other at the junction of the Han River and the Yangtze. Additional tunnels or bridges may be constructed at different points when the city grows larger in the future. All the outlying land of these trio-cities should be taken up on the same basis as at our projected seaports, so that private monopoly and speculation in land may be prevented, and that the unearned increment will go to the State to help the payment of capital and interest on the foreign loans which are to be made in this international development scheme.

在整治长江堤岸，吾人须填筑汉口前面，由汉水合流点龙王庙渡头起，迄于长江向东屈折之左岸一点。此所填之地，平均约阔五百码至六百码。如是，所以收窄此部分之河，全河身一律有五六链（每链为一海里十分之一）之阔，又令汉口租界得一长条之高价土地于其临江之处也。此部之价，可以偿还建市所费之一部分。汉水将入江处之急激曲折，应行改直，于是以缓徐曲线绕龙王庙角，且使江汉流水，于其会合处向同一方面流下。汉阳河岸应密接现在之河边，沿岸建筑，毋突过于铁厂渡头之外。武昌上游广阔之空处，当圈为有闸船坞，以供内河外洋船舶之用。武昌下游应建一大堤，与左岸平行，则将来此市可远扩至于

现在市之下面。在京汉铁路线，于长江边第一转变处，应穿一隧道过江底，以联络两岸。更于汉水口以桥或隧道，联络武昌、汉口、汉阳三城为一市。至将来此市扩大，则更有数点可以建桥，或穿隧道。凡此三联市外围之地，均当依上述大海港之办法收归国有，然后私人独占土地与土地之投机赌博，可以预防。如是则不劳而获之利，即自然之土地增价，利可尽归之公家，而以之偿还此国际发展计划所求之外债本息也。

Part IV The Improvement of the Existing Waterways and Canals

The existing waterways and canals in connection with the Yangtze may be enumerated as follows:

- a. The Grand Canal.
- b. The Hweiho.
- c. The Kiangnan Waterway System.
- d. The Poyang Waterway System.
- e. The Han River.
- f. The Tungting System.
- g. The Upper Yangtze.

a. The Grand Canal

The Grand Canal connects with the Yangtze at a point opposite Chinkiang and runs northward right up to Tientsin, a distance of over 600 miles. We understand that a detailed survey of the Kiangpeh part of the canal has begun and the work of improving it will commence soon. In our project, I propose to substitute the Kiangpeh portion of the Grand Canal by the Yangtze outlet of the Hweiho.

b. The Hweiho

The Hweiho rises in the northwest corner of Honan and runs southeast and east to the north of Anhwei and Kiangsu. Its outlets have been sealed up in recent years so its water has accumulated in the Hungtse Lake and it depends upon evaporation as its only means of disposing the water. Thus in the heavy rainy season, it floods a vast extent of the country surrounding the lake and causes great misery to millions of people. So the conservancy of the Hweiho is a very urgent question of China to-day. Recently many investigations have been made and many plans proposed. Mr. Jameson, chief engineer for the American Red Cross Society, has proposed two outlets for the Hweiho: one following the old course of the Yellow River to the sea and another through Paoying and Kao-yu Lakes to the Yangtze. In this project I propose to follow Mr. Jameson's plan for the sea outlet only as far as the old Yellow River and for the Yangtze outlet only as far as

Yangchow. When the sea outlet or north branch reaches the old Yellow River I will lead it across into the Yenho and follow the Yenho to its northern turn. From there, we cut across the narrow strip of land into the Kuanho which enters the sea at the nearest deep water line. This saves a great deal of work of excavating the old course of the Hoangho. When the southern branch reaches Yangchow, I propose to make the canal pass east of that city instead of west as Mr. Jameson proposed, so that its current will join the Yangtze in the same direction at the new curve below Chinkiang city.

第四部 改良扬子江之现存水路及运河

兹将现存水路运河、扬子江相联络者，列举如下：

甲 北运河。

乙 淮河。

丙 江南水路系统。

丁 鄱阳水路系统。

戊 汉水。

己 洞庭系统。

庚 扬子江上游。

甲 北运河

北运河在镇江对岸一点与扬子江联络，北走直至天津，其长逾六百英里。在江北之一部运河，现已著手为详细之测量，改良工事不久可以起工，此吾人所共知者也。在吾计划，吾将以淮水注江之一段，代江北一段运河之用。

乙 淮河

淮河出河南省西北隅，东南流，又折而东流，至安徽、江苏两省之北部。其通海之口近年已经淤塞，故其水郁积于洪泽湖，全恃蒸发以为消水之路，于是一入大雨期，洪水泛滥于沿湖广大区域，人民受其荼毒者以百万计。所以修浚淮河，为中国今日刻不容缓之问题。近年迭经调查，屡有改良之提案。美国红十字会技师长詹美生君，曾献议为淮河开两出口，其一循黄河旧槽以达海，其一经宝应、高邮两湖以达扬子江。在此计划，吾赞成詹君通海、通江之方法，但于用黄河旧槽及其经过扬州西面一节，有所商榷。在其出海之口，即淮河北支已达黄河旧槽之后，吾将导以横行入于盐河，循盐河而下，至其北折一处，复离盐河过河边狭地，直入灌河，以取入深海最近之路，此可以大省开凿黄河旧路之烦也。其在南支在扬州入江之处，吾意当使运河经过扬州城东，以代詹君经城西入江之计划。盖如此则淮河流入，刚在镇江下面新曲线，以同一方向与大江会流矣。

Both of these outlets or branches of the Hweiho should be made at least twenty feet deep right along, so that coastal vessels from the north to the Yangtze could use them as passage instead of going round the Yangtze estuary, thus shortening the distance by about 300 miles. And with twenty feet depth for both outlets, the Hweiho and the

Hungtse Lake would be well drained and the present bottom of the lake, which is sixteen feet above sea level would be converted into agricultural land at once. Thus 6,000,000 mow of land could be reclaimed according to the estimate of Mr. Jameson, from the Hungtse and the neighboring lakes. If twenty dollars a mow be taken for its value, a sum of \$120,000,000 could be netted. Besides this direct profit to the Government, there is an area of some 17,000 square miles of occasionally flooded land which would be made flood-proof so that normally we shall have two crops a year instead of two only in five years. That is to say, the 17,000 square miles or 10,880,000 acres will be made to produce five times more than at present. For instance, if the value of the gross production be estimated at fifty dollars an acre, then the total value would be \$544,000,000 Mex. and five times this sum would amount to \$2,720,000,000 Mex. What an enormous profit to the country!

c. The Kiangnan Waterway System

This system comprises the South Grand Canal, the Whangpoo, the Taihu, and its connections. The most important improvement I intend to make here is to widen and deepen the Wuhu-Ihsing Waterway between the Yangtze and the Taihu, and from there to dredge a deep channel right through the Taihu to a point midway of the Grand Canal between Suchow and Kashing. At Kashing, divide it into two branches:—one following the Kashing Sunkiang Canal to Whangpoo, and the other, to the Projected Port at Chapu. This waterway between the Yangtze and the Whangpoo, before it reaches Shanghai, should be made as wide and deep as possible so as to make it carry sufficient water to flush the Shanghai harbor as well as to provide a shorter passage for inland water vessels between the Yangtze and the seaports. This waterway will act as silt carrier by which the Taihu and the various lakes alongside of it may be reclaimed in the future. Besides the main object for which this canal is assigned, the reclamation scheme and the local traffic would also add profit to it. This makes its remuneration doubly sure. As no accurate surveys of the shallow Taihu and other lakes and swamps could be obtained, the exact number of mow to be reclaimed could not be given here. But in a rough estimate I should say that the reclaimed space of the Kiangnan Lakes would be about the same in extent as those of Kiangpeh (the North of the Yangtze).

淮河此两支，至少均须得二十英尺深之水流，则沿岸商船自北方赴长江各地，可免绕道经由江口以入，所省航程近三百英里。而两支既各有二十英尺之深，则洪泽与淮河之水流宣畅；而今日高于海面十六英尺之湖底，即时可以变作农田。则以洪泽合之其旁诸湖，依詹美生君之计

算，六百万亩之地，咄嗟可致也。如此以二十元为其一亩之价，则此纯粹地价已足一万二千万元，此政府之直接收入也。而又有一万七千英方里地，向苦水潦^[9]之灾者，今既无忧，所以昔日五年而仅两获者，今一年而可再获，是一万七千英里者，得一千零八十八万英亩（七千余万中亩），各得五倍奇收获也。假如总生产额一英亩所值为五十元，则此地所产总额原得五万四千四百万元者，今为二十七万二千万元也。其在国家，岂非超越寻常之利益乎！

丙 江南水路系统

此项系统包含南运河与黄浦江、与太湖、及其与为联络之水路而言。此中吾所欲为最重要之改良，乃在浚广浚深芜湖、宜兴间之水路，以联长江与太湖，而又贯通太湖浚一深水道，以达南运河苏州、嘉兴间之一点。其在嘉兴歧为两支，一支循嘉兴、松江之运河，以达黄浦江；他一支则至乍浦之计划港。此项长江、黄浦间水路，当其未达上海之前，应先行浚令广深至其极限，使能载足流水。一面以洗涤上海港面，不容淤积；一面亦使内河船舶来往于江海之间者经此，大减其路程也。而此水路又可为挟土壤俱来之用，太湖暨其旁诸湖沿水路之各区，将来均可因其填塞，成为耕地。故于建此水路之大目的以外，又有此种填筑计划及本地载货之利益可收，于是其获利之性质，可以加倍确实。现在太湖暨其他诸湖沼地之精确测量尚无可行，则能填筑为田者当有几亩，今亦未可遽言^[10]，但以粗略算之，则填筑江南诸湖所得之地，吾意其亩数必不在江北之田以下。

d. The Poyang Waterway System

This system drains the entire area of Kiangzi province. Every hsien, city, and important town is reached by waterway. Waterways are the only means of communication in this province as well as in all the provinces of Southeastern China, before the advent of railways. The lower part of the Kiangsi waterway system suffers the same irregularities as those of the lower Yangtze as both are on low land. So, to regulate it, a similar work as that for the Yangtze should be applied. The Poyang Lake should be divided by deep channels from the junction of each river, and these should join together to form larger channels and finally unite into one main channel at a point near Chuki and, running through the narrow part of the lake, join the Yangtze at Hukow. The sides of the deep channels should be lined with submerged stone ridges as high as the shallow part of the lake, whereby the channels would serve the purpose of draining as well as of navigation.

The shallow space beside those channels will be reclaimed into arable land in due time. So the work of regulating the Poyang channels will be well paid by reclamation.

e. The Han River

This river is navigable for small crafts through its main body up to Hanchung in the southwest corner of Shensi; and through its branches up to Nanyang and Shekichen in the southwest corner of Honan. This navigable stream commands quite a large area of watershed. The upper part, that is above Siangyang, is in mountainous country. From Siangyang to Shayang it is in a wide, open valley and below Shayang it runs into the Hupeh swamp.

丁 鄱阳水路系统

此一系统，为江西全省排水之用。每县、每城乃至每一重要市镇，均可由水路达到。全省交通，惟恃水路，此乃未有铁路前，中国东南各省所同者也。江西下游水路系统受不规则之害与长江同，皆以其为低地之故，然则其整治之工亦应与长江相同。鄱阳湖应按各水入湖之路，分为多数水道，然后逐渐汇流，卒至渚溪附近乃合而为一。度此湖狭隘之部，而与长江合于湖口。此深水道两旁应各叠水底石堤为一线，使刚与湖中浅处同高，以是其水道可以于排水之外并作航行之用也。水道以外之浅处，将来于相当时间可填为耕地。于是整治鄱阳湖各水道之计划，可以其填筑而得充足之报酬矣。

戊 汉水

此水以小舟溯其正流，可达陕西西南隅之汉中；又循其旁流，可达河南西南隅之南阳及赊旗店。此可航之水流，支配甚大之分水区域：自襄阳以上，皆为山国；其下以至沙洋，则为广大开豁之谷地；由沙洋以降，则流注湖北沼地之间，以达于江。

To improve this river dams should be built above Siangyang in order to utilize water power as well as to make locks for larger crafts to ascend to the navigable point now navigable only for small crafts. Below Siangyang, where the river is very wide and shallow, rudimental dikes should be constructed of stones or piles in order to restrict its channel and to reclaim the shallow space on both sides by natural process. In the swamp, the river should be straightened and deepened. A new canal between the Han and the Yangtze at Shasi should be constructed to provide a shorter passage between Hankow and Shasi and beyond. This canal in the swamp should be open to the lakes along its course so as to let the silt-carrying water enter into them in the flood season, thus filling them up quicker.

f. The Tungting System

This system of waterway drains the whole province of Hunan and

beyond. The most important branches are the Siangkang and the Yuankiang. The former runs through Hunan into the northeast corner of Kwangsi province and connects with the Sikiang system by a canal near Kweilin. The latter runs across the west border of Hunan into the eastern part of Kweichow province. Both could be improved for the navigation of large crafts. The canal between the Yangtze and the Sikiang watersheds should be reconstructed and modern locks should be provided in it as well as along the two waterways. Thus, vessels of ten feet draught may freely pass between the Yangtze and the Sikiang. The Tungting Lake should be drained by deep channels in the same manner as the Poyang Lake, and its shallow space reclaimed by natural process.

g. The Upper Yangtze

I include the part from Hankow to Ichang also in the Upper Yangtze, because it is at Hankow that the ocean navigation ends, and the inland water communication begins. So, in dealing with the improvement of the Upper Yangtze, I will begin at Hankow. At present the Upper Yangtze is navigable for shallow draught steamers up to Kiating, a point about 1,100 miles above Hankow by river. If improvement be made farther on, than shallow draught steamers could navigate right up to Chengtu, the capital of Szechuen province, and the center of the richest plain in West China, about sixty miles up the Min River.

改良此水，应在襄阳上游设水闸。此一面可以利用水力，一面又使巨船可以通航于现在惟通小舟之处也。襄阳以下，河身广而浅，须用木桩或叠石作为初级河堤，以约束其水道，又以自然水力填筑两岸洼地也。及至沼地一节，须将河身改直浚深。其在沙市，须新开一运河，沟通江汉，使由汉口赴沙市以上各地得一捷径。此运河经过沼地之际，对于沿岸各湖，均任其通流，所以使洪水季节挟泥之水溢入渚湖，益速其填塞也。

己 洞庭系统

此项水路系统，为湖南全省及其上游排水之用。此中最重要之两支流，为湘江与沅江。湘江纵贯湖南全省，其源远在广西之东北隅，有一运河^[11] 在桂林附近，与西江系统相联络。沅江通布湖南西部，而上流则跨在贵州省之东。两江均可改良，以供大河船^[12] 航行。其湘江、西江分水界上之运河，更须改造。于此运河及湘江、西江各节，均须设新式水闸，如是则吃水十英尺之巨船，可以自由来往于长江、西江之间。洞庭湖则须照鄱阳湖例，疏为深水道，而依自然之力，以填筑其浅地为田。

庚 长江上游

自汉口至宜昌一段，吾亦括之入于长江上游一语之中。因在汉口为航洋船之终点，而内河航运则自兹始，故说长江上游之改良，吾将发轫于汉口。现在以浅水船航行长江上游，可抵嘉定，此地离汉口约一千一百英里。如使改良更进，则浅水船可以直抵四川首府之成都。斯乃中华西部最富之平原之中心，在岷江之上游，离嘉定仅约六十英里耳。

To improve the Upper Yangtze from Hankow to Yochow, the work is much similar to that of the lower part. The channel should be regulated by rudimental dikes. The concave embankments in sharp bends should be protected by stone or concrete; obstacles in midstream should be removed. The great loop, called the Farmer Bend, above Kinkow, should be cut through at the neck of Paichow, and the sharp point of Hanchin Kwang should be cut away to make the curve of the river more gentle.

The tortuous part of the Yangtze, north of the Tungting Lake, between Kinho Kow and Skipper Point, should be blocked up altogether and a new channel made through Tungting Lake, returning to the Yangtze by the Yochow Channel. This avoids the crooked passage and shortens the river course considerably. From Skipper Point to Ichang the dilatations should be restricted by dikes of stone or piling, and some sharp points of the shores should be cut away to make the curves more gentle.

The Yangtze River above Ichang enters the Gorges which run about a hundred miles up to the Szechuen depression, known as the Red Basin. This part of the river from Ichang right along to its source is confined by rocky banks, very narrow and deep, having an average depth of six fathoms and at some particular points even thirty fathoms. Many rapids and obstructions occur along its course.

To improve the Upper Yangtze, the rapids should be dammed up to form locks to enable crafts to ascend the river as well as to generate water power. Obstructions should be blasted and boulders removed. Thus, a ten-foot channel right along from Hankow to Chungking could be obtained so that through inland water transportation could be established from Chungking to Peking in the north and to Canton in the south, as well as to all navigable points in China Proper all the year round. In this way, transportation expenses to the richest emporium in West China could be reduced hundredfold. The benefit to the people will be enormous and the encouragement to commerce will indeed be great.

改良自汉口至岳州一段，其工程大类下游各部。当筑初步河堤，以整齐其水道。而急弯曲之凹岸，当护以石堤，或用土敏土坚结。中流洲

屿，均应削去。金口上游大湾，所谓簪州曲者，应于簪州地颈开一新河以通航。至后金关之突出地角，则应削除，使河形之曲折较为缓徐。

洞庭之北、长江屈曲之部，自荆河口起以至石首一节，吾意当加闭塞。由石首开新道，通洞庭湖，再由岳州水道归入本流。此所以使河身径直，抑亦缩短航程不少。自石首以至宜昌，中间有泛滥处，当以木石为堤约束之；其河岸有突出点数处，须行削去，而后河形之曲折可更缓也。

自宜昌而上，入峡行，约一百英里而达四川之低地，即地学家所谓红盆地也。此宜昌以上迄于江源一部分河流，两岸岩石束江，使窄且深，平均深有六英寻（三十六英尺），最深有至三十英寻者。急流与滩石，沿流皆是。

改良此上游一段，当以水闸堰其水，使舟得溯流以行，而又可资其水力。其滩石应行爆开除去。于是水深十英尺之航路，下起汉口，上达重庆，可得而致。而内地直通水路运输，可自重庆北走直达北京，南走直至广东，乃至全国通航之港无不可达。由此之道，则在中华西部商业中心，运输之费当可减至百分之十也。其所以益人民者何等巨大，而其鼓舞商业何等有力耶！

Part V The Establishment of Large Cement Works

Steel and cement are the basis of modern construction, and the most important factors of the material civilization of the present age. In the various projects of our development scheme, the demand for steel and cement will be so enormous that all manufacturing countries combined will not be able to supply the needs. Therefore, in our first program, I have proposed to establish large steel works in the rich iron and coal fields in the provinces of Shansi and Chihli; so in this second program I propose to establish large cement works along the shores of the Yangtze River. The Yangtze Valley is exceptionally rich in materials for cement,—limestone and coal lying side by side at the water edge along the navigable channel from Chinkiang upward. Thus, local supplies could be created for local needs.

At present, there is one cement works at Shihuiyau near Hoangshikang at the upper reach. It is situated between a deep water wharf and a limestone hill. The limestone is so near by that it can be cut and shoveled into the kilns immediately. Between Hankow and Kiukiang there are many places possessing the same advantage. Below Kiukiang, there are also many such advantageous positions as Matang, Wushiki and many others between Kiukiang and Anking. Between Anking and Nanking there are exceptionally good locations for putting up cement works such as Tatung, Tikang, and Tsaishisze, all these places being provided abundantly with limestone and coal and iron, lying side by side.

With the huge harbor works, city building, and embankment construction, the market for cement will be so great that a capital of one to two hundred million dollars should be invested for the supply. This work should be started gradually in accord with the acceleration of the other works of the general development so that one project will further the other, and over-production and waste of capital individually in any of the parts of the general scheme will be guarded against. This will help make each of them a profitable business by itself.

第五部 创建大土敏土厂

钢铁与土敏土为现代建筑之基，且为今兹物质文明之最重要分子。在吾发展计划之种种设计，所需钢铁与土敏土不可胜计，即合世界以制造著名之各国所产，犹恐不足供此所求。所以在吾第一计划，吾提议建一大炼钢厂于煤铁最富之山西、直隶。则在此第二计划，吾拟欲沿扬子江岸建无数土敏土厂。长江谷地特富于土敏土原料，自镇江而上可航之水道，夹岸皆有灰石及煤，是以即为其本地所需要，还于其地得有供给也。今日已有制土敏土之厂在黄石港上游不远之石灰窑，其位置刚在深水码头与灰石山之间。其山既若是近，故直可由山上以锹锄起石，直移之窑中，无须转运。而在汉口、九江之间，与此相类之便利，尚复多有。九江以下，马当、黄石矶以及九江、安庆间诸地，又有极多之便利相同之灰石山。其安庆以下至南京之间，多为极有利于制土敏土之地区，即如大通、荻港、采石矶，均有丰裕之灰石及煤铁矿，夹江相望也。

筑港、建市街、起江河堤岸诸大工程同时并举，土敏土市场既如斯巨大，则应投一二万万之资本，以供给此土敏土厂矣。而此业之进行，即与全盘其他计划相为关连，徐徐俱进，则以一规划奖进其他规划，各无忧于生产过剩与资本误投，而各计划俱能自致其为一有利事业矣。

[1] fathom：英寻，海洋测量中计算水深的单位，1英寻＝6英尺。——编者注

[2] 遥劣：相差很远。

[3] 孟遮斯打：今译曼彻斯特。

[4] 英方里：平方英里。——编者注

[5] 渟水：在大江大河不远处，因洪水或暴雨而形成的大湖。渟：水停止不流。

[6] 希觐：罕见，少有。觐：遇见。

[7] 苏彝士：今译苏伊士（运河）。

[8] 芝加高：今译芝加哥。

[9] 水潦：因雨水过多而积在田地里的水或流于地面的水。此指洪涝之灾。

[10] 遽言：仓猝作出结论。

[11] 运河：此指灵渠，又称湘桂运河或兴安运河。

[12] 河舶：指专用于内河航运的船舶，与用于航海的海舶相区别。

PROGRAM III

The main feature of the third program will be the construction of a great southern port which will complete the plan for three first-class seaports in China as proposed in the preliminary part of this International Development Scheme. Our Great Southern Port will naturally be Canton, which is not only the center of commerce in South China but also the largest city in all China. Until recent times it was the largest city on the coasts of the Pacific, and the center of commerce of Asia. With the development of China, Canton will surely resume its former importance. Around this southern metropolis I formulate the third program as follows:

I. The Improvement of Canton as a World Port.

II. The Improvement of the Waterway System of Canton

III. The Construction of the Southwestern Railway System of China.

IV. The Construction of Coast Ports and Fishing Harbors.

V. The Establishment of Shipbuilding Yards.

Part I The Improvement of Canton as a World Port

Canton's position as a seaport has been taken away by Hongkong since its cession to England after the Opium War. But as a commercial center of South China, Canton still holds its own, despite the advantages of deep-water harbor, the artificial improvements of Hongkong, and the political dominance of England. The loss of its position as a seaport is entirely due to the ignorance of the Chinese people who never made any combined effort to improve the welfare of the country, and also to the corrupt government and officials of the Manchu dynasty. Since the establishment of the Republic, the people have begun to awake very rapidly and many schemes have been suggested to make Canton a seaport. This awakening of the millions of Chinese has caused much apprehension to the Hongkong Government. The authorities of that colony have been doing their utmost to hinder every move to restore Canton as a seaport and try to nip every scheme in the bud. Of course, if Canton is improved and made into a world port, then all the services that Hongkong performs for her as a shipping stage would be dispensed with altogether. But a developed Canton and a prosperous China will recompense Hongkong in various ways a hundred times more than its present position as the monopolized ocean port of a backward and poor China. Just look at the port of Victoria in British Columbia, which was once the only seaport of West Canada as well as the Northwestern region of the United States, but it prospered very little then with an undeveloped hinterland despite its monopolistic character. Whereas as soon as the rival ports arose, Vancouver on its own side, and Seattle and Tacoma on the American side, all within the same distance as Hongkong is to Canton, all of them because of a developed hinterland prospered wonderfully, despite the keen competition between them as seaports. Thus, we see that competitive seaports like Vancouver, Seattle, and Tacoma instead of killing Victoria, as was once supposed by shortsighted people, have made it more prosperous than ever. Then, why doubt that a prosperous Canton and a developed China would not give the same result to Hongkong? This is but a natural outcome. Therefore, there should be no fear that a prosperous Canton and a developed China would be harmful to Hongkong as a free port. So, instead of doing the utmost as hitherto to hinder the development of Canton as a seaport, the Hongkong authorities should do their utmost to encourage such a project. Besides, the development of Canton and South China will benefit the English as a whole commercially a

hundred times more than Hongkong can do at present. Although the local authorities of that crown colony do not see far enough to realize it, however, I believe that the great statesmen and captains of industries in the now mightiest empire of the world would surely see it. With this belief in my mind I feel quite safe in giving publicity to the scheme of my international development of Canton as a world port in South China.

叁 第三计划

第三计划主要之点，为建设一南方大港，以完成《国际发展计划》篇首所称中国之三头等海港。吾人之南方大港，当然为广州。广州不仅中国南部之商业中心，亦为通中国最大之都市。迄于近世，广州实太平洋岸最大都市也，亚洲之商业中心也。中国而得开发者，广州将必恢复其昔时之重要矣。吾以此都会为中心，制定第三计划如下：

- 一、改良广州为一世界港。
- 二、改良广州水路系统。
- 三、建设中国西南铁路系统。
- 四、建设沿海商埠及渔业港。
- 五、创立造船厂。

第一部 改良广州为一世界港

广州之海港地位，自鸦片战争结束，香港归英领后，已为所夺。然香港虽有深水港面之利益，有技术之改良，又加以英国政治的优势，而广州尚自不失为中国南方商业中心也。其所以失海港之位置也，全由中国人民之无识，未尝合力以改善一地之公共利益，而又益之以满洲朝代之腐败政府及官僚耳。自民国建立以来，人民忽然觉醒，于是提议使广州成为海港之计划甚多。以此亿兆中国人民之觉醒，使香港政府大为警戒。该地当局，用其全力以阻止一切使广州成为海港之运动；凡诸计划，稍有萌芽，即摧折之。夫广州诚成为一世界港，则香港之为泊船载货站头之一切用处，自然均将归于无有矣。但以此既开发之广州与既繁荣之中国论，必有他途为香港之利，而比之现在仅为一退化贫穷之中国之独占海港，利必百倍可知。试征之英领哥伦比亚域多利港^[1]之例，彼固尝为西坎拿大^[2]与美国西北区之唯一海港矣。然而即使有独占之性质，而当时腹地贫穷，未经开发，其为利益，实乃甚小。乃至一方有温哥华起于同国方面，他方美国又有些路与打金麻并起为其竞争港，^[3]此诸港之距域多利远近恰与香港之距广州相似，而以其腹地开发之故，即使其俱为海港，竞争之切有如是，仍各繁荣非常。所以吾人知竞争海港，有如温哥华、些路、打金麻者，不惟不如短见者所尝推测，以域多利埠置之死地，且又使之繁荣有加于昔。然则何疑于既开发之广东、既繁荣之中国，不能以与此相同之结果与香港耶？实则此本自然之结果而已，不必有虑于广东之开发、中国之繁荣，伤及香港之为自由港矣。如是，香港当局正当以其全力，鼓励此改良广州以为海港一事，不应复如向日以其全力阻止之矣。抑且广州与中国南方之发展，在于商业上所以益英国全体者，不止百倍于香港今日所以益之者。即使此直辖殖民地之地方当局，无此远见以实行之，吾信今日寰球最强之帝国之各大政治家、各实业首领必能见及于此。吾既怀此信念，故吾以为以我国际共同发展广州以为中国南方世界大港之计划，布之公众，绝无碍也。

Canton is situated at the head of the Canton Delta, which is formed by the junction of three rivers—the Sikiang or West River, the Peikiang or North River, and the Tungkiang or East River. The area of this delta is about 3,000 square miles and it has the most fertile alluvial soil known in China. The land yields three crops a year—two crops of rice and one crop of other products such as potatoes or beets. In silk culture, it gives eight crops every year. The most delicious fruits of many varieties are produced in this delta. This is the most thickly populated district of all China. Within this delta and its immediate neighborhood, more than half of the population of Kwangtung province is found. This is the reason why, despite the great productivity of this fertile delta, large quantities of foods have to be supplied by the surrounding country as well as by foreign imports.

Before the age of machinery Canton for centuries was well known as an industrial center of Eastern Asia. The workmanship and handicraft of its people are still unequaled in many parts of the world. If machinery will be introduced in its industries under our international development scheme, Canton will soon recover its former grandeur as a great manufacturing center.

广州位于广州河汊之顶，此河汊由西江、北江、东江三河流会合而成，全面积有三千英方里，而为在中国最肥饶之冲积土壤。此地每年有三次收获，二次为米作，一次为杂粮，如马铃薯或甜菜之类。其在蚕丝每年有八次之收成。此河汊又产最美味之果实多种。在中国，此为住民最密之区域，广东全省人口过半住于此河汊及其附近。此所以纵有河汊沃壤所产出巨额产物，犹须求多数之食料于邻近之地与外国也。在机器时代以前，广州以东亚实业中心著名者几百年矣。其人民之工作手艺，至今在世界中仍有多处不能与匹。若在吾国际共同发展实业计划之下，使用机器，助其工业，则广州不久必复其昔日为大制造中心之繁盛都会矣。

As a world port, Canton is in a most advantageous position. Being situated at the junction of three navigable rivers and at the head of the ocean navigation it is a pivot of inland water as well as ocean communication in South China. If the Southwestern railway system is completed, then Canton will be equal in importance to the two great ports in North and East China, in regard to transportation facilities. The ocean approach of Canton is generally deep excepting at two points which can be easily trained and dredged to enable modern liners to pass in and out at any hour. The deep water line of the ocean reaches up to Lingting Island, where the depth is from 8 to 10 fathoms. Above Lingting, the channel gets shallower (about 3 or 4 fathoms) and runs about 15 miles up to the Fumen Entrance. From this point the water becomes deep again (between 6 and 10 fathoms) right up to the Second Bar—a distance of 20 miles. At the Second Bar, the water is about 18 to 20 feet deep for only a few hundred yards. After crossing the Second Bar, the water becomes deep again for a distance of 10 miles averaging about 30 feet deep up to the First Bar which will be the city limit of our future Canton.

To improve the Approach to Canton, I suggest that two submerged training walls be built at the left side of Canton Estuary above Lingting Island—one from the shore to the head of the Kongsu Bank, and another from the end of the same bank to the head of the Lingting Bank. The first training wall will be 3 to 4 feet under water just at the same level of the bank. The second wall will be from 4 feet at one end to 16 feet at the other, which are the levels of the respective banks which it connects. (See (1) (3) Map XI.) It will cross a channel of 24 feet deep between them. These two walls together with

the four-foot Kongsu Bank will act as one continuous wall and will direct the undercurrent which now runs between the left shore and Lingting Bank, into the middle part of the estuary, thus cutting a channel between the bar and the bank of the same name to meet the deep water on the west side of Lingting Island. On the right side of the Canton Estuary, a training wall should be built from the lower part of Fraser Bank in a southeasterly direction across the 24-foot channel into the Lingting Bar ending at the east edge of that bar. (See (2) Map XI.) Thus, with these submerged walls on both sides of the estuary to confine the undercurrent in the middle, a very deep channel can be formed to connect with the Fumen Entrance at one end and the Lingting trough at the other both of which are about 50 feet deep so that a thoroughfare from deep sea right up to the Second Bar of the Pearl River will be created.

以世界海港论，广州实居于最便利之地位。既已位于此可容航行之三江会流一点，又在海洋航运之起点，所以既为中国南方内河水运之中轴，又为海洋交通之枢纽也。如使西南铁路系统完成，则以其运输便利论，广州之重要将与中国北方、东方两大港相侔^[4]矣。广州通大洋之水路大概甚深，惟有二处较浅，而此二处又甚易范之以堤，且浚渫之，使现代航海最大之船可以随时出入无碍也。海洋深水线，直到零丁岛边，该处水深自八英寻至十英寻。自零丁以上，水道稍浅（其深约三四英寻），以达于虎门，凡十五英里。自虎门起，水乃复深，自六英寻至十英寻。直至莲花山脚之第二门洲，其长二十英里；在第二门洲处，仅有数百码水深自十八英尺至二十英尺而已。过第二门洲后，其水又深，平均得三十英尺者约十英里，以至于第一门洲，此即吾人所欲定为将来广州港面水界之处也。将改良此通广州之通海路，吾意须在广东河口零丁岛上游左边建两水底范堤：其一，由海岸筑至东新坦头，他一则由该坦尾起筑至零丁坦顶上。此第一范堤之顶，应在水面下三四英尺，约与该坦同高。第二范堤一端低于水面四英尺，一端低十六英尺，各按所联之坦之高低（参照第十一图之1及3），此堤须横断两坦间深二十四英尺之水道。合此两堤与此四英尺高之东新坦，将成为一连续海堤之功用，可以导引现在冲过左边海岸与零丁岛之间之下层水流，入于河口当中一部。于是可以在零丁横沙与同名之坦中间，开一新水道，而与零丁岛右边深水相接。在广东河口右边须建一范堤，自万顷沙外面沙堤下面起，向东南行，横断二十四英尺深之水道，直穿过零丁横沙至其东头尽处为止（参照第十一图之2）。如是，以此河口两边各水底堤，限制下层水流，使趋中央一路，则可得一甚深之水道。自虎门起，直通零丁口，约五十英尺深。于是可得创造一自深海直达珠江之第二门洲之通路矣。

These submerged sea walls taken together are about 8 miles in length and will be built only 6 to 12 feet from the bottom of the sea. The expenses will not be much while the acceleration of the natural reclamation process will be very great. Thus, the lands that will be formed on both sides by these walls will far more than repay the expenses of the work of building these walls.

To regulate the Approach of Canton, in that part of the Pearl River from the Fumen Entrance to Whampoa, I suggest that the East River Estuaries be concentrated in a single outlet by using the uppermost channel which joins the Pearl River at the lower point of Davids Island. The other outlets of the East River, which joins the Pearl River below the Second Bar, should be closed up by dams built to the height of the normal water level so as to permit them to serve as flood channels in the rainy season. By concentrating the whole volume of water of the East River above the Second Bar, a stronger current could be obtained to flush the upper part of this section of the river.

合此各水底堤计之，其长约八英里，而其高只须离海底六英尺至十二英尺而已。其所费者应不甚多，而其使自然填筑进行加速之力则甚大。故因此诸堤两岸新成之地，必能偿还筑此诸堤之工程所费，且大有余裕也。

整治此广州通海之路，自虎门至黄埔一段珠江，吾意须使东江出口集中于一支，即用其最上之水道，于鹿步墟岛下游一点与珠江合流者。其他在第二门洲以下与珠江会流各支，概须筑与寻常水面同高之堰，以截塞之，至入雨期则仍以供宣泄洪水之水道之用。此集会东江全流于第二门洲上面，可以得更强之水，以冲洗珠江上部也。

In the training works of this section, I propose that several jetties should be built as follows: First, a jetty from Elliot Island at point (A) to the farther side of Calcutta Shoal opposite the lower point of Parker Island. This will block the current between Elliot Island and Calcutta Shoal and divert it into the present 36-foot channel thus making it deeper by its natural force. Second, another jetty from Bolton Island, at point (B) to midstream terminating at the lower side of the Second Bar, on the right side of the river. Third, a jetty from the lower point of Patteranger Island at (C) to midstream terminating at the lower side of the same bar on the left side of the river. Thus the Second Bar would be flushed by the concentrated current created by these two jetties. The shallow bottom above these jetties should be dredged to the required depth. If a rocky bottom is found at this bar it should be blasted and removed, so as to give a uniform depth to the whole approach. Fourth, the channel between the right bank of the river and Bolton Island should be blocked up at (D). Fifth, a jetty from Patteranger Island at (E) to the head of the Second Bar Bank in midstream so as to cut off the current at the left side of the river and to increase the velocity in the middle channel. Sixth, a jetty from the right shore at (F) about midway between Danes Island and the Second Bar, should be built to the head of the Midstream Shoal so as to cut off the current at the right side of the river. And seventh, another jetty from the lower point of Davids Island at (G) to midstream opposite to the end

of jetty (F). Jetties (G) and (F) will concentrate the current of the upper Pearl River while at the same time jetty (G) will also turn the East River current into the same direction as that of the Pearl River. (See Map XII.)

By these seven jetties, the current between Whampoa and Fumen could be controlled and the bottom of the river flushed to a depth of 40 feet or more, thus creating a thoroughfare for ocean-going steamers from the open sea right up to the city of Canton. These jetties taken together will be not more than 5 miles in length and mostly in very shallow water. After the building of these jetties, land will be rapidly formed between jetties along both sides of the channel by natural process. The reclaimed land alone will be quite enough to pay the expenses of constructing these jetties, aside from the fact that the main object of regulating the river and opening up a deep channel for ocean transportation will have been realized.

此一段范水工程，吾意须筑多数之坝如下：第一，自江鸥沙之A点筑一坝，至撒沙岛低端对面加里吉打滩边。此坝所以堵截江鸥沙与加里吉打滩中间之水流，而转之入于现在三十六英尺深之水道，以其自然之力浚使更深。第二，于此河右岸，由海心沙之B点起另筑一坝，至中流第二门洲下端为终点。第三，于此河左岸，自漳澎尾沙下头C点筑一坝，至中流，亦以第二门洲下端为终点。以是借此两坝所束集中水流之力，可以刷去第二门洲，其两坝上面浅处，则可浚之至得所求之深为止。若发现河底有岩石，则应炸而去之，然后全部通路可得一律之水深也。第四，在此河右岸与海心沙中间之水道，须堵塞之于D点（即瑞成围头）。第五，在漳澎常安围上游之E点起筑一坝，至第二门洲坦之上端中流。如是，则此河左边水流截断，而中央水道之流速可以增加也。第六，在右岸长洲岛与第二门洲之间适中之处F点起筑一坝，至中流滩之顶上，以截断此河右边之水流。第七，于鹿步墟岛下端G点起筑一坝，至中流，与前述之F坝相对。此EG两坝所以集中珠江上段水流，而G坝同时又导引东江，使其流向与珠江同一也。（参照第十二图）

以此七坝，自黄埔以迄虎门之水流可得有条理，而冲刷河底可致四十英尺以上之深，如是则为航洋巨舶开一通路，自公海直通至广州城矣。合此诸坝，其长当不过五英里，而又大半建于浅水处。自建坝以后，水道两旁各坝之间，以其自然之力，新填地出现必极速。单以所填之地而论，必足以偿还筑坝所费。况又有整治珠江与为海洋运输开一深水道之两大目的，可由此而实现乎！

|---------------------|--------|
| (1) Cambridge Reach | 甘布利治水道 |
| (2) American Reach | 亞美利根水道 |
| (3) Actaeon Island | 小洲及士華 |
| (4) Elliot Passage | 依里阿水道 |
| (5) Mariners Island | 大尾島 |
| (6) Macao Fort | 車寶砲臺 |

Having dealt with the approach to Canton, we may now take up the improvement of Canton City itself as a world port. The harbor limit of Canton will be at the First Bar. From there, the harbor will follow the deep water of Cambridge Reach and the water between Whampoa and Danes Island into American Reach. At this point it will cut through Actaeon Island to the south of Honam Island and follow

the Elliot Passage to Mariners Island. From Mariners Island following the Fatshan Creek, a straight channel should be cut in a southwesterly direction to the Tamchow Channel. Thus, a new waterway will be made from the First Bar to Tamchow Channel, a distance of about 25 miles. This waterway will be the main outlet of the North River as well as a thoroughfare for the West River, and will also serve as the harbor of Canton. By conveying all the water of the North River and a part of that of the West River through this waterway, the current will be strong enough to flush the harbor to a depth of 40 feet or more. (See Map XIII.)

The new city of Canton will be extended from Whampoa to Fatshan, separated by the Macao Fort and Shameen Reaches. The section that lies east of this water should be developed into commercial quarters and that west of it into factory quarters. The factory section should be transected by canals connecting with the Fati and Fatshan creeks so as to give cheap transportation facilities to every factory. In the commercial section, tidal wharves with modern plants and warehouses should be provided. A bund should be built from the First Bar Island along the north side of the new waterway, the west side of Honam to connect with the bund of Shameen, and the northwestern side of Canton city. Another bund should be built from above Fati along the east side of Fati Island to Mariners Island thence turning southwest along the left bank of the new waterway. The Front Reach, that is, the river between the present Canton city and Honam Island should be filled up from the upper point of Honam to Whampoa for city building.

In regard to the question of remuneration, the development of Canton as a world port will be the most profitable undertaking of the kind in the International Development Scheme. Because, besides its commanding position as a commercial metropolis and its possession of advantageous facilities as a manufacturing center of South China, a modern residential city is in great demand in this part of the country. The well-to-do people and merchants of this rich delta as well as those retired Chinese merchants and millionaires abroad all over the world are very eager to spend their remaining days at home. But owing to the lack of modern conveniences and comforts they reluctantly remain in foreign countries. Thus to build a new city with modern equipments for residential purposes alone, in Canton, would pay splendidly. The land outside of Canton is at present about 200 dollars a mow. If the land marked off for the future city of Canton should be taken up by the State on the same basis as elsewhere in this International Development Scheme, immediately after the streets are laid out and improvements made, the price of land would rise from ten to fifty

times its original value.

吾人既为广州通海水路作计，则可次及改良广州城以为世界商港一事矣。广州港面水界应至第一门洲为止。由此处起，港面应循甘布列治水道（乌涌与大吉沙之间），经长洲、黄埔两岛之间，以入亚美利根水道（深井与仑头之间）。于是凿土华、小洲之间，开一新路，以达于河南岛之南端，复循依里阿水道（沥滘^[5]、下滘之间），以至大尾岛（三山对面）。于是循佛山旧水道，更凿一新水道，直向西南方，与潭洲水道会流。如是，由第一门洲起以达潭洲水道，成一新水路矣，其长当有二十五英里。此水路将为北江之主要出口，又以与西江相通连。一面又作为广州港面，以北江水量全部及西江水量一部，经此水路以注于海。故其水流之强，将必足以刷洗此港面，令有四十英尺以上之深也。（参见第十三图）

新建之广州市，应跨有黄埔与佛山，而界之以车卖炮台及沙面水路。此水以东一段地方，应发展之以为商业地段；其西一段，则以为工厂地段。此工厂一区，又应开小运河以与花地及佛山水道通连，则每一工厂均可得有廉价运送之便利也。在商业地段，应副之以应潮高下之码头，与现代设备及仓库，而筑一堤岸。自第一门洲起，沿新水路北边及河南岛西边，与沙面堤岸联为一起。又另自花地上游起筑一堤岸，沿花地岛东边，至大尾乃转向西南，沿新水路左岸筑之。其现在省城与河南岛中间之水道，所谓省河者，应行填塞。自河南头填起，直至黄埔岛，以供市街之用。从利益问题论之，开发广州以为一世界商港，实为此国际共同发展计划内三大港中最有利润之企业。所以然者，广州占商业中枢之首要地位，又握有利之条件，恰称为中国南方制造中心，更加以此部地方之要求新式住宅地甚大也。此河汉内之殷富商民与华人在外国经商致富暮年退隐者，无不切盼归乡，度其余年；但坐缺乏新式之便宜与享乐之故，彼等不免踌躇，仍留外国。然则建一新市街于广州，加以新式设备，专供住居之用，必能获非常之利矣。广州城附近之地，今日每亩约值二百元，如使划定以为将来广州市用之地，即应用前此所述方法收用之，则划定街道加以改良之后，地价立可升高至原价之十倍至五十倍矣。

The landscape of the environment of Canton is exceptionally beautiful and charming. It is an ideal place for planning a garden city with attractive parks. The location of the city of Canton resembles that of Nanking but is of greater magnitude and beauty. It possesses three natural elements—deep water, high mountains, and vast extent of level land which furnish facilities for an industrial and commercial center and provide as well natural scenery for the enjoyment of man. The beautiful valleys and hills of the northern shore of the Pearl River could be laid out for ideal winter resorts and the high mountain tops could be utilized for summer resorts.

Within the city limits at the northwest corner, a rich coal field has been found. When the coal is mined and modern plants for generating

electricity and producing gas are provided, then cheap electricity and gas could be had for transportation, for manufacturing, for lighting, heating, and cooking purposes. And so the present wasteful methods of transportation, and expensive fuels for manufacturing and cooking for the populous city of Canton can be done away with entirely. Thus great economic wonders could be wrought by such improvements. The present population of Canton is over a million and if our development plan is carried out, this city would grow in leaps and bounds within a very short time. The population will become greater than any other city and the profit of our undertaking will become correspondingly large.

Part II The Improvement of the Waterway System of Canton

The most important waterway system in South China is the Canton system. Besides this the others are not of much importance and will be dealt with elsewhere with their ports. In dealing with the Canton system of waterways, I have to divide it as follows:

a. The Canton Delta.

b. The West River.

广州附近景物，特为美丽动人，若以建一花园都市，加以悦目之林圉，真可谓理想之位置也。广州城之地势，恰似南京，而其伟观与美景，抑又过之。夫自然之原素有三：深水、高山与广大之平地也。此所以利便其为工商业中心，又以供给美景以娱居人也。珠江北岸美丽之陵谷，可以经营之以为理想的避寒地，而高岭之巅，又可利用之以为避暑地也。

在西北隅市街界内，已经发现一丰富之煤矿。若开采之，而加以新式设计，以产出电力及煤气供给市中，则可资其廉价之电力、煤气以为制造、为运输，又使居民得光、得热、得以炊爨也。如是则今日耗费至多之运输，与烦费之用薪炊爨制造，行于此人烟稠密之市中者，可以悉免矣。是此种改良，可得经济上之奇效也。现在广州居民一百万，若行吾计划，则于极短时期之中将见有飞跃之进步，其人口将进至超过一切都市，而吾人企业之利益，亦比例而与之俱增矣。

第二部 改良广州水路系统

中国南部最重要之水路系统，为广州系统。除此以外皆不甚重要，将于论各商埠时附述之。论广州水路系统，吾将分之为下四项：

甲 广州河汊。

乙 西江。

c. The North River.

d. The East River.

a. The Canton Delta

To improve the Canton Delta we have to consider the proposition from three points of view: First, the problem of flood prevention; second, the problem of navigation; and third, the problem of reclamation. Each of these problems affects the others so the solution of one will help that of the others.

First, the problem of flood prevention. The frequent repetition of floods in recent years has wrought great disasters to the people in the neighborhood of Canton. It has destroyed lives by the thousands and property by the millions. The part which suffers most is the country between Canton and Lupao, lying just immediately north of the Canton Delta. This fatal spot is, I think, created by the silting up of the main outlet of the North River immediately below Sainam. On account of this, the North River has to find its outlets through the West River by the short canal at Samshui and through two small streams, one from Sainam, and another from Lupao. The former runs in a northeasterly direction and the latter in a southeasterly direction and they join at Kuanyao. From this point, the river takes a northeasterly course as far as Kumli, thence, turning southeast, passes the west suburb of Canton. Since the North River is silted up below Sainam, its channel above that spot is also getting shallower every year. At present the river above Samshui city is only about four or five feet deep. When the North River rises its water generally finds its way into the West River through the Kongkun Canal. But if the West River should rise at the same time, then there would be no outlet for the North River and its water would accumulate until it overflowed its dikes above and below Lupao. This would naturally cause the dikes to break at some point and allow the water to rush out and flood the whole country that is meant to be protected by these dikes. The

remedy for the North River is to reopen the main outlet below Sainam and have the whole channel dredged deep from Tsingyuen to the sea. Fortunately, in our improvement of the navigation of the Canton Delta, we have to do the same thing; so this one work will serve two purposes.

The remedy for the West River is that the shallow part just at its junction with the sea between Wangkum and Sanchoo Islands should be trained by walls on both sides—a long one on the left, and a short one on the right—so as to concentrate the current to cut the river bed here to a depth of twenty feet or more. In this way, a uniform depth is secured, for after passing the Moto Entrance the West River has an average depth of 20 to 30 feet right along its whole course through this delta. With a uniform depth all the way to the sea, the undercurrent will run quickly and drain off the flood water more rapidly. Besides the deepening process, both shores should be regulated so as to give a uniform width to the channel. Midstream shoals and islands should be removed.

丙 北江。

丁 东江。

甲 广州河汊

吾人论广州河汊之改良，须从三观察点以立议：第一，防止水灾问题；第二，航行问题；第三，填筑新地问题。每一问题皆能加影响于他二者，故解决其一，即亦有裨于其他也。

第一，防止水灾问题。近年水灾频频发生，于广州附近人民实为巨害，其丧失生命以千计，财产以百万计。受害最甚者，为广州与芦包间，其地恰在广州河汊之直北。吾以为此不幸之点，实因西南下游北江正流之淤塞而成。以此之故，北江须经由三水之短河道，以入西江，借为出路；同时又经由两小溪流，一自西南，一自芦包，以得出路。此二溪者，一向东南行，一向东北行，而再合流于官窑。自官窑起，复东北流，至于金利，又折而东南流，经过广州之西关。自北江在西南下游淤塞之后，其淤塞点之上游一段，亦逐年变浅；现在三水县城上游之处，亦仅深四五英尺。当北江水涨之时，常借冈根河（即思贤濠）以泄其水于西江。但若西江同时水涨，则北江之水无从得其出路，惟有停积，至高过芦包上下游之基围^[6]而后已。如是，自然基围有数处被水冲决，水即横流，而基围所护之地域全区均受水灾矣。欲治北江，须重开西南下面之北江正流，而将自清远至海一段，一律浚深。幸而吾人改良广州河汊之航行时，亦正有事于此项浚深，故一举而可两得也。

救治西江，须于其入海处横琴与三灶两岛之间两岸，各筑一堤，左长右短以范之。如是则将水流集中，以割此河床，使成深二十英尺以上之水道；如是则水深之齐一，可得而致。盖自磨刀门以上，通沿广州河

汉之一段，西江平均有二十英尺至三十英尺之深也。如有全段一律之水深，以达于海，则下层水流将愈速，而洪水时泄去其水更速矣。除此浚深之工程以外，两岸务须改归齐整，令全河得一律之河阔；中流之暗礁及沙洲，均应除去。

The East River Valley does not suffer so severely from floods as those of the other two rivers, the West and the North, and its remedy will be provided in the regulation of the river for navigation. This will be dealt with in that connection.

Second, the problem of navigation in the Canton Delta in connection with the three rivers. In dealing with this question we commence with the West River. In former days the traffic between the West River Valley and Canton always passed through Fatshan and Samshui, a distance of about 35 miles. But since the silting up of the Fatshan Channel below Sai- nam, the traffic has to take a great detour by descending the Pearl River southeastward as far as Fumen, then turn northwest into the Shawan Channel, then southeast into the Tamchow Channel, and then west into the Tailiang Channel and south into the Junction Channel and Maning Reach. Here it enters into the West River and runs a northwesterly direction up to Samshui Junction on this river. The whole journey covers a distance of about 95 miles, which compared with the old route is longer by 60 miles. The traffic between Canton and the West River Valley is very great. At present there are many thousands of steam launches plying between Canton City and the outlying districts, and more than half of that number are carrying traffic to and fro on the West River. Every boat has to run 95 miles on each trip whereas if the channel between Samshui and Canton is improved, the distance would be only 35 miles. What a great saving it will be!

In our project to improve the Canton Approach and Harbor, I suggested the draining of a deep channel from the sea to Whampoa and from Whampoa to Tamchow Channel. We now have to prolong this channel from its Tamchow Junction up to Samshui Junction on the West River. This Channel should be made at least 20 feet deep so as to join the deeper water of the West River above the Samshui Junction. And the same depth should be maintained in the North River itself some distance above Samshui, so as to give facility for the navigation of larger vessels up the river when the whole waterway is improved.

东江流域之受水灾，不如西、北二江之深重。则整治此河，以供航行，即可得其救治，留俟该项论之。

第二，航行问题。广州河汉之航行问题，与三江相连，论此问题，须自西江始。往日西江流域与广州间往来载货，常经由三水与佛山，此

路全长三十五英里。但自佛山水道由西南下游起淤塞之后，载货船只须为大迂回：沿珠江而下以至虎门，转向西北以入沙湾水道，又转向东南入于潭洲水道，西入于大良水路，又南入于黄色水道（自合成围至莺歌嘴）及马宁水路，于此始入西江。西北泝江以至三水西北江合流之处，此路全长九十五英里，比之旧路多六十英里。而广州与西江流域之来往船只，其数甚多，现在广州与近县来往之小火轮有数千艘，其中有大半为载货往来西江者。夫使广州、三水间水道得其改良，则今之每船一往复须行九十五英里者，忽减而为三十五英里也，其所益之大，为何如哉！

在吾改良广州通海路及港面之计划，吾曾提议浚一深水道，自海至于黄埔，又由黄埔以至潭洲水道。今吾人更须将此水道延长，自潭洲水道合流点起，以至三水与西江合流之处。此水道至少须有二十英尺水深，以与西江在三水上游深水处相接。而北江自身，亦须保有与此同一之水深，至于三水上游若干里之处，所以便于该河上流既经改良之后大舶之航行也。

1. Shawan Channel 沙湾水道
2. Junction Channel 汇水道
3. Maning Reach 马宁水道
4. Tamchow Channel Junction 潭州水路汇流
5. Tsignai 紫泥
6. Taiiong Channel 大良水道
7. Yellow Reach 黄水道
8. Junction Bend 汇流路
9. Haichow Creek 海洲小河
10. Kuchan Channel 古镇水道
11. Kangkun Canal 恩葵溪 (网根运河)

圖四十第
MAP XIV

指示治水工程建設處及開鑿深處

第十五圖

MAP XV

To improve the East River for navigation in the Canton Delta we should concentrate the current of its estuaries into one single outlet by using the right channel which joins the Pearl River at Davids Island, thus deepening the channel as well as shortening the distance between Canton and the East River districts when the upper part of the river is improved.

Another improvement in the Canton Delta for navigation is the opening of a straight canal between Canton City and Kongmoon so as to shorten the passage of the heavy traffic between this metropolis and the Szeyap districts. This canal should begin by straightening the Chanchun Creek south of Canton as far as Tsznai. Then crossing the Tamchow Channel it should enter into the Shuntuck Creek and follow this creek to its end emerging into the Shuntuck Branch at right angles. From there, a new canal must be cut straight to the turn of the Taiiang Channel near Yungki, then the canal should follow this channel through Yellow Reach as far as the Junction Bend. Here another new canal must be cut through to the Hoichow Creek, then it should follow Kuchan Channel to the main channel of the West River, and crossing it enter into the Kongmoon Branch. Thus, a straight canal can be formed between Canton and Kongmoon. In order to understand the improvement of the Canton Delta more clearly see Maps XIV and XV.

Third, the problem of reclamation. A very profitable undertaking in the Canton Delta is the reclamation of new land. This process has been going on for centuries. Many thousands of acres of new land are thus being added to cultivation from year to year. But hitherto all the reclamation has been effected by private enterprise only, and there are no regulations for it. So sometimes this private enterprise causes great detriment to public welfare such as blocking up navigable channels and causing floods. A glaring case is the reclamation work just above the Moto Islands, which blocks more than half of the Main Channel of the West River. In the regulation of the West River, I propose to cut this new land away. In order to protect the public welfare, the reclamation work in this Delta must be taken up by the State and the profits must go to defray the expenses of improving this waterway system for navigation, as well as for the prevention of floods. At present, the area that can be gradually reclaimed is large in extent. On the left side of the Canton Estuary, the available area is about 40 square miles, and on the right side, about 140 square miles. On the estuaries of the West River from Macao to Tongkwa Island, there is an available area of about 200 square miles. Of the 380 square miles, about one fourth would be ready for reclamation within the next ten years. That is to say about 95 square miles could be reclaimed and put to cultivation within a decade. As one square mile contains 640 acres and one acre six mow, so 95 square miles will be equal to 364,800 mow. As cultivated land in this part of China generally costs more than fifty dollars a mow, so, if fifty dollars be taken as the average rate, the value of these 364,800 mow would amount to \$18,240,000. This will help a great deal to defray the expenses of improving the waterway for navigation and for preventing floods in this Delta.

为广州河汉之航行以改良东江，吾人应将其出口之水流，集中于鹿步墟岛上面之处与珠江合流之最右之一水道。此所以使水道加深，又使异日上流既经改良之日，广州与东江地区路程更短也。

为航行计，广州河汉更须有一改良，即开一直运河于广州与江门之间，此所以使省城与四邑间之运输得一捷径也。此运河应先将陈村小河改直，达天紫泥，于是横过潭洲水道，以入于顺德小河。循此小河，从直角入于顺德支流。由此处须凿新运河一段，直至大良水道近容奇曲处（竹林）。又循此水道，通过黄水道，至汇流路（南沙、小榄之间起莺歌嘴至冈美之对岸）为止。于此处须更凿一段新运河，以通海洲小河，循古镇水道，以达西江正流，横过之以入于江门支流。此即为广州、江门间直达之运河矣。欲更清晰了解广州河汉之改良，可观附图第十四、第十五。

第三，填筑新地问题。在广州河汉，最有利之企业，为填筑新地。此项进行，已兆始于数百年前。于是其所增新地供农作之用者，岁逾百十顷。但前此所有填筑，仅由私人尽力经营，非有矩矱^[7]。于是有时私人经营，有阻塞航路、诱致洪水等等事情，危及公安；如在磨刀岛上游之填筑工事，闭塞西江正流水路过半，其最著者也。论整治西江，吾意须将此新坦削去。为保护公安计，此河汉之填筑工作，必须归之国家。而其利益，则须以偿因航行及防水灾而改良此水路系统之所费。现在可徐徐填筑之地区，面积极广。在广州河口左岸，可用之地有四十英方里，其右岸有一百四十英方里；在西江河口，东起澳门，西至铜鼓洲，可用之地约二百英方里。此三百八十英方里之中，四分之一可于十年之内填筑成为新坦，即十年之内有九十五英方里之地可以填筑，变为耕地也。以一英方里当六百四十英亩，而一英亩当六亩计，九十五英方里将等于三十六万四千八百亩。而中国此方可耕之地，通常不止值五十元一亩，假以平均五十元一亩算，则此三十六万四千八百亩，已值一千八百二十四万元矣。此大有助于偿还此河汉为航行及防水灾所为改良水路之费也。

b. The West River

The West River is at present navigable for comparatively large river steamers up to Wuchow, a distance of 220 miles by water from Canton, and for small steamers up to Nanning, a distance of 500 miles from Canton, at all seasons. As for small crafts, the West River is navigable in most of its branches, west to the Yunnan frontier, north to Kweichow, northeast to Hunan and the Yangtze Valley by the Shingan Canal.

In improving the West River for navigation I shall divide the work into subsections as follows:

(1) From Samshui to Wuchow.

(2) From Wuchow to the junction of the Liukiang.

(3) Kweikiang or the North Branch of the West River from Wuchow to Kweilin and beyond.

(4) The South Branch from Shunchow to Nanning.

(1) From Samshui to Wuchow. This part of the West River is generally deep and does not need much improvement for vessels up to ten-foot draught excepting at a few points. The midstream rocks should be blasted and removed and sand banks and dilating parts should be regulated by submerged dikes to secure a uniform channel and to make the velocity of the current even, so that a stable fairway could be maintained all the year round. The traffic of this river would be sufficiently great to pay for all the improvements which we propose to make.

(2) From Wuchow to the Junction of the Liukiang. At this junction, a river port should be built to connect the deep navigation from the sea and the shallow navigation of Hungshui Kiang and the Liukiang which penetrate the rich mineral districts of Northwest Kwangsi and Southwest Kweichow. This port will be about fifty miles from Shunchow which is the junction of the Nanning branch of the river. So here we have only to improve a distance of fifty miles, for the improvement of the river between Shunchow and Wuchow will be included in the plan for the Nanning Port. Dams and locks would be necessary to make this part of the river navigable for ten-foot draught vessels. But these dams at the same time would serve the purpose of producing water power.

乙 西江

现在西江之航行，较大之航河汽船可至距广州二百二十英里之梧州，而较小之汽船则可达距广州五百里之南宁，无间冬夏。至于小船，则可通航于各支流，西至云南边界，北至贵州边界，东北则以兴安运河通于湖南以及长江流域。

为航行计改良西江，吾将以其工程细分为四：

一、自三水至梧州。

二、自梧州至柳江口。

三、桂江（即西江之北支）由梧州起，溯流至桂林以上。

四、南支自浔州至南宁。

一、自三水至梧州。西江此段，水道常深，除三数处外，为吃水十英尺以下之船航行计，不须多加改良。其中流岩石须行爆去，其沙质之岸及泛滥之部分应以水底堤范之，使水深一律，而流速亦随之。于是有一确实航路，终年保持不替矣。西江所运货载之多，固尽足以偿还吾今

所提议改良之一切费用也。

二、自梧州至柳江口。在柳江口应建一商埠，以联红水江及柳江之浅水航运，与通海之航运。此两江实渗入广西之西北部与贵州之东南部丰富之矿产地区者也。此商埠应设于离浔州五十英里之处，浔州即此江与南宁一支合流处也。是故在此项改良，所须着力之处只有五十英里，因梧州至浔州一段，为南宁商埠计划所包括也。为使吃水十英尺以上之船可以航行，必须筑堰，且设水闸于此一部分。而此所设之堰，又同时可借以发生水电也。

(3) Kweikiang or the North Branch of the West River from Wuchow to Kweilin and beyond. As Kweikiang is smaller, shallower and has more rapids along its course, so its improvement will be more difficult than that of the other parts of the waterway. But this will be a very profitable proposition in this Southern waterway project, for this river not only serves the purpose of transportation in this rich territory but will also serve as a passage for through traffic between the Yangtze and the West River valleys. The improvement should commence from the junction at Wuchow up to Kweilin, and thence upward to the Shingan Canal, then downward to the Siang River, and thereby connecting with the Yangtze River. A series of dams and locks should be built for vessels to ascend to the inter-watershed canal and another series should descend on the other side. The expenses of building these two series of dams and locks could not be estimated until accurate surveys are made. But I am sure this project will be a paying one.

(4) From Shunchow to Nanning. This portion of the Yuhkiang is navigable for small steamers up to Nanning, the center of commerce in South Kwangsi. From Nanning small crafts can navigate through the Yuhkiang as far as the east border of Yunnan, and through Tsokiang as far as the north border of Tongking. If this waterway be improved up to Nanning, then it would be the nearest deep river port for the rich mineral districts of the whole southwest corner of China, which includes the whole province of Yunnan, a greater part of Kweichow and half of Kwangsi. The immediate neighborhood of Nanning is also very rich in minerals, such as antimony, tin, iron, coal and also in agricultural products. So to make Nanning the head of a deep water communication system will be a paying proposition. To improve the waterway up to Nanning, a few dams and locks along its course will have to be built for vessels of ten-foot draught to go up as well as for water power. The expense for this work cannot be estimated without detailed surveys but it would probably be much less than the improvement of Kweikiang from Wuchow to the Shingan Canal.

三、桂江（即西江之北支）由梧州起溯流至桂林以上。桂江较小较

浅，而沿江水流又较速，故其改良，比之其他水路更觉困难。然而，此实南方水路规划中，极有利益之案。因此江不特足供此富饶地区运输之目的而已也，又以供扬子江流域与西江流域载货来往孔道^[8]之用。此项改良，应自梧州分歧点起，以迄桂林，由此再溯流至兴安运河，顺流至湘江，因之以达长江。于此当建多数之堰及水闸，使船得升至分水界之运河；他方又须建多数之堰闸，以便其降下。此建堰闸所须之费，非经详细调查，不能为预算也。然而吾有所确信者，则此计划为不亏本之计划也。

四、由浔州至南宁。此右江一部分，上至南宁，可通小轮船。南宁者，广西南部之商业中心也。自南宁起，由右江用小船可通至云南东界，由左江可通至越南东京之北界。如使改良水道，以迄南宁，则南宁将为中国西南隅——云南全省、贵州大半省、广西半省——矿产丰富之全地区之最近深水商埠矣。南宁之直接附近又多产锑、锡、煤、铁等矿物，而同时亦富于农产。则经营南宁，以为深水交通系统之顶点，必不失为有利之计划也。改良迄南宁之水道，沿河稍须设堰及水闸，使吃水十英尺之船可以通航，并资之以生电力。此项工程所费，亦非经详细测量不能预算，但比之改良自梧州至兴安运河一节桂江所费，当必大减矣。

c. The North River

The North River from Samshui to Shiuchow is about 140 miles long. The greater part of its course is confined in the hilly districts, but after it emerges from the Tsingyuen Gorge it comes into a wide, open country, which connects with the plain of Canton. Here the dangerous floods occur most often. Since the silting up of its proper outlet below Sainam, the North River from that point up to the gorge has become shallower every year, so the dikes at the left side, that is, on the side of the plain, often break thus causing the inundation of the whole plain above Canton. Thus the regulation of the river at this part has two aspects to be considered: First, the prevention of floods and second, the improvement for navigation. In dealing with the first aspect nothing could be better than deepening the river by dredging. In the improvement of the Canton Approach and Harbor and also of the Canton Delta, we have to cut a deep channel right from the deep sea up to Sainam. In the improvement of the lower part of the North River, we have simply to continue the cutting process higher up until we have a deep channel, say 15 to 20 feet as far as the Tsingyuen Gorge, either by artificial or natural means. By this deepening of the bottom of the river, the present height of the dikes will be quite enough to protect the plains from being flooded.

In dealing with the second aspect, as we have already deepened the part of the river from Sainam to the Tsingyuen Gorge for flood

prevention, we have at the same time solved the navigation question. It has now only the upper part to be dealt with. I propose to make this river navigable up to Shiuchow, the center of commerce as well as the center of the coal and iron fields of Northern Kwangtung. To improve the part above the gorge for navigation, dams and locks should be built in one or two places before a ten-foot draught vessel can ascend up to that point. Although this river is parallel with the Hankow-Canton Railway, yet if the coal and iron fields of Shiuchow are properly developed, a deep waterway will still be needed for cheap transportation of such heavy freight as iron and coal to the coast. So to build dams for water power and to construct locks for navigation in this river will be a profitable undertaking as well as a necessary condition for the development of this part of the country.

d. The East River

The East River is navigable for shallow crafts up to Laolung Sze, a distance of about 170 miles from the estuary at the lower point of Davids Island near Whampoa. Along its upper course, rich iron and coal deposits are found. Iron has been mined here since time immemorial. At present most of the utensils used in this province are manufactured from the iron mined. So to make a deep navigable waterway up to these iron and coal fields will be most remunerative.

丙 北江

北江自三水至韶州，约长一百四十英里，全河中有大部分为山地所夹。但自出清远峡以后，河流入于广谿之区，其地与广州平原相联，此处危险之水灾常见。自西南下游水道淤塞之后，自峡至西南一段河身逐年变浅，左岸靠平原之基围时时崩决，致广州以上之平原大受水灾。所以整治一部分河流，有二事须加考察：第一，防止洪水；第二，航运改良。关于第一事，无有逾于浚深河身一法者。在改良广州通海路及港面并广州河汊时，吾人应开一深水水路，从深海起，直达西南。在改良北江下段时，吾人只须将此工程加长，溯流直至清远峡，拟使有水深自十五英尺至二十英尺之深水道。其浚此水道，或用人工，或兼用自然之力。既已浚深此河底矣，则即以今日基围之高言，亦足以防卫此平原不使其遭水患矣。

论及此第二事，则既为防止水灾，将西南至清远峡一节之北江浚深，即航行问题同时解决矣。然则今所须商及者，只此上段一部而已。吾欲提议将此北江韶州以下一段改良，令可航行。韶州者，广东省北部之商业中心也，又其煤铁矿之中心也。欲改良此峡上一部令可航行，则须先建堰与水闸于一二处，然后十英尺吃水之船可以航行无碍，直至韶州。虽此江与粤汉铁路平行，然而若此地矿山得有相当开发之后，此等煤铁重货仍须有廉值之运输以达之于海，即此水路为不可缺矣。然则于

此河中设堰以生水电，设水闸以利航行，固不失为一有利之企业也，况又为发展此一部分地方之必要条件也。

丁 东江

东江以浅水船航行可达于老龙市，此地离黄埔附近鹿步墟岛东江总出口处约一百七十英里。沿此江上段，所在皆有煤铁矿田。铁矿之开采于此地也，实在于久远之往昔，记忆所不及之年代。在今日全省所用各种铁器之中，实有一大部分，为用此地所出之铁制造之者。是故浚一可航行之深水道，直上至于煤铁矿区中心者，必非无利之业也。

To improve the East River for navigation as well as for flood prevention, I propose to start the work at the lower point of Davids Island as stated in the improvement of the Canton Approach. From here, a deep channel should be dredged up to Suntang, and a mile above that point a new channel should be opened in the direction of Tungkun city, by connecting the various arms of water between these two places and joining the left branch of the East River immediately above Tungkun city. All other channels leading from this new channel to the Pearl River should be closed up to normal water level so as to make these closed-up channels serve as flood outlets in rainy seasons. Thus by blocking up the rest of the estuaries of the East River, all the water would form one strong current which would dredge the river bottom deeper, and maintain the depth permanently. The body of the river should be trained to a uniform width right along its course up to tidal point, and above this point, the river should be narrowed in proportion to its volume of water. Thus the whole river would dredge itself deep far up above Waichow city. The railway bridge at the south side of Shelung should be made a turning bridge so as to permit large steamers to pass through it. Some sharp turns of the river should be reduced to gentle curves and midstream obstacles should be removed. The portion of the river above Waichow should be provided with dams and locks so as to enable ten-foot draught vessels to ascend as near as possible to the iron and coal fields in the valley.

Part III The Construction of the Southwestern Railway System of China

The southwestern part of China comprises Szechwan, the largest and richest province of China Proper, Yunnan, the second largest province, Kwangsi and Kweichow which are rich in mineral resources, and a part of Hunan and Kwangtung. It has an area of 600,000 square miles, and a population of over 100,000,000. This large and populous part of China is almost untouched by railways, except a French line of narrow gauge from Laokay to Yunnanfu, covering a distance of 290 miles.

改良此东江，一面以防止其水害，一面又便利其航行。吾意欲从鹿步墟岛下游之处着手，于前论广州通海路已述之矣。由此点起，须浚一深水道，上至新塘。自新塘上游约一英里之处，应凿一新水道直达东莞城，而以此悉联东江左边在东莞与新塘间之各支流为一。以此新水道为界，所有自此新水道左岸以迄珠江，中间上述各支流之旧路，悉行闭塞。其闭塞处之高，须约与通常水平相同，而以此已涸之河身，供异日雨期洪水宣流之用。如是，东江之他出口已被一律封闭，则所有之水将汇成强力之水流，此水流即能浚河身使加深，又使全河水深能保其恒久不变也。河身须沿流加以改削，令有一律之河幅，上至潮水能达之处；自此处起，则应按河流之量多寡，以定河身之广狭。如是，则东江将以其自力浚深惠州城以下一段矣。石龙镇南边之铁路桥，应改建为开合铁桥，使大轮船可以往来于其间。东江有急激转弯数处，应改以为缓徐曲线，并将中流沙洲除去。惠州以上一部江流，应加堰与水闸，令吃水十英尺之船，可以上溯至极近于此东江流域煤铁矿田而后已。

第三部 建设中国西南铁路系统

中国西南一部，所包含者：四川，中国本部最大且最富之省分也；云南，次大之省也；广西、贵州，皆矿产最丰之地也；而又有广东、湖南两省之一部。此区面积有六十万英方里，人口过一万万，除由老街至云南府约二百九十英里法国所经营之窄轨铁路外，中国广地众民之此一部，殆全不与铁路相接触也。

There are great possibilities for railway development in this part of the country. A network of lines should radiate fan-like from Canton as pivot to connect every important city and rich mineral field with the Great Southern Port. The construction of railways in this part of China is not only needed for the development of Canton but also is essential for the prosperity of all the southwestern provinces. With the construction of railways rich mines of various kinds could be developed and cities and towns could be built along the lines. Developed lands are still very cheap and undeveloped lands and those with mining possibilities cost almost next to nothing even though not state owned. So if all the future city sites and mining lands be taken up by the government before railway construction is started, the profit would be enormous. Thus no matter how large a sum is invested in railway construction, the payment of its interest and principal will be assured. Besides, the development of Canton as a world port is entirely dependent upon this system of railways. If there be no such network of railway traversing the length and breadth of the southwestern section of China, Canton could not be developed up to our expectations.

The southwestern section of China is very mountainous, except the Canton and Chengtu plains, which have an area of from 3,000 to 4,000 square miles each. The rest of the country is made up almost entirely of hills and valleys with more or less open space here and there. The mountains in the eastern part of this section are seldom over 3,000 feet high but those near the Tibetan frontier generally have an altitude of 10,000 feet or more. The engineering difficulties in building these railways are much greater than those of the northwestern plain. Many tunnels and loops will have to be constructed and so the construction costs of the railway per mile will be greater than in other parts of China.

With Canton as the terminus of this system of railroads, I propose that the following lines be constructed:

- a. The Canton-Chungking line via Hunan.
- b. The Canton-Chungking line via Hunan and Kweichow.
- c. The Canton-Chengtou line via Kweilin and Luchow.
- d. The Canton-Chengtou line via Wuchow and Suifu.
- e. The Canton-Yunnanfu-Tali-Tengyueh line ending at the Burma border.
- f. The Canton-Szema line.
- g. The Canton-Yamchow line ending at Tunghing, on the Annam border.

于此一地区，大有开发铁路之机会。应由广州起，向各重要城市、矿产地引铁路线，成为扇形之铁路网，使各与南方大港相联结。在中国此部建设铁路者，非特为发展广州所必要，抑亦于西南各省全部之繁荣为最有用者也。以建设此项铁路之故，种种丰富之矿产可以开发，而城镇亦可于沿途建之。其既开之地，价尚甚廉，至于未开地及含有矿产之区，虽非现归国有，其价之贱，去不费一钱可得者亦仅一间耳。所以若将来市街用地及矿产地，预由政府收用，然后开始建筑铁路，则其获利必极丰厚。然则不论建筑铁路投资多至若干，可保其偿还本息，必充足有余矣。又况开发广州以为世界大港，亦全赖此铁路系统，如使缺此纵横联属西南广袤之一部之铁路网，则广州亦不能有如吾人所预期之发达矣。

西南地方，除广州及成都两平原地各有三四千英方里之面积外，地皆险峻。此诸地者，非山即谷，其间处处留有多少之隙地。在此区东部，山岳之高，鲜逾三千英尺；至其西部与西藏交界之处，平均高至一万英尺以上。故建此诸铁路之工程上困难，比之西北平原铁路系统，乃至数倍。多数之隧道与凿山路，须行开凿，故建筑之费，此诸路当为中国各路之冠。

吾提议以广州为此铁路系统终点，以建下列之七路：

甲 广州重庆线，经由湖南。

乙 广州重庆线，经由湖南、贵州。

丙 广州成都线，经由桂林、泸州。

丁 广州成都线，经由梧州、叙府。

戊 广州云南大理腾越线，至缅甸边界为止。

己 广州思茅线。

庚 广州钦州线，至安南界东兴为止。

a. The Canton-Chungking Line via Hunan

This line will start from Canton and follow the same direction as the Canton-Hankow line as far as the junction of the Linkiang with the North River. From that point the railroad turns into the valley of Linkiang, and follows the course of the river upward above the city of Linchow. There it crosses the watershed between the Linkiang and the Taokiang and proceeds to Taochow, Hunan. Thence it follows the Taokiang to Yungchow, Paoking, Sinhwa, and Shenchow, and up to Peiho across the boundary of Hunan into Szechwan by Yuyang. From Yuyang the line proceeds across the mountain to Nanchuen, thence to Chungking after crossing the Yangtze. This railway which has a total length of about 900 miles passes through a rich mineral and agricultural country. In the Linchow district north of Kwangtung, rich coal, antimony, and wolfram deposits are found; in southwestern Hunan, tin, antimony, coal, iron, copper and silver; and at Yuyang, east of Szechwan, antimony and quicksilver. Among agricultural products found along this line we may mention sugar, groundnuts, hemp, tung oil, tea, cotton, tobacco, silk, grains, etc. There is also an abundance of timber, bamboo and various kinds of forest products.

b. The Canton-Chungking Line via Hunan and Kweichow

This line is about 800 miles in length, but as it runs in the same track with line (a) from Canton to Taochow, a distance of about 250 miles, it leaves only 550 miles to be accounted for. This line, therefore, actually begins at Taochow, Hunan, and goes through the northeastern corner of Kwangsi passing by Chuanchow, and then through the southwestern corner of Hunan passing by Chengpu and Tsingchow. Thence it enters into Kweichow by Sankiang and Tsingkiang and crosses a range of hill to Chengyuan. From Chengyuan this line has to cross the watershed between Yuan Kiang and Wukiang to Tsunyi. From Tsunyi it will follow the trade route which leads to Kikiang and then crosses the Yangtze by the same bridge as line (a) to Chungking. This railway will also pass through rich mineral and timber districts.

c. The Canton-Chengtui Line via Kweilin and Luchow

This line is about 1,000 miles long. It runs from Canton directly west to Samshui, where it crosses the North River to the mouth of Suikong. Then, it ascends the valley of the same name to Szewui and Kwongning. Next, it enters into Kwangsi at Waisap, thence to Hohsien and Pinglo. From there it follows the course of the Kweikiang up to Kweilin. Thus the rich iron and coal fields that lie between these two

provincial capitals, Canton and Kweilin, will be tapped. From Kweilin the road turns west to Yungning and then proceeds to follow the Liukiang valley into Kweichow province at Kuchow. From Kuchow it goes to Tukiang and Pachai and following the same valley it crosses a range of hills into Pingyueh, thence it goes across the Yuankiang watershed into the Wukiang valley at Wengan and Yosejen. From Yosejen it follows the trade route through Luipien hills to Jenhwai, Chishui, and Nachi. Then it crosses the Yangtzekiang to Luchow. From Luchow, it runs through Lungchang, Neikiang, Tzechow, Tseyang and Kienchow to Chengtu. The last part of the line traverses very rich and populous districts of the famous Red Basin of Szechwan province. The middle portion of this line between Kweilin and Luchow lies in a very rich mineral country which possesses great possibilities for further development. This line will open up a thinly populated part for the crowded districts at both ends of the line.

甲 广州重庆线经由湖南

此线应由广州出发，与粤汉线同方向，直至连江与北江会流之处。自此点起，本路折向连江流域，循连江岸上至连州以上，于此横过连江与道江之分水界，进至湖南之道州。于是隧道江以至永州、宝庆、新化、辰州，溯西水过川、湘之界入于酉阳，由酉阳横过山脉而至南川，从南川渡扬子江而至重庆。此路全长有九百英里，经过富饶之矿区与农区。在广东之北连州之地，已发见丰富之煤矿、铁矿、锑矿、钨矿；于湖南之西南隅，则有锡、锑、煤、铁、铜、银；于四川之酉阳，则有锑与水银。其在沿线之农产物，则吾可举砂糖、花生、大麻、桐油、茶叶、棉花、烟叶、生丝、谷物等等；又复多有竹材、木材及其他一切森林产物。

乙 广州重庆线经由湖南、贵州

此线约长八百英里，但自广州至道州一段即走于甲线之上，凡二百五十英里，故只有五百五十英里计入此线。所以实际从湖南道州起筑，横过广西省东北突出一段，于全州再入湖南西南境，过城步及靖州。于是入贵州界，经三江及清江两地，横过山脉，以至镇远。此线由镇远须横过沅江、乌江之分水界，以至遵义；由遵义则循商人通路，直至綦江，以达重庆。此铁路所经，皆为产出木材、矿物极富之区域。

丙 广州成都线经由桂林、泸州

此线长约一千英里。由广东西行，直至三水在此处之绥江口地点，渡过北江。循绥江流域，经过四会、广宁，次于怀集入广西。经过贺县及平乐，由此处循桂江水流，上达桂林。于是广东、广西两省省城之间，各煤铁矿田可得而开凿矣。自桂林起，路转而西，至于永宁，又循柳江流域，上至贵州边界。越界至古州，由古州过都江及八寨，仍循此

河谷而上，逾一段连山至平越。由平越横渡沅江分水界，于瓮安及岳四城，入乌江流域。自岳四城循商人通路逾雷边山至仁怀、赤水、纳溪。于是渡扬子江，以至泸州。自泸州起，经过隆昌、内江、资州、资阳、简州，以达成都。此路最后之一段，横过所谓“四川省之红盆地”，有名富庶之区也。其在桂林、泸州之间，此路中段则富于矿产，为将来开发希望最大者。此路将为其两端人口最密之区，开一土旷人稀之域，以收容之者也。

d. The Canton-Chengtú Line via Wuchow and Suifu

This line is about 1,200 miles in distance. It commences at the west end of the Samshui bridge which crosses the North River at that point for line (c), and following the left bank of the West River enters the Shihing Gorge to the Shihing city. It passes Takhing, Wuchow, and Tahwang along the same bank. While the river here turns southwestwards the line turns northwestwards to Siangchow and then crosses Liukiang to Liuchow and Kingyuan. Then it goes to Szegenhsien and across the Kwangsi and Kweichow border to Tushan and Tuyun. From Tuyun the line turns more westerly to Kweiyang, the capital of Kweichow Province. Next, it proceeds to Kiensi and Tating and then leaving the Kweichow border at Pichieh it enters Yunnan at Chenhiung. Turning northward to Lohsintu and crossing the Szechwan border at that point, it proceeds to Suifu. From Suifu the road follows the course of the Minkiang, passes by Kiating and enters the Chengtú plain to Chengtú, the capital of Szechwan. This line runs from one densely populated district to another and passes through a wide strip of thinly populated and undeveloped country in the middle. Along its course many rich iron and coal fields, silver, tin, antimony, and other valuable metal deposits are found.

e. The Canton-Yunnanfu-Tali-Tengyueh Line

This line is about 1,300 miles in length from Canton to the Burma border at Tengyueh. The first 300 miles of the line from Canton to Tahwang will be the same as line (d). From the Tahwang junction this line branches off to Wusuan and following in a general way the course of the Hungshui Kiang passes through Tsienkiang and Tunglan. Then it cuts across the southwestern corner of Kweichow province passing by Sinyih sien and thence enters Yunnan province at Loping and by way of Luliang to Yunnanfu, the capital of the province. From Yunnanfu this line runs through Tsuyung to Tali, then turns southwestwards to Yungchang and Tengyueh ending at the Burma border.

丁 广州成都线经由梧州与叙府

此线长约一千二百英里。自丙线渡北江之三水铁路桥之西端起，循西江之左岸，以入于肇庆峡，至肇庆城。即循此岸，上至德庆、梧州、大湟。在大湟，河身转而走西南，路转而走西北，至象州，渡柳江，至柳州及庆远。于是进至思恩，过桂、黔边界，入贵州，至独山及都匀。自都匀起，此路再折偏西走，至贵州省城之贵阳，次进至黔西及大定。离贵州界于毕节，于镇雄入云南界。北转而至乐新渡，过四川界，入叙府。自叙府起，循岷江而上，至嘉定，渡江，入于成都平原，以至成都。此路起自富庶之区域，迄于富庶之区域，中间经过宽幅之旷土未经开发、人口极稀之地。沿线富有煤、铁矿田，又有银、锡、锑等等贵金属矿。

戊 广州云南大理腾越线

此线长约一千三百英里。起自广州，迄于云南、缅甸边界之腾越。其首段三百英里，自广州至大湟，与丁线相同。自大湟江口分支至武宣，循红水江常道，经迁江及东兰。于是经兴义县，横过贵州省之西南隅入云南省，至罗平，从陆凉一路以至云南省城。自省城经过楚雄，以至大理。于是折而西南，至永昌，遂至腾越，终于缅甸边界。

At Tunlgan, near the Kweichow border in Kwangsi, a branch line of about 400 miles should be projected. This line should follow the Pepan Kiang valley, up to Kotuho, and Weining. Thence it enters Yunnan at Chaotung, and crosses the Yangtze River at Hokeow, where it enters Szechwan. Crossing the Taliang mountain, it goes to Ningyuan. This branch line taps the famous copper field between Chaotung and Ning-yuan, the richest of its kind in China.

The main line running through the length of Kwangsi and Yunnan from east to west, will be of international importance, for at the frontier it will join the Rangoon Bhamo line of the Burmese Railway System. It will be the shortest road from India to China. It will bring the two populous countries nearer to each other than now. By the new way the journey can be made in a few days, whereas by the present sea-route it takes as many weeks.

f. The Canton-Szema Line

This line to the border of Burma is about 1,100 miles long. It starts from south of Canton, passes Fatshan, Kunshan, and crosses the West River from Taipinghü to Samchowhü. Thence it proceeds to Koming, Sinhing, and Loting. After passing Loting it crosses the Kwangsi border at Pingho, and proceeds to Junghsien and then westward, crossing the Yukiang branch of the West River, to Kweihsien. Thence it runs north of Yukiang to Nanning. At Nanning a branch line of 120 miles should be projected. Following the course of the Tsokiang it goes to Lungchow where it turns southward to

Chennankwan on the Tongking border to join the French line at that point. The main line from Nanning proceeds in the same course as the upper Yukiang to Poseh. Then it crosses the border into Yunnan at Poyai, and by way of Pamen, Koukan, Tungtu and Putsitang to Amichow, where it crosses the French Laokay-Yunnan line. From Amichow it proceeds to Linanfu, Shihping and Yuankiang where it crosses the river of the same name. Thence it passes through Talang, Puerhfu and Szemao and finally ends at the border of Burma near the Mekong River. This line taps the rich tin, silver, and antimony deposits of south Yunnan and Kwangsi, while rich iron and coal fields are found right along the whole line. Gold, copper, mercury, and lead are also found in many places. As regards agricultural products, rice and groundnuts are found in great abundance, also camphor, cassia, sugar, tobacco, and various kinds of fruits.

在广西之东兰，近贵州边界处，此路应引一支线，约长四百英里。此线应循北盘江流域，上至可渡河与威宁，于昭通入云南，在河口过扬子江。即于此处入四川，横截大凉山，至于宁远。此路所以开昭通、宁远间有名铜矿地之障碍，此项铜矿为中国全国最丰之矿区也。

此路本线，自东至西，贯通桂、滇两省，将来在国际上必见重要。因在此线缅甸界上，当与缅甸铁路系统之仰光、八莫一线相接，将来此即自印度至中国最捷之路也。以此路故，此两人口稠密之大邦，必比现在更为接近。今日由海路，此两地交通须数礼拜者，异时由此新路，则数日而足矣。

己 广州思茅线

此线至缅甸界止，约长一千一百英里。起自广州市西南隅，经佛山、官山，由太平墟渡过西江，至对岸之三洲墟。于是进入高明、新兴、罗定。既守罗定，入广西界，至平河，进至容县。于是西向，渡左江，至于贵县，即循左江之北岸以达南宁。在南宁应设一支线，约长一百二十英里，循上左江水路以至龙州，折而南，至镇南关、安南东京界上止，与法国铁路相接。其本线，由南宁循上右江而上，至于百色。于是过省界入云南，到剥隘，经巴门、高甘、东都、普子塘一路，至阿迷州，截老街、云南铁路而过。由阿迷州进至临安府、石屏、元江。于是渡过元江，通过他郎、普洱及思茅，至缅甸边界近澜沧江处为止。此线穿入云南、广西之南部锡、银、锑三种矿产最富之地，同时沿线又有煤铁矿田至多，复有多地产出金、铜、水银、铅。论其农产，则米与花生均极丰饶，加以樟脑、桂油、蔗糖、烟叶，各种果类。

g. The Canton-Yamchow Line

This line is about 400 miles long measuring from the west end of the Sikiang bridge. Starting from Canton it runs on the tracks of line (f) as far as the farther side of the bridge over the West River. Thence

it branches off to the southwest to Hoiping and Yanping, and by way of Yeungchun to Kochow and Fachow. At Fachow, a branch line of 100 miles should be projected to Suikai, Luichow and Haian on the Hainan Straits where, by means of a ferry, it connects with Hainan Island. The mainline continues from Fachow westward to Sheshing, Limchow, Yamchow and ends on the Annam border at Tunghing, where it may connect with a French line to Haiphong. This line is entirely within the Kwangtung province. It passes through a very populous and productive country. Coal and iron are found along the whole line, while gold and antimony, in some parts. Agricultural products, as sugar, silk, camphor, ramie, indigo, groundnuts, and various kinds of fruits are raised here.

The total length of this system as outlined above is about 6,700 miles. In addition there will be two connecting lines between Chengtu and Chungking; another from east of Tsunyi on line (b) southward to Wengan on line (c); another from Pingyueh on line (c) to Tuyun on line (d); another from the border of Kweichow on line (d) through Nantan and Noti to Tunglan on line (e), thence through Szecheng to Poseh on line (f). These connecting lines total about 600 miles. So the grand total will be about 7,300 miles.

This system will be intersected by three lines. First, the existing French line from Laokay to Yunnanfu with a projected line from Yunnanfu to Chungking crosses line (f) at Amichow, line (e) at Weining, line (d) at Suifu, line (c) at Luchow, and meets lines (a) and (b) at Chungking. Second, the projected British line from Shasi to Sinyi crosses line (a) at Shenchow, line (b) at Chenyuen, line (c) at Pingyueh, line (d) at Kweiyang and a branch of line (e) at a point west of Yungning. Third, the projected American line from Chuchow to Yamchow crosses line (a) at Yungchow, line (b) at Chuanchow, line (c) at Kweilin, line (d) at Liuchow, line (e) at Tsienkiang, line (f) at Nanning, and meets line (g) at Yamchow. Thus, if this system and the three projected French, British, and American lines are completed, Southwestern China would be well provided with railway communications.

庚 广州钦州线

此线从西江铁路桥西首起算，约长四百英里。自广州起，西行至于太平墟之西江铁路，与己线同轨。过江始分支，向开平、恩平，经阳春，至高州及化州。于化州须引一支线，至遂溪、雷州，达于琼州海峡之海安，约长一百英里。于海安再以渡船与琼州岛^[9]联络。其本线，仍自化州西行，过石城、廉州、钦州，达于与安南交界之东兴为止。东兴对面芒街至海防之间，将来有法国铁路可与相接。此线全在广东省范围

之内，经过人口多、物产富之区域，线路两旁皆有煤铁矿，有数处产金及锑，农产则有蔗糖、生丝、樟脑、苧麻、靛青、花生及种种果类。

此系统内各线，如上所述，约六千七百英里。此外须加以联络成都、重庆之两线。又须另设一线，起自乙线遵义之东，向南行至瓮安，与丙线接；又一线自丙线之平越起，至丁线之都匀；又一线由丁线贵州界上一点，经南丹、那地，以至戊线之东兰，再经泗城，以至己线之百色。此联络各线，全长约六百英里。故总计应有七千三百英里。

此系统将于下文所举三线经济上大有关系：一、法国经营之老街、云南府已成线，及云南府、重庆计划线。此线与己线交于阿迷州，与戊线交于威宁，与丁线交于叙府，与丙线交于泸州，而与甲乙两线会于重庆。二、英国经营之沙市、兴义计划线。此线与甲线交于辰州，与乙线交于镇远，与丙线交于平越，与丁线交于贵阳，而于戊线之支线交于永定西方之一点。三、美国经营之株洲、钦州计划线。此线与甲线交于永州，乙线交于全州，丙线交于桂林，丁线交于柳州，戊线交于迁江，己线交于南宁，而与庚线会于钦州。所以此法、英、美三线，与本系统各线，一律完成之后，中国西南各省之铁道交通可无缺少矣。

All these lines will run through the length and breadth of a vast mineral country, in which most of the essential and valuable metals of the world are found. There is no place in the world which possesses as here so many varieties of rare metals, such as wolfram, tin, antimony, silver, gold, and platinum and at the same time so richly provided with the common but essential metals, such as copper, lead, and iron. Furthermore, almost every district in this region is abundantly provided with coal, so much so that there is a common saying: "Mu mei pu lih cheng," that is, "Nobody would build a city where there is no coal underneath." The idea was that in case of a siege those within the city might obtain fuel from under the ground. In Szechwan, petroleum and natural gas are also found in abundance.

Thus, we see that this Southwestern Railway System for the development of mineral resources in the mountainous regions of Southwestern China is just as important as the Northwestern Railway System is for the development of agricultural resources in the vast prairies of Mongolia and Turkestan. These railway systems are a necessity to the Chinese people and a very profitable undertaking to foreign capitalists. They are of about equal length, viz.—about 7,000 miles. The cost per mile of the Southwestern System will be at least twice that of the Northwestern System, but the remuneration from the development of mineral resources will be many times that from the development of agricultural resources.

Part IV The Construction of Coast Ports and Fishing Harbors

After planning the three world ports on the coast of China, it is time for me to go on and deal with the development of second- and third-class seaports and fishing harbors along the whole coast in order to complete a system of seaports for China. Recently, my projected plan of the Great Northern Port was so enthusiastically received by the people of Chihli Province that the Provincial Assembly has approved the project and decided to carry it out at once as a provincial undertaking. For this object, a loan of \$40,000,000 has been voted. This is an encouraging sign and doubtless the other projects will be taken up sooner or later by either the provinces or the Central Government, when the people begin to realize their necessity. I propose that four second-class seaports and nine third-class seaports and numerous fishing harbors should be constructed.

此诸线皆经过广大且长之矿产地，其地有世界上有用且高价之多种金属。世界中无有如此地含有丰富之稀有金属者，如钨、如锡、如锑、如银、如金、如白金等等；同时又有虽甚普通而尤有用之金属，如铜、如铁、如铅。抑且每一区之中，均有丰裕之煤。南方俗语有云：“无煤不立城。”盖谓预计城被围时，能于地中取炭，不事薪采，此可见其随在有煤产出也。四川省又有石油矿及自然煤气（火井），极为丰裕。

是故吾人得知，以西南铁路系统开发西南山地之矿产利源，正与以西北铁路系统开发蒙古、新疆大平原之农产利源，同其重要。此两铁路系统，于中国人民为最必要，而于外国投资者又为最有利之事业也。论两系统之长短，大略相同，约七千英里。此西南系统，每英里所费平均须在彼系统两部以上，但以其开发矿产利源之利益言，又视开发农产利源之利益更多数倍也。

第四部 建设沿海商埠及渔业港

既于中国海岸为此三世界大港之计划，今则已至进而说及发展二三等海港及渔业港于沿中国全海岸，以完成中国之海港系统之机会矣。近日以吾北方大港计划为直隶省人民所热心容纳，于是省议会赞同此计划，而决定作为省营事业立即举办，以此目的，经已票决募债四千万。此为一种猛进之征兆。而其他规划，亦必或早或晚，或由省营，或由国营，随于民心感其必要，次第采用。吾意则须建四个二等海港、九个三等海港及十五个渔业港。

The four second-class seaports will be arranged so as to be placed in the following manner: one on the extreme north, one on the extreme south, and the other two midway between the three great world ports.

I shall deal with them according to the order of their future importance as follows:

- a. Yingkow.
- b. Haichow.
- c. Foochow.
- d. Yamchow.

a. Yingkow

Yingkow is situated at the head of the Liaotung Gulf and was once the only seaport of Manchuria. Since the improvement of Talien as a seaport, the trade of Yingkow has dwindled and lost half of its former business. As a seaport, Yingkow has two disadvantages, first, the shallowness of its approach from the sea and second, the blocking up by ice for several months in winter. Its only advantages over Talien is that it is situated at the mouth of the Liao river and has inland water communication throughout the Liao valley in south Manchuria. The half of the former trade that it still holds at present against Talien is entirely due to the inland water facility. To make Yingkow outmatch Talien again in the future and become first in importance after the three great world ports, we must improve its inland water communication, as well as deepen its approach from the sea. In regard to the improvement of the approach work similar to the improvement of the Canton Approach should be adopted. Besides the construction of a deep channel, about twenty feet in depth, reclamation work should be carried out at the same time. For, the shallow and extensive

swamp at the head of the Liaotung Gulf could be turned into rice-producing land from which great profit could be derived. Regarding the inland water communication, not only the water system in the Liao valley but also the Sungari and the Amur Systems have to be improved. The most important work is the construction of a canal to connect these systems and this I shall now discuss in the next paragraph.

The Liaoho-Sungari Canal is the most important factor in the future prosperity of Yingkow. It is by this canal only that this port can be made the most important of the second-class seaports in China and further the vast forest lands, the virgin soil and the rich mineral resources of North Manchuria can be connected by water communication with Yingkow. So this canal is all important for Yingkow, without which Yingkow as a seaport could at most hold her present position, a town of 60,000 to 70,000 inhabitants and an annual trade of \$30,000,000 to \$40,000,000 only and could never gain a place as the first of the second-class seaports in China. This canal can be cut either south of Hwaiteh in a line parallel to the South Manchurian Railway between Fan Kia Tun and Sze Tung Shan, a distance of less than ten miles, or north of Hwaiteh in a line between Tsing-shan-pao and Kaw-shan-tun, a distance of about fifteen miles. In the former case the canal is shorter but it makes the waterway as a whole longer, while in the latter case, the canal is about twice as long but it makes the waterway as a whole shorter between the two systems. In either line, there are no impassable physical obstacles. Both lines are on the plain but the elevation of the one may be higher than that of the other, which is the only factor that will determine the choice between the two. If this canal is constructed, then the rich provinces of Kirin and Heilungkiang and a portion of Outer Mongolia will be brought within direct water communication with China Proper. At present, all water traffic has to go by way of the Russian Lower Amur, then round a great detour of the Japan Sea before reaching China Proper. This canal will not only be a great necessity to Yingkow as a seaport, but will also have a great bearing on the whole Chinese nation economically and politically. With the Liaoho-Sungari Canal completed Yingkow will be the grand terminus of the inland waterway system of all Manchuria and Northeastern Mongolia; and with the approach from the sea deepened it will also be a seaport next in importance only to the three first-class world ports.

此四个二等海港，应以下列之情形配置之，即一在北极端，一在南极端，其他之港则间在此三世界大港之间。

此项港口，按其将来重要之程度排列之如下：

甲 营口。

乙 海州。^[10]

丙 福州。

丁 钦州。

甲 营口

营口位于辽东湾之顶上，昔者尝为东三省之唯一海港矣。自改建大连为一海港以后，营口商业大减，昔日之事业殆失其半。以海港论，营口之不利有二：一为其由海入口之通路较浅，二为冬期冰锢至数月之久。而其胜于大连唯一之点，则为位置在辽河之口，拥有内地交通遍及于南满辽河流域之内；其所以仍保有昔时贸易之半与大连抗者，全以其内地水路之便也。欲使营口将来再能凌驾大连而肩随^[11]于前言三世界大港之后，吾人必须一面改良内地水路交通，一面浚深其达海之通路。关于通路改良之工程，当取与改良广州通海路相同的方法，既设一水深约二十英尺之深水道，而又同时行填筑之工程。盖以辽东湾头广而浅之沼地，可以转为种稻之田，借之可得甚丰之利润也。至于内地水路交通，则不独辽河一系，即松花江、黑龙江两系统亦应一并改良。其最重要之工程，则为凿一运河，联此各系统，此则吾当继此有所讨论。

辽河与松花江间之运河，于将来营口之繁荣，实为最要分子。惟由此运河，此港始能成为中国二等海港中最重要者。而在将来，此北满之伟大森林地及处女壤土丰富矿源，可以以水路交通与营口相衔接也。所以为营口计，此运河为最重要；使其缺此，则营口之为一海港也，最多不过保其现在之位置，人口六、七万，全年贸易三、四千万元，极矣，无由再占中国二等海港首位之益矣。此运河可凿之于怀德以南，范家屯与四童山之间，与南满铁路平行，其长不及十英里；亦可凿之于怀德以北，青山堡与靠山屯之间，其长约十五英里。在前一线，所凿者短，而以全水路计则长；在后一线，运河之长几倍前者，而计此两江系统间之全水路则较短。两线均无不可逾越之物质的障碍，二者俱在平原，但其中一线高于海面上之度或较他一线为多，则将来择用于二者间唯一之取决点也。若此运河既经开浚，则吉林、黑龙江两富省及外蒙古之一部，皆将因此与中国本部可以水路交通相接，然则此运河不特营口之为海港大有需要焉也，又与中国全国国民政治上、经济上亦大有关系。辽河、松花江运河完成以后，营口将为全满洲与蒙古东北部内地水路系统之大终点。而通海之路既经浚深以后，彼又将为重要仅亚于三大港之海港矣。

b. Haichow

Haichow is situated on the eastern edge of the central plain of China. This plain is one of the most extensive and fertile areas on earth. As a seaport, Haichow is midway between the two great world ports along the coast line, namely the Great Northern and the Great

Eastern Ports. It has been made as the terminus of the Hailan railway, the trunk line of central China from east to west. Haichow also possesses the facility of inland water communication. If the Grand Canal and the other waterway systems are improved, it will be connected with the Hoangho Valley in North China, the Yangtze Valley in Central China, and the Sikiang Valley in South China. Its deep sea approach is comparatively good, being the only spot along the 250 miles of the North Kiangsu coast that could be reached by ocean steamers to within a few miles of the shore. To make Haichow a seaport for 20 feet draught vessels, the approach has to be dredged for many miles from the mouth of the river before the four fathom line could be reached. Although possessing better advantages than Yingkow, in being ice free, Haichow, as a second-class seaport, has to be content to take a second place after Yingkow, because she does not have as vast a hinterland as Yingkow, nor such a monopolistic position in regard to inland water communication.

乙 海州

海州位于中国中部平原东陲，此平原者，世界上最广大肥沃之地区之一也。海州以为海港，则刚在北方大港与东方大港二大世界港之间，今已定为东西横贯中国中部大干线海兰铁路之终点。海州又有内地水运交通之利便，如使改良大运河其他水路系统已毕，则将北通黄河流域，南通西江流域，中通扬子江流域。海州之通海深水路，可称较善。在沿江北境二百五十英里海岸之中，只此一点，可以容航洋巨舶逼近岸边数英里内而已。欲使海州成为吃水二十英尺之船海港，须先浚深其通路至离河口数英里外，然后可得四英寻深之水。海州之比营口，少去结冰，大为优越；然仍不能不甘居营口之下者，以其所控腹地不如营口之宏大，亦不如彼在内地水运上有独占之位置也。

c. Foochow

Foochow, the capital of Fukien Province, ranks third among our second-class seaports. Foochow is already a very large city, its inhabitants being nearly a million. It is situated at the lower reach of the Min River, about 30 miles from the sea. The hinterland of this port is confined to the Min Valley with an area of about 30,000 square miles. The territory beyond this valley will be commanded by other coast or river ports, so the area commanded by this port is much smaller than that by Haichow. Consequently, it could be given only the third place in the category of second-class seaports. The Foochow approach from the Outer Bar to Kinpei Entrance is very shallow. After this Entrance is passed, the river is confined on both sides by high hills and becomes narrow and deep right up to Pagoda Anchorage.

I propose that a new port should be constructed at the lower part of Nantai Island. For here land is cheap and there will be plenty of room for modern improvement. A locked basin for shipping could be constructed at the lower point of Nantai Island, just above Pagoda Anchorage. The left branch of the Min River above Foochow City should be blocked up so as to concentrate the current to flush the harbor at the south side of Nantai. The blocked-up channel on the north side of that island should be left to be reclaimed by natural process or may be used as a tidal basin to flush the channel below Pagoda Anchorage, if it is found necessary. The upper Min River must be improved as far as possible for inland water traffic. Its lower reach from Pagoda Anchorage to the sea must be trained and regulated to secure a through channel of 30 feet or more to the open sea. Thus Foochow could also be made a calling port for ocean liners that ply between the world ports.

d. Yamchow

Yamchow is situated at the head of Tongking Gulf in the extreme south of the China Coast. This city is about 400 miles west of Canton—the Great Southern Port. All the districts lying west of Yamchow will find their way to the sea by this port 400 miles shorter than by Canton. As sea transportation is commonly known to be twenty times cheaper than rail transportation, the shortening of a distance of 400 miles to the sea means a great deal economically to the provinces of Szechuan, Yunnan, Kweichow, and a part of Kwangsi. Although Nanning, an inland water port, lying northwest of Yamchow, is much nearer to the hinterland than Yamchow, yet it could not serve this hinterland as a seaport. So all the direct import and export trade will find Yamchow the cheapest shipping stage.

丙 福州

福建省城在吾二等海港中居第三位。福州今日已为一大城市，其人口近一百万，位于闽江之下游，离海约三十英里。此港之腹地，以闽江流域为范围，面积约三万方英里。至于此流域以外之地区，将归他内河商埠或他海港所管，故此港所管地区又狭于海州。所以以顺位言，二等海港之中，此港应居第三位。福州通海之路，自外门洲以至金牌口，水甚浅；自金牌口而上，两岸高山夹之，既窄且深，直至于罗星塔下。

吾拟建此新港于南台岛之下游一部，以此地地价较贱，而施最新改良之余地甚多也。容船舶之锁口水塘，应建设于南台岛下端，近罗星塔处。闽江左边一支，在福州城上游处应行闭塞，以集中水流，为冲刷南台岛南边港面之用。其所闭故道，绕南台岛北边者，应留待自然填塞，或遇有必要，改作蓄潮水塘（收容潮涨时之水，俟潮退时放出，以助冲

洗港内浮沙)，以冲洗罗星塔以下一节水道。闽江上段，应加改良，人力所能至之处为止，以供内地水运之用。其下一段，自罗星塔以至于海，必须范围整治之，以求一深三十英尺以上之水道，达于公海。于是福州可为两世界大港间航洋汽船之一寄港地矣。

丁 钦州

钦州位于东京湾之顶，中国海岸之最南端。此城在广州即南方大港之西四百英里。凡在钦州以西之地，将择此港以出于海，则比经广州可减四百英里。通常皆知海运比之铁路运价廉二十倍，然则节省四百英里者，在四川、贵州、云南及广西之一部言之，其经济上受益为不小矣。虽其北亦有南宁以为内河商埠，比之钦州更近腹地，然不能有海港之用，所以直接输入输出贸易，仍以钦州为最省俭之积载地也。

To improve Yamchow as a seaport the Lungmen River should be regulated in order to secure a deep channel to the city, and the estuary should be deepened by dredging and training to provide a good approach to the port. This port has been selected as the terminus of the Chuchow Yamchow Railway (Chu-Kin line) which will run from Hunan through Kwangsi into Kwangtung. Although the hinterland of this port is much larger than that of Foochow, yet I still rank it after that city because the area commanded by it is also commanded by Canton, the southern world port, and by Nanning, the river port, and so all internal as well as indirect import and export trade must go to the other two ports. It is only the direct foreign trade that will use Yamchow. Thus, in spite of its extensive hinterland it is very improbable that it could outmatch Foochow in the future as a second-class port.

Besides the three great world ports, and the four second-class ports, I propose to construct nine third-class ports along the China coast, from north to south, as follows:

- a. ~~Hulutao~~ Port.
- d. ~~Ningchow~~.
- g. ~~Soochow~~.

a. Hulutao

Hulutao is an ice-free and deep-water port, situated on the west side of the head of Liaotung Gulf, about 60 miles from Yingkow. As a winter port for Manchuria, it is in a more advantageous position than Talien for it is about 200 miles shorter by rail to the sea than the latter and is on the edge of a rich coal field. When this coal field and the surrounding mineral resources are developed, Hulutao will become the first of the third-class ports and a good outlet for Jehol and Eastern Mongolia. This port may be projected as an alternative to

Yingkow, as the sole port of Manchuria and Eastern Mongolia, if a canal could be constructed to connect it with the Liaoho. It is only by inland water communication that Yingkow could be made the important port of Manchuria in the future and it will be the same in the case of Hulutao. So if inland water communication could be secured for Hulutao it will entirely displace Yingkow. If it is found to be economically cheaper in the long run to construct a Hulutao-Liaoho Canal than to construct a deep harbor at Yingkow, the Hulutao harbor will have to be placed on the northwest side of the peninsula instead of on the southwest as at present projected. For the present site has not enough room for anchorage without building an extensive breakwater into the deep sea, which will be a very expensive work. Furthermore, there would not be room enough for city planning on the narrow peninsula, whereas on the other side, the city could be built on the mainland with unlimited space for its development.

改良钦州以为海港，须先整治龙门江，以得一深水道直达钦州城。其河口当浚深之，且范之以堤，令此港得一良好通路。此港已选定为通过湘、桂入粤之株钦铁路之终点。虽其腹地较之福州为大，而吾尚置之次位者，以其所管地区，同时又为广州世界港、南宁内河港所管，所以一切国内贸易及间接输出贸易皆将为他二港所占，惟有直接贸易始利用钦州耳。是以腹地虽广，于将来二等港中，欲凌福州而上，恐或不可能也。

此三个世界大港、四个二等港之外，吾拟于中国沿海，建九个三等港，自北至南如下：[\[12\]](#)

丙 蘆南港。

戊 蘆南。

庚 蘆南。

甲 葫芦岛

此岛为不冻深水港，位于辽东湾顶西侧，离营口约六十英里。论东三省之冬期港，此港位置远胜大连，以其到海所经铁路较彼短二百英里，又在丰富煤田之边沿也。当此煤田及其附近矿产既开发之际，葫芦岛将为三等港中之首出者，为热河及东蒙古之良好出路。此港又可计划之，以为东蒙古及满洲全部之商港，以代营口，但须建一运河以与辽河相连耳。将来惟有由内地水路交通可以成一重要商港，而葫芦岛恰亦与之相同，所以葫芦岛若得内地水路交通，自然可代营口而兴。如使确知于此凿长距离运河，以通葫芦岛于辽河，比之建一深水港面于营口，经济上更为廉价，则葫芦岛港面应置之于此半岛之西北边，不如今之计划置之半岛之西南。盖今日之位置，不足以多容船舶碇泊，除非建一广大之防波堤直入深海中，此工程所费又甚多也。且此狭隘之半岛，又不足以容都市规划，若其在他一边，则市街可建于本陆，有无限之空隙容其发展也。

I suggest that a sea wall be built from the northern point of Lienshanwan to the northern point of Hulutao to close up the Lienshan Bay and make it into a closed harbor, and an entrance be opened in the neck of Hulutao to the south side where deep water is found. This closed harbor will be over 10 square miles in extent but only some parts need to be dredged to the required depth at present. On the north side of the harbor, another entrance into the neighboring bay should be left open between the sea wall and the shore, and another breakwater should be built across the next bay. From there, a canal should be constructed either by cutting into the shore or by building a wall parallel with the coast line until it reaches the lowland from where a canal should be cut to connect with the Liaoho. If a canal is thus constructed for Hulutao, then it will at once take the place of Yingkow and become the first of the second-class ports.

b. The Hoangho Port

The Hoangho Port will be situated at the estuary of the Hoangho on the southern side of the Gulf of Pechihli, about 80 miles from our Great Northern Port. When the Hoangho regulation is completed its estuary will be approachable by ocean steamers, and a seaport will naturally spring up there. As it commands a considerable part of the northern plain in the provinces of Shantung, Chihli, and Honan and possesses the facility of inland water communication, this port is bound to become an important third-class port.

吾意須自連山灣之北角起，筑一海堤，至于葫蘆島之北端，以閉塞連山灣，使成為鎖口港面。在葫蘆島之頸部，開一口，向南方深水處；此閉塞港面，應有十英方里之廣。但此中現在只有一部分須浚至所求之深。在此港面北方，須另留一出口，介于海堤、海岸之間，以通其鄰近海灣。并須另建一防波堤，橫過第二海灣。由該處起，應建一運河，或凿之于海岸线内，或建一海堤与海岸线平行，至与易凿之低地连接为止。再由该地开凿运河，与辽河相连。如能为葫蘆島凿此运河，则此島立能取營口而代之，居二等港首位矣。

乙 黄河港

此港将位于黄河河口北直隶湾之南边，离吾人之北方大港约八十英里。当整治黄河工程已完成之日，此河口将得为航洋汽船所经由，自然有一海港萌芽于是。以是所管北方平原在直隶、山东、河南各省有相当之部分，而又益以内地水运交通，所以此港欲不成为重要三等海港，亦不可得矣。

c. Chefoo

Chefoo is an old treaty port situated on the northern side of the Shantung Peninsula. Once it was the only ice-free port in the whole of North China. Since the development of Talien in the north and the development of Tsingtau in the south its trade has dwindled considerably. As a seaport, it will undoubtedly hold its own when the railroads in the Shantung Peninsula are developed, and the artificial harbor is completed.

d. Ningpo

Ningpo is also an old treaty port, situated on a small river, the Yungkiang, in the eastern part of Chekiang province. It has a good approach, deep water reaching right up to the estuary of the river. The harbor can be easily improved by simply training and straightening two bends along its course up to the city. Ningpo commands a very small but rich hinterland. Its people are very enterprising, and are famed for their workmanship and handicrafts second only to those of Canton. Thus Ningpo is bound to become a manufacturing city when China is industrially developed. But owing to the proximity of the Great Eastern Port, Ningpo will not likely have much import and export trade directly with foreign countries. Most of its trade will be carried on with the Great Eastern Port. So a moderate harbor for local and coast-wise traffic will be quite sufficient for Ningpo.

e. Wenchow

Wenchow is situated near the mouth of the Wukiang in south Chekiang. This seaport has a wider hinterland than Ningpo, its surrounding districts being very productive. If railroads are developed it will undoubtedly command considerable local trade. At present the harbor is very shallow, unapproachable by even moderate-sized coastal steamers. I suggest that a new harbor at Panshiwei, north of Wenchow Island be constructed. For this purpose, a dike should be built between the northern bank and the head of Wenchow Island to block up the river entirely on the northern side of that island leaving only a lock entrance. The Wukiang should be led through the channel on the south side of the island for the purpose of reclaiming the vast expanse of the near-by shallows as well as for draining the upper stream. The approach from the southern side of Hutau Island to the port should be dredged. On the right side of the approach, a wall should be built in the shallow between Wenchow Island and Miau Island and in the shallows between Miau Island and Sanpam Island so as to form a continuous wall to prevent the silt of Wukiang from entering into the approach. Thus a permanent deep channel will be secured for the new port of Wenchow.

丙 芝罘

芝罘为老条约港^[13]，位于山东半岛之北侧，尝为全中国北部之惟一不冻港矣。自其北方有大连开发，南方又有青岛兴起，其贸易遂与之俱减。以海港论，如使山东半岛之铁路得其开发，而筑港之工程又已完毕，则此港自有其所长。

丁 宁波

宁波亦一老条约港也，位于浙江省之东方，甬江一小河之口。此地有极良通海路，深水直达此河之口。此港极易改良，只须范之以堤，改直其沿流两曲处，直抵城边。宁波所管腹地极小，然而极富，其人善企业，其以工作手工知名，肩随于广州。中国之于实业上得发展者，宁波固当为一制造之城市也。但以东方大港过近之故，宁波与外国直接之出入口贸易未必能多，此种贸易多数归东方大港。故以宁波计，有一相当港面以为本地及沿岸载货之用，亦已足矣。

戊 温州

温州在浙江省之南，瓯江之口。此港比之宁波，其腹地较广，其周围之地区皆为生产甚富者，如使铁路发展，必管有相当之地方贸易无疑。现在港面极浅，中等沿岸商船已不能进出。吾意须于盘石卫即温州岛之北（温州岛者，瓯江口之小岛，非温州城）建筑新港。由此目的，须建一堰于北岸与温州岛北端之间，使此岛北之河流完全闭塞，单留一闭锁之入口。至于瓯江，应引之循南水道，经温州岛，使其填塞附近浅地之大区，而又以范上段水流也。其自虎头岛南边以此港之通路，应行浚深。在此通路右，应于温州岛与尾妖岛之间浅处，及尾妖岛与三盘岛各浅处之间建堤。于是成一连堤，可以防瓯江沙泥不令侵入此通路。如此，然后温州新港可以得一恒常深水道也。

f. Amoy

Amoy, an old treaty port, is situated on the island of Siming. It has a great, deep, and fine harbor, commanding a considerable hinterland in southern Fukien and Kiangsi, very rich in coal and iron deposits. This port carries on a busy trade with the Malay Archipelago and the Southeastern Asian Peninsula. Most of the Chinese residents in the southern islands, Annam, Burma, Siam, and the Malay States are from the neighborhood of Amoy. So the passenger traffic between Amoy and the southern colonies is very great. If railways are developed to tap the rich iron and coal fields in the hinterland, Amoy is bound to develop into a much larger seaport than it is at present. I suggest that a modern port be constructed on the west side of the harbor to act as an outlet for the rich mineral fields of southern Fukien and Kiangsi. This port should be equipped with modern plants

in order to connect land and sea transportation.

g. Swatow

Swatow is situated at the mouth of the Hankiang at the extreme east of Kwangtung. In relation to emigration, Swatow is much similar to Amoy, for it also supplies a great number of colonists to southeastern Asia and the Malay Archipelago. So its passenger traffic with the south is just as busy as Amoy. As a seaport Swatow is far inferior to Amoy, on account of its shallow approach. But in regard to inland water communication, Swatow is in a better position as the Hankiang is navigable for many hundreds of miles inland by shallow crafts. The country around Swatow is very productive agriculturally, being second only to the Canton Delta along the Southern seaboard. In the upper reaches of the Hankiang there are very rich iron and coal deposits. The approach to the port of Swatow can be improved easily by a little training and dredging, thus making it a fine local port.

h. Tienpak

Tienpak is situated at a point in the coast of Kwangtung province between the estuary of the West River and the island of Hainan. Its surrounding districts are rich in agricultural products and mineral deposits. So a shipping port in this part is quite necessary. Tienpak can be made into a fine harbor by entirely walling in the bay from its west side and by opening a new entrance into the deep water in the neck of the peninsula southeast of the bay. Thus a good approach could be secured. The harbor is very wide but only a part need be dredged for large vessels and the rest of the space could be used by fishing boats and other shallow crafts.

己 厦门

此亦一老条约港也，在于思明岛。厦门有深广且良好之港面，管有相当之腹地，跨福建、江西两省之南部，富于煤铁矿产。此港经营对马来群岛及南亚细亚半岛之频繁贸易，所有南洋诸岛、安南、缅甸、暹罗、马来各邦之华侨，大抵来自厦门附近，故厦门与南洋之间载客之业极盛。如使铁路已经发展，穿入腹地煤铁矿区，则厦门必开发而为比现在更大之海港。吾意须于此港面之西方建新式商埠，以为江西、福建南部丰富矿区之一出口。此港应施以新式设备，使能联陆海两面之运输以为一气。

庚 汕头

汕头在韩江^[14] 口，广东省极东之处。以移民海外之关系，汕头与

厦門極相類似，以其亦供大量之移民于東南亞細亞及馬來群島也。故其与南洋來往船客之頻繁，亦不亞厦門。以海港論，汕頭大不如厦門，以其入口通路之淺也。然以內地水運論，則汕頭為較勝，以用淺水船則韓江可航行者數百英里地。圍汕頭之地，農產極盛，在南方海岸能追隨廣州河汊者，獨此地耳。韓江上一段，煤鐵極豐富。汕頭通海之路，只須少加範圍浚濬之功，易成為一地方良港也。

辛 電白

此港在廣東省海岸、西江河口與海南島間當中之點。其周圍地區富于農產、礦田，則此地必須有一商港，以供船運之用矣。如使以堤全圍繞電白灣之西邊，另于灣之東南半島頸地開一新出入口，以達深海，則電白可成一佳港面，而良好通路亦可獲得矣。港面本甚寬闊，但有一部須加浚濬，以容巨船，其餘空隙則留供漁船及其他淺水船之用。

i. Hoihou

Hoihou is situated on the north side of Hainan Island on the strait of the same name, opposite Haian on the Luichow Peninsula. Hoihou is a treaty port, similar to Amoy and Swatow, supplying a great number of colonists to the south; Hainan is a very rich but undeveloped island. Only the land along the coast is cultivated, the central part being still covered by thick forests and inhabited by aborigines, and it is very rich in mineral deposits. When the whole island is fully developed, the port of Hoihou will be a busy harbor for export and import traffic. The harbor of Hoihou is very shallow, and so even small vessels have to anchor miles away in the roadstead outside. This is very inconvenient for passengers and cargoes, so the improvement of the Hoihou harbor is a necessity. Furthermore this harbor will be the ferry point between this island and the mainland for railway traffic when the railway systems of the mainland and the island are completed.

Fishing Harbors

As regards fishing harbors all our first-, second-, and third-class ports must also furnish facilities and accommodations for fishery. Thus all of these, i.e., three first-class ports, four second-class ports, and nine third-class ports, will be fishing harbors as well. But besides these sixteen ports there is still room and need to construct more fishing harbors along the coast of China. I propose, therefore, that five fishing harbors be constructed along the northern coast, that is, along the coast of Fengtien, Chihli, and Shantung, as follows:

- (1) Antung, on Yalu River, on the border of Korea.

(2) Haiyangtao, on the Yalu Bay, south of Liaotung Peninsula.

(3) Chinwangtao, on the coast of Chihli, between the Liaotung and Pechihli gulfs, the present ice-free port of Chihli province.

(4) Lungkau, on the northwestern side of Shantung Peninsula.

(5) Shitauwan, at the southeastern point of the Shantung Peninsula.

Six fishing harbors should be constructed along the eastern coast, that is, along the coasts of Kiangsu, Chekiang, and Fukien, as follows:

(6) Shinyangkang, on the eastern coast of Kiangsu, south of the old mouth of the Hoangho.

壬 海口

此港位于海南岛之北端，琼州海峡之边，与雷州半岛之海安相对。海口与厦门、汕头俱为条约港，巨额之移民赴南洋者，皆由此出，而海南固又甚富而未开发之地也。已耕作者仅有沿海一带地方，其中央犹为茂密之森林，黎人所居，其藏矿最富。如使全岛悉已开发，则海口一港，将为出入口货辐辏^[15]之区。海口港面极浅，即行小船，犹须下锚于数英里外之泊船地，此于载客、载货均不大便。所以海口港面必须改良。况此港面，又以供异日本陆及此岛铁路完成之后，两地往来接驳货载^[16]之联络船码头之用也。

于渔业港一层，吾前所述之头二三等海港均须兼为便利适合渔业之设备，即三个头等港、四个二等港、九个三等港皆同时为渔业港也。然除此十六港以外，中国沿岸仍有多建渔业港之余地，抑且有其必要。故吾意在北方奉天、直隶、山东三省海岸，应设五渔业港如下：

一、安东^[17]：在高丽交界之鸭绿江。

二、海洋岛：在鸭绿湾辽东半岛之南。

三、秦皇岛：在直隶海岸辽东湾与直隶湾之间，现在直隶省之独一不冻港也。

四、龙口：在山东半岛之西北方。

五、石岛湾：在山东半岛之东南角。

东部江苏、浙江、福建三省之海岸，应建六渔业港如下：

六、新洋港：在江苏省东陲，旧黄河南方。

(7) Luszekang, at the northern point of the Yangtze Estuary.

(8) Changtukang, in the midst of Chusan Archipelago.

(9) Shipu, north of Sammen Bay, east of Chekiang.

(10) Funing, between Foochow and Wenchow, east of Fukien.

(11) Meichow Harbor, north of Meichow Island, between Foochow and Amoy.

Four fishing harbors should be constructed on the southern coast, that is, along the seaboard of Kwangtung and Hainan Island, as follows.

(12) Sanmei, on the eastern coast of Kwangtung, between Hongkong and Swatow.

(13) Sikiang Mouth. This harbor should be on the northern side of Wangkum Island. When the Sikiang Mouth is regulated, the Wangkum Island will be connected with the mainland by a sea wall, so a good harbor site could thus be provided.

(14) Haian, situated at the end of the Luichow Peninsula opposite to Hoihou, on the other side of Hainan Strait.

(15) Yulinkang a fine natural harbor at the extreme south of the Hainan Island.

These fifteen fishing harbors with the greater ports, numbering 31 in all, will link up the whole coast line of China from Antung, on the Korean border to Yamchow, near the Annam border, providing, on an average, a port for every 100 miles of coast line. This completes my project of seaports and fishing harbors for China.

At first sight objections might be raised that too many seaports and fishing harbors are provided for one country. But I must remind my readers that this one country, China, is as big as Europe and has a population larger than that of Europe. If we take a similar length of the coast line of western Europe we would see that there are many more ports in Europe than in China. Besides, the coast line of Europe is many times longer than that of China, and in every hundred miles of the European coast line there are more than one considerable-sized port. Take Holland, for instance. Its whole area is not larger than the hinterland of Swatow, one of our third-class seaports, yet it possesses two first-class ports, Amsterdam and Rotterdam, and numerous small fishing ports. Let us also compare our country with the United States of America in regard to seaports. America has only one fourth the population of China yet the number of ports on her Atlantic coast alone is many times more than the number provided in my plan. Thus, this number of ports for China for the future is but a bare necessity. And I have considered only those that will pay from the beginning so as to adhere strictly to the principle of remuneration that was laid down at the outset of my first program. See Map XVI.

七、吕四港：在扬子江口北边一点。

八、长涂港：在舟山列岛之中央。

九、石浦：浙江之东，三门湾之北。

十、福宁：在福建之东，介于福州与温州之间。

十一、湄州港：福州与厦门之间，湄州岛之北方。

南部广东省及海南岛海岸，应建四渔业港如下：

十二、汕尾：在广东之东海岸，香港、汕头之间。

十三、西江口：此港应建于横琴岛之北侧。西江口既经整治以后，横琴岛将借海堤以与本陆相连，而有一良好港面地区出现矣。

十四、海安：此港位于雷州半岛之末端，隔琼州海峡与海南岛之海口相对。

十五、榆林港：海南岛南端之一良好天然港面也。

以此十五渔业港，合之前述各较大之港，总三十有一。可以连合中国全海岸线，起于高丽界之安东，止于近越南界之钦州。平均每海岸线百英里，而得一港。吾之中国海港及渔业港计划，于是始完。

瞥见之下，当有致疑于一国而须如是之多海港与渔业港者。然读者须记此中国一国之大与欧洲等，其人则较欧洲为多。如使吾人取西欧海岸线与中国等长之一节计之，则知欧洲海港之多，远过中国。欧洲海岸线之长过中国数倍，而以每百英里计，尚不止有一与此相当形式之港。例如荷兰，其全地域不较大于吾人三等港中汕头一港之腹地，而尚有安斯得坦与洛得坦两头等海港，^[18] 又有多数之小渔业港附随之。又使与北美合众国较其海港，美国人口仅得中国四分之一，而单就其大西洋沿岸海港而论，已数倍于吾计划中所举之数。所以此项海港之数，不过仅敷中国将来必要之用而已。且吾亦仅择其自始有利可图者言之，以坚守第一计划中所标定之“必选有利之途”一原则也。（参照第十六图。）

Part V The Establishment of Shipbuilding Yards

When China is well developed according to my programs, the possession of an oversea mercantile fleet, of ships for coastal and inland water transportation, and of a large fishing fleet will be an urgent necessity. Before the outbreak of the late World War, the world's seagoing tonnage was 45,000,000 tons. If China is equally developed industrially, according to the proportion of her population, she would need at least 10,000,000 tons of oversea and coastal shipping for her transportation service. The building of this tonnage must be a part of our industrial development scheme; for cheap materials and labor can be obtained in the country, and so we could build ships for ourselves much cheaper than any foreign country could do for us. And besides the building of a seagoing fleet, we have to build our inland water crafts and fishing fleets. Foreign shipping yards could not do this service for us on account of the impracticability of transporting such numerous small crafts across the ocean. Thus, in any case, China has to put up her own yards to build her inland water crafts and fishing fleets. So the establishment of ship building yards is a necessary as well as a profitable undertaking from the beginning. The shipping yards should be established at such river and coastal ports that have the facility of supplying materials and labor. All the yards should be under one central management. Large capital should be invested in the project so as to procure a yearly output of 2,000,000 tons of various kinds of vessels.

第五部 创立造船厂

当中国既经按吾计划发展无缺之际，其急要者，当有一航行海外之商船队，亦要多数沿岸及内地之浅水运船，并须有无数之渔船。当此次世界大战未开之际，全世界海船吨数为四千五百万吨；使中国在实业上，按其人口比例，有相等之发达，则至少须有航行海外及沿岸商船一千万吨，然后可敷运输之用。建造此项商船，必须在吾发展实业计划中占一位置。以中国有廉价之劳工与材料，固当比外国为吾人所建所费较廉。且除航海船队以外，吾人尚须建造大队内河浅水船及渔船，以船载此等小船远涉重洋，实际不易，故外国船厂不能为吾建造此等船只，则中国于此际必须自设备其船厂，自建其浅水船、渔船船队矣。然则建立造船厂者，必要之企业，又自始为有利之企业者。此造船厂应建于内河及海岸商埠，便于得材料人工之处。所有船厂应归一处管理，而投大资本于此计划，至年可造各种船只二百万吨之限为止。

All types of vessels should be standardized both in design and equipment. The old and wasteful types of inland water crafts and fishing boats should be replaced by modern efficient designs. The inland water crafts should be designed on the basis of certain standard draughts such as the 2-foot, 5-foot, and 10-foot classes. The fishing trawlers should be standardized into the one-day, the five-day, and the ten-day service class. The coastal transports should be standardized into the 2,000-, the 4,000-, and the 6,000-ton class, and for oversea transports we should have standardized ships of 12,000-, 24,000-, and 36,000-ton classes. Thus, the many thousands of inland water crafts and fishing junks that now ply the rivers, lakes, and coasts of China may be displaced by new and cheaper crafts of a few standard types which could perform better services at less expense.

一切船舶当以其设计及其设备定有基准，所有旧式内河浅水船及渔船，当以新式效力大之设计代之。内河浅水船当以一定之吃水基准为基础设计之，如二英尺级、五英尺级、十英尺级之类。鱼拖船（船旁拖网者）应以行一日、行五日、行十日分级为基准。沿海船可分为二千吨级、四千吨级、六千吨级。而驶赴海外之船，则当设定一万二千吨级、二万四千吨级、三万六千吨级为基准。于是今日以万计之内河船及渔艇来往中国各江、各湖、各海岸者，将为基准划一，可使费少、功多、较新、较廉之船只所代矣。

[1] 域多利港：今译维多利亚，加拿大不列颠哥伦比亚省省会，太平洋岸温哥华岛东南端不冻港。

[2] 坎拿大：今译加拿大。

[3] 些路：今译西雅图，美国西北部重要工商业城市、港口。打金麻：今译塔科马，美国华盛顿州西部港口城市。

- [4] 相侔：相齐等，同样。亦作“相牟”。
- [5] 沥涿：方言，指河道相通处，多用作地名。
- [6] 基围：指广东靠近海的田地，为防御水患而在周围修筑的堤围。
- [7] 矩矱：规矩，法度。
- [8] 孔道：通往某处必经之关口。
- [9] 琼州岛：即今海南岛。
- [10] 海州：今连云港市海州区，位于江苏省北部。
- [11] 肩随：跟上，比得上。
- [12] 芝罘：今山东省烟台市。
- [13] 条约港：指近代中国依据清政府与各西方资本主义国家签订的不平等条约而开放的通商港口。
- [14] 韩江：中国广东省第二大河。古称恶溪，因鳄鱼出没而得名，后纪念韩愈驱鳄而改称韩江。
- [15] 辐辏：形容人或物聚集，像车辐集中于车毂一样。也作辐凑。
- [16] 接驳货趺：船只往来停泊运输货物。
- [17] 安东：即今辽宁省丹东市一带。
- [18] 安斯得坦：今译阿姆斯特丹，荷兰首都，现为荷兰第二大港。洛得坦：今译鹿特丹，荷兰第二大城市，世界最大的港口。

PROGRAM IV

In my first and third programs, I have described my plans for the Northwestern Railway System and the Southwestern Railway System. The former is for the purpose of relieving the congestion of population in the coast districts and the Yangtze Valley by opening up for colonization the vast unpopulated territory in Mongolia and Sinkiang, as well as of developing the Great Northern Port. The latter is for the purpose of exploiting the mineral resources of Southwestern China, as well as of developing the Great Southern Port—Canton. More railroads will be needed for the adequate development of the whole country. So in this fourth program, I shall deal entirely with railroads which will complete the 100,000 miles proposed in my introductory part of this International Development Scheme. The program will be as follows:

- I. The Central Railway System.
- II. The Southeastern Railway System.
- III. The Northeastern Railway System.
- IV. The Extension of the Northwestern Railway System.
- V. The Highland Railway System.
- VI. The Establishment of Locomotive and Car Factories.

Part I The Central Railway System

This will be the most important railway system in China. The area which it serves comprises all of China Proper north of the Yangtze and a part of Mongolia and Sinkiang. The economic nature of this vast region is that the southeastern part is densely populated while the northwestern part is thinly populated, and that the southeastern part possesses great mineral wealth while the northwestern part possesses great potential agricultural resources. So every line of this system will surely pay as the Peking-Mukden line has proved.

With the Great Eastern Port and the Great Northern Port as termini of this system of railroads, I propose that, besides the existing and projected lines in this region, the following be constructed, all of which shall constitute the Central Railway System.

- a. The Great Eastern Port-Tarbogotai line.
- b. The Great Eastern Port-Urga line.

肆 第四计划

在吾第一、第三两计划，吾已详写吾西南铁路系统、西北铁路系统两规划矣。前者以移民于蒙古、新疆之广大无人境地，消纳长江及沿海充盈之人口为目的，而又以开发北方大港；后者则所以开中国西南部之矿产富源，又以开发广州之南方大港也。此外仍须有铁路多条，以使全国得相当之开发。故于此第四计划，吾于《国际共同发展计划》绪论中所拟十万英里之铁路细加说明，其目如下：

- 一、中央铁路系统。
- 二、东南铁路系统。
- 三、东北铁路系统。
- 四、扩张西北铁路系统。
- 五、高原铁路系统。
- 六、创立机关车、客货车制造厂。

第一部 中央铁路系统

此系统将为中国铁路系统中最重要者，其效能所及之地区，遍包长江以北之中国本部，及蒙古、新疆之一部。论此广大地域之经济的性质，则其东南一部人口甚密，西北则疏；东南大有矿产之富，而西北则有潜在地中之农业富源。所以此系统中每一线，皆能保其能有利如京奉路也。

以此北方、东方两大港为此系统诸路之终点故，吾拟除本区现有及已计划各线之外，建筑下列各线，合而成为中央铁路系统：

天 东方大港塔城线。

地 东方大港库伦线。

c. The Great Eastern Port-Uliassutai line.

d. The Nanking-Loyang line.

e. The Nanking-Hankow line.

f. The Sian-Tatung line.

g. The Sian-Ninghsia line.

h. The Sian-Hankow line.

i. The Sian-Chungking line.

j. The Lanchow-Chungking line.

k. The Ansichow-Iden line.

l. The Chochiang-Koria line.

m. The Great Northern Port-Hami line.

n. The Great Northern Port-Sian line.

o. The Great Northern Port-Hankow line.

p. The Hoangho Port-Hankow line.

q. The Chefoo-Hankow line.

r. The Haichow-Tsinan line.

s. The Haichow-Hankow line.

t. The Haichow-Nanking line.

u. The Sinyangkang-Hankow line.

v. The Luszekang-Nanking line.

w. The Coast line.

x. The Hwoshan-Kashing line.

a. The Great Eastern Port-Tarbogotai Line

This line begins at the Great Eastern Port on the seaboard, and runs in a northwesterly direction to Tarbogotai on the Russian frontier, covering a distance of about 3,000 miles. If Shanghai be the Great Eastern Port, the Shanghai-Nanking Railway will form its first section. But if Chapu be chosen, then this line should skirt the Taihu Lake on the southwest through the cities of Huchow, Changhing, and Liyang to Nanking, then crossing the Yangtze at a point south of Nanking, to Chiantiao and Tingyuen. Thence, the line turns westward to Showchow and Yingshang, and enters Honan province at Sintsai. After crossing the Peking-Hankow line at Kioshan, and passing Piyang, Tanghsien, and Tengchow, it turns northwestward to Sichwan and Kingtsekwan, and enters the province of Shensi. Ascending the Tan Kiang Valley, it passes through Lungkucha and Shangchow, and crosses the Tsinling Pass to Lantien and Sian, the capital of Shensi, formerly the capital of China. From Sian, it goes westward, following the valley of the Weiho. It passes through Chowchih, Meihsien, and Paoki and enters the province of Kansu at Sancha, thence proceeding to Tsinchow, Kungchang, Titao, and Lanchow, the capital of Kansu. From Lanchow it follows the old highway which leads into Liangchow, Kanchow, Suchow, Yumen, and Ansichow. Thence it crosses the desert in a northwesterly direction to Hami, where it turns westward to Turfan. At Turfan this line meets the Northwestern Railway System and runs on the latter's track to Urumochi and Manass where it leaves that track and proceeds northwesterly to Tarbogotai on the frontier, crossing the Shair Mountain on the way. This line runs from one end of the country to the other encountering in its entire length of 3,000 miles only four mountain passes, all of which are not impassable for they have been used from time immemorial, as trade highways of Asia.

玄 东方大港乌里雅苏台线

黄 南京洛阳线。

宇 南京汉口线。

宙 西安大同线。

洪 西安宁夏线。

荒 西安汉口线。

日 西安重庆线。

月 兰州重庆线。

盈 安西州于阗线。

昃 婁羌库尔勒线。

辰 北方大港哈密线。

宿 北方大港西安线。

列 北方大港汉口线。

张 黄河港汉口线。

寒 芝罘汉口线。

来 海州济南线。

暑 海州汉口线。

往 海州南京线。

秋 新洋港南京线。

收 吕四港南京线。

冬 海岸线。

藏 霍山嘉兴线。

天 东方大港塔城线

此线起自东方大港之海边，向西北直走，至俄国交界之塔城为止，全长约三千英里。如使以上海为东方大港，则沪宁铁路即成为此路之首一段。但若择用乍浦，则此线应沿太湖之西南岸，经湖州、长兴、溧阳，以至南京。于是在南京之南，渡长江，至全椒及定远。此时线转而西，经寿州及颍上，于新蔡入河南界。在确山，横截京汉线后，过泌阳、唐县、邓州，转而西北，至淅川及荆紫关，入陕西界。溯丹江谷地而上，通过龙驹寨及商州，度蓝关至蓝田及西安。西安者，陕西之省城，中国之古都也。由西安循渭河而西行，过盩厔、郿县、宝鸡，于三岔入甘肃界。进向秦州、巩昌、狄道，及于甘肃省城之兰州。自兰州从昔日通路，以至凉州、甘州、肃州、玉门及安西州。由此西北行，横绝沙漠以至哈密。自哈密转而西，达土鲁番^[1]。在土鲁番，与西北铁路系统之线会，即用其线路轨，以至迪化及绥来。自绥来与该线分离，直向边界上之塔城，途中切断齐尔山而过。此线自中国之一端至于他一端，全长三千英里，仅经过四山脉。而此四山脉皆非不可逾越者，由其自未有历史以前已成为亚洲贸易路一事，可以知之矣。

b. The Great Eastern Port-Urga Line

This line starts from the Great Eastern Port and uses the same track as line (a) as far as Tingyuen, the second city after crossing the

Yangtze River at Nanking. From Tingyuen, its own track begins and the line proceeds in a northwesterly direction to Hwaiyuan, on the Hwai River, thence to Mongcheng, Kwoyang, and Pochow. Turning more northward, it crosses the Anhwei border into Honan, and passing through Kweiteh it crosses the Honan border into Shantung. After passing through Tsaohsien, Tingtao, and Tsaochow, it crosses the Hoangbo and enters Chihli province. Passing through Kaichow it re-enters Honan to Changteh, thence it follows the Tsingchangho valley, in a northwesterly direction, across the Honan border into Shansi. Here the line enters the northeastern corner of the vast iron and coal field of Shansi. After entering Shansi, the line follows the river valley to Liaochow and Yicheng, and crosses the watershed into the Tungkwoshui Valley to Yutse and Taiyuan. From Taiyuan, it proceeds northwestward through another rich iron and coal field of Shansi to Kolan. Thence, it turns westward to Poate, where it crosses the Hoangho to Fuku, in the northeastern corner of Shensi. From Fuku, the line proceeds northward, cuts through the Great Wall into the Suiyuan District and crosses the Hoangho to Saratsi. From Saratsi, the line runs in a northwesterly direction across the vast prairie to Junction A of the Northwestern Trunk Line, where it joins the common track of the Dolon Nor-Urga line to Urga. This line runs from a thickly populated country at one end in Central China to the vast thinly populated but fertile regions of Central Mongolia, having a distance of about 1,300 miles from Tingyuen to Junction A.

地 东方大港库伦线

此线自东方大港起，即用天线路轨迄于定远。定远即在南京渡江后第二城也。自定远起，始自建其路轨，进向西北，达于淮河上之怀远。于是历蒙城、涡阳及亳州，更转迤北，过安徽界，入河南，经归德，又出河南界，入山东界。于是经曹县、定陶、曹州，渡黄河，入直隶界。通过开州，再入河南，至于彰德。自彰德循清漳河谷地西北走，出河南界，入山西界。于是本线通过山西省大煤铁矿田之东北隅矣。既入山西，仍遵此谷地，至辽州及仪城，越分水界，入洞涡水谷地，至榆次及太原。自太原西北进，入山西省之另一煤铁矿区，至于岢岚。又转而西，至保德，于此渡黄河，至府谷，陕西省之东北隅也。此线自府谷北行，截开万里长城，入绥远区，再渡黄河，至萨拉齐。由萨拉齐起西北行，截过此大平原，至西北干路之甲接合点。在此处与多伦诺尔、库伦间之公线合，以至库伦。此线自中国中部人口最密之地，通至中部蒙古土沃人稀之广大地域。其自定远至甲接合点之间，约长一千三百英里。

c. The Great Eastern Port-Uliassutai Line

Starting from the Great Eastern Port, this line follows line (a) as far as Tingyuen, and line (b) as far as Pochow. At Pochow, it branches

off on its own track and proceeds westward across the border to Luye, in Honan. Thence it turns northwestward to Taikang, Tungsu, and Chungmow where it meets the Hailan line and runs in the same direction with it to Chengchow, Jungyang, and Szeshui. From Szeshui it crosses the Hoangho to Wenhsien, thence to Hwaiking and over the Honan border into Shansi. It now passes through Yangcheng, Chinshui, and Fowshan to Pingyang where it crosses the Fen River and proceeds to Puhsien and Taning, then westward to the border where it crosses the Hoangho into Shensi. Thence it proceeds to Yenchang, and follows the Yenshui Valley to Yenan, Siaokwan, and Tsingpien. Then running along the south side of the Great Wall, it enters Kansu, and crosses the Hoangho to Ninghsia. From Ninghsia, it proceeds northwestward across the Alashan Mountain to Tingyuanying at the edge of the desert. Thence it proceeds in a straight line northwestward to Junction B of the Northwestern Railway System, where it joins that system and runs to Uliassutai. This part of the line passes through desert and grassland both of which could be improved by irrigation. The distance of this line from Pochow to Junction B is 1,800 miles.

d. The Nanking-Loyang Line

This line runs between two former capitals of China, passes through a very populous and fertile country, and taps a very rich coal field at the Loyang end. It starts from Nanking, running on the common track of lines (a) and (b) and branches off at Hwaiyuan westward to Taiho. After passing Taiho, it crosses the Anhwei border into Honan. Thence it runs alongside the left bank of the Tashaho to Chowkiakow, a large commercial town. From Chowkiakow, it proceeds to Linying where it crosses the Peking-Hankow line thence to Hiangcheng and Yuchow where the rich coal field of Honan lies. After Yuchow it crosses the Sungshan watershed to Loyang where it meets the Hailan line running from east to west. This line is about 300 miles from Hwaiyuan to Loyang.

玄 东方大港乌里雅苏台线

自东方大港，因用天线路轨，至于定远，再用地线路轨，至于亳州。由亳州起，分支自筑路轨，西向行越安徽省界，至河南之鹿邑。自此处转向西北，逾太康、通许，以及中牟。在中牟与海兰线相会，并行至于郑州、荥阳、汜水。在汜水渡过黄河，至温县。又在怀庆出河南界，入山西界。于是乃过阳城、沁水、浮山，以至平阳。在平阳渡汾水，至蒲县、大宁。转而西，至省界，再渡黄河，入陕西境。于是进至延长，遵延水流域，以至于延安、小关、靖边，然后循长城之南边，以入甘肃。又渡黄河，至宁夏。自宁夏而西北，过贺兰山脉，至沙漠缘端之定远营。于此取一直线向西北走，直至西北铁路系统之乙接合点，与

此系统合一线以至乌里雅苏台。此线所经之沙漠及草地之部分，均可以以灌溉工事改善之。其自亳州至乙接合点之距离，为一千八百英里。

黄 南京洛阳线

此线走于中国两古都之间，通过烟户^[2] 极稠、地质极肥之乡落，又于洛阳一端触及极丰富之矿田。此线自南京起，走于天、地两线公共路轨之上，自怀远起始分支西行，至太和。既过太和，乃逾安徽界，入河南界。又沿大沙河之左岸，至周家口，此一大商业市镇也。自周家口进至于临颖，与京汉线交。更进至襄城、禹州，则河南省大煤矿田所在地也。自禹州而往，过嵩山分水界，以逮洛阳，与自东徂西之海兰线相会。此线自怀远至洛阳，凡三百英里。

e. The Nanking-Hankow Line

This line will run alongside the left bank of the Yangtzekiang, connecting with Kiukiang by a branch line. It starts on the opposite side of Nanking and goes southwest to Hochow, Wuweichow and Anking, the capital of Anwei province. After Anking, it continues in the same direction to Susung and Hwangmei, where a branch should be projected to Siaochnikow, thence across the Yangtze River to Kiukiang. After Hwangmei, the line turns westward to Kwangchi, then northwestward to Kishui, and finally westward to Hankow. It covers a distance of about 350 miles through a comparatively level country.

f. The Sian-Tatung Line

This line starts from Sian and runs northward to Sanyuan, Yaochow, Tungkwan, Yichun, Chungpu, Foochow, Kanchuan, and Yen-an, where it meets the Great Eastern Port-Uliassutai line. From Yen-an, it turns northeastward to Suiteh, Michih, and Kiachow on the right bank of the Hoangho. Thence it runs along the same bank to the junction of the Weifen River with the Hoangho (on the opposite side), where it crosses the Hoangho to the Weifen Valley and proceeds to Singhsien and Kolan, there crossing the Great Eastern Port-Urga line. From Kolan, it proceeds to Wuchai and Yangfang, where it crosses the Great Wall to Sochow and then Tatung there meeting the Peking-Suiyuan line. This line is about 600 miles long. It passes through the famous oil field in Shensi, and the northern border of the northwestern Shansi coal field. At Tatung, where it ends, it joins the Peking-Suiyuan line and through the section from Tatung to Kalgan it will connect with the future Northwestern System which will link Kalgan and Dolon Nor together.

g. The Sian-Ningshia Line

This line will start from Sian in a northwesterly direction to Kingyanghsien, Shunhwa, and Sanshui. After Sanshui, it crosses the Shensi border into Kansu at Chengning and then turns west to Ningchow. From Ningchow, it follows the Hwan Valley along the left bank of the river up to Kingyangfu and Hwanhsien, where it leaves the bank and proceeds to Tsingping and Pingyuan, where it meets the Hwan River again and follows that valley up to the watershed. After crossing the watershed, it proceeds to Lingchow, then across the Hoangho to Ninghsia. This line covers a distance of about 400 miles and passes through a rich mineral and petroleum country.

宇 南京汉口线

此线应循扬子江岸而行，以一支线与九江联络。自南京对岸起西南行，至和州、无为州及安庆。安庆者，安徽者城也。自安庆起，仍循同一方向至宿松、黄梅。自黄梅别开一支线，至小池口，渡扬子江，以达九江。本线则自黄梅转而西至广济，又转而西北至蕲水，卒西向以至汉口，距离约三百五十英里，而所走之路平坦较多。

宙 西安大同线

此线自西安起，北行至于三原、耀州、同官、宜君、中部、甘泉，以至延安，与东方大港乌里雅苏台线相会。自延安起转而东北，至于绥德、米脂及黄河右岸之葭州，即循此岸而行，至蔚汾河与黄河汇流处（在对岸）。渡黄河至蔚汾河谷地，循之以至兴县、苛岚，在苛岚与东方大港库伦线相交。过苛岚，至五寨及羊房。在羊房截长城而过，至朔州，乃至大同，与京绥线相会。此线约长六百英里。经过陕西有名之煤油矿，又过山西西北煤田之北境，其在终点大同与京绥线合。借大同至张家口一段之助，可与将来西北系统中联络张家口与多伦诺尔之一线相属。

洪 西安宁夏线

此线应自西安起，西北向行，至泾阳县、淳化、三水（今改称枸邑）。过三水后，出陕西界，入甘肃界，于正宁转而西，至宁州。自宁州始入环河谷地，循其左岸，上至庆阳府及环县。乃离河岸，经清平、平远后，与环河相会，仍循该谷地，上至分水界。过分水界后，至灵州，渡黄河至宁夏。此线长约四百英里，经过矿产及石油最富之地区。

h. The Sian-Hankow Line

This is a very important line connecting the richest portion of the Hoangho Valley with the richest portion of the central section of the Yangtze Valley. It starts from Sian on the track of line (a), crosses the Tsingling and descends the Tankiang Valley as far as Sichwan. At this

point, it branches off southward across the border into Hupeh, and following the left bank of the Han River, passes Laohokow to Fencheng, opposite Siangyang. After Fencheng, it follows continuously the same bank of the Han River to Anlu, thence proceeding in a direct line southeastward to Hanchwan and Hankow. This line is about 300 miles long.

i. The Sian-Chungking Line

This line starts from Sian almost directly southward, crosses the Tsingling Mountain into the Han Valley, passes through Ningshen, Shihchuan, and Tzeyang, ascends the Jenho Valley across the southern border of Shensi into the province of Szechwan at Tachuho. Then crossing the watershed of the Tapashan into the Tapingho Valley, it follows that valley down to Suiting and Chuhsien. Thence it turns to the left side of the valley to Linshui and follows the trade road to Kiang-peh and Chungking. The entire distance of this line is about 450 miles through a very productive region and rich timber land.

j. The Lanchow-Chungking Line

This line starts from Lanchow southwestward and follows the same route as line (a) as far as Titao. Thence, it branches off and ascends the Taoho Valley across the Minshan watershed into the Heishui Valley following it down to Kiaichow and Pikow. After Pikow, it crosses the Kansu border into Szechwan and proceeds to Chaohwa, where the Heishui joins the Kialing. From Chaohwa, it follows the course of the Kialing River down to Paoning, Shunking, Hochow, and Chungking. The line is about 600 miles long, running through a very productive and rich mineral land.

荒 西安汉口线

此线联络黄河流域最富饶一部与中部长江流域最富饶一部之一重要线路。此线自西安起，用天线路轨，过秦岭，进至丹江谷地。直至淅川，始分线南行，过省界，至湖北。循汉水左岸，经老河口，以至襄阳对岸之樊城。由樊城仍循此岸以至安陆，由此以一直线东南至汉川及汉口。全线约长三百英里。

日 西安重庆线

此线自西安起，直向南行，度秦岭，入汉水谷地。经宁陕、石泉、紫阳，进入任河谷地，逾陕西之南界，于大竹河入四川界。于是逾大巴山之分水界，以入太平河谷地。循此谷地而下，至绥定及渠县，乃转入此谷地之左边，至于邻水。又循商路，以至江北及重庆。此线全长约四

百五十英里，经由极多产物之地区及富于材木之地。

月 兰州重庆线

此线从兰州起西南行，用天线之线路，直至狄道为止。由此分支进入洮河谷地，过岷山分水界，入黑水谷地沿之而下，至于阶州及碧口。自碧口而降，出甘肃界，入四川界，进逮昭化黑水河，即在昭化与嘉陵江合。自昭化起，即顺嘉陵江，降至保宁、顺庆、合州以及重庆。此线约长六百英里，经过物产极多、矿山极富之地区。

k. The Ansichow-Iden Line

This line passes through the fertile belt of land between the Gobi Desert and the Altyn Tagh Mountain. Although this strip of land is well watered by numerous mountain streams yet it is very sparsely populated, owing to the lack of means of communication. When this line is completed, this strip of land will be most valuable to Chinese colonists. The line starts from Ansichow westward to Tunhwang, and skirts the southern edge of the Lobnor Swamp to Chochiang. From Chochiang, it proceeds in the same direction via Cherchen to Iden where it connects with the terminus of the Northwestern System. With this System, it forms a continuous and direct line from the Great Eastern Port to Kashgar at the extreme west end of China. This line from Ansichow to Iden is about 800 miles in length.

l. The Chochiang-Koria Line

This line runs across the desert alongside the lower part of the Tarim River. The land on both sides of the line is well watered and will be valuable for colonization as soon as the railroad is completed. This line is about 250 miles in length and connects with the line that runs along the northern edge of the desert. It is a short cut between fertile lands on the two sides of the desert.

m. The Great Northern Port-Hami Line

This line runs from the Great Northern Port in a northwesterly direction by way of Paoti and Siangho to Peking. From Peking it runs on the same track with the Peking-Kalgan Railway to Kalgan, where it ascends the Mongolian Plateau. Then it follows the caravan road northwestward to Chintai, Bolutai, Sessy, and Tolibulyk. From Tolibulyk, it takes a straight line westward crossing the prairie and desert of both the Inner and Outer Mongolia to Hami where it connects with the Great Eastern Port-Tarbogotai line which runs almost directly west to Urumochi, the capital of Sinkiang. Thus, it will

be the direct line from Urumochi to Peking and the Great Northern Port. This line is about 1,500 miles in length, the greater part of which will run through arable land and so when it is completed it will form one of the most valuable railways for colonization.

盈 安西州于阗线

此线贯通于戈壁沙漠与阿勒腾塔格岭中间一带肥沃之地。虽此一带地方，本为无数山间小河所灌溉，润泽无缺，而人口尚极萧条，则交通方法缺乏之所致也。此线完成之后，此一带地方必为中国殖民最有价值之处。此线起自安西州，西行至敦煌，循罗布泊沼地之南缘端，以至婁羌。自婁羌仍用同一方向，经车城，以至于阗，与西北系统线之终点相接。借此系统之助，得一东方大港与中国极西端之喀什噶尔直接相通之线。自安西州以至于阗，长约八百英里。

昃 婁羌库尔勒线

此线沿塔里木河之下游，截过沙漠，其线路两旁之地给水丰足，铁路一旦完成，即为殖民上最有价值之地。本线长约二百五十英里，与走于沙漠北缘端之线上联属。沙漠两边肥饶土地之间，此为捷径。

辰 北方大港哈密线

此线自北方大港西北行，经宝坻、香河，以至北京。由北京起即用京张路轨，以至张家口，由此以进入蒙古高原。于是循用商队通路，向西北行，以至陈台、布鲁台、哲斯、托里布拉克。自托里布拉克向西，取一直线，横度内外蒙古之平原及沙漠，以至哈密，以与东方大港塔城线相联络。而该线则直通于西方新疆首府之迪化。故此线，即为迪化城与北京及北方大港之直通线。此线长约一千五百英里，其中有大部分走于可耕地之上。然则其完成之后，必为殖民上最有价值之铁路矣。

n. The Great Northern Port-Sian Line

This line will run westward from the Great Northern Port to Tientsin. From here it runs southwestward to Hokien, passing through Tsinghai and Tachen. From Hokien, it runs more westerly to Shentseh, Wuki, and Chengting where it joins the Chengtai line as well as crosses the Kinhan line. From Chengting it takes the same road as the narrow-gauge Chengtai line which has to be reconstructed into standard gauge so as to facilitate through trains to Taiyuan and farther on. From Taiyuan it runs southwestward to Kiaocheng, Wenshui, Fenchow, Sichow, and Taning. After Taning it turns westward and crossing the Hoangho, it turns southwestward to Yichwan, Lochwan, and Chungpu where it joins the Sian-Tatung line and runs on the same tracks to Sian. Its length is about 700 miles over very rich and

extensive iron, coal, and petroleum fields, as well as productive agricultural lands.

o. The Great Northern Port-Hankow Line

This line starts from the Great Northern Port skirting the coast to Petang, Taku, and Chikow, thence to Yenshan and crosses the Chihli border into Shantung at Loling. From Loling, it goes to Tehping, Linyi and Yucheng where it crosses the Tientsin-Pukow line, proceeds to Tungchang and Fanhsien, and then crosses the Hoangho to Tsaochow. After Tsaochow it passes the Shantung border into Honan, crossing the Hailan line to Suichow. From Suichow it proceeds to Taikang where it crosses line (c), then to Chenchow and Chowkiakow where it crosses line (d) and thence to Siangcheng, Sintsai, Kwangchow, and Kwangshan. After Kwangshan it crosses the boundary mountain into Hupeh, passing through Hwangan to Hankow. This line is about 700 miles long, running from the Great Northern Port to the commercial center of central China.

p. The Hoangho Port-Hankow Line

This line starts from the Hoangho Port in a southwesterly direction to Pohsing, Sincheng, and Changshan, then across the Kiauchow-Tsinan line to Poshan. Thence it ascends the watershed into the Wen Valley to Taian where it crosses the Tientsin-Pukow line to Ningyang and Tsining. From Tsining it proceeds in a straight line southwestward to Pochow in Anhwei, and Sintsai in Honan. At Sintsai it joins the Great Northern Port-Hankow line to Hankow. The distance of this line from the Hoangho Port to Sintsai is about 400 miles.

宿 北方大港西安线

此线自北方大港西行，至于天津。由该处西行，经过静海、大城，以至河间。由河间更偏西行，至于深泽、无极，又与京汉线交于正定，即于此处与正太线相接。自正定起，即用正太线路。但该线之窄轨，应重新建筑，改为标准轨阔，此所以便于太原以往之通车也。自太原起，此线向西南行，经交城、文水、汾州、隰州，以至大宁。由大宁转而西行，渡黄河。又西南行，至宜川、洛川、中部。在中部，与西安大同线相会，即用其路线以达西安。此线长约七百英里。其所经者，则农产物极多之地区，又煤、铁、石油丰富广大之矿田也。

列 北方大港汉口线

此线自北方大港起，循海岸而行，至北塘、大沽、岐口，又至盐山，出直隶界，入山东界于乐陵。自乐陵而往，经德平、临邑，至禹

城，与津浦线相交，进至东昌、范县，于是渡黄河，至曹州。既过曹州，出山东界，入河南界，与海兰线相交，至睢州。由此进至太康，与玄线相交，经陈州及周家口，与黄线相交，又至项城、新蔡、光州及光山。既过光山，逾分界岭，入湖北境，经黄安，至汉口。此线长约七百英里，自北方大港以至中国中部之商业中心。

张 黄河港汉口线

此线自黄河港起，西南行，至于博兴、新城、长山，乃与胶济线相交，至博山。上至分水界，入于汶河谷地，至泰安。与津浦线相交，又至宁阳及济宁。自济宁而进，以一直线向西南，至安徽之亳州、河南之新蔡。自新蔡起，与北方大港汉口线合，以至汉口。自黄河港至新蔡，约四百英里。

q. The Chefoo-Hankow Line

This line starts at Chefoo on the northern side of the Shantung Peninsula and crosses that Peninsula to Tsimo, on the southern side, via Laiyang and Kinkiakow. From Tsimo it proceeds southwestward across the shallow mud flat at the head of Kiauchow Bay in a straight line to Chucheng. After Chucheng it crosses the watershed into the Shuho Valley to Chuchow and Ichow, then proceeds to Hsuchow where it meets the Tientsin-Pukow line and the Hailan line. From Hsuchow it runs on the same track with the Tientsin-Pukow line as far as Suchow in Anhwei, then branches off to Mongcheng and Yinchow, and crosses the border into Honan at Kwangchow, where it meets the Great Northern Port-Hankow line and proceeds together to Hankow. This line from Chefoo to Kwangchow is about 550 miles in length.

r. The Haichow-Tsinan Line

This line starts from Haichow following the Linhung River to Kwantunpu, then turns westward to Ichow. From Ichow it turns first northward then northwestward, passing by Mongyin and Sintai to Tai-an. At Tai-an it joins the Tsinpu line and proceeds in the same track to Tsinan. This line covers a distance, from Haichow to Tai-an, of about 110 miles, tapping the coal and iron fields of southern Shantung.

s. The Haichow-Hankow Line

This line starts at Haichow in a southwesterly direction, goes to Shuyang and Sutsien, probably in the same route as the projected Hailan line. From Sutsien it proceeds to Szechow and Hwaiyuan, where it crosses the Great Eastern Port Urga and Uliassutai lines. After Hwaiyuan it goes to Showchow and Chenyangkwan, thence

continuing in the same direction across the southeastern corner of Honan and the boundary mountain into Hupeh, proceeds to Macheng and Hankow, covering a distance of about 400 miles.

t. The Haichow-Nanking Line

This line goes from Haichow southward to Antung then inclining a little south to Hwaiian. After Hwaiian it crosses the Paoying Lake (which will be reclaimed according to the regulation of the Hwaiho in Part IV, Program II) to Tienchang and Luho, thence to Nanking. Distance, about 180 miles.

寒 芝罘汉口线

此线起于山东半岛北边之芝罘，即横断此半岛，经过莱阳、金家口，以至于其南边之即墨。由即墨起，向西南，过胶州湾顶之洼泥地，作一直线，至于诸城。既过诸城，越分水界以入沭河谷地，至莒州及沂州，进至徐州，与津浦海兰线相会。自徐州起，即用津浦路轨，直至安徽之宿州。乃分路至蒙城、颍州，过省界，入河南光州，即于此处与北方大港汉口线相会，由之以至汉口。此线自芝罘至光州，长约五百五十英里。

来 海州济南线

此线发海州，循临洪河至欢墩埠，转西向，至临沂。由临沂始转北向，次西北向，经蒙阴、新泰，至泰安。在泰安与津浦线会合，取同一轨道，而至济南。此线自海州至泰安，长约一百一十英里，经过山东南部之煤铁矿场。

暑 海州汉口线

此线自海州出发，西南行，至沭阳与宿迁，或与现在海兰线之预定线路相同。自宿迁而往，经泗州、怀远，与东方大港库伦线及乌里雅苏台线相交。既过怀远，乃向寿州及正阳关，即循同一方向，横过河南省之东南角及湖北之分界岭，过麻城，至汉口。长约四百英里。

往 海州南京线

此线从海州向南至安东，稍南至淮安。既过淮安，渡宝应湖（此湖应按第二计划第四部整治淮河，施以填筑），经天长、六合，以至南京。全长一百八十英里。

u. The Sinyangkang-Hankow Line

This line starts from Sinyangkang to Yencheng, then crossing the

Tasung Lake (which will be reclaimed) to Hwaian. From Hwaian it turns southwestward passing over the southeastern corner of the Hungtse Lake (which will also be reclaimed) to Suyi, in Anhwei. After Suyi, it crosses the Tientsin-Pukow line near Mingkwang, to Tingyuen, where it meets lines (b) and (c). After Tingyuen, it proceeds to Liu-an and Hwoshan, then crosses the boundary mountain into Hupeh passing through Lotien to Hankow, a distance of about 420 miles.

v. The Luszekang-Nanking Line

This line starts at Luszekang, a fishing harbor to be constructed at the extremity of the northern point of the Yangtze Estuary. From Luszekang it proceeds westward to Tungchow where it turns northwestward to Jukao, and then westward to Taichow, Yangchow, Luho, and Nanking. This line is about 200 miles long.

w. The Coast Line

This line starts at the Great Northern Port, and follows the Great Northern Port-Hankow line as far as Chikow, where it begins its own line. Keeping along the coast, it crosses the Chihli border to the Hoangho Port, in Shantung, then proceeds to Laichow where it takes a straight cut away from the coast to Chaoyuan and Chefoo, thus avoiding the projected Chefoo-Weihsien line. From Chefoo it proceeds southeastward through Ninghai to Wenteng, where one branch runs to Jungcheng and another to Shihtao. The main line turns southwestward to Haiyang and Kinkiakow, where it joins the Chefoo-Hankow line, and follows it as far as the western side of Kiauchow Bay, thence southward to Lingshanwei. From Lingshanwei the line proceeds southwestward along the coast to Jichao, and crosses the Shantung border into Kiangsu, passing Kanyu to Haichow. Thence it proceeds southeastward to Yencheng, Tungtai, Tungchow, Haimen, and Tsungming Island which will be connected with the mainland by the regulation works of Yangtze embankment. From Tsungming trains can be ferried over to Shanghai. This line from Chikow to Tsungming is about 1,000 miles in length.

秋 新洋港汉口线

此线自新洋港而起，至于盐城，过大纵湖（此亦应填筑），至淮安。自淮安转向西南，渡过洪泽湖之东南角（此湖仍应填筑），至安徽之盱眙。既过盱眙，在明光附近与津浦线相交，又至定远，与地、玄两线相会。过定远后，进至六安、霍山，逾湖北之分界岭，过罗田，以至汉口。全长约四百二十英里。

收 吕四港南京线

此线由吕四港而起。吕四港者，将来于扬子江口北端尽处应建之渔业港也。自吕四港起西行，至于通州，转西北行，至如皋，又西行至泰州、扬州、六合、南京。全长约二百英里。

冬 海岸线

此线自北方大港起，循北方大港汉口线，至于岐口。始自开线路，密接海岸以行，过直隶界，至山东之黄河港，进至于莱州。自莱州离海岸，画一直线，至招远及芝罘，以避烟潍铁路之计划线。由芝罘转而东南，经过宁海及文登。自文登引一支线至荣城，又一线至石岛，其本线转而西南，至海阳及金家口，与芝罘汉口线合。循之直至于胶州湾之西端，折而南至灵山卫。自灵山卫转而西南，循海岸至日照，过山东界，入江苏省，经赣榆，至海州。于是向西南，进至盐城、东台、通州、海门，以达于崇明岛。此岛以扬子江之治水堤之故，将与大陆联为一气矣。其自崇明赴上海，可用渡船载列车而过。此自岐口迄崇明之线，约长一千英里。

x. The Hwoshan-Wuhu-Soochow-Kashing Line

This line starts from Hwoshan to Shucheng and Wuwei, then across the Yangtze River to Wuhu. After Wuhu it goes to Kaoshun, Liyang, and Ihsing, then crosses over the northern end of Taihu (which will be reclaimed) to Soochow, where it meets the Shanghai-Nanking line. From Soochow it turns southward to Kashing on the Shanghai-Hangchow line. This line runs over very populous and rich districts of Anhwei and Kiangsu provinces, covering a distance of about 300 miles, which will form the greater part of the shortest line from Shanghai to Hankow.

Part II The Southeastern Railway System

This system covers the irregular triangle which is formed by the Coast line between the Great Eastern and the Great Southern Ports, as the base, by the Yangtze River from Chungking to Shanghai, as one side, and by line (a) of the Canton-Chungking Railway as the other side, with Chungking as the apex. This triangle comprises the provinces of Chekiang, Fukien, and Kiangsi, and a part respectively of Kiangsu, Anhwei, Hupeh, Hunan, and Kwangtung. This region is very rich in mineral and agricultural products, especially iron and coal deposits which are found everywhere. And the whole region is thickly populated. So railway construction will be very remunerative.

With the Great Eastern Port and the Great Southern Port and the second- and third-class ports that lie between the two as termini of this system of railroads, I propose that the following lines be constructed:

- a. The Great Eastern Port-Chungking Line.
- b. The Great Eastern Port-Canton Line.
- c. The Foochow-Chinkiang Line.
- d. The Foochow-Wuchang Line.
- e. The Foochow-Kweilin Line.
- f. The Wenchow-Shenchow Line.
- g. The Amoy-Kienchang Line.
- h. The Amoy-Canton Line.
- i. The Swatow-Changteh Line.

藏 霍山芜湖苏州嘉兴线

此线自霍山起，至舒城及无为，乃过扬子江，至芜湖。又过高淳、溧阳、宜兴，过太湖之北端（将来填筑），至苏州，与沪宁线会。过苏州后，转而南，至沪杭线上之嘉兴。此线走过皖、苏两省富庶之区，长三百英里，将成为上海、汉口间之直接路线之大部分。

中央铁路系统各线，全长统共约一万六千六百英里。

第二部 东南铁路系统

本系统纵横布列于一不规则三角形之一。此三角形以东方大港与广州间之海岸线为底，以扬子江重庆至上海一段为一边，更以经由湖南之广州重庆甲线为第二边，而以重庆为之顶点。此三角形全保有浙江、福建、江西三省，并及江苏、安徽、湖北、湖南、广东之各一部。此地富有农矿物产，而煤铁尤多，随在有之，且全区人口甚密，故其建铁路，必获大利。

以东方大港、南方大港及其间之二三等港，为此铁路之终点，可建筑下列之各线：

天 东方大港重庆线。

地 东方大港广州线。

玄 福州镇江线。

黄 福州武昌线。

宇 福州桂林线。

宙 温州辰州线。

洪 厦门建昌线。

荒 厦门广州线。

日 汕头常德线。

j. The Nanking-Siuchow Line.

k. The Nanking-Kaying Line.

l. The Coast Line Between the Great Eastern and Great Southern Ports.

m. The Kienchang-Yuanchow Line.

a. The Great Eastern Port-Chungking Line

This line connects the commercial center of western China—Chungking—with the Great Eastern Port in almost a straight route south of the Yangtze River. It starts from the Great Eastern Port and goes to Hangchow, then through Linan, Ghanghwa, to Hweichow, in Anhwei. From Hweichow it proceeds to Siuning and Kimen, then crosses the border into Kiangsi and passing Hukow reaches Kiukiang. From Kiukiang it follows the right bank of the Yangtze, crosses the Hupeh border to Hingkwochow and then proceeds to Tungshan and

Tsungyang, where it passes over the border to Yochow in Hunan. From Yochow it takes a straight line across the Tungting Lake (which will be reclaimed) to Changteh. From Changteh it proceeds up the Liu Shui Valley, passing through Tzeli, and crossing the Hunan border to Hofeng, in Hupeh and then to Shinan and Lichwan. At Shinan a branch should be projected northeastward to Ichang, and at Lichwan another branch should be projected northwestward to Wanhsien, both on the left side of the Yangtze River. After Lichwan it crosses the Hupeh border into Szechwan, passing Shihchu to Foochow, then passes the Wukiang and proceeds along the right side of the Yangtze River as far as lines (a) and (b) of the Canton-Chungking Railway and then crosses together on the same bridge to Chungking on the other side of the river. The length of this line including branches, is about 1,200 miles.

b. The Great Eastern Port-Canton Line

This is a straight line from one first-class seaport to another. It starts from the Great Eastern Port and goes to Hangchow, then turning southwestward, follows the left bank of the Tsien Tang River through Fuyang, Tunglu to Yenchow and Chuchow. Then it proceeds across the Chekiang-Kiangsi border to Kwangsin. From Kwangsin it goes through Shangtsing and Kinki to Kienchang, then proceeds to Nan-feng, Kwangchang, and Ningtu. After Ningtu it proceeds to Yutu, Sinfeng, Lungnan, and crossing the boundary mountain of Kiangsi and Kwangtung, to Changning. Thence via Tsungfa it goes to Canton, covering a distance of about 900 miles.

月 南京韶州线。

盈 南京嘉应线。

旻 东方南方两大港间海岸线。

辰 建昌沅州线。

天 东方大港重庆线

此线越扬子江以南，殆以一直线联结中国西方商业中心之重庆与东方大港。此线起于东方大港，至杭州，经临安、昌化，以至安徽省之徽州（歙县）。由徽州进至休宁、祁门，于是越省界，入江西境，过湖口，至九江。自九江起，循扬子江右岸，越湖北界，至兴国州，又进至通山、崇阳。在崇阳逾界至湖南岳州。自岳州起，取一直线，贯洞庭湖（此湖将来进行填塞）至于常德。由常德溯淞水谷地而上，过慈利，再逾省界，入湖北之鹤峰，于是及于施南与利川。在施南应开一支线，向东北界走，至宜昌；在利川应另开一支线，西北行至万县。此宜昌、万县两地，均在长江左岸。自利川而后，入四川界，过石砭，至涪州。遂

过乌江，循扬子江右岸而上，至与广州重庆乙线会而后已。此后以同一之桥渡江，至对岸之重庆。连支线，长约一千二百英里。

地 东方大港广州线

此线由一头等海港，以一直线，至他头等海港。自东方大港起，至杭州。折而西南行，遵钱塘江左岸，过富阳、桐庐，至严州及衢州。更进过浙、赣省界，至广信（上饶）。由广信起，经上清、金溪，至建昌，然后进至南丰、广昌、宁都。由宁都而往，至零都、信丰、龙南。过赣、粤界岭，至长宁（新丰）。于是经从化，以至广州。长约九百英里。

c. The Foochow-Chinkiang Line

This line starts from Foochow, goes by way of Loyuan and Ningteh to Fuan, and then proceeds across the Fukien-Chekiang border to Taishun, Kingning, Yunho, and Chuchow. Thence it proceeds to Wuyi, Yiwu, Chukih, and Hangchow. After Hangchow it goes to Tehtsing and Huchow and then crosses the Chekiang border into Kiangsu. Then it proceeds by way of Ihsing, Kintan, and Tanyang to Chinkiang. This line is about 550 miles in length.

d. The Foochow-Wuchang Line

This line starts from Foochow and following the left bank of the Min River and passing Shuikow and Yenping reaches Shaowu. After Shaowu, it proceeds across the Fukien border into Kiangsi and then passes through Kienchang and Fuchow to Nanchang, the capital of Kiangsi. From Nanchang it proceeds to Hingkwo, in Hupeh, and passes on to Wuchang, the capital of Hupeh. It covers a distance of about 550 miles.

e. The Foochow-Kweilin Line

This line starts from Foochow, crosses the Min River and proceeds by way of Yungfu, Tatien, Ningyang, and Liencheng to Tingchow. Thence it crosses the Fukien-Kiangsi border to Shuikin. From Shuikin it proceeds to Yutu and Kanchow and then to Shangyiu and Chungyi. After Chungyi it crosses the Kiangsi-Hunan border to Kweiyanghsien and Chenchow, where it crosses the Canton-Hankow line to Kweiyangchow. Thence it continues to Sintien, Ningyuan, and Taochow, where it meets lines (a) and (b) of the Canton-Chungking Railway. After Taochow it turns southward following the Taoho Valley to the Kwangsi border and then crossing it, proceeds to Kweilin. This line covers a distance of about 750 miles.

f. The Wenchow-Shenchow Line

This line begins from the new Wenchow Port and follows the left bank of the Wukiang as far as Tsingtien. From Tsingtien it proceeds to Chuchow and Suenping and turns westward across the Chekiang border to Yushan in Kiangsi. After Yushan it goes to Tehsing, Loping, and then skirting the southern shore of Poyang Lake goes through Yukan to Nanchang, the capital of Kiangsi. From Nanchang it proceeds to Juichow, Shangkao, and Wantsai, then crosses the Kiangsi border to Liuyang in Hunan, and Changsha, the capital of Hunan. After Changsha it goes to Ningsiang, Anhwa, and Shenchow where it connects with line (a) of the Canton-Chungking Railway, and with the Shasi-Singyi line. This line covers a distance of about 850 miles.

玄 福州镇江线

此线起自福州，经罗源、宁德，以至福安。于是进而逾闽、浙边界，以至泰顺、景宁、云和、处州。于是进经武义、义乌、诸暨，以达杭州。杭州以后经德清及湖州，逾浙江省界，以入江苏，循宜兴、金坛、丹阳之路而进，以至镇江。此线长五百五十英里。

黄 福州武昌线

此线自福州起，沿闽江左岸，过水口及延平，至于邵武。邵武以后过福建界，入于江西，经建昌及抚州，以至省城南昌。由南昌而入湖北之兴国，过之，以至湖北省城武昌。全长约五百五十英里。

宇 福州桂林线

此线自福州起，渡过闽江，进而取永福（永泰）、大田、宁洋、连城一路，以至汀州（长汀）。于是过闽、赣省界，入于瑞金。由瑞金进至零都、赣州，又进至上犹及崇义。崇义以后，过赣、湘边界，至桂阳县（汝城）及郴州，与粤汉线交于郴州，遂至桂阳州。又进至于新田、宁远、道州，与广州重庆甲乙两线相遇。道州以后，转而南，循道江谷地而上，至广西边界，过界直至桂林。此线长约七百五十英里。

宙 温州辰州线

此线由温州新港起，循瓯江左岸而上，至于青田。由青田进向处州及宣平，转而西出浙江省界，入江西之玉山。自玉山经过德兴、乐平，乃沿鄱阳湖之南岸，经余干，至于南昌。由南昌经过瑞州（高安）、上高、万载，逾江西省界，入湖南之浏阳，遂至长沙。由长沙经宁乡、安化，以至辰州，与广州重庆甲线及沙市兴义线会合。长约八百五十英里。

g. The Amoy-Kienchang Line

This line starts from the new port of Amoy and goes to Changtai, then following the Kiulungkiang to Changping, Ningyang, Tsingliu, and Kienning. After Kienning it proceeds across the Kiangsi border to Kienchang, where it connects with the Great Eastern Port-Canton line, the Foochow-Wuchang line, and the Kienchang-Yuanchow line. This line covers a distance of about 250 miles.

h. The Amoy-Canton Line

This line starts at the new port of Amoy, and proceeds to Changchow, Nantsing, and Siayang, where it crosses the Fukien border to Tapu, in Kwangtung. From Tapu it goes to Tsungkow, Kaying, Hinning, and Wuhwa. After Wuhwa it crosses the watershed between the Hankiang and the Tungkiang rivers to Lungchan, then following the Tungkiang down to Hoyun, it crosses another watershed to Lungmoon, Tsengshin and Canton. This line covers a distance of about 400 miles.

i. The Swatow-Changteh Line

This line starts from Swatow, proceeds to Chaochow, Kaying, and then crosses the Kwangtung border to Changning in Kiangsi. From Changning it crosses the watershed into Kungkiang Valley and follows that river down to Hweichang and Kanchow. From Kanchow it proceeds to Lungchuan, Yungning, and Lienhwa, where it crosses the Kiangsi border into Hunan. After that, it proceeds to Chuchow and Changsha, the capital of Hunan. From Changsha it goes to Ningsiang, Yiyang, and Changteh where it ends, connecting with the Great Eastern Port-Chungking line, and the Shasia-Singyi line. This line covers a distance of about 650 miles.

洪 厦門建昌線

此線自厦門新港起，至長泰。溯九龍江而上，至漳平、寧洋、清流及建寧縣。自建寧以後，過省界，至江西之建昌，與東方大港廣州線、福州武昌線、建昌沅州線相會。此線長約二百五十英里。

荒 厦門廣州線

此線自厦門新港起，進至漳州、南靖、下洋，于此出福建界，至廣東之大埔。由大埔過松口、嘉應、興寧、五華。于五華，過韓江及東江之分水界，至龍川。乃遵東江而下，至河源。又過一分水界，至于龍門、增城，以至廣州。長約四百英里。

日 汕头常德线

此线自汕头起，进至潮州、嘉应，出广东界，至江西之长宁（寻邬）。自长宁越分水界，入贡江谷地，循之以下，至于会昌、赣州。由赣州以至龙泉（遂川）、永宁（宁冈）、莲花。在莲花逾江西界，入湖南，于是进至株洲及长沙。由长沙经过宁乡、益阳，终于常德与东方大港重庆线及沙市兴义线相会。此线长约六百五十英里。

j. The Nanking-Siuchow Line

This line starts from Nanking and runs along the right bank of the Yangtze to Taiping, Wuhu, Tungling, Chichow, and Tungliu. After Tungliu it passes over the Anhwei border into Kiangsi, at Pengtseh, and goes to Hukow. At Hukow it meets the Great Eastern Port-Chungking line and crosses the bridge together with that line to the projected Poyang Port. From the Poyang Port it runs along the west shore of the Poyang Lake through Nanking and Wucheng to Nanchang, where it meets the Wenchow-Shenchow and Foochow-Wuchang lines. From Nanchang it proceeds up the Kan Kiang Valley, via Linkiang to Kian, where it crosses the projected Kienchang-Yuanchow line. After Kian, it proceeds to Kanchow where it crosses the Foochow-Kweilin line. Thence it goes to Nankanghsien and Nanan. After Nanan it crosses the boundary mountain, Tayuling, into Kwangtung at Nanyung, thence passes through Chihing to Siuchow, where it meets the Canton-Hankow line. This line covers a distance of about 800 miles.

k. The Nanking-Kaying Line

This line starts from Nanking, proceeds to Lishui and Kaoshun and then crosses the Kiangsu border into Anhwei at Suencheng. From Suencheng it proceeds to Ningkwo and Hweichow. After Hweichow it crosses the Anhwei border into Chekiang, passing through Kaihwa, Changshan, and Kiangshan, and leaving Chekiang enters Fukien at Pucheng. From Pucheng it proceeds via Kienningfu to Yenping where it crosses the Foochow-Wuchang line and then goes through Shahsien and Yungan to Ningyang, where it meets the Foochow-Kweilin and Amoy-Kienchang lines. From Ningyang it proceeds to Lungyen and Yungting, then joining the Amoy-Canton line at Tsungkow proceeds together to Kaying, its terminus. This line runs over a distance of about 750 miles.

1. The Coast Line Between the Great Eastern and the Great Southern Ports

This line starts from the Great Southern Port—Canton—proceeds in the same direction as the Canton-Kowloon line as far as Shelung and then goes its own way following the course of the Tungkiang River to Waichow. From Waichow it proceeds to Samtochuck, Haifung, and Lukfung, then turning northeastward goes to Kityang and Chaochow. After Chaochow it goes to Jaoping, then crossing the Kwangtung-Fukien border to Chaoan. Thence it proceeds to Yunsiao, Changpu, Changchow, and Amoy. From Amoy it proceeds to Chuanchow, Hinghwa, and Foochow, the capital of Fukien. After Foochow it proceeds in the same direction as the Foochow-Chinkiang line, as far as Fuan, then turns eastward to Funing, and northward to Futing. After Futing it crosses the Fukien border into Chekiang and proceeds through Pingyang to Wenchow. At Wenchow it crosses the Wukiang and proceeds to Lotsing, Hwangyen, and Taichow. Thence, it proceeds through Ninghai to Ningpo, its own terminus, where it connects with the Ningpo-Hangchow line, thus linking it up with the Great Eastern Port via Hangchow. This line covers a distance from Canton to Ningpo of about 1,100 miles.

月 南京韶州线

此线自南京起，循扬子江右岸而上，至于太平、芜湖、铜陵、池州、东流以后，出安徽界，入江西之彭泽，遂至湖口。在湖口与东方大港重庆线会，即用该线之桥，以至鄱阳港。于是沿鄱阳湖之西岸，经过南康（星子）、吴城，以至南昌，与温州辰州线及福州武昌线会于南昌。由南昌溯赣江谷地而上，由临江（江渡）至吉安，与建昌沅州之计划线交于吉安。由吉安至于赣州，复与福州桂林线交焉。于是进向南康县，及南安。南安以后，过大庾岭分界处，入广东之南雄。于是经始兴，至韶州，与粤汉线会。此线长约八百英里。

盈 南京嘉应线

此线自南京起，进至溧水、高淳。于是出江苏界，入安徽之宣城。自宣城进至宁国及徽州（歙县）。徽州以后，出安徽界，入浙江界，经开化、常山及江山。出浙江界，入福建之浦城。自浦城，由建宁（建瓯）以至延平，与福州武昌线交，更过沙县、永安以至宁洋，与福州桂林线及厦门建昌线会。自宁洋复进至龙岩、永定，至松口与厦门广州线合，迄嘉应而止。所经之路约七百五十英里。

昃 东方南方两大港间海岸线

此线自南方大港广州起，与广九铁路采同一方向，行至石龙，乃自择路线，取东江沿岸一路，以至惠州。由惠州经三多祝、海丰、陆丰，转东北行，至揭阳及潮州。潮州以后，经饶平出广东界，入福建之诏安。自诏安经云霄、漳浦、漳州，以及厦门。由厦门，历泉州、兴化，

而至福州省城。自福州以后，用与福州镇江线同一之方向抵福安，乃转而东，至福宁，又转而北，至福鼎。过福鼎后，出福建界，入浙江界，经平阳，至温州。于温州渡瓯江，进至乐清、黄岩、台州，又进历宁海，至于宁波，以为终点。即用杭甬铁路，经杭州，以与东方大港相接。此线自广州至宁波，长约一千一百英里。

m. The Kienchang-Yuanchow Line

This line starts from Kienchang and runs through Yihwang, Loan, Yungfeng, and Kishui to Kian, where it crosses the Nanking-Siuchow line. After Kian it proceeds to Yungsin and Lienhwa where it meets the Swatow-Changteh line. Thence it crosses the Kiangsi border into Hunan, at Chaling, then through Anjen to Hengchow where it crosses the Canton-Hankow line. From Hengchow the line proceeds to Paoking where it crosses line (a) of the Canton-Chungking Railway then westward to Yuanchow, its terminus, where it joins with the Shasi-Singyi line. This line covers a distance of about 550 miles. The total length of this Southeastern Railway System is about 9,000 miles.

Part III The Northeastern Railway System

This system will cover the whole of Manchuria, a part of Mongolia, and a part of Chihli province—an area of nearly 500,000 square miles, with a population of 25,000,000. This region is surrounded by mountains on three sides and opens on the south to the Liaotung Gulf. Amidst these three mountain ranges lies a vast and fertile plain drained by three rivers—the Nonni on the north, the Sungari on the northeast, and the Liaoho on the south. This part of China was once regarded as a desert, but since the completion of the Chinese Eastern Railway it has been found to be the most productive soil in China. It supplies the whole of Japan and a part of China with nitrogenous food in the form of soya bean. This bean, the wonderful properties of which were early discovered by the Chinese, contains the richest nitrogenous substance among vegetables and has been used as a meat substitute for many thousand years. Vegetable milk is extracted from this bean, and from this milk various kinds of preparations are made. The extraction from this bean has been proved by modern chemists to be richer than any kind of meat. The Chinese and the Japanese have used this kind of artificial meat and milk from time immemorial. Recently food administrators in Europe and America have paid great attention to this meat substitute, while the export of soya bean to Europe and America has steadily increased. This Manchu-Mongolian plain is destined to be the source of the world's supply of soya bean. Besides soya bean, this plain also produces a great quantity of various kinds of grains, and supplies the entire Eastern Siberia with wheat. The Manchurian mountains are exceedingly rich in timber and minerals—gold being especially found in great quantities in many localities.

辰 建昌沅州线

此线自建昌起，行经宜黄、乐安、永丰、吉水，以至吉安，即于该地与南京韶州线相交。由吉安进而及永新、莲花，与汕头常德线会。于是出江西界，入湖南之茶陵，乃经安仁，至衡州，遇粤汉线。于是由衡州更进至宝庆，则与广州重庆甲线交焉。由是西行，至于终点沅州（芷江），与沙市兴义线相遇。此线长约五百五十英里。东南铁路系统各线，全长统共约九千英里。

第三部 东北铁路系统

此系统包括满洲之全部，与蒙古及直隶省之各一部分，占有面积约五十万英方里，人口约二千五百万。其地域三面为山所围绕，独于南部则开放，直达至辽东海湾。在此三山脉之中，低落成为一广浩肥美之平原，并为三河流所贯注，嫩江位于北，松花江位于东北，辽河位于南。此之境界，中国前时视之，等于荒漠，但自中东铁路成立后，始知其为中国最肥沃之地。此地能以其所产大豆，供给日本全国与中国一部分为食料之用。此种大豆为奇美物品，在植物中含有最富蛋白质之物，早为中国人所发明；经用以代肉品，不下数千年。由此种大豆可以提出一种豆浆，其质等于牛奶，复由此种豆奶制成各种食品，此种食品为近代化学家所证明，其涵肉质比肉类尤为丰富；而中国人与日本人用以当肉与奶用者，已不知其始自何时矣。近来欧美各国政府之粮食管理官，对于此项用以代肉之物品，其为注意。所以此种大豆之输出于欧美者，亦日见增加。由此观之，满洲平原确可称为世界供给大豆之产地。除此大豆以外，此平原并产各种谷类极多，就麦一类言之，已足供西伯利亚东部需用。至于满洲之山岭，森林、矿产素称最富，金矿之发见于各地者亦称最旺。

Railway construction in this region has proved to be a most profitable undertaking. At present there are already three railway systems tapping this rich country, viz., the Peking-Mukden line, the best paying railroad in China, the Japanese South-Manchurian Railway, also a very remunerative line, and the Chinese Eastern Railway, the best paying portion of the whole Siberian system. Besides these, there are many lines projected by the Japanese. In order to develop this rich region properly a network of railways should be projected.

Before dealing with the separate lines of this network of railways, I should like to propose a center for them, just as the spider's nest is to a cobweb. I shall name this central city "Tungchin," the Eastern Mart, which should be situated at a point southwest of the junction of the Sungari and Nonni rivers, about 110 miles west by south from Harbin, and will be in a more advantageous position than the latter. This new city will be the center not only of the railway system but also of the inland water communication when the Liaoho-Sungari Canal is completed.

With the projected city of Tungchin as a center, I propose the following lines:

- a. The Tungchin-Hulutao line.

- b. The Tungchin-Great Northern Port line.
- c. The Tungchin-Dolon Nor line.
- d. The Tungchin-Kerulen line
- e. The Tungchin-Moho line.
- f. The Tungchin-Korfen line.

敷设铁路于此境域，经已证明其为最有利益之事业。现已成立铁路贯通于此富饶区域者，已有三干线。如京奉线，为在中国之最旺铁路；日本之南满铁路，亦为获利最厚路线；中东铁路，又为西伯利亚系统之最旺部分。除此以外，尚有数线为日本人所计划经营。如欲依次发展此之富庶区域，即应敷设一网式铁路，乃足敷用也。

在未论及此网式铁路之各支线以前，吾意以为当先设立一铁路中区，犹蜘蛛巢之于蜘蛛网也。吾且名此铁路中区曰“东镇”。此东镇当设立于嫩江与松花江合流处之西南，约距哈尔滨之西南偏一百英里，将来必成为一最有利益之位置。此之新镇，不独可为铁路系统之中心，至当辽河、松花江间之运河成立后，且可成为水陆交通之要地。

既以此计划之新市镇“东镇”为中区，吾拟建筑如下之各线：

天 东镇葫芦岛线。

地 东镇北方大港线。

玄 东镇多伦线。

黄 东镇克鲁伦线。

宇 东镇漠河线。

宙 东镇科尔芬线。

g. The Tungchin-Yaoho line.

h. The Tungchin-Yenchi line.

i. The Tungchin-Changpeh line.

j. The Hulutao-Jehol-Peking line.

k. The Hulutao-Kerulen line.

l. The Hulutao-Hailar line.

m. The Hulutao-Antung line.

n. The Moho-Suiyuan line.

o. The Huma-Chilalin or Shihwei line.

p. The Ussuri-Tumen-Yalu-Coast line.

q. The Linkiang-Dolon Nor line.

r. The Chikatobo-Sansing or Ilan line.

s. The Sansing or Ilan-Kirin line.

t. The Kirin-Dolon Nor line.

a. The Tungchin-Hulutao Line

This is the first line that radiates from this projected Manchurian railway center, and is the shorter of the two direct lines that lead to the ice-free ports on the Liaotung-Chihli Gulf. It runs almost parallel to the South Manchurian Railway, the distance between the two lines being about 80 miles at the northern end, converging to 40 miles at Sinmin, and diverging again after that point. According to the original agreement with the former Russian Government, no parallel line within 100 miles was allowed to be built. But such restriction must be abolished under this new International Development Scheme for the benefit of all concerned. This line starts from Tungchin, and proceeds southward across the vast Manchurian plain by Changling, Shuangshan, Liaoyuan, and Kangping, to Sinmin in a straight line covering a distance of about 270 miles. After Sinmin, the line joins the Peking-Mukden Railway and runs on the same track for a distance of about 130 miles to Hulutao.

b. The Tungchin-Great Northern Port Line

This line is the second that radiates from this railway center direct to a deep water ice-free seaport. It starts from Tungchin, proceeding in a southwesterly direction, passes Kwangan, midway between Tungchin and the West Liaoho, and many other small settlements before it crosses the Liaoho. After crossing the Liaoho, it enters the mountainous regions of the Jehol district by a valley to Fowsin, a hsien city, and crosses the watershed into the Talingho Valley. After passing through the Talingho Valley, the line crosses another watershed into the Luan Valley by a branch of the same river. Then it penetrates the Great Wall and proceeds to the Great Northern Port by way of Yungping and Loting. The whole length of this line is about 550 miles, the first half of which is on level land and the second half in mountainous country.

洪 东镇饶河线。

荒 东镇延吉线。

日 东镇长白线。

月 葫芦岛热河北京线。

盈 葫芦克鲁伦线。

昃 葫芦岛呼伦线。

辰 葫芦岛安东线。

宿 漠河绥远线。

列 呼玛室韦线。

张 乌苏里图们鸭绿沿海线。

寒 临江多伦线。

来 节克多博依兰线。

暑 依兰吉林线。

往 吉林多伦线。

天 东镇葫芦岛线

此是由计划中之满洲铁路中区分出之第一线。比较其他直达辽东半岛之不冰口岸之二线为短，路线与南满铁路平行。在两线之北部末尾，相距约八十英里。依据与俄前政府所订原约，不能在南满铁路百里以内建筑并行路线，但当施行国际发展计划，为共同利益起见，此等约束必须废除。此线起自东镇，向南延进，经过满洲大平原，由长岭、双山、辽源、康平而至新民，成为一直线，约有二百七十英里之长。过新民后，即与京奉铁路合轨，约行一百三十英里之长，即至葫芦岛。

地 东镇北方大港线

此是由铁路中区直达不冰之深水港之第二线。起自东镇，向西南方延进，经过广安于东镇与西辽河间之中道。在未到西辽河以前，先须经过无数小村落。当经过辽河之后，即进入热河区域之多山境界。经过一谷地至阜新县城，再经过分水界，进入大凌河谷地。当经过大凌河谷地之后，此线即由此河之支流，再经一分水界而入于滦河谷地。然后通过万里长城，取道永平与乐亭，而至北方大港。此线共长约五百五十英里，前半截所经过者是平地，后半截所经过者是山区。

c. The Tungchin-Dolon Nor Line

This is the third line that radiates from the railway center and proceeds nearly in a westerly direction across the plain to Taonan where it crosses the projected Aigun-Jehol line (Japanese), and also meets the termini of two other projected lines, the Changchun-Taonan and the Tsengkiatun-Taonan (Japanese). After Taonan, the line turns more southward by skirting along the foothills of the southeastern side of the Great Khingan range where vast virgin forests and rich minerals are found. Then it passes through the upper Liaoho Valley formed by

the Great Khingan Mountain on the north, and the Jehol Mountain on the south and through the towns of Linsi and Kingpang to Dolon Nor, where it meets the trunk line of the Northwestern Railway system. This line covers a distance of about 480 miles, a greater part of which is on level land.

d. The Tungchin-Kerulen Line

This is the fourth line that radiates from the Tungchin Railway center. It runs in a northwesterly direction almost parallel with the Harbin-Manchuli line of the Chinese Eastern Railway, the distance between the two lines varying from 100 to 130 miles. The line starts from Tungchin on the north side of the junction of the Nonni and Sungari rivers and proceeds westward across the Nonni River to Talai, and then turns northwestward across the plain into the valley of the north branch of the Guileli River. After entering the valley, it follows the stream up to its source, then crosses the Great Khingan Mountain watershed into the Mongolian Plain by the Khalka River, and follows the right bank of this river to the north end of Bor Nor Lake. Thence it turns directly westward to the Kerulen River, and follows the south bank of the river to Kerulen. This line covers a distance of about 630 miles.

玄 东镇多伦线

此是由铁路中区分出之第三线。向西方直走，经过平原，至洮南。由此横过日本之计划瑗珲热河线，并与长春洮南及郑家屯洮南两计划路线之终点相合。经过洮南后，此线即沿大兴安岭山脉东南方之山脚转向南走，在此一带山脉，发见有最丰盛之森林与富饶之矿产。然后经过上辽河谷地，此谷地即由在北之大兴安岭与在南之热河山所成。再通过林西与经棚等市镇，至多伦，于是由此处与西北铁路系统之干线相合。此线长约有四百八十英里，大半皆在平地。

黄 东镇克鲁伦线

此由东镇铁路中区分出之第四线。向西北走，几与中东路之哈尔滨满洲里线平行。两线相隔之距离，由一百英里至一百三十英里不等。此线由嫩江与松花江合流处之东镇北部起，复向西渡嫩江，至大赉，转西北向，横过平原，进入奎勒河之北支流谷地。当进入此谷地后，即沿此河流直上至河源处，然后横过大兴安岭分水界，进入蒙古平原。于是从哈尔哈河之右岸至贝尔池北之末端，由彼处转向西走，至克鲁伦河，即循克鲁伦河南岸至克鲁伦。此线约共长六百三十英里。

e. The Tungchin-Moho Line

This is the fifth line that radiates from this railway center. It starts from the north side of the junction of the Nonni and Sungari rivers, and proceeds northwestward across the northern end of the Great Manchurian Plain to Tsitsiha. At Tsitsiha, it joins the projected Kinchow-Aigun line and proceeds together northwestward alongside the left bank of the Nonni River as far as Nunkiang where it separates from the other. Thence it resumes the northwesterly direction and proceeds into the upper Nonni Valley until the headwater is reached. Then it crosses the northern extremity of the Great Khingan Range to Moho, where it joins the terminus of the Dolon Nor-Moho line. This line is about 600 miles long. About a quarter of this length runs on the plain, the second quarter runs along the lower Nonni Valley, the third along the Upper Valley, and the fourth runs in mountainous but gold-bearing regions, where only physical difficulties are to be expected.

f. The Tungchin-Korfen Line

This is the sixth line from the railway center. It also starts on the northern side of the Nonni-Sungari junction, and proceeds across the plain by the cities Chaotung and Tsing kang. After Tsing kang it crosses the Tungkun River, proceeds to Hailun, and then, ascending the Tungkun Valley, crosses the watershed of the Little Khingan Mountain. Thence it descends into the Korfen Valley and proceeds by Chelu to Korfen on the right bank of the Amur River. This line covers a distance of 350 miles, two thirds of which run on comparatively level land and one third in mountainous district. This is the shortest line from Tungchin to the Amur River and the Russian territory on yonder side.

g. The Tungchin-Yaoho Line

This is the seventh line that radiates from this railway center. It starts from the northern side of the Nonni-Sungari junction and traverses the plain on the left of the Sungari River by Chaochow, then crosses the Chinese Eastern Railway, and the Hulan River to Hulan. After Hulan, it proceeds to Payen, Mulan, and Tungho, then crosses the Sungari River to Sansing, now called Ilan. Thence it proceeds into the Wokan Valley and crosses the watershed by Chihshingshitse and Takokai into the Nolocho Valley and passing by various villages and towns along this river to Yaohohsien, ends at the junction of the Nolocho and the Ussuri River. This line covers a distance of 500 miles in very fertile country.

宇 东镇漠河线

此是由铁路中区发出之第五线。起自嫩江与松花江合流处之北部，向西北行，横过满洲平原之北端，至齐齐哈尔。在齐齐哈尔与计划之锦瑗线相会，同向西北方，沿嫩江左岸走，至嫩江，而后彼此分路。于是再向西北走，进入嫩江上流谷地，至发源处再横过大兴安岭山脉之北部末尾处至漠河，在漠河与多伦漠河线之末站相会。此线约长六百英里。全线首之四分一行经平原，其次之四分一沿嫩江下流走，第三之四分一行经上流谷地，第四之四分一截经山岭。是为金矿产地，但天然险阻亦意中事也。

宙 东镇科尔芬线

此是由铁路中区分出之第六线。起至嫩江与松花江合流处之北边，向平原前行，经肇东、青冈等城镇。到青冈后，渡通肯河，至海伦。然后上通肯河谷地，横过小兴安岭分水界，由此即向下进入科尔芬谷地。经车陆前行，至科尔芬，即黑龙江之右岸也。此线共长约三百五十英里，三分二为平地，三分一为山地。此为由东镇至黑龙江之最短线，黑龙江之对岸即俄境也。

洪 东镇饶河线

此是由铁路中区分出之第七线。起自嫩江、松花江合流处之北边，经肇州，绕松花江左岸行经平原，而后再横过中东铁路，渡呼兰河，而至呼兰。过呼兰后，向巴彦、木兰、通河等地方前进，再渡松花江至三姓，即今名依兰地方也。于是向前进入倭肯河谷地，过分水界，经七星碣子与大锅盖等地方，进入饶河谷地。于是沿此河边经过无数村落市镇，始至饶河县，以饶河与乌苏里江合流处为终点。此线之距离约有五百英里，所经之处皆为肥美土地。

h. The Tungchin-Yenchi Line

This is the eighth line that radiates from this railway center. It starts from the eastern side of the Nonni-Sungari junction and proceeds in a southeasterly direction on the right side of the Sungari River to Fuyu or Petunai and various towns along the road on the same side of the river until it comes across the Harbin-Talien Railway, then turns away from the road and proceeds eastward to Yushu and Wuchang. After Wuchang, the line turning more southward, proceeds to Fengtechang and then follows the same direction to Omu. At Omu, it crosses the Mutan River, then proceeds to Liangshuichuan and Shehtauho, where it joins the Japanese Hweining-Kirin line and proceeds together to Yenchi. This line covers a length of about 330 miles through very rich agricultural and mineral country.

i. The Tungchin-Changpeh Line

This is the ninth line that radiates from the Tungchin railway center. It starts from the south side of the Nonni-Sungari junction and proceeds in a southeasterly direction across the plain to Nungan. After Nungan, it crosses the Itung River and proceeds continuously in the same direction across several branches of the same river to Kiudaichan, where it joins the Changchun-Kirin line and proceeds together as far as Kirin. After Kirin, it goes its own way following the right bank of the Sungari River in a southeasterly direction to the junction of Lafaho River and turns southward along the same bank of the Sungari to Huatien. After Huatien, it continues in the same course up to Toutaokiang, as far as Fusung, then turns southeastward into the Sunghsiangho Valley and proceeds upward to the Changpeh Shan watershed by skirting the south side of the Celestial Lake, then turns southward following the Aikiang River to Changpeh on the Korean frontier. This line covers a distance of about 330 miles. Some great difficulties are to be overcome in the last portion of the line where it crosses the Changpeh watershed.

荒 东镇延吉线

此是第八线，由铁路中区分出。起自嫩江、松花江会流处之东边，循松花江右岸，向东南方前行，至扶余（又名伯都讷），并经过此江边之镇甚多，至横过哈尔滨大连铁路后，即转向东行，至榆树与五常等地方。到五常后，此线转偏南行，向丰德栈前进，而后依同一方向至额穆。于是由额穆渡牡丹江，然后向凉水泉与石头河前行，至此即与日本会宁吉林线合轨，直达于延吉。此线约共长三百三十英里，经过各农产与矿产极丰富之地方。

日 东镇长白线

此是由铁路中区分出之第九线。起自嫩江、松花江相会处之南部，向东南方走，横过平原，至农安。渡伊通河，相继向同一方进行，经过此河之各支流，至九台站。复由此与长春吉林线合轨，直行至吉林。迨至吉林后，则由其本路循松花江右岸，向东南行至拉法河合流处，即沿松花江河岸转南行，至桦甸。即再由此溯流而上，至头道沟，直达抚松。即转东南行，进入松香河谷地。再溯流前行，经长白山分水界，绕天地湖边南部，然后转向循爱江至长白，即近高丽边界地方也。此线之距离约共三百三十英里。最后之一部分，当经过长白分水界时，须历许多困难崎岖之地。

j. The Hulutao-Jehol-Peking Line

With this line I shall begin to deal with a new group of the Northeastern Railway System which will make Hulutao, the ice-free port on the Liaotung Gulf as their center and terminus. This, the first

line, starts from Hulutao and proceeds westward up the Shaho Valley to Sintaipienmen. Thence it crosses the mountainous district through Haiting, Mangniuyingtse, and Sanshihkiatse to Pingchuan, and continues in the same direction to Jehol or Chengteh. After Jehol, it proceeds by the old imperial highway to Lwanping, then turns southwestward to Kupehkwow where it penetrates the Great Wall. Thence it follows the same highway through Miyun and Shunyi to Peking. This line covers a distance of about 270 miles.

k. The Hulutao-Kerulen Line

This is the second line of the Hulutao radiation. It starts from this seaport and proceeds northward through the mountainous region of Jehol by Kienping and Chihfeng. Thence, the line follows the highway across the Upper Valley of Liaoho to Chianchang, Sitoo, Takinkou, and Linsi. After Linsi, it proceeds up the Lukiako Valley and crosses the watershed at the southern extremity of the Great Khingan Mountain, through Kanchumiao and Yufuchih. Then it proceeds to Payenbolak, Uniket, and Khombukure where it joins with the Dolon Nor-Kerulen line and proceeds together to Kerulen. This line up to Khombukure covers a distance of about 450 miles, tapping a very rich mineral, timber, and agricultural country.

l. The Hulutao-Hailar Line

This, the third line, starts from Hulutao and proceeds by way of Chinchow along the west side on the Talingho River to Yichow, where it crosses the Talingho to Chinghopienmen and Fowsin. After Fowsin, the line goes northward to Suitung, thence, crossing the Siliaoho to Kailu, it proceeds between the Great and Little Fish Lakes to Kinpan and Tachuan. Then it proceeds across the Great Khingan Mountain into the Oman Valley and follows the same river to Hailar. This line covers a distance of about 600 miles passing through rich mineral and agricultural land and virgin forests.

月 葫芦岛热河北京线

由此吾将从而另为计划东北铁路系统之一新组，此组以辽东半岛之不冰口岸葫芦岛为总站。此第一线起自葫芦岛，向西方走进沙河谷地，

至新台边门。于是行过海亭、^桦牛营子、三十家子之多山境界，至平泉，复依同一方向直达热河（又名承德）。到热河后，由旧官路至滦平，然后转西南向，至古北口，通过万里长城，由彼处循通路经密云与顺义，至北京。此线之距离约有二百七十英里。

盈 葫芦岛克鲁伦线

此是由葫芦岛分出之第二线。起自葫芦岛口岸，向北直走，经建平与赤峰。行过热河之多山地域后，此线循通道而行，过辽河谷地上部，至间场、西图、大金沟与林西等地方。到林西即进至陆家窝谷地，即由甘珠庙、右府迹，经过大兴安岭极南之水分界。然后再进至巴原布拉克、乌尼克特及欢布库列，由此即与多伦克鲁伦线合轨，直达克鲁伦。此线以达至欢布库列计之，约长四百五十英里，经过丰富之矿产、木材、农业等地方。

晨 葫芦岛呼伦线

此是由葫芦岛分出之第三线。取道锦州，循大凌河右边直走至义州，由此渡大凌河，至清河边门与阜新。到阜新后，此线即向北直行至绥东，由此渡西辽至开鲁，再由大鱼湖与小鱼湖之间直达合板与突泉。然后横过大兴安岭，进入阿满谷地，沿河流直达呼伦。此线长约六百英里，所经过地方皆富于矿产与农业，并有未开发之森林。

m. The Hulutao-Antung Line

This, the fourth line, starts from Hulutao and proceeding northeastward, follows the course of the projected Liaoho-Hulutao Canal, and then goes eastward to Newchwang and Haicheng. From there it proceeds southeastward to Sinmucheng, where it joins the Antung-Mukden line and proceeds together to Antung on the Korean border. This line covers a distance of about 220 miles. This together with the Hulutao-Jehol-Peking line will make the shortest line from Antung and beyond, i. e., Korea, to Peking.

n. The Moho-Suiyuan Line

With this as the first I am going to deal with another group of lines in this system. These will be the circumferential lines which link up the radii from the Tungchin center in two semicircles, the outer and the inner. This Moho-Suiyuan line starts from Moho and proceeds along the right bank of the Amur River to Ussuri, Omurh, Panga, Kaikukang, Anlo, and Woshimen. After this point, the river bends more southward and the line follows the same bend to Ankan, Chahayen, Wanghata, and Huma. From Huma, it proceeds to Sierhkenchi, Chila, Manchutun, Heiho, and Aigun where it meets the terminus of the Chinchow-Aigun line. After Aigun, the line turns more eastward to Homolerhchin, Chilirh, and Korfen where it meets the terminus of the Tungchin-Korfen line. Thence it proceeds to Wuyun, Foshan, and Lopeh. After Lopeh, it goes to Hokang at the junction of the Amur and Sungari. At this point, the line crosses the Sungari River

to Tungkiang and proceeds to Kaitsingkow, Otu, and Suiyuan where it ends. This line covers a distance of 900 miles running all its way through the gold-producing region.

o. The Huma-Chilalin or Shihwei Line

This is merely a branch of the Moho-Suiyuan line. It starts from Huma and follows the Kumara River passing by the Taleitse Gold Mine and Wapalakow Gold Mine. Then it proceeds up the Kumara River in a westerly and southwesterly direction to its southern source and there it crosses the watershed into the Halarh Valley, thence descending the valley to Chilalin or Shihwei. This line covers a distance of about 320 miles running in an extremely rich gold district.

辰 葫芦岛安东线

此第四线，自葫芦岛起，向东北方走，循计划中之辽河葫芦岛运河边直上，而后转东南行至牛庄与海城，由此再转东南行至析木城，于是与安东奉天线合轨，直达近高丽境界之安东。此线约长二百二十英里。此线与葫芦岛热河北京线连合，则成为一由安东以外之高丽至北京之至直捷之线矣。

宿 漠河绥远线

此是别一组铁路系统中之第一线，吾且进而论之。此等为环形线，以东镇中区为轴，成二半圆形，一内一外。此之漠河绥远线，起自漠河，沿黑龙江边前进至乌苏里、额木尔苹果、奎库堪、安罗、倭西们等地。过彼处后，此后转折南流，故此线亦循之至安干、察哈颜、望安达、呼玛等处。于是再由呼玛前行，至锡尔根奇、奇拉、满洲屯、黑河、瑗琿，在瑗琿乃与锦瑗线之终点相会。过瑗琿后，此线即渐转而东向，直达霍尔木勒津、奇克勒与科尔芬等处，在科尔芬与东镇科尔芬线相会。然后由彼处再进至乌云、佛山与萝北，由萝北直至同江，此即黑龙江与松花江会流之点也。此线即由此处渡松花江，抵同江。再由此向街津口额图前行，至绥远，即黑龙江与乌苏里河之合流处也。此线长约九百英里，至所经之地方，皆系金矿产地。

列 呼玛室韦线

此本是漠河绥远线之支线。起自呼玛，循库玛尔河，经过大砬子与瓦巴拉沟等金矿。然后溯库玛尔而上，向西行，又西南偏至此河北源。遂由彼处过分水界，进入哈拉尔谷地，于是由此谷地上达室韦。此线约长三百二十英里，经过极丰富之金矿地方。

p. The Ussuri-Tumen-Yalu-Coast Line

This, the second line of the outer semicircle, starts by continuing the first line at Suiyuan, and proceeds along the left bank of the Ussuri River, passing Kaulan, Fuyeu, and Minkang, to Yaoho, where it meets the terminus of the Tungchin-Yaoho line. From Yaoho, it runs parallel to the Russian Ussuri Railway on the east side of the river as far as Fulin. After Fulin, it parts from the Russian line by turning westward following the Mulingho River to Mishan on the northwestern corner of the Hanka Lake. Thence it goes to Pinganchin, turns southward alongside the boundary line and crosses the Harbin-Vladivostok line at Siusuifen Station to Tungning. After Tungning, it continues the same southward course alongside the boundary line to a point between Szetaukow and Wutaukow, then turns westward to Hunchun, and northwestward to Yenchu where it meets the projected Japanese Hweining-Kirin line. From Yenchu, it follows the Japanese line to Holung, and proceeds southwestward by the left side of the Tumen River across the watershed into the Yalu Valley, where it meets the Tungchin-Changpeh line. After Changpeh it turns westward and northwestward following the right bank of the Yalu to Linkiang, thence southwestward, still following the right bank of the Yalu, to Tsianhsien and then continues in the same direction, along the Yalu bank, to Antung, where it meets the Antung-Mukden Railway. After Antung, it proceeds to Tatungchow at the mouth of the Yalu, thence along the coast to Takushan and Chwangho, then westward through Situn and Pingfangtien to join the South Manchurian Railway at Wukiatus. This line covers a distance of 1,100 miles, which runs from end to end right along the southeastern boundary of Manchuria.

q. The Linkiang-Dolon Nor Line

This is the third line of the outer semicircle of the Tungchin railway center, and connects the radiating lines south of the center. It starts from Linkiang at the southwestward turn of the Yalu River, and proceeds across the mountainous region passing by Tunghwa, Hingking, and Fushun, to Mukden, where it crosses the South Manchurian Railway. From Mukden, it goes together with the Peking-Mukden line as far as Sinmin, where it crosses the Tungchin-Hulutao line and proceeds northwestward through Sinlihtun to Fowsin. After Fowsin the line enters the hilly district of the upper Liaoho Valley, and proceeds to Chihfeng, after passing through numerous small villages and camping places in this vast pasture. After Chihfeng the line proceeds through the Yinho Valley by Sanchotien, Kungchuling, and Tachientse, to Famuku, thence follows the Tulakanho to Dolon Nor, covering a distance of about 500 miles.

张 乌苏里图们鸭绿沿海线

此是外半圆形之第二线。由绥远起与第一线相续，沿乌苏里江前行，经过高兰、富有、民康等处，至饶河，于是此线与东镇饶河线之末站相会。由饶河起南行，则与在乌苏里江东边之俄乌铁路成平行线，直达虎林而止。到虎林后即离俄罗斯线，转向西方，循穆陵河至兴凯湖之西北角之密山县。由此再至平安镇，转南向，循国界在小绥芬车站横过哈尔滨海参威线，直至东宁。到东宁后相继南向，循国界而行，至五道沟与四道沟间之交点。然后转而西行，至琿春，再西北走至延吉，于是与日本之会宁吉林线相会。由延吉循日本线至和龙，离日本线由图们江左岸向西南走，经过分水界，进入鸭绿谷地，即在此处与东镇长白线相会。过长白后即转西向，又西北偏，沿鸭绿江右岸至临江。彼时又复西南偏，仍沿鸭绿江右岸前行，至辑安县。再相继依同一方向，沿鸭绿江右岸直达安乐，由此即与安东奉天铁路相会。过安东后，向鸭绿江口之大东沟前走，循此海岸线至大孤山与庄河等处。然后转而西向，经平西屯、房店，至吴家屯，与南满铁路相会。此线之距离约有一千一百英里，自头至尾皆依满洲东南之国界而行也。

寒 临江多伦线

此是东镇铁路中区外半圆之第三线。与在中区南部分出之支线相接。此线起自临江，即鸭绿江之西南转弯处也。由此处向多山地域前进，经过通化、兴京与抚顺等地方，至奉天，横过南满铁路。于是此线由奉天与京奉线合轨，直达新民。由此横过东镇葫芦岛线，转向西北走，经过新立屯，至阜新。过阜新后，此线进入辽河谷地上部之山地，直向赤峰前行，经过无数小村落与帐幕地，皆大牧场也。此线由赤峰再前行，经三座店、公主陵、大碾子等处，通过银河谷地至发木谷，然后循吐根河至多伦诺尔。此线长五百英里。

r. The Chikatobo-Sansing or Ilan Line

This is the first line of the inner semicircle which connects the radiating lines from the Tungchin railway center on the northeast. It starts from Chikatobo on the upper reach of the Amur, and proceeds eastward and southeastward through many valleys and mountains of the Great Khingan Range to Nunkiang. After Nunkiang, it goes in a more southerly direction to Keshan, thence to Hailun, and then crosses the Sungari to Sansing or Ilan. This line covers a distance of about 700 miles, passing through an agricultural and gold-producing country.

s. The Sansing or Ilan-Kirin Line

This is the second line of the inner semicircle. It starts from Sansing and proceeds southwestward along the right bank of the Mutan River through Tauchan, Erchan, Sanchan, and Szuchan, to

Chengtse where it crosses the Harbin-Vladivostok line. Then it goes to Ninguta, after crossing over the Mutan River from right to the left bank. After Ninguta it proceeds southwestward passing through Wungcheng, Lanchichan, Talachan, and Fungwangtien, to Omu. From Omu it joins the Japanese Hweining-Kirin line and proceeds westward to Kirin. This line covers a distance of about 200 miles, along the fertile Mutan Valley.

t. The Kirin-Dolon Nor Line

This is the third line of the inner semicircle in the Tungchin system. It starts from Kirin and follows the old highway westward to Changchun where it meets the termini of the Chinese Eastern Railway from the north and the Japanese South Manchurian Railway from the south. After Changchun, it proceeds across the plain to Shuangshan where it meets the Tungchin-Hulutao line and the Japanese Szuping kai-Chengkiatun-Taonan line. From Shuangshan, it crosses the Liao River to Liaoyuan, thence it traverses the vast plain, crossing the Tungchin-Great Northern Port line and goes to Suitung where it meets the Hulutao-Hailar line. After Suitung, it proceeds up the Liao Valley where it comes across the Hulutao-Kerulen line and then crosses the watershed to Dolon Nor where it ends. This line covers a distance of 500 miles. This completes the cobweb system of the projected Northeastern Railway. The total length of this entire system is about 9,000 miles.

来 节克多博依兰线

此是内半圆形之第一线。与东镇铁路中区之东北方所分出之各支线相连。起自黑龙江上游之节克多博，向东前行，又东南偏，经过大兴安岭山脉之谷地、山地数处，即至嫩江。过嫩江后，渐转南向，至克山，由彼处再至海伦，然后渡松花江至三姓，即依兰也。此线长约七百英里，经过农业与金矿地方。

暑 依兰吉林线

此是内半圆之第二线。起自依兰，向西南方，沿牡丹江右岸前行，经过头站、二站、三站、四站，到城子，即由此处横过哈尔滨海参威线。于是由牡丹江右岸渡至左岸，直往宁古塔。过宁古塔后，复向西方前行，经过瓮城、蓝旗站、搭拉站与凤凰店，至额穆。于此与日本之会宁吉林线相合，向西前行，至吉林。此线所行之长度线约二百英里，经过牡丹江之肥美谷地。

往 吉林多伦线

此是在东镇铁路系统中内半圆形之第三线。起自吉林，循旧通路西行至长春，于是在此与中东铁路北来之线及日本南满铁路南来之线之两末站相会。过长春后，即横过平原，至双山，又在此与东镇葫芦岛线及日本之四平街郑家屯洮南线相会。再由双山渡辽河，至辽源，复由彼处行经一大平原，经过东镇北方大港线，直达绥东，与葫芦岛呼伦线相会。过绥东后，循辽河谷地上行，先横过葫芦岛克鲁伦线，然后过分水界至多伦，是为终站。此线所经之远度约有五百英里。由以上所举，方能完成吾计划中东北铁路之蜘蛛网系统。就全系统路线之长言之，其总数约有九千英里。

Part IV The Extension of the Northwestern Railway System

The Northwestern Railway System covers the region of Mongolia, Sinkiang, and a part of Kansu, an area of 1,700,000 square miles. This territory exceeds the area of the Argentine Republic by 600,000 square miles. Argentina is now the greatest source of the world's meat supply, while the Mongolian pasture is not yet developed, owing to the lack of transportation facilities. As Argentina has superseded the United States in supplying the world with meat, so the Mongolian pasture will some day take the place of Argentina, when railways are developed and cattle raising is scientifically improved. Thus the construction of railroads in this vast food-producing region is an urgent necessity as a means of relieving the world from food shortage. In the first program of this International Development Scheme, I proposed 7,000 miles of railways for this vast and fertile region, for the purpose of developing the Great Northern Port, and relieving the congested population of southeastern China. But this 7,000 miles of railways form merely a pioneer line. In order to develop this virgin continent properly, more railways have to be constructed. Therefore in this plan, namely, the Extension of the Northwestern Railway System, I propose the following lines:

- a. The Dolon Nor-Kiakata line.
- b. The Kalgan-Urga-Tannu Ola line.
- c. The Suiyuan-Uliassutai-Kobdo line.
- d. The Tsingpien-Tannu Ola line.
- e. The Suchow-Kobdo line.
- f. The Northwestern Frontier line.
- g. The Tihwa or Urumochi-Ulankom line.
- h. The Gaskhiun-Tannu Ola line.
- i. The Uliassutai-Kiakata line.
- j. The Chensi or Barkul-Urga line.

第四部 扩张西北铁路系统

西北铁路系统包有蒙古、新疆与甘肃一部分之地域，面积约有一百七十万英方里。此幅土地，大于阿根廷共和国约六十万英方里。阿根廷为供给世界肉类之最大出产地，而蒙古牧场尚未开发，以运输之不便利也。以阿根廷既可代美国而以肉类供给世界，如蒙古地方能得铁路利便，又能以科学之方法改良畜牧，将来必可取阿根廷之地位而代之。此所以在此最大食物之生产地方建筑铁路为最要之图，亦可以救济世界食物之匮乏也。在国际共同发展中国之第一计划中，吾曾提议须敷设七千英里铁路于此境域，以为建筑北方大港之目的，而复可以将中国东南部过密之人民逐渐迁移。但此七千英里之铁路不过为一开拓者，如欲从实际上发展此丰富之境域，铁路必须增筑。故在此扩张西北铁路系统之计划中，吾提议建筑下列之各线：

天 多伦恰克图线。

地 张家口库伦乌梁海线。

玄 绥远乌里雅苏台科布多线。

黄 靖边乌梁海线。

宇 肃州科布多线。

宙 西北边界线。

洪 迪化乌兰固穆线。

荒 夏什温乌梁海线。

k. The Suchow-Urga line.

1. The Desert Junction-Kerulen line.

m. The Khobor-Kerulen-Chikatobo line.

n. The Wuyuan-Taonan line.

o. The Wuyuan-Dolon Nor line.

p. The Yenki-Ili line.

q. The Ili-Hotien line.

r. The Chensi-Kashgar line and its branches.

a. The Dolon Nor-Kiakata Line

This Line starts from Dolon Nor and proceeds in a northwesterly direction, following the caravan road across the vast pasture to Khorkho, Kuoto, and Suliehto. After Suliehto, it crosses the boundary line into Outer Mongolia by the same road to Khoshentun, Lukuchelu, and Yangto. Thence it crosses the Kerulen River to Otukunkholato, and enters the hilly region where it crosses the Kerulen watershed and the Chikoi watershed. The water from the Kerulen watershed flows into the Amur, and thence into the Pacific Ocean, while the water from the Chikoi watershed flows into Lake Baikal, and thence to the Arctic Ocean. After crossing the Chikoi watershed, it follows a branch of the Chikoi River to Kiakata. This line covers a distance of about 800 miles.

b. The Kalgan-Urga-Tannu Ola Line

This line starts from Kalgan at the Great Wall, and proceeds northwestward up the plateau, crosses a range of hills into the Mongolian prairie, and goes to Mingan, Boroldshi, Ude, and Khobor, where it crosses the Dolon Nor-Urumochi trunk line. After Khobor, it proceeds across the vast and rich pasture of Mubulan, then proceeds in a straight line through Mukata and Nalaiha to Urga. From Urga, it goes into the hilly district crossing Selenga Valley to a point opposite the southern end of Lake Kos Gol, and then turns northward across a range of mountains to Khatkhyl on the southern shore of Kos Gol. After Khatkhyl, it skirts Kos Gol Lake along the western shore for some distance, then turns northwestward and westward, following the course of the Khua Kem River to a point near its exit at the frontier line, then turns southwestward up the Kemtshik Valley to its headwater, passes through Pakuoshwo, and ends at the boundary line between the Russian and Chinese territories. This line covers a distance of about 1,700 miles.

天 多伦恰克图线

此线起自多伦，向西北方前行，循驿路横过大牧场，至喀特尔呼、阔多、苏叠图等处。过苏叠图后，此线即横过界线至外蒙古，依同一路线至霍申屯、鲁库车鲁、杨图等地方。由彼处渡克鲁伦河，至额都根、霍勒阔，进入山地。于是即横过克鲁伦河分水界与赤奎河分水界，克鲁伦分水界之水则流入黑龙江而至太平洋，赤奎河分水界之水则流入贝加尔湖，再由彼处至北冰洋。过克奎河分水界后，此路即循赤奎河之支派，至恰克图。其线长约八百英里。

地 张家口库伦乌梁海线

此线起自万里长城之张家口，向西北前进高原，横过山脉，进入蒙古大草场，走向明安、博罗里治、乌得与格合，即横过多伦迪化干线。过格合后，此线前行经过穆布伦之广大肥沃牧场，然后依直线再前行，经穆克图、那赖哈、库伦。由库伦此线即进入山地，横过色楞格谷地，至一地点，在库苏古尔泊南部末端之对面。然后再转北向，横过山脉，从库苏古尔之南岸之哈特呼尔。过哈特呼尔后，此线绕库苏古尔泊边走约一段距离，即再转西北向，又西偏循乌鲁克穆河岸，至近国界之出口点，复转西南向，直上克穆赤克谷地，至其发源处，通过巴阔洼，直达中俄国境交界处而止。此线之距离约有一千七百英里。

c. The Suiyuan-Uliassutai-Kobdo Line

This line starts from Suiyuan in the northwestern corner of Shansi, and proceeds in a northwesterly direction across the hilly country into the Mongolian pasture to Tolibulyk, where it crosses the Great Northern Port-Hami line, and the Great Eastern Port-Urga line. After Tolibulyk, it proceeds in a straight line in the same direction passing through Barunsudshi to the capital of Tuchetu. Thence it continues in the same straight line northwestward to Gorida. After Gorida, it follows the caravan road to Kolutikolik where it crosses the Great Northern Port-Urumochi trunk line. From Kolutikolik, the line turns northwestward, then westward and proceeds across many streams and valleys and passes by many small towns to Uliassutai. At Uliassutai, it crosses the B. Junction-Frontier branch of the Great Eastern Port-Urumochi line. After Uliassutai, the line proceeds westward following the trade road, passes through Khuduku, Bogu, Durganor, and Sakhibuluk to Kobdo. Thence the line turns northwestward to Khonga, Ukha, and Clegei, then westward to Belev and ends at the frontier. This line is about 1,500 miles long.

d. The Tsingpien-Tannu Ola Line

This line starts from Tsingpien at the Great Wall, on the northern border of Shensi, proceeds through the Ordos country by Bonobalgasun, Orto, and Shinchao, and then crosses the Hoangho to

Santaoho. From Santaoho, it proceeds across Charanarinula Mountain into Mongolian prairie in a northwesterly direction to Kurbansihata where it crosses the Peking-Hami line, then it goes to Unikuto and Enkin, where it crosses the Great Northern Port-Urumochi line. After Enkin, the line enters into a valley and watered district, proceeds northward to Karakorum, and then turns northwestward across various streams and valleys of the tributary of the Selenga River by Sabokatai and Tsulimiau. After Tsulimiau, it proceeds in the same direction across the Selenga River, follows its branch, the Telgir Morin River, up to its source and crosses the watershed into Lake Teri Nor. Then it follows the outlet of the Teri Nor to the Khua Kem River, where it ends by joining the Kalgan Urga-Tannu Ola line. This line covers a distance of about 1,200 miles.

玄 绥远乌里雅苏台科布多线

此线起自绥远，近于山西省之西北角地方，向西北方前进，经过山地进入蒙古牧场托里布拉克，于是横过北方大港哈密线与北方大港库伦线。过托里布拉克后，此线由同一方向依直线前行，通过匝们苏治，至土谢图省会。由彼处仍依直线向西北走，至霍勒特，再循商路至郭里得果勒。此线即转西向，再西北向前行，通过河流、谷地数处与小市镇，即至乌里雅苏台，于是在乌里雅苏台横过北方大港与乌鲁木齐线之第二联站边界支线。过乌里雅苏台后，此线即依商路向西方前行，通过呼都克卒尔、巴尔淖尔与匝哈布鲁等处，致科布多。彼时此线转西北向，至欢戛喀图与列盖等处，即复西走至别留，以国界为终点。此线约长一千五百英里。

黄 靖边乌梁海线

此线起自靖边，即在陕西北界与万里长城相接地方也。此线向鄂尔多斯乡落前行，经波罗波勒格孙、鄂托、臣浊等处，然后过黄河至三道河。由三道河再前行，过哈那那林、乌拉岭，即进入在西北方之蒙古大草场，直至古尔斑、昔哈特，在此即经过北京哈密线。然后至乌尼格图、恩京，由恩京即经过北方大港乌鲁木齐线。过恩京后，此线进入谷地与分水界地，向北前进，至西库伦。于是再转西北行，经过色楞格河流域之各支流与谷地，即抵沙布克台与粗里庙等处。至粗里庙后，再向同一方向前行，渡色楞格河，沿其支流帖里吉尔穆连河，至发源处，经过流入帖里淖尔湖之分水界。然后沿此湖之出口，至乌鲁克穆河，即与张家口库伦乌梁海线相合，此即终点也。此线之长约有一千二百英里。

e. The Suchow-Kobdo Line

This line starts from Suchow in a northwesterly direction penetrating the Great Wall at Chiennew, and proceeds to the coal field, about 150 miles from Suchow. Then it goes to Habirhaubuluk

and Ilatoli. A short way from this place the line comes across the Peking-Hami line and then proceeds to Balaktai. After this the line passes a bit of pure desert to Timenchi. After entering the hilly and watered country it proceeds to Gaskhiun where it crosses the Great Northern Port-Urumochi trunk line. After Gaskhiun, it proceeds to Wolanhutok, Tabateng, and Tabutu where it joins the Kucheng and Kobdo highway and following it, proceeds to Kobdo, through Batokuntai and Sutai. Here the line ends, covering a distance of about 700 miles.

f. The Northwestern Frontier Line

This line starts from Ili following the Urumochi-Ili line to Santai, on the eastern side of Zairam Lake, then proceeds northeastward by itself to Tuszusai on the west side of Ebi Lake. After Tuszusai it proceeds to Toli where it crosses the Central Trunk line, that is, the Great Eastern Port-Tarbogotai line. Thence it goes to Namukotai and Stolokaitai by passing through a vast forest and a rich coal field. From Stolokaitai, the line follows the highway and proceeds to Chenghwaszu, the capital of Altai province. Thence it crosses a mountain range by the Urmocaitu Pass into the Kobdo Valley, and follows the course of the Kobdo River to Beleu where it joins the Suiyuan-Kobdo line and proceeds to Clegei. From Clegei, it proceeds by itself to Tabtu via Usungola and Ulamkom. At Tabtu, it joins the other line again and proceeds together to the Khua Kem River in the Tannu Ola district. It then turns eastward ascending the river to the junction of the Bei Kem and Khua Kem rivers, then starts again on its own course, following the former river and proceeds up to its source in a northeasterly direction ending at the frontier. This line covers a distance of about 900 miles.

g. The Tihwa or Urumochi-Ulankora Line

This line starts from Tihwa following the Dolon Nor trunk line to Fowkang, then proceeds by its own route almost northward through Chipichuan to Khorchute. From Khorchute, it turns northeastward and proceeds across a hilly district to Kaiche, then to Turhuta, where it crosses a branch line from Junction C. of the Great Northern Port-Urumochi line. After Turhuta, it turns northward, proceeds up the Pakaningale Valley to Zehoshita, and then crosses the Tilikta Pass. Thence it turns northeastward proceeding across the newly cultivated country to Kobdo. After Kobdo, it proceeds through a fertile plateau, by crossing many rivers and skirting many lakes to Ulankom, where it ends by joining the Northwestern Frontier line. It covers a distance of about 550 miles.

宇 肃州科布多线

此线起自肃州，向西北方走，在尖牛贯通万里长城，向煤矿地方前行，即离肃州二百五十里地方也。由彼处即往哈毕尔罕布鲁克与伊哈托里。离伊哈托里不远，此线即经过北京哈密线，然后前行至伯勒台，过此处后，经过一小块沙漠，即至底门赤鲁。当进此多山与下隰^[3]之乡落，再前行至夏什温，即横过北方大港乌鲁木齐干线。过夏什温，向倭伦呼都克、塔巴腾与塔普图，即由塔普图与古城科布多通道相合。于是循此路经伯多滚台、苏台，前行至科布多，即此线之末站。约共长七百英里。

宙 西北边界线

此线起自伊犁，循乌鲁木齐伊犁线，至三台，即赛里木湖之东边也。此线由此处向东北自行，沿艾比湖西方，至土斯赛。过土斯赛后，向托里前行，横过中央干线，即北方大港塔城线也。由彼处，此线即往纳木果台与斯托罗盖台，经过最大之森林与最富之煤矿地方。再由斯托罗盖台依通道前行，至承化寺，是阿尔泰省之省会。于是由彼处横过山脉，经乌尔霍盖图山口入至科布多谷地，循科布多河河源至别留，由此与绥远科布多线直达乌列盖。由乌列盖依其本路取道乌松阔勒与乌兰固穆，行至塔布图，于是与他线再合，同行至在唐努乌梁海境内之乌鲁克穆河。然后转东向，沿河流而上，至别开穆与乌鲁河之合流处。即再前行，沿前流依东北方溯源直上至境界，是为终点。此线所经之距离约九百英里。

洪 迪化（又名乌鲁木齐）乌兰固穆线

此线起自迪化，依多伦迪化干线至阜康。然后循其本路向北前进，经自辟川，至霍尔楚台。由此转东北走，经过山地，至开车。然后至土尔扈特，于是横过北方大港乌鲁木齐线之支线第三交点。过土尔扈特后，转北行，经巴夏宁格力谷地，至斯和硕特。然后过帖列克特山口，由彼处即转东北向前行，经过一新耕种地方，即至科布多。再前行经过一肥沃草场，渡数河流，沿经数湖，即至乌兰固穆，在此即与西北边界线相会。此线长约五百五十英里。

h. The Gaskhiun-Tannu Ola Line

This line starts from Gaskhiun and proceeds northeastward across a hilly and watered country through Hatonhutuk and Talangjoleu, to Pornulu. After Pornulu, the line proceeds across the Saphkhyn Valley by Huchirtu and Porkho to Uliassutai where it meets the Suiyuan-Kobdo, and the Great Eastern Port-Uliassutai lines. After Uliassutai, the line proceeds northward to a quite new country by first crossing the headwaters of Selenga, then the headwaters of the Tess River. In the Tess Valley the line crosses a vast virgin forest. After emerging

from this forest it proceeds northwestward across the watershed into the Khua Kem Valley in Tannu Ola and ends by joining the Northwestern Frontier line. This line covers a distance of about 650 miles.

i. The Uliassutai-Kiakata Line

This line starts from Uliassutai and runs on the track of the Gaskhiun-Tannu Ola line, until it reaches the Eder River, a branch of the Selenga. Then, turning off eastward, it begins its own course and proceeds downward following the course of the Eder River, crossing the Tsingpien-Tannu Ola line, to the junction of this river with the Selenga. There it joins the Kalgan-Urga-Tannu Ola line and proceeds together eastward in the common track for some distance until the other line turns southeastward, when this line turns northeastward following the Selenga down to Kiakata. This line covers a distance of about 550 miles, running through a fertile valley.

荒 夏什温乌梁海线

此线起自夏什温，向东北前行，横过多山与隰地境界，经哈同呼图克与达兰趣律、博尔努鲁。过博尔努鲁后，此线通过匝盆谷地，经呼志尔图与博尔霍，至乌里雅苏台，在此与绥远科布多线及北方大港乌里雅苏台线相会。于是此线向北方前行于一新境地，先经过色楞格河之正源，然后经过帖斯河之正源，当在帖斯河谷地中，此线经过一极大未辟之森林。过此森林后，即转向西北走，经过分水界，进入在唐努乌梁海地方之乌鲁克穆谷地，与西北边界线相会，是为末站。此线共长六百五十英里。

日 乌里雅苏台恰克图线

此线起自乌里雅苏台，依夏什温乌梁海线前行，至色楞格河支流之鄂叠尔河止。然后转而东向，由其本线循鄂叠尔河流域前行而下，横过靖边乌梁海线，至鄂叠尔河与色楞格河合流处而止，于是与张家口库伦乌梁海线合轨，向东方前行颇远，待至彼线转东南向而止。当此线转东北向时，即循色楞格河下至恰克图。此线包有之距离约五百五十英里，经过一肥美谷地。

j. The Chensi or Barkul-Urga Line

This Line starts from Chensi or Barkul and proceeds northeastward across a cultivated region through Tutaku to Urkesiat. After Urkesiat, it crosses the Suchow-Kobdo line, then traverses the vast pasture on the north side of the Gobi Desert to Suchi and Dalantura. Thence it turns more northward across the Great Eastern

Port-Uliassutai line, and the Dolon Nor-Urumochi line to Tashunhutuk. After this point the line crosses the Suiyuan-Uliassutai line at Ologai and proceeds over the watershed into the Selenga Valley where it crosses the Tsingpien-Tannu Ola line at Sabokatai. From here it turns eastward across a hilly and watered region to Urga. This line covers a distance of about 800 miles.

k. The Suchow-Urga Line

This line starts from Suchow and proceeds by Kinta to Maumu, and then follows the Taoho or Edsina River, which waters this strip of oasis, to the lakes. Thence it crosses the Gobi Desert, where it meets the crossing lines of the Peking-Hami and the Great Eastern Port-Uliassutai railways and with them forms a common junction. From this junction it proceeds across desert and pasture lands to another railway crossing which is formed by the Suiyuan-Kobdo and Tsingpien-Tannu Ola lines, also forming a common junction together. Thence it proceeds into pasture land through Hatengtut and Tolik to Sanintalai, where it crosses the Dolon Nor-Urumochi line. After Sanintalai, the line proceeds through Ulanhoshih and many other small towns and encampments to Urga. This line covers a distance of about 700 miles. One third of this length is through the desert and the other two thirds through watered pasture land.

l. The Desert Junction-Kerulen Line

This line starts from the Desert Junction, proceeds northeastward to the pastoral land and crosses the Tsingpien-Tannu Ola line south of Ulan Nor Lake. Thence it proceeds to the Tuchetu Capital where it crosses the Suiyuan-Kobdo line. After the Tuchetu Capital it goes across a pasture to Junction A. From Junction A. it proceeds to Ulanhutuk and Chientingche, then crosses the Kalgan-Tannu Ola line to Zesenkhan. From Zesenkhan, the line follows the course of the Kerulen River down in a northeasterly direction to the city of Kerulen, where it crosses the Dolon Nor-Kerulen line, and meets the Kerulen-Tungchin line. This line covers a distance of about 800 miles.

月 镇西库伦线

此线起自镇西，向东北前行，横过一种植地域，道经图塔古，至苓尔格斜特。于是由乌尔格科特行过肃州科布多线，然后行经戈壁沙漠北边之大草场，至苏治与达阑图鲁。由彼处再向北走，横过北方大港乌里雅苏台线与多伦诺尔乌里雅苏台线，至塔顺呼图克。过此处后，此线即在鄂罗盖地方横过绥远乌里雅苏台线，前行过分水界，进入色楞格河谷地。于是在沙布克台行过靖边乌梁海线，从此即转东向，经过一多山水

之境域，至库伦。此线所经之距离约八百英里。

盈 肃州库伦线

此线起自肃州，前行经金塔，至毛目。于是随道河（又名额经纳河）而行，此河可以之灌注沙漠中之沃地。然后乃沿河流域而至一湖，复由彼处行经戈壁沙漠，即与北京哈密线及北方大港乌里雅苏台线之相交处相会，成为一共同联站。过此以后，此线向沙漠与草场前行，经过别一铁路交点，此铁路之交点即由绥远科布多线与靖边乌梁海线所成。于是此线在此处亦成为共同联站，由彼处前行，进入一大草地，经过哈滕与图里克，至三音达赖，于此即横过多伦诺尔乌鲁木齐线。过三音达赖后，此线前行经乌兰和硕与许多市镇营寨，即至库伦。此线包有之距离约七百英里，三分一路经过沙漠，其余三分之二经过低湿草地。

晨 沙漠联站克鲁伦线

此线起自沙漠联站，向东方前行，至一大草地。于是在鄂兰淖尔湖南方横过靖边乌梁海线，由彼处前行，至土谢图汗都会，于此经过绥远科布多线。过土谢图汗都会后，行经大草场，至第一联站。由第一联站即前行至乌兰呼图克与尖顶车，然后横过张家口乌梁海线，至车臣汗。由车臣汗此线向东北循河流域而下，直达克鲁伦城，于此即横过多伦克鲁伦线并与克鲁伦东镇线相会。此线长约八百英里。

m. The Khobor-Kerulen-Chikatobo Line

This line starts from Khobor, the crossing junction of the Dolon Nor-Urumochi, and the Kalgan-Urga-Tannu Ola lines, and proceeds northeastward across a vast pasture to Khoshentun, where it crosses the Dolon Nor-Kiakata line. After Khoshentun, it proceeds in the same direction across a similar pasture to Kerulen, where it crosses the Dolon Nor-Kerulen line. Then it proceeds first along the right bank of the Kerulen River, then crosses to the left side, and passes along the northwestern side of Hulan Lake. After Hulan Lake, the line crosses the Chinese Eastern Railway, and the Arguna River, then proceeds along the right bank of the river to Chikatobo, where the line ends by joining the Dolon Nor-Moho and the Chikatobo-Sansing lines. This line covers a distance of about 600 miles. The first half of it runs on dry land and the second half on watered land.

n. The Wuyuan-Taonan Line

This line starts from Wuyuan at the northwest bend of the Hoangho and proceeds northeastward across the Sheiten Ula Mountain and pasture to Tolibulyk, where it meets the crossing junction of three lines—the Peking-Hami line, the Suiyuan-Kobdo line,

and the Great Eastern Port-Urga line. From Tolibulyk the line proceeds continuously in the same direction across a pasture to Khobor where it meets the crossing junction of the Dolon Nor-Urumochi and the Peking-Urga lines, and also the terminus of the Khobor-Kerulen line. After Khobor the line turns more eastward and runs across the Dolon Nor-Kiakata line midway to Khombukure, where it crosses the Dolon Nor-Kerulen and the Hulutao-Kerulen lines. From Khombukure the line proceeds to Dakmusuma, where it crosses the Dolon Nor-Moho line. Thence it goes eastward across the Great Khingan Mountain to Tuchuan, then turns southeastward to Taonan, where it ends. This line covers a distance of about 900 miles.

辰 格合克鲁伦节克多博线

此线起自格合，此即多伦诺尔乌鲁木齐与张家口库伦乌梁海二线之交点也。由彼处向东北前行，经过大草场，至霍申屯，于是横过多伦恰克图线。过霍申屯后，依同一方向前行，又经过一大草场，至克鲁伦，即由此横过呼伦克鲁伦线。然后依克鲁伦河右岸前行，再渡左岸，经过呼伦池之西北边。过呼伦池后，此线横过中东铁路，渡额尔古纳河。然后沿此河右岸直达节克多博，于是与多伦诺尔漠河与节克多博依兰二线相会，此即此线之末站也。此线包有之距离约六百英里，上半截经过旱地，下半经过湿地。

宿 五原洮南线

此线起自黄河西北边之五原地方，向东北前行，横过晒田、乌拉山与大草地，即抵托里布拉克，于是与北京哈密线、绥远科布多线及北方大港库伦线之三路交点相会。由托里布拉克此线再向同一方向前行，经过草地场，至格合，在此即与多伦乌鲁木齐与北京库伦二线相会，亦即格合克鲁伦线之首站也。过格合后，此线渐转东向，横过多伦恰克图线之中部，至欢布库里，于是在此横过多伦克鲁伦与葫芦岛克鲁伦之二线。由欢布库里此线行经界线之南，即循之行至达克木苏马，于是与多伦漠河线相会。由彼处行向东方，横过兴安岭，至突泉，然后转东南向，至洮南，此即终站也。此线长约九百英里。

o. The Wuyuan-Dolon Nor Line

This line starts from Wuyuan and proceeds northeastward across the Sheiten Ula Mountain to Maomingan, where it crosses the Great Eastern Port-Urga line. Then it proceeds across the vast pasture and the Suiyuan-Kobdo line to Bombotu, where it passes over the Peking-Hami line. After Bombotu, the line turns eastward and proceeds across the Kalgan-Urga-Tannu Ola line, then goes to Dolon Nor, where it ends by joining the Dolon Nor-Mukden-Linkiang line, which forms a direct route from the upper Hoangho Valley to the rich Liaoho Valley.

This line covers a distance of about 500 miles.

p. The Yenki-Ili Line

This line starts from Yenki or Karashar, and proceeds northwestward across the mountain pass into the Ili Valley. It then follows the Kunges River downward, in a westerly direction, traversing a most fertile valley, to Ining and Kuldja or Ili, the principal city of the Ili district near the Russian border, where it joins the Ili-Urumochi line. This line covers a distance of about 400 miles.

q. The Ili-Hotien Line

This line starts from Ili or Kuldja, proceeds southward across the Ili River, then eastward along the left side of the river and then southeastward and southward to Bordai. From here it turns southwestward into Tekes Valley and proceeding upward crosses the Tekes River to Tienchiao and then ascends the mountain pass. After the mountain pass the line turns southeastward, traverses a vast coal field and then turns southwestward to Shamudai, where it crosses the Turfan-Kashgar line. From Shamudai it turns southward across the fertile zone of the north side of the Tarim Valley, to Bastutakelak. Then it proceeds southwestward to Hotien passing by on the way many small settlements in the fertile zone of the Hotien River which flows across the desert. At Hotien the line meets the Kashgar-Iden line. After Hotien the line proceeds upward to the highland south of the city and ends at the frontier. This line covers a distance of about 700 miles.

列 五原多伦线

此线起自五原，向东北前行，横过晒田、乌拉岭，至茂名安旗，即在此经过北方大港库伦线。然后向一大草场前行，经过绥远科布多线，至邦博图，经过北京哈密线。过邦博图后，此线转而东向前行，经过张家口库伦乌梁海线。然后至多伦，与多伦奉天临江线相合为终站。此线由黄河上流谷地，成一直接路线至肥美之辽河谷地，包有距离约五百英里。

张 焉耆伊犁线

此线起自焉耆（又名喀喇沙），向西北前行，横过山岭，进入伊犁谷地。然后循空吉斯河向西下行，绕极肥美谷地，至伊宁与绥定（即伊犁城）等，此皆在伊犁地方、近俄罗斯边境之主要城镇也。于是在伊犁与伊犁乌鲁木齐线相合。此线长约四百英里。

寒 伊犁和阗线

此线起自伊犁，向南前行，渡伊犁河，然后东向沿此河左岸而行。初向东南，继向南，行至博尔台。由此即转西南向，进入帖克斯谷地。然后溯帖克斯河而上，至天桥，再上山道。过此山道后，此线转东南向行，绕过一极大煤矿地方，然后再转西南，至札木台，于此即经过吐鲁番喀什噶尔线。由札木台即转南向，行过塔里木谷地北边之最肥美区域，至巴斯团搭格拉克。再向西南行，至和阗。此路经过无数小部落，皆在和阗河之肥沃区域中，此河即流入沙漠。此线在和阗与喀什噶尔于阗线相会。过和阗后，即向此城南方上行至高原，以国界为终站。此线包有距离约七百英里。

r. The Chensi-Kashgar Line and Its Branches

This line starts from Chensi and proceeds southwestward along the Tianshan pasture through Yenampo, Shihkialoong, and Taolaitse to Chikoching, then along the Tianshan forest through Wutungkwo, Tung-yenchi, Siyenchi, and Olong to Sensien, where it crosses the Central Trunk line. After Sensien it proceeds along the northern edge of the Tarim Desert through Lakesun City and Shehchuan to Hora, where it crosses the Cherchen-Koria line. From Hora the line proceeds along the course of the Tarim River, passing by many new settlements, fertile regions, and virgin forests, to Bastutakelak, where it crosses the Ili-Hotien line. Thence it goes through Pachu to Kashgar where it meets the Urumochi-Iden line. After Kashgar it proceeds northwestward to the frontier where it ends. Attached to this line are two branches. The first branch proceeds from Hora southwestward through many oases to Cherchen. The second proceeds from Pachu southwestward along the Yarkand River to Sache and then westward to Puli near the frontier. This line including the branches covers a distance of about 1,600 miles. The total length of this entire system is about 16,000 miles. See general map.

Part V The Highland Railway System

This, the last part of my railway program, is the most difficult and most expensive undertaking of its kind; consequently, it must be the least remunerative of all the railway enterprises in China. So no work should be attempted in this part until all the other parts are fully developed. But when all the other parts are well equipped with railways then railway construction in this highland region will also be remunerative, despite the difficulties and the highly expensive work in construction.

The highland region consists of Tibet, Kokonor, and a part of Sinkiang, Kansu, Szechwan, and Yunnan, an area of about 1,000,000 square miles. Tibet is known to be the richest country in the world for gold deposits. Furthermore the adjacent territories possess rich agricultural and pastoral lands. This vast region is little known to the outside world. The Chinese call Tibet "the Western Treasury," for, besides gold, there are other kinds of metals especially copper, in great quantities. Indeed the name of the Western Treasury is most appropriately applied to this unknown region. When the world's supply of precious metals are exhausted, we have to resort to this vast mineral bearing region for supply. So railways will be necessary at least for mining purposes. I therefore propose the following lines:

来 镇西喀什噶尔线与其支线

此线起自镇西，向西南行，循天山草场，经延安堡、薛家陇与陶赖子，至七个井。然后循天山森林，经过桐窝西盐池与阿朗，至鄯善，由此即经过中央干线。过鄯善后，即循塔里木沙漠北边而行，经鲁克沁与石泉，至河拉，于此横过车城库尔勒线。由河拉前行，循塔里木河流域，经过无数新村落肥美地方与未开发之森林，即至巴斯团塔格拉克，在此横过伊犁和阗线。行经巴楚，至喀什噶尔，在此与乌鲁木齐齐和阗线相会。过喀什噶尔后，此线即向西北前行至国界，是为终站。至与此线有连续关系者，约有二支线：第一支线，由河拉西南方前行，经沙漠中沃地数处至车城；第二支线，则由巴西楚南方循叶尔羌河至莎车，然后西南至蒲犁，即近国界地方也。此线与其各支线合计之，约共长一千六百英里。如就此系统全部言之，约共长一万六千英里。

第五部 高原铁路系统

此是吾铁路计划之最后部分，其工程极为繁难，其费用亦甚巨大，而以之比较其他在中国之一切铁路事业，其报酬亦为至微。故此铁路之工程，当他部分铁路未完全成立后，不能兴筑。但待至他部分铁路完全成立，然后兴筑此高原境域之铁路，即使其工程浩大，亦当有良好报酬也。

此高原之境域包括西藏、青海、新疆之一部，与甘肃、四川、云南等地方，面积约一百万英方里。附近之土地，皆有最富之农产与最美之牧场。但此伟大之境域，外国多有未之知者。而中国人则目西藏为西方宝藏，盖因除金产丰富外，尚有他种金属，黄铜尤其特产；故以宝藏之名。加于此世人罕知之境域，洵^[4]确当也。当世界金属行将用尽时，吾等可于此广大之矿域中求之。故为开矿而建设铁路，为必要之图。吾拟下之各线：

- a. The Lhasa-Lanchow line.
- b. The Lhasa-Chengtú line.
- c. The Lhasa-Tali-Cheli line.
- d. The Lhasa-Taklongshong line.
- e. The Lhasa-Yatung line.
- f. The Lhasa-Laichiyaling line.
- g. The Lhasa-Nohho line.
- h. The Lhasa-Iden line.
- i. The Lanchow-Chochiang line.
- j. The Chengtu-Dzunsasak line.
- k. The Ningyuan-Cherchen line.
- l. The Chengtu-Menkong line.
- m. The Chengtu-Yuankiang line.
- n. The Suifu-Tali line.
- o. The Suifu-Mengting line.
- p. The Iden-Gortok line.

a. The Lhasa-Lanchow Line

This is the most important line of this system for it connects the

capital city of Tibet—a vast secluded region with several millions of people—with the central trunk line of the country. The route which it passes through is inhabitable and is already slightly inhabited in the region between the ends of the proposed line. So it will probably be a paying line from the beginning. This line starts from Lhasa, following the old imperial highway in a northward direction and proceeds by Talong to Yarh, which lies on the southeastern side of Tengri Nor Lake. After Yarh, the line turns more eastward and proceeds across the watershed from the Sanpo Valley to the Lukiang Valley by the Shuangtsu Pass. Thence turning more eastward the line proceeds across the headwater of the Lukiang to that of the Yangtze by passing many valleys, streams, and mountain passes. Then it crosses the main body of the Upper Yangtze, which is here known as the Kinshakiang, over the Huhusair Bridge. After crossing the bridge, it turns southeastward, then eastward across the Yangtze Valley into the Hoangho Valley, where it passes through many small towns and encampments into the Starry Sea region. At the Starry Sea, the line passes between the lakes of Oring Nor and Tsaring Nor. Thence it turns northeastward across the southeast valley of the Zaidam region, and returns into the Hoangho Valley again. Then it proceeds through Katolapo and various towns to Dangar, now called Hwangyuan, situated near the border between Kansu and Kokonor. After Dangar, the line turns southeastward following the course of the Sining River, proceeds downward through a very rich valley and passes through Sining, Nienpai, and hundreds of small towns and villages to Lanchow. This line covers a distance of 1,100 miles.

天 拉萨兰州线。

地 拉萨成都线。

玄 拉萨大理车里线。

黄 拉萨提郎宗线。

宇 拉萨亚东线。

宙 拉萨来吉雅令及其支线。

洪 拉萨诺和线。

荒 拉萨于阗线。

日 兰州婁羌线。

月 成都宗札萨克线。

盈 宁远车城线。

辰 成都门公线。

辰 成都沅江线。

宿 叙府大理线。

列 叙府孟定线。

张 于阗噶尔渡线。

天 拉萨兰州线

此线与西藏都会相连，为彼境域之中央干线，足称为此系统中之重要路线。沿此线之起点与终点，现已有少数居民，将来可成为一大殖民地，故即当开办之始，或可成为一有价值之路线也。此线起自拉萨，循旧官路向北前行，经达隆，至雅尔，即腾格里池之东南方也。过雅尔后，此线暂转东向，由藏布谷地过分水界，经双竹山口，至潞江谷地。然后转而东向，渡潞江正源，经过数处谷地、河流及山岭，而至扬子江。于是渡扬子江上流正源之金沙江，过苦苦赛尔桥。过此桥后转东南向，又东向通过扬子江谷地，进入黄河谷地。于是由此经过数小村落与帐幕地，进至札陵湖与鄂陵湖间之星宿海。然后东北向，过柴塔木之东南谷地，再转入黄河谷地，即前进经过喀拉普及数小市镇，至丹噶尔（今名湟源，界于甘肃与青海之间）。过丹噶尔后，此线即转东南，循西宁河流之肥美谷地下行，经过西宁、碾伯与数百小市镇、小村落，至兰州。此线行经之距离约一千一百英里。

b. The Lhasa-Chengtú Line

This line starts from Lhasa and proceeds northeastward on the former imperial highway by Teking and Nanmo to Motsukungchia. Thence it turns southeastward and northeastward to Giamda. From Giamda, the line turns northward, then northeastward where it proceeds through the Tolala Pass to Lhari. After Lhari the line goes in an easterly direction and passes Pianpa, Shihtuh, and many small towns to Lo-longchong. Thence it crosses the Lukiang by the Kayu Bridge and then turns northeastward to Kinda and Chiamdo. After Chiamdo, the line instead of following the imperial highway southeastward to Batang, turns northeastward, following another trade route, and proceeds to Payung at the northwestern corner of Szechwan. From Payung, it proceeds across the Kinshakiang over the bridge near Sawusantusze. The line then turns southeastward, enters the Ichu Valley and proceeds downward to Kantzu on the Yalung River. Thence it proceeds to Chango and Yinker, to Badi on the Great Golden River, and Mongan on the Little Golden River. After Mongan, the line goes through the Balan Pass to Kwanhsien, and entering the Chengtu Plain, reaches Chengtu by Pih sien. This line covers a distance of about 1,000 miles.

c. The Lhasa-Tali-Cheli Line

This line starts from Lhasa by the same track as the Lhasa-Chengtuo line as far as Giamda. From Giamda, it proceeds by its own track southeastward, following a branch of the Sanpo River to Yulu, where this branch joins its main stream. After Yulu, it follows the left bank of the Sanpo River passing by Kongposaga to Timchao. From Timchao, the line turns away from the Sanpo River and proceeds in an eastward direction to Timchong city, Ikung, Kuba, and Shuachong. After Shuachong, the line proceeds southeastward to Lima, thence eastward to Menkong on the Lukiang. From Menkong, the line turns southward and goes along the right bank of the Lukiang passing Samotung to Tantau. Then crossing the Lukiang, it proceeds across the watershed through Gaiwa village to the Lantsang (or Mekong) River, and to Hsiaoweisi beyond it. After Hsiaoweisi, it follows the river bank to the Chenghsin Copper Mine, thence it turns away from the river and proceeds by Hosi, Erhyuan, Tengchow, and Shangkwang to Tali. From Tali, the line proceeds to Hsiakwang, Fengyi, Menghwa, and then meets the Lantsang River again at Paotien. Thence it follows the left bank southward right through to Cheli, where it ends. This line covers a distance of 900 miles.

地 拉萨成都线

此线起自拉萨，东北向，依旧官路前行，经德庆、南摩，至墨竹工卡。然后转东南向，又东北向，至江达。于是由江达转北向，又转东北向前行，经过托拉山，至拉里。过拉里后，此线向东行，经边坝硕督与数小市镇，至洛龙宗。然后由嘉裕桥渡潞江，即转东北向，至恩达与察木多。过察木多后，此线不循东南之官路至巴塘，乃向东北，而循别一商路前行，至四川省西北角之巴戎。由此前行过桥渡金沙江，即札武三土司附近地方也。于是此线转东南向，进入依杵谷地，沿鸦龙江下行至甘孜^[5]。再前进经长葛、英沟，至大金川之倍田，并至小金川之望安。过望安后，此线即横过斑烂山，至灌县，进入成都平原，即由郫县至成都。此线行经之距离约一千英里。

玄 拉萨大理车里线

此线起自拉萨，与拉萨成都线同轨，直行至江达。于是由江达循其本路路轨西南向，沿藏布江^[6]支流至油鲁，即其河支流与正流会合之点也。过油鲁后，即沿藏布江口左岸，经公布什噶城，至底穆昭。由底穆昭离藏布江向东前行，至底穆宗城、遗贡、巴谷、刷宗城。过刷宗城后，此线转东南行至力马，再东行至潞江之门公。于是由门公转南向前行，沿潞江右岸，经菖蒲桶，至丹邬。然后渡潞江，由崖瓦村谷地过分水界，至澜沧江（又名美江），乃渡江至小维西。过小维西后，即沿河边至诚心铜厂。然后离河前行，经河西、洱源、邓州、上关，至大理。

由大理南行至下关、凤仪、蒙化，再行至保甸，与澜沧江再会。于是南行沿江之左岸，至车里，为此线之终点。其路线之长约九百英里。

d. The Lhasa-Taklongshong Line

This line starts from Lhasa and proceeds southward by way of Teking to the Sanpo River where turning eastward it follows the left bank of the river to Sakorshong. After crossing the Sanpo River to Chetang, it proceeds southward by Chikablung, Menchona, Tawang, Dhirangjong to Taklongshong and continues farther on until it reaches the Assam frontier. This line covers a distance of 200 miles.

e. The Lhasa-Yatung Line

This line starts from Lhasa and proceeds southwestward by Chashih following the former imperial highway by Yitang and Kiangli to Chushui. At Chushui, it crosses to Sanpo River over the Mulih Bridge to Chakamo on the south side, thence to Tamalung, Paiti, Tabolung, and Nagartse. After Nagartse, the line turns westward to Jungku, Lhaling, and Shachia. At Shachia, the line leaves the former imperial highway and turns southwestward again and proceeds via Kula to Yatung at the Sikkim border. This line covers a distance of 250 miles.

f. The Lhasa-Laichiyaling Line and Branches

This line starts from Lhasa and proceeds northwestward by Chashih following the former imperial road to Little Taking, and westward to Yangpachin and Sangtolohai. Thence turning southwestward, it proceeds to Namaling and Tangto, and crosses the Sanpo River at Lhaku. After Lhaku, the line turns westward to Shigatse, the second important city in Tibet whence it proceeds in the same direction to Chashihkang, Pangcholing, and Lhatse all on the right side of the Sanpo River. From Lhatse, a branch line starts southwestward via Chayakor and Dingri to Niehlahmuh on the Nepal border. The main line, however, crosses to the left side of the Sanpo River and proceeds on the same highway via Nabringtaka to Tadum where another branch line proceeds southwestward to the Nepal border. The main line continues northwestward via Tamusa and Choshan to Gartok, thence turning westward it proceeds to Laichiyaling on the Sutlej River and ends on the Indian border. This line, including the two branches, covers a distance of 850 miles.

黄 拉萨提郎宗线

此线起自拉萨，向南行，道经德庆，至藏布江。再由藏布江转东向，沿河之左岸，至札噶尔总。渡藏布江至泽当，即南向前行，经吹夹坡郎、满楚纳、塔旺，至提郎宗。再接续前行，至印度之亚三边界^[7]。此线长约二百英里。

宇 拉萨亚东线

此线起自拉萨，西南向，由札什循旧官路，经僵里，至曲水。由曲水过末力桥，渡藏布江南之查戛木，然后至塔马隆、白地、达布隆与浪噶子等地方。过浪噶子后，此线转西向，至翁古、拉萨、沙加等地。于是由沙加离官路再转向西南行，道经孤拉，至亚东，是哲孟雄边界^[8]。此线约长二百五十英里。

宙 拉萨来吉雅令及其支线

此线起自拉萨，向西北行，由札什循旧官路前行，至小德庆。再西行至桑驼骆池，转西南行至那马陵与当多汛，即在拉古地方渡藏布江。过拉古后，此线即转西向，至日喀则城，是为西藏之第二重要市镇。由此依同一方向，向沿藏布江边右岸前行，经过札什冈、朋错岭与拉子等地方。于是由拉子分一支线向西南行，取道胁噶尔、定日，至尼泊尔边界之聂拉木。但其干线则横过藏布江之右边，循官路行，取道那布林格喀，至大屯。由此再分一支线向西南行，至尼泊尔边界。而其干线仍接续西北行，取道塔木札卓山，至噶尔渡。然后向西前行，至萨特来得河之来吉雅令，以印度边界为终点。此线与其二支线合计之，约共长八百五十英里。

g. The Lhasa-Nohho Line

This line starts from Lhasa and runs in the same track as line (f) to Sangtolo hai where it proceeds by its own line northwestward to Tching, Sangchashong, and Taktung. Thence, it enters into the richest gold field in Tibet and through Wengpo, Tulakpa, Kwangkwei, and Ikar reaches Nohho, where the line ends. It covers a distance of 700 miles.

h. The Lhasa-Iden Line

This line starts from Lhasa, following the common track of lines (f) and (g) to the southwestern corner of Tengri Lake, whence it proceeds by its own track northwestward by Lungmajing, Tipoktolo and four or five other small places to Sari. After Sari, the line penetrates a vast tract of uninhabited land to Pakar and Suketi. Thence crossing the mountain passes and descending from the highland to the Tarim Basin through Sorkek to Yasulakun, the line joins the Cherchen-Iden railway of the Northwestern System and

proceeds on the same track to Iden. This line covers a distance of 700 miles.

i. The Lanchow-Chochiang Line

This line starts from Lanchow, on the same track of the Lhasa-Lanchow line as far as the southeastern corner of the Lake Kokonor. Thence it proceeds on its own track by skirting along the southern shore of Lake Kokonor to Dulankit, where it turns southwestward to Dzunsasak. From Dzunsasak, the line proceeds in a westerly course along the southern side of the Zaidam Swamp, and passes Tunyueh, Halori, and Golmot to Hatikair. After Hatikair, the line turns northwestward by Baipa, Nolinjoha, to Orsinte. Thence turning more northward, it proceeds across the mountain range by Tsesinvitusiuk and Tuntunomik to Chochiang, where it ends by joining the Ansi-Iden and Chochiang-Koria lines, covering a distance of 700 miles.

洪 拉萨诺和线

此线起自拉萨，与宙线同转，行至桑驼骆池，始循其本线向西北前行，至得贞、桑札宗及塔克东。于是由此处进入西藏之金矿最富地方，再经过翁波、都拉克巴、光贵与于喀尔，至诺和，为此线之终点。其距离约长七百英里。

荒 拉萨于阗线

此线起自拉萨，循宙、洪两线之轨道，至腾格里池之西南角。于是由其本轨向西北前行，经隆马绒、特布克托罗海与四五处小地方，至萨里。过萨里后，此线即通过一大幅无人居之地，至巴喀尔与苏格特。横过山岭，遂由高原而下，经索尔克，至塔里木河流域之雅苏勒公，在此与西北铁路系统之车尔城于阗线合轨，前行至于阗。此线共长约七百英里。

日 兰州婁羌线

此线起自兰州，循拉萨兰州线轨道同行，至青海之东南角。于是由其本轨绕青海南岸，至都兰奇特，即由此转西南走，至宗札萨克。由宗札萨克依柴达木低洼地之南边，向西南行，经过屯月、哈罗里与各尔莫，至哈自格尔。过哈自格尔后，此线即转西北向，经拜把水泉、那林租哈，至阿尔善特水泉。然后暂转北向前行，横过山脉，至婁羌，即与安西于阗线及婁羌库勒线联合，是为终站。此线约长七百英里。

j. The Chengtu-Dzunsasak Line

This line starts from Chengtu and proceeds to Kwanhsien on the

track of the Lhasa-Chengt'u line, thence northward on its own track by Wenchuan, to Mauchow. Then, it proceeds northwestward following the course of the Minkiang to Sungpan. After Sungpan, it ascends the Min Valley passing Tungpi to Shangle Yao, where it crosses the watershed from the Yangtze River side to that of the Hoangho. Thence the line proceeds to Orguseri, and following a branch of the Hoangho to the northwestern turn of its main stream, it proceeds along its right bank via Chahuntsin to Peilelachabu. There it crosses the Hoangho to the northwest turn of the old imperial road, where it joins the Lhasa-Lanchow line and proceeds as far as Lanipar. Then turning northwestward, it proceeds by its own line to Dzunsasak, where it ends by joining the Lanchow-Chochiang line. This line covers a distance of 650 miles.

k. The Ningyuan-Cherchen Line

This line starts from Ningyuan and proceeds in a northwestward direction via Hwaiyuanchen to the Yalungkiang. Then it ascends along the left side of that river to Yakiang, and crossing to the right side of that river it proceeds by the old post road to Siolo, where it turns away from the river and follows the same post road to Litang. From Litang it proceeds in the same direction but follows another road to Kangtu, on the left side of the Kinshakiang. Following the same side of the river, it proceeds to Sawusantusze, where it crosses the Lhasa-Chengt'u line. After Sawusantusze, the line continues in the same direction and follows the same side of the Kinshakiang via Tashigompa, to the Huhusair Bridge, where it crosses the Lhasa-Lanchow line. Then following a northern branch of the Kinshakiang to its source and crossing the watershed, it proceeds along the caravan road by Hsinszukiang and Olokung to Cherchen, where it ends, covering a distance of about 1,350 miles. This is the longest line of this system.

月 成都宗札萨克线

此线起自成都，循拉萨成都线轨道前行，至灌县。然后由其本轨向北前行，经汶川，至茂州。于是循岷江河流向西北前行，至松潘。过松潘后，即入岷山谷地，经过东丕，至上勒凹。即由此处横过扬子江与黄河间之分水界，再接续前行至鄂尔吉库舍里。于是由黄河支源西北转至其正流，沿河右边，取道察汉津，至布勒拉察布。渡黄河至旧官路，西北转，与拉萨兰州线合轨前行，直达拉尼巴尔。再转西北向，循其本轨前行，至宗札萨克，与兰州岷羌线相会，是为终站。此线行经之距离约六百五十英里。

盈 宁远车城线

此线起自宁远，向西北行，取道怀远镇，至雅江。横过江之右岸，循旧驿路前行，至西俄落，即离江边循驿路至里塘。由里塘仍依同一方向，从别路前行至金沙江左岸之冈沱。再沿此河边前行，至札武三土司，横过拉萨成都线。过札武三土司后，此线仍依同一方向前行，沿金沙江边，取道图登贡巴，至苦苦赛尔桥，即在此横过拉萨兰州线。再循金沙江之北支源至其发源处，过分水界，循骆驼路前行，经沁司坎、阿洛共，至车城，是为终站。其距离约长一千三百五十英里，此线为此系统之最长路线。

l. The Chengtu-Menkong Line

This line starts from Chengtu and proceeds southwestward by Shuangliu, Hsintsin, Mingshan, to Yachow. From Yachow, it turns northwestward and proceeds to Tienchuan, then westward to Tatsienlu, Tunyolo, and Litang. After Litang, the line proceeds southwestward through Batang and Yakalo, to Menkong, covering a distance of about 400 miles of very mountainous country.

m. The Chengtu-Yuankiang Line

This line starts from Chengtu on the same track of the Chengtu-Menkong line, proceeds to Yachow and thence by its own track in the same direction via Jungching, to Tsingliu. After Tsingliu, the line proceeds southward through Yuehsi to Ningyuan, where it meets the head of the Ningyuan-Cherchen line. After Ningyuan, it goes to Kwaitai, then crosses the Kinshakiang to Yunnanfu where it crosses the Canton-Tali line. From Yunnanfu, it proceeds along the west side of the Kunming Lake to Kunyang, and through Hsinshing, Hsingo, to Yuankiang, where the line ends by joining the Canton-Szemo line. It covers a distance of about 600 miles.

n. The Suifu-Tali Line

This line starts from Suifu and proceeds along the left bank of the Yangtze River to Pingshan and Lupo. After Lupo, it turns away from the river in a southwesterly direction and scales the Taliangshan Mountains to Ningyuan, where it crosses the Chengtu-Yuankiang line and meets the termini of the Canton-Ningyuan line and the Ningyuan-Cherchen line. Thence continuing in the same direction, it crosses the Yalungkiang to Yenyuan and Yungpeh. After Yungpeh, the line turns more southward, across the Kinshakiang to Sincheng and thence to Tali, where it ends by meeting the Canton-Tali line and the Lhasa-Tali line. It covers a distance of about 400 miles.

o. The Suifu-Mengting Line

This line starts from Suifu on the same track as the Suifu-Tali line as far as Lupo. From Lupo, it goes on its own track across the Yangtze River here known as the Kinshakiang, and follows the right side of that river upward to its southward bend where it crosses the Chengtu-Yuankiang line, to Yuanmow. From Yuanmow, it proceeds to Tsuyung, where it crosses the Canton-Tali line, thence to Kingtung. After Kingtung, it proceeds southwestward across the Lantsangkiang or Mekong River, to Yunchow, thence turning southwestward, it follows a branch of the Lukiang River to Mengting and ends on the frontier. This line covers a distance of about 500 miles.

晨 成都门公线

此线起自成都，向西南行，经双流、新津、名山，至雅州。转西北向，前行至天全。复转西行，至打箭炉、东俄落、里塘等地方。过里塘后，此线向西南行，经过巴塘、宴尔喀罗，至门公^[9]。约共长四百英里，所经过地方皆系山岭。

辰 成都沅江线

此线起自成都，循成都门公线路轨，前行至雅州。然后由其本轨依同一方向，取道荣经，至清溪。过清溪后，此线向南行，经越嶲，至宁远，即于此与宁远车城线之首站相会。过宁远后，即至会理，然后渡金沙江至云南府，与广州大理线相会。于是由云南府循昆明池西边至昆明，经过新兴、峨峨，到沅江，与广州思茅线相会，是为终站。其距离约六百英里。

宿 叙府大理线

此线起自叙府，沿扬子江左岸，前行至屏山、雷波。过雷波后，即离此河向西南行，过大梁山，至宁远，即于此横过成都宁远线，并与广州宁远线及宁远车城线之首站相会。于是再接续依同一方向前行，横过鸦龙江，至盐源、永北。过永北后，此线暂转南向，渡金沙江至宾川，然后至大理，与广州大理线及拉萨大理线相会，是为终站。共长约四百英里。

列 叙府孟定线

此线起自叙府，循叙府大理线路轨，直行至雷波。即由扬子江上流名曰金沙江横过，沿此江之上流左岸，至其湾南处，即横过成都元江线，至元谋。复由元谋前行，至楚雄。横过广州大理线，至景东。复向西南前行，横过澜沧江，至云州。然后转西南向，循潞江支脉至孟定，以边界为终站。此线共长约五百英里。

p. The Iden-Gartok Line

This line starts from Iden, and proceeds southward along the Keriya River to Polu, thence following the caravan road up the highland to Kuluk. From Kuluk, it proceeds southwestward via Alasa and Tunglong to Nohho, where it meets the terminus of the Lhasa-Nohho line. After Nohho, it skirts around the eastern end of the Noh-tso-Lake to Rudok and proceeds southwestward to Demchok, on the Indus River. From Demchok, it proceeds southeastward following the Indus River up to Gartok, where it ends by joining the Lhasa-Laichiyaling line. This line covers a distance of about 500 miles. This highland system totals about 11,000 miles.

Part VI The Establishment of Locomotive and Car Factories

The railways projected in the Fourth Program will total about 62,000 miles; and those in the First and the Third Programs about 14,000 miles. Besides these, there will be double tracks in the various trunk lines, which will make up a grand total of no less than 100,000 miles, as stated in the preliminary part of these programs. With this 100,000 miles of railways to be constructed in the coming ten years, the demands for locomotives and cars will be tremendous. The factories of the world will be unable to supply them, especially at this juncture of reconstruction after the great world war. So the establishment of locomotive and car factories in China to supply our own demands of railway equipment will be a necessary as well as a profitable undertaking. China possesses unlimited supplies of raw materials and cheap labor. What we need for establishing such factories is foreign capital and experts. What amount of capital should be invested in this project, I have to leave to experts to decide.

张 于阗噶尔渡线

此线起自于阗，沿克利雅河，向南行，至波鲁。由波鲁复转西南行，取道阿拉什东郎，至诺和，即与拉萨诺和线之终站相会。过诺和后，即绕诺和湖之东边，至罗多克。复向西南行，沿印度河至碟木绰克。复由碟木绰克东南向，沿印度河上行，至噶尔渡，即于此与拉萨来吉雅令线相会，是为终站。此线长约五百英里。

此高原铁路系统，全部共长一万一千英里。

第六部 设机关车、客货车制造厂

上部第四计划所预定之路线，约共长六万二千英里。至第一、第三计划所预定者，约一万四千英里。除此以外，并有多数干线当设双轨，故合数计划路线计之，至少当有十万英里。若以此十万英里之铁路，在十年内建筑之，机关车与客货车之需要必当大增。现当此战后改造时期，世界之制造厂将难以供应。此所以在中国建设机关车、客货车之制造厂，以应建筑铁路之需，为必要之图，且其为有利事业尤不可不注意也。中国有无限之原料与低廉之人工，是为建设此等制造厂之基础。但举办此种事业所必需者，为外国资本与专门家耳。至此项之计划应用资本若干，吾当留为对于此种工程有经验者定之。

I suggest that four large factories should be started simultaneously at the beginning—two on the coast and two on the Yangtze. Of those on the coast, one should be at the Great Northern Port, and the other at the Greatern Southern Port—Canton. Of those on the Yangtze, one should be at Nanking and the other at Hankow. All four are in centers of both land and water communication, where skilled labor can easily be obtained. They are also near our iron and coal fields. Besides these four great factories, others should be established at suitable centers of iron and coal fields when our railways will be more developed.

All the factories should be under one central control. The locomotives and cars of our future railways should be standardized so as to make possible the interchange of parts of machinery and equipment. We should also adopt the standard gauge, that is, the 4 feet 8½ inch gauge which has been adopted by most of the railways of the world. In fact, almost all the railways hitherto built in China are of this gauge. The purpose of the proposed standardization is to secure the highest efficiency as well as the greatest economy.

[中文译本中此二段无对应译文——编者注]

[1] 土鲁番：即吐鲁番。

[2] 烟户：人烟户口，户籍的总称。

[3] 下隰；低湿的地方。

[4] 洵：诚然，实在。

[5] 雅龙江：今雅砻江，位于四川省西部，金沙江支流。

[6] 藏布江：今雅鲁藏布江，流经今西藏自治区南部，为我国最高的大河之一。

[7] 亚三：今译阿萨姆，位于印度东北部。

[8] 哲孟雄：即锡金。

[9] 门公：即今芒康，位于西藏自治区东南部。

PROGRAM V

In the preceding four programs, I dealt exclusively with the development of the key and basic industries. In this one, I am going to deal with the development of the *main* group of industries which need foreign help. By the main group of industries, I mean those industries which provide every individual and family with the necessities and comforts of life. Of course, when the key and basic industries are developed, the various other industries will spontaneously spring up all over the country, in a very short time. This had been the case in Europe and America after the industrial revolution. The development of the key and the basic industries will give plenty of work to the people and will raise their wages as well as their standard of living. When wages are high, the price for necessities and comforts of life will also be increased. So the rise in wages will be accompanied by the rise in the cost of living. Therefore, the aim of the development of some of the main group of industries is to help reduce the high cost of living when China is in the process of international development, by giving to the majority of the people plenty of the essentials and comforts of life as well as higher wages.

It is commonly thought that China is the cheapest country to live in. This is a misconception owing to the common notion of measuring everything by the value of money. If we measure the cost of living by the value of labor then it will be found that China is the most expensive country for a common worker to live in. A Chinese coolie, a muscular worker, has to work 14 to 16 hours a day in order to earn a bare subsistence. A clerk in a shop, or a teacher in a village school cannot earn more than a hundred dollars a year. And the farmers after paying their rents and exchanging for a few articles of need with their produce have to live from hand to mouth. Labor is very cheap and plentiful but food and commodities of life are just enough to go round for the great multitude of the four hundred millions in China in an ordinary good year. In a bad year, a great number succumb to want and starvation. This miserable condition among the Chinese proletariat is due to the non-development of the country, the crude methods of production and the wastefulness of labor. The radical cure for all this is industrial development by foreign capital and experts for

the benefit of the whole nation. Europe and America are a hundred years ahead of us in industrial development; so in order to catch up in a very short time we have to use their capital, mainly their machinery. If foreign capital cannot be gotten, we will have to get at least their experts and inventors to make for us our own machinery. In any case, we must use machinery to assist our enormous man-power to develop our unlimited resources.

伍 第五计划

前四种计划既专论关键及根本工业之发达方法，今则进述工业本部之须外力扶助发达者。所谓工业本部者，乃以个人及家族生活所必需，且生活安适所由得。当关键及根本工业既发达，其他多种工业皆自然于全国在甚短时期内同时发生，欧美工业革命之后，既已如是。关键及根本工业发达，人民有许多工事可为，而工资及生活程度皆增高；工资既增多，生活必要品及安适品之价格亦增加。故发达本部工业之目的，乃当中国发展进行之时，使多数人民既得较高工资，又得许多生活必要品、安适品而减少其生活费也。世人尝以中国为生活最廉之国，其错误因为寻常见解以金钱之价值衡量百物；若以工作之价值衡量生活费用，则中国为工人生活最贵之国。中国一寻常劳工，每日须工作十四至十六小时，仅能维持其生活。商店之司书^[1]，村乡之学究，每年所得恒在百元以下。农人既以所生产价还地租及交换少数必要品之后，所余已无几。工力多而廉，惟食物及生活货品，虽在寻常丰年亦仅足敷四万万人之用，若值荒年则多数将陷于穷乏死亡。中国平民所以有此悲惨境遇者，由于国内一切事业皆不发达，生产方法不良，工力失去甚多。凡此一切之根本救治，为用外国资本及专门家发达工业以图全国之福利。欧美二洲之工业发达，早于中国百年，今欲于甚短时期内追及之，须用其资本、用其机器。若外国资本不可得，至少亦须用其专门家、发明家，以为吾国制造机器。无论如何，必须用机器以辅助中国巨大之人工，以发达中国无限之富源也。

In modern civilization, the material essentials of life are five, namely: food, clothing, shelter, means of locomotion, and the printed page. Accordingly I will formulate this program as follows:

- I. The Food Industry.
- II. The Clothing Industry.
- III. The Housing Industry.
- IV. The Motoring Industry.
- V. The Printing Industry.

Part I The Food Industry

The food industry should be treated under the following headings:

- a. The Production of Food.
- b. The Storage and Transportation of Food.
- c. The Preparation and Preservation of Food.
- d. The Distribution and Exportation of Food.

a. The Production of Food

Human foods are derived from three sources: the land, the sea and the air. By far the most important and greatest in quantity consumed is aerial food of which oxygen is the most vital element. But this aerial food is abundantly provided by nature, and no human labor is needed for its production except that which is occasionally needed for the airman and the submariner. So this food is free to all. It is not necessary for us to discuss it here. The production of food from the sea which I have already touched upon when I dealt with the construction of fishing harbors and the building of fishing crafts, will also be left out here. It is the specific industries in the production of food from land, which need foreign help that are to be discussed here.

China is an agricultural country. About four-fifths of its population is occupied in the work of producing food. The Chinese farmer is very skillful in intensive cultivation. He can make the land yield to its utmost capacity. But vast tracts of arable lands are lying waste in thickly populated districts for one cause or other. Some are due to lack of water, some to too much of it and some to the "dog in the manger" system,—the holding up of arable land by speculators and land sharks for higher rents and prices.

据近世文明言，生活之物质原件共有五种，即食、衣、住、行及印刷是也。吾故定此种计划如下：

- 一、粮食工业。
- 二、衣服工业。
- 三、居室工业。
- 四、行动工业。
- 五、印刷工业。

第一部 粮食工业

粮食工业又分类如下：

甲 食物之生产。

乙 食物之贮藏及运输。

丙 食物之制造及保存。

丁 食物之分配及输出。

甲 食物之生产

人类食物得自三种来源，即陆地、海水、空气三者。其中最重要、最多量者为空气食物，譬如养气^[2]为此中有力元素，惟自然界本具此甚多，除飞行家及潜艇乘员闲时须特备外，不须人工以为生产，故此种食物人人可自由得之，于此不须详论。吾前此论捕鱼海港之建设及捕鱼船舶之构造，已涉及海水食物，故于此亦不更述。惟陆地食物生产之事须国际扶助者，此下论之。

中国为农业国，其人数过半皆为食物生产之工作。中国农人颇长于深耕农业，能使土地生产至最多量。虽然，人口甚密之区，依诸种原因，仍有可耕之地流为荒废，或则缺水，或则水多，或则因地主投机求得高租善价，故不肯放出也。

The land of the eighteen provinces alone is at present supporting a population of four hundred millions. Yet there is still room for development which can make this same area of land yield more food if the waste land be brought under cultivation, and the already cultivated land be improved by modern machinery and scientific methods. The farmers must be protected and encouraged by liberal land laws by which they can duly reap the fruits of their own labor.

In regard to the production of food in our international development scheme, two necessary undertakings should be carried out which will be profitable at the same time.

(1) A scientific survey of the land.

(2) The establishment of factories for manufacturing agricultural machinery and implements.

(1) A scientific survey of the land. China has never been scientifically surveyed and mapped out. The administration of land is in the most chaotic state and the taxation of land is in great confusion, thus causing great hardships on the poor peasants and farmers. So,

under any circumstance, the survey of land is the first duty of the government to execute. But this could not be done without foreign help, owing to lack of funds and experts. Therefore, I suggest that this work be taken up by an international organization. This organization should provide the expenses of the work by a loan, and should carry out the work with the required number of experts and equipment. How much will be the expenses for the survey and what is the amount of time required and how large an organization is sufficient to carry on the work, and whether aerial survey by aeroplanes be practical for this work are questions which I shall leave to experts to decide.

When the topographical survey is going on a geological survey may be carried out at the same time so as to economize expenses. When the survey work is done and the land of each province is minutely mapped out, we shall be able to readjust the taxation of the already cultivated and improved land. As regards the waste and uncultivated lands we shall be able to determine whether they are suitable for agriculture, for pasture, for forestry, or for mining. In this way, we can estimate their value and lease them out to the users for whatever production that is most suitable. The surplus tax of the cultivated land and the proceeds of waste land will be for the payment of the interest and principal of the foreign loan. Besides the eighteen provinces, we have a vast extent of agricultural and pastoral lands in Manchuria, Mongolia, and Sinkiang, and a vast extent of pastoral land in Tibet and Kokonor. They will have to be developed by extensive cultivation under the colonization scheme, which is alluded to in the first program.

中国十八省之土地，现乃无以养四万万人民。如将废地耕种，且将已耕之地依近世机器及科学方法改良，则此同面积之土地，可使其出产更多，故尽有发达之余地。惟须有自由农业法以保护、奖励农民，使其获得己力之结果。

就国际发展食物生产计划言之，须为同时有利益之下列二事：

- 一、测量农地。
- 二、设立农器制造厂。

一、测量农地。中国土地向未经科学测量制图，土地管理、征税皆混乱不清，贫家之乡人及农夫皆受其害。故无论如何，农地测量为政府应尽之第一种义务。然因公款及专门家缺乏之故，此事亦须有外力扶助。故吾以为是当以国际机关行之，由此机关募集公债以供其费用，雇用专门家及诸种设备以实行其工事。测量费用几何，所需时间几何，机关之大小如何，以飞行机测量亦适用于工事否，是须专门家决定之。

地质探验，当与地图测量并行，以省费用。测量工事即毕，各省荒废未耕之地，或宜种植，或宜放牧，或宜造林，或宜开矿，由是可估得

其价值，以备使用者租佃，为最合宜之生产。耕地既增加之租税，及荒地新增之租税，将足以偿还外债之本息。除十八省外，满洲、蒙古、新疆有农地牧地极广，西藏、青海有牧地极广，可依移民计划如吾第一计划所述者，以广耕法开发之。

(2) The establishment of factories for manufacturing agricultural machinery and implements. When the waste land is reclaimed, cultivated land improved and waste labor set to work on the land, the demands for agricultural machinery and implements will be very great. As we have cheap labor and plenty of iron and coal, it is better and cheaper for us to manufacture than to import the implements and machinery. For this purpose, much capital should be invested, and factories should be put up in industrial centers or in the neighborhood of iron and coal fields, where labor and material could be easily found.

b. The Storage and Transportation of Food

The most important foodstuff to be stored and transported is grain. Under the present Chinese method, the storage of grain is most wasteful for if kept in large quantities it is often destroyed by insects or damaged by weather. It is only in small quantities and by great and constant care that grains can be preserved for a certain period of time. And the transportation of grains is also most expensive for the work is mostly done on man's shoulders. When the grains reach the waterway it is carried in a most makeshift way, without the least semblance of system. If the method of storing and transporting of grain be improved, a great economic saving could be accomplished. I propose that a chain of grain elevators be built all over the country and a special transport fleet be equipped all along the waterways by this International Development Organization. What will be the capital for this project and where the elevators should be situated have yet to be investigated by experts.

c. The Preparation and Preservation of Food

Hitherto the preparation of food is entirely by hand with a few primitive implements. The preservation of food is either by salt or sun heat. Mills and cannery method are scarcely known. I suggest that a system of rice mills should be constructed in all the large cities and towns in the Yangtze Valley and South China where rice is the staple food. Flour mills should be put up in all large cities and towns north of the Yangtze Valley, where wheat, oats, and cereals other than rice are the staple food. All these mills should be under one central management so as to produce the best economic results. What amount

of capital should be invested in this mill system by this international development scheme should be subjected to detailed investigation.

二、设立农器制造厂。欲开放废地，改良农地，以闲力归于农事，则农器之需要必甚多。中国工价甚廉，煤铁亦富，故须自制造一切农器，不必由外国输入。此需资本甚多。此工场直设于煤铁矿所在之邻地，即工力及物料易得之所。

乙 食物之贮藏及运输

此所言当贮藏及运输之重要食物，即谷类。现在中国贮藏谷类之方法不良，若所藏之量过多，每不免为虫类所蛀损，气候所伤害；故其量甚少，且须非常注意，乃能于一定时期内保存之。又谷类之运输，大半皆以人力，故费用甚巨。及谷类已达水道，则船舶往来，运输漫无定制。若将谷类贮藏及运输方法改良，必省费不少。吾意当由国际开发机关于全国内设谷类运转器，且沿河设特别运船。此事所需资本几何，且谷类运转器当设于何处，应由专门家调查之。

丙 食物之制造及保存

前此中国之食物制造，几全赖手工，而以少数简单器具助之；至于食物保存，则以食盐或日光制造之，至机器及罐头方法，为前此所不知。吾意扬子江及南部中国诸大城镇以米为主食者，当设许多磨米房；扬子江以北以小麦、燕麦及米以外之他谷类为主食者，其诸大城镇当设许多磨麦机房。此种机房，当由中央一处管理，以得最省费之结果。是所需资本几何，当俟详细调查。

In regard to the preservation of food, fruits, meats and fishes should be preserved by canning or by refrigeration. If the canning industry is developed there will be created a great demand for tinplates. Therefore the establishment of tinplate factories will be necessary and also profitable. Such factories should be situated near the iron and tin fields. There are many localities in South China where tin, iron, and coal are situated near each other, thus providing ready materials for the factories. The tinplate factories and the canneries should be combined into one enterprise so as to secure best economic results.

d. The Distribution and Exportation of Food

In ordinary good years, China never lacks food. There is a common saying in China that "One year's tilling will provide three years' wants." In the richer sections of the country, the people generally reserve three or four years' food supply in order to combat a bad year. But when China is developed and organized as an economic whole, one year's food reserve should be kept in the country for the

use of the local people and the surplus should be sent out to the industrial centers. As the storage and transportation of food will be under a central management so the distribution and exportation of food should be under the same charge. All surplus grains of a country district should be sent to the nearest town for storage and each town or city should store one year's food. All the staple food should be sold only at cost price to the inhabitants according to their number, by the distributing department. And the surplus food should be exported to foreign countries where it is wanted and where the highest price can be obtained by the export department under the central management. Thus the surplus food will not be wasted as hitherto under the prohibition law. The proceeds of this export will surely amount to a huge sum which will be used in the payment of the interest and principal of the foreign loan invested in this undertaking.

We cannot complete this part of the food industry without giving special consideration to the Tea and Soya industries. The former, as a beverage, is well known throughout and used by the civilized world and the latter is just beginning to be realized as an important foodstuff by the scientists and food administrators. Tea, the most healthy and delicious beverage of mankind, is produced in China. Its cultivation and preparation form one of the most important industries of the country. Once China was the only country that supplied the world with tea. Now, China's tea trade has been wrested away from her by India and Japan. But the quality of the Chinese tea is still unequalled. The Indian tea contains too much tannic acid, and the Japanese tea lacks the flavor which the Chinese tea possesses. The best tea is only obtainable in China-the native land of tea. China lost her tea trade owing to the high cost of its production. The high cost of production is caused by the inland tax as well as the export duty and by the old methods of cultivation and preparation. If the tax and duty are done away with and new methods introduced, China can recover her former position in this trade easily. In this International Development Scheme, I suggest that a system of modern factories for the preparation of tea should be established in all the tea districts, so that the tea should be prepared by machinery instead of, as hitherto, by hand. Thus the cost of production can be greatly reduced and the quality improved. As the world's demand for tea is daily increasing and will be more so by a dry United States of America, a project to supply cheaper and better tea will surely be a profitable one.

食物果类、肉类、鱼类之保存，或用锡铁罐，或用冰冷法。若锡铁罐工业发达，则锡铁片之需要必大增，故锡铁片工场之建设为必要，且有利益。此种工场当设于铁矿之近处。中国南部有许多地方皆发见有锡、铁、煤三种，如欲建筑工场，材料最为完备。锡铁片工场及罐工场

当合同经营，以得最良之节省结果。

丁 食物之分配及输出

在寻常丰年，中国向不缺乏食物，故中国有常言云：“一年耕，则足三年之食。”国内较富部分之人民，大概有三四年食物之积储以对付荒年。若中国既发达，有生计组织，则当预储一年之食物以为地方人民之用，其余运至工业中枢。食物之分配及运出，亦由中央机关管理，与其贮藏及运输无异。每县余出之谷类，送至近城贮藏；每一城镇须有一年食物之贮积。经理部当按人数依实价售主要食物于其民，更有所余，乃以售之于外国需此宗食物且可得最高价者。以隶中央经理部之输出部司之。于是乃不如前此禁止输出法之下，食物多所废坏。输出所得巨资，以之偿还外债本息，固有余也。

于叙论食物工业之部，不能不特论茶叶及黄豆二种工业，以毕所说。茶为文明国所既知己用之一种饮料，科学家及食物管理部今复初认黄豆为一种重要食料。就茶言之，是为最合卫生、最优美之人类饮料，中国实产出之，其种植及制造，为中国最重要工业之一。前此中国曾为以茶叶供给全世界之唯一国家，今则中国茶叶商业已为印度、日本所夺。惟中国茶叶之品质，仍非其他各国所能及。印度茶含有丹宁酸太多，日本茶无中国茶所具之香味。最良之茶，惟可自产茶之母国即中国得之。中国之所以失去茶叶商业者，因其生产费过高。生产费过高之故，在厘金^[3]及出口税，又在种植及制造方法太旧。若除厘金及出口税，采用新法，则中国之茶叶商业仍易复旧。在国际发展计划中，吾意当于产茶区域，设立制茶新式工场，以机器代手工，而生产费可大减，品质亦可改良。世界对于茶叶之需要日增，美国又方禁酒^[4]，倘能以更廉、更良之茶叶供给之，是诚有利益之一种计划也。

Soya bean as a meat substitute was discovered by the Chinese and used by the Chinese and the Japanese as a staple food for many thousands of years. As meat shortage has been keenly felt in carnivorous countries at present, a solution must be found to relieve it. For this reason I suggest that in this International Development Scheme we should introduce this artificial meat, milk, butter and cheese to Europe and America, by establishing a system of soya bean factories in all the large cities of those countries, so as to provide cheap nitrogenous food to the western people. Modern factories should also be established in China to replace those old and expensive methods of production by hand, so as to procure better economic results as well as to produce better commodities.

Part II The Clothing Industry

The principal materials for clothes are silk, linen, cotton, wool and animal skins. I shall accordingly deal with them under the following headings:

- a. The Silk Industry.
- b. The Linen Industry.
- c. The Cotton Industry
- d. The Woolen Industry.
- e. The Leather Industry.
- f. The Manufacturing of Clothing Machinery.

以黄豆代肉类，是中国人之发明。中国人、日本人用为主要食料，既历数千年。现今食肉诸国，大患肉类缺乏，是必须有解决方法，故吾意国际发展计划中，当以黄豆所制之肉乳油酪输入欧美，于诸国大城市设立黄豆制品工场，以较廉之蛋白质食料供给西方人民。又于中国设立新式工场，以代手工生产之古法，而其结果可使价值较廉，出品亦较佳矣。

第二部 衣服工业

衣服之主要原料为丝、麻、棉、羊毛、兽皮五种，今分论如下：

甲 丝工业。

乙 麻工业。

丙 棉工业。

丁 羊毛工业。

戊 皮工业。

己 制衣机器工业。

a. The Silk Industry

Silk is a Chinese discovery and was used as a material for clothes for many thousands of years before the Christian Era. It is one of the important national industries of China. Up to recent times, China was the only country that supplied silk to the world. But now this dominant trade has been taken away from China by Japan, Italy and France, because those countries have adopted scientific methods for silk culture and manufacture, while China still uses the same old methods of many thousand years ago. As the world's demand for silk is increasing daily, the improvement of the culture and manufacture of silk will be a very profitable undertaking. In this International Development Scheme, I suggest first that scientific bureaus be established in every silk district to give directions to the farmers and to provide healthy silk-worm eggs. These bureaus should be under central control. At the same time, they will act as collecting stations for cocoons so as to secure a fair price for the farmers. Secondly, silk filatures with up-to-date machinery should be established in suitable districts to reel the silk for home as well as for foreign consumption. And lastly, modern factories should be put up for manufacturing silk for both home and foreign markets. All silk filatures and factories should be under a single national control and will be financed with foreign capital and supervised by experts to secure the best economic results and to produce better and cheaper commodities.

b. The Linen Industry

This is an old Chinese industry. In southern China there is produced a kind of very fine linen in the form of ramie, known as

China-grass. This fiber if treated by modern methods and machinery becomes almost as fine and glossy as silk. But in China, so far as I know, there is not yet such new method and machinery for the manufacturing of this linen. The famous Chinese grass-cloth is manufactured by the old method of hand- looms. I propose that new methods and machinery be introduced into China by this International Development Organization to manufacture this linen. A system of modern factories should be established all over the ramie-producing districts in South China where raw materials and labor are obtainable.

c. The Cotton Industry

Cotton is a foreign product which was introduced into China centuries ago. It became a very important Chinese industry during the hand-loom age. But after the import of foreign cotton goods into China, this native handicraft industry was gradually killed by the foreign trade. So, great quantities of raw cotton are exported and finished cotton goods are imported in large quantities into China. What an anomaly when we consider the enormous, cheap labor in China. However a few cotton mills have been started recently in treaty ports which have made enormous profits. It is reported that during the last two or three years most of the Shanghai cotton mills declared a dividend of 100 per cent and some even 200 per cent! The demand for cotton goods in China is very great but the supply falls short. It is necessary to put up more mills in China for cotton manufacturing. Therefore, I suggest in this International Development Scheme to put up a system of large cotton mills all over the cotton-producing districts under one central national control. Thus the best economic results will be obtained and cotton goods can be supplied to the people at a lower cost.

甲 蚕丝工业

蚕丝为中国所发明，西历纪元前数千年已用为制衣原料，为中国重要工业之一，直至近日，中国为以蚕丝供给全世界之唯一国家。惟现今日本、意大利、法兰西诸国，已起而与中国争此商业，因此诸国已应用科学方法于养蚕制丝之事，而中国固守数千年以来之同样旧法也。世界对于蚕丝之需要既逐日增加，则养蚕，制丝之改良，将为甚有利益之事。吾意国际发展计划，应于每一养蚕之县设立科学局所，指导农民，以无病蚕子供给之。此等局所，当受中央机关监督，同时司买收蚕茧之事，使农民可得善价。次乃于适宜地方设缫丝所，采用新式机器，以备国内国外之消费。最后乃设制绸工场，以应国内国外之需求。缫丝及制丝工场皆同受一国家机关之监督，借用外资，受专门家之指挥，而其结果可使该物价廉省，品物亦较良较贱矣。

乙 麻工业

是亦为中国之古工业。惟中国所产苧麻，与欧美所产之亚麻异，若以新法及机器制之，其细滑与蚕丝无异。然中国至今尚无以新法及机器制麻者，有名之中国麻布皆依旧法及手工织造。中国南部之麻原料甚富，人工亦廉，故于此区域宜设立许多新式工场也。

丙 棉工业

棉花本外国产物，其输入中国在数百年前，在手工纺织时代，是为中国一种甚重要之工业。然自外国棉货输入中国之后，此种本国手工业殆渐归灭绝，于是以许多棉花输出，以许多棉货输入。试思中国工力既多且廉，乃不能产出棉货，岂非大可怪之事。近今乃有少数纺纱、织布厂于通商诸埠，获利极巨。或谓：“最近二三年内，上海纺织厂分红百分之百至百分之二百。”皆因中国对于棉货之需要，远过于供给，故中国须设纺织厂甚多。吾意国际发展计划，当于产棉区域设诸大纺织厂，而由中国立中央机关监督之，于是最良节省之结果可得，而可以较廉之棉货供给人民也。

d. The Woolen Industry

Although the whole of Northwestern China—about two-thirds of the entire country is a pastoral land yet the woolen industry has never been developed. Every year, plenty of raw materials are exported from China on the one hand and plenty of finished woolen goods imported on the other. Judging by the import and export of the woolen trade the development of woolen industry in China will surely be a profitable business. I suggest that scientific methods be applied to the raising of sheep and to the treatment of wool so as to improve the quality and increase the quantity. Modern factories should be established all over northwestern China for manufacturing all kinds of finished woolen goods. Here we have the raw materials, cheap labor and unlimited market. What we want for the development of this industry is foreign capital and experts. This will be one of the most remunerative projects in our International Development Scheme, for the industry will be a new one and there will be no private competitors on the field.

e. The Leather Industry

This will also be a new industry in China, despite the fact that there are a few tanneries in the treaty ports. The export of hides from and the import of leather goods into China are increasing every year. So, to establish a system of tanneries and factories for leather goods and foot-gear will be a lucrative undertaking.

丁 羊毛工业

中国西北部占全国面积三分之二用为牧地，而羊毛工业则从未见发达，每年由中国输出羊毛甚多，制为毛货，又复输入中国。自羊毛商业输出输入观之，可知发达羊毛工业，为在中国甚有利之事。吾意当以科学方法养羊、剪毛，以改良其制品，增加其数量。于中国西北全部设立工场以制造一切羊毛货物，原料及工价甚廉，市场复大至无限。此工业之发达，须有外国资本及专门家，是为国际发展计划中最有报酬者，因是属一种新工业，无其他私人竞争也。

戊 皮工业

通商诸埠虽有多少制皮工场，是实为中国之新工业。生皮之输出，熟皮之输入，每年皆有增加。故设立制皮工场及设立制造皮货及靴、鞋类工场，甚为有利益之事。

f. The Manufacturing of Clothing Machinery

The machinery for the manufacturing of various kinds of clothing materials is in great demand in China. It is reported that the orders for cotton mill machinery have been filled up for the next three years from manufacturers in Europe and America. If China is developed according to my programs, the demand for machinery will be many times greater than at present and the supply in Europe and America will be too short to meet it. Therefore to establish factories for the manufacturing of clothing machinery is a necessary as well as a profitable undertaking. Such factories should be established in the neighborhood of iron and steel factories, so as to save expenses for transportation of heavy materials. What will be the capital for this undertaking should be decided by experts.

Part III The Housing Industry

Among the four hundred millions in China the poor still live in huts and hovels, and in caves in the loess region of north China while the middle and the rich classes live in temples. All the so-called houses in China, excepting a few after western style and those in treaty ports are built after the model of a temple. When a Chinese builds a house he has more regard for the dead than for the living. The first consideration of the owner is his ancestral shrine. This must be placed at the center of the house, and all the other parts must be complement and secondary to it. The house is planned not for comfort but for ceremonies, that is, for "the red and white affairs," as they are called in China. The "red affair" is the marriage or other felicitous celebrations of any member of the family, and the "white affair" is the funeral ceremonies. Besides the ancestral shrine there are the shrines of the various household gods. All these are of more importance than man and must be considered before him. There is not a home in old China that is planned for the comfort and convenience of man alone. So now when we plan the housing industry in China in our International Development Scheme, we must take the houses of the entire population of China into consideration. "To build houses for four hundred millions, it is impossible!" some may exclaim. This is the largest job ever conceived by man. But if China is going to give up her foolish traditions and useless habits and customs of the last three thousand years and begin to adopt modern civilization, as our industrial development scheme is going to introduce, the remodelling of all the houses according to modern comforts and conveniences is bound to come, either unconsciously by social evolution or consciously by artificial construction. The modern civilization so far attained by western nations is entirely an unconscious progress, for social and economic sciences are but recent discoveries. But henceforth all human progress will be more or less based upon knowledge, that is upon scientific planning. As we can foresee now, within half a century under our industrial development, the houses of all China will be renewed according to modern comfort and convenience. Is it not far better and cheaper to rebuild the houses of all China by a preconceived scientific plan than by none? I have no doubt that if we plan to build a thousand houses at one time it would be ten times cheaper than to plan and build one at a time, and the more we build the cheaper terms we would get. This is a positive economic law. The only danger in this is over-production. That is the

only obstacle for all production on a large scale. Since the industrial revolution in Europe and America, every financial panic before the world war was caused by over-production. In the case of our housing industry in China, there are four hundred million customers. At least fifty million houses will be needed in the coming fifty years. Thus a million houses a year will be the normal demand of the country.

己 制衣机器工业

中国需要各种制衣机器甚多。或谓中国在欧美所订购纺织机器，须此后三年内乃能交清。若依予计划发展中国，则所需机器当较多于现在数倍，欧美且不足供给之。故设立制造制衣机器为必要，且有利之事。此种工场，当设于附近钢铁工场之处，以省粗重原料运输之费。此事所需资本几何，当由专门家决定之。

第三部 居室工业

中国四万万人中，贫者仍居茅屋陋室，北方有居士穴者，而中国上等社会之居室，乃有类于庙宇。除通商口岸有少数居室依西式外，中国一切居室，皆可谓为庙宇式。中国人建筑居室，所以为死者计过于为生者计，屋主先谋祖先神龛之所，是以安置于屋室中央，其他一切部分皆不及。于是重要居室非以图安适，而以合于所谓红白事者。红事者，即家族中任何人嫁娶及其他喜庆之事；白事者，即丧葬之事。除祖先神龛之外，尚须安设许多家神之龛位。凡此一切神事，皆较人事为更重要，须先谋及之。故旧中国之居室，殆无一为人类之安适及方便计者。今于国际发展计划中，为居室工业计划，必须谋及全中国之居室。或谓为四万万入建屋，乃不可能。吾亦认此事过巨。但中国若弃其最近三千年愚蒙之古说及无用之习惯，而适用近世文明，如予国际发展计划之所引导，则改建一切居室以合于近世安适方便之式，乃势所必至。或因社会进化于无意识中达到，或因人工建设于有意识中达到，西方民族达到近世文明，殆全由于无意识的进步，因社会经济学乃最近发明也。但一切人类进步，皆多少以知识即科学计划为基础，依吾所定国际发展计划，则中国一切居室将于五十年内依近世安适方便新式改造，是予所能预言者。以预定科学计划建筑中国一切居室，必较之毫无计划更佳更廉。若同时建筑居室千间，必较之建筑一间者价廉十倍。建筑愈多，价值愈廉，是为生计学定律。生计学唯一之危险，为生产过多，一切大规模之生产皆受此种阻碍。自欧美工业进化以来，世界之大战前所有财政恐慌，皆生产过多之所致。就中国之居室工业论，雇主乃有四万万人，未来五十年中至少需新居室者有五千万，每年造屋一百万间，乃普通所需要也。

Houses are a great factor in civilization. They give men more enjoyment and happiness than food and clothes. More than half of the human industries are contributing to household needs. The housing industry will be the greatest undertaking of our International Development Scheme, and also will be the most profitable part of it. My object of the development of the housing industry is to provide cheap houses to the masses. A ten thousand dollar house now built in the treaty port can be produced for less than a thousand dollars and yet a high margin of profit can be made. In order to accomplish this we have to produce transport, and distribute the materials for construction. After the house is finished, all household equipment must be furnished. Both of these will be comprised in the housing industry which I shall formulate as follows:

- a. The Production and Transportation of Building Materials.
- b. The Construction of Houses.

c. The Manufacturing of Furniture.

d. The Supply of Household Utilities.

居室为文明一因子，人类由是所得之快乐，较之衣食更多。人类之工业过半数，皆以应居室需要者。故居室工业，为国际计划中之最大企业，且为其最有利益之一部分。吾所定发展居室计划，乃为群众预备廉价居室。通商诸埠所筑之屋，今需万元者，可以千元以下得之，建屋者且有利益可获。为是之故，当谋建筑材料之生产、运输、分配，建屋既毕，尚须谋屋中之家具装置，是皆包括于居室工业之内。今定其分类如下：

甲 建筑材料之生产及运输。

乙 居室之建筑。

丙 家具之制造。

丁 家用物之供给。

a. The Production and Transportation of Building Materials

The building materials are bricks, tiles, timber, skeleton iron, stone, cement and mortar. Each of these materials must be manufactured or cut out from raw materials. So kilns for the manufacture of tiles and bricks must be put up. Mills for timbers must be established, also factories for skeleton irons. Quarries must be opened and factories for cement and mortar must be started. All these establishments must be put up at suitable districts where materials and markets are near one another. All should be under one central control so as to regulate the output of each of these materials in proportion to the demand. After the materials are ready they must be transported to the places where they are wanted by special bottoms on waterways, and by special cars on railways so as to reduce the cost as low as possible. For this purpose special boats and cars must be built by the shipbuilding department and the car factory.

b. The Construction of Houses

The houses to be built in China will comprise public buildings and private residences. As the public buildings are to be built with public funds for public uses which will not be a profitable undertaking, a special Government Department should therefore be created to take charge. The houses that are to be built under this International Development Scheme will be private residences only with the object to provide cheap houses for the people, as well as to make profit for this International concern. The houses will be built on standardized

types. In cities and towns the houses should be constructed on two lines: the single family and the group family houses. The former should again be sub-divided into eight-roomed, ten-roomed and twelve-roomed houses, and the latter into ten-family, hundred-family and thousand-family houses, with four or six rooms for each family. In the country districts the houses should be classified according to the occupation of the people, and special annexes such as barns and dairies should be provided for the farmers. All houses should be designed and built according to the needs and comfort of man; so a special architectural department should be established to study the habits, occupations and needs of different people and make improvements from time to time. The construction should be performed as much as possible by labor-saving machinery so as to accelerate work and save expenses.

c. The Manufacturing of Furniture

As all houses in China should be remodelled all furniture should be replaced by up-to-date ones, which are made for the comforts and needs of man. Furniture of the following kinds should be manufactured: the library, the parlor, the bedroom, the kitchen, the bathroom and the toilet. Each kind should be manufactured in a special factory under the management of the International Development Organization.

甲 建筑材料之生产及运输

建筑材料为砖、瓦、木材、铁架、石、塞门土、三合土等，其每一种皆须制造，或与其他原料分离。如制造砖瓦则须建窑，木材须建锯木工场，铁架须建制铁工场，此外须设石工场、塞门土工场、三合土工场等。须择适宜之地，材料与市场相近者为之。且一切须在中央机关监督之下，使材料之制出与需要成比例。材料既制成，则水路用舟，陆路用车，以运至需要之地，务设法减省一切费用。造船部、造车部于此则造特别之舟、车以应之。

乙 居室之建筑

此项建筑事业，包括一切公私屋宇。公众建筑，以公款为之，以应公有，无利可图，由政府设专部以司其事。其私人居室，为国际发展计划所建筑者，乃以低廉居室供给人民，而司建筑者仍须有利可获。此类居室之建筑，须依一定模范。在城市中所建屋，分为二类：一为一家之居室，一为多家同居室。前者分为八房间、十房间、十二房间诸种，后者分为十家、百家、千家同居者诸种，每家有四房间至六房间。乡村中之居室，依人民之营业而异，为农民所居者当附属谷仓、乳房之类。一切居室设计，皆务使居人得其安适。故须设特别建筑部以考察人民习

惯、营业需要，随处加以改良。建造工事，务须以节省人力之机器为之，于是工事可加速、费用可节省也。

丙 家具之制造

中国所有居室既须改造，则一切家具亦须改用新式者，以图国人之安适，而应其需要。食堂、书室、客厅、卧室、厨房、浴室、便所所用家具，皆须制造。每种皆以特别工场制造之，立于国际发展机关管理之下。

d. The Supply of Household Utilities

The household utilities are water, light, heat, fuel and telephones. Except in treaty ports, there is no water-supply system in any of the cities and towns of China. Even many treaty ports possess none as yet. In all the large cities, the people obtain their water from rivers which at the same time act as sewage. The water supply of the large cities and towns in China is most unsanitary. (1) It is an urgent necessity that water supply systems should be installed in all cities and towns in China without delay. Therefore special factories for equipping the water system should be established in order to meet the needs. (2) Lighting plants should be installed in all the cities and towns in China. So factories for the manufacture of the machinery lighting plants should be established. (3) Modern heating plants should be installed in every household, using either electricity, gas, or steam. So the manufacturing of heating equipment is a necessity. Factories should be established for this purpose. (4) Cooking fuel is one of the most costly items in the daily needs of the Chinese people. In the country the people generally devote ten per cent of their working time to gathering firewoods. In town the people spend about twenty per cent of their living expenses for firewood alone. Thus this firewood question accumulates into a great national waste. The firewood and grass as a cooking fuel must be substituted by coal in the country districts, and by gas or electricity in towns and cities. In order to use coal gas and electricity, proper equipment must be provided. So factories for the manufacturing of coal gas, and electricity, stoves for every family must be established by this International Development Organization. (5) Telephones must also be supplied to every family in the cities as well as in the country. So factories for manufacturing the equipment must be put up in China, in order to render them as cheap as possible.

Part IV The Motoring Industry

The Chinese are a stagnant race. From time immemorial a man is praised for staying at home and caring for his immediate surroundings only. Laotse—a contemporary of Confucius—says: "The good people are those who live in countries so near to each other that they can hear each other's cock crow and dog bark and yet they never have had intercourse with each other during their lifetime." This is often quoted as the Golden Age of the Chinese people. But in modern civilization the condition is entirely changed. Moving about occupies a great part of a man's life time. It is the movement of man that makes civilization progress. China, in order to catch up with modern civilization, must move. And the movement of the individual forms an important part of the national activity. A man must move whenever and wherever he pleases with ease and rapidity. However, China, at present, lacks the means of facility for individual movement, for all the old great highways were ruined and have disappeared, and the automobile has not yet been introduced into the interior of the country. The motor car, a recent invention, is a necessity for rapid movement. If we wish to move quickly and do more work, we must adopt the motor car as a vehicle. But before we can use the motor car, we have to build our roads. In the preliminary part of this International Development Scheme, I proposed to construct one million miles of roads. These should be apportioned according to the ratio of population in each district for construction. In the eighteen provinces of China Proper, there are nearly 2,000 hsiens. If all parts of China are to adopt the hsien administration, there will be nearly 4,000 hsiens in all. Thus the construction of roads for each hsien will be on an average of 250 miles. But some of the hsiens have more people and some have less. If we divide the million miles of roads by the four hundred million people, we shall have one mile to every four hundred. For four hundred people to build one mile of road is not a very difficult task to accomplish. If my scheme of making road-building as a condition for granting local autonomy is adopted by the nation, we shall see one million miles of road built in a very short time as if by a magic wand.

丁 家用物之供给

家用物为水、光、燃料、电话等。（一）除通商口岸之外，中国诸城市中无自来水，即通商口岸亦多不具此者。许多大城市所食水为河水，而污水皆流至河中，故中国城市中所食水皆不合卫生。今须于一切

大城市中设供给自来水之工场，以应急需。（二）于中国一切大城市供给灯光，设立制造机器发光工场。（三）设立电工场、煤气工场、蒸气工场，以供给暖热。（四）厨用燃料在中国为日用者。最贫乡村之人，每费年工十分之一以采集柴薪。城市之人，买柴薪之费占其生活费十分之二。故柴薪问题，为国民最大耗费。今当使乡村中以煤炭代木草，城市用煤气或电力。然欲用煤炭、煤气、电力等，皆须有特别设备，即由国际发展机关制造煤气、电力火炉诸工场。（五）无论城乡各家，皆宜有电话。故当于中国设立制造电话器具工场，以使其价甚廉。

第四部 行动工业

中国人为凝滞民族，自古以来，安居于家，仅烦虑近事者，多为人所赞称。与孔子同时之老子有言曰：“邻国相望，鸡犬之声相闻，民至老死不相往来。”中国人民每述此为黄金时代。惟据近世文明，此种状态已全变，人生时期内，行动最多，各人之有行动，故文明得以进步。中国欲得近时文明，必须行动。个人之行动为国民之重要部分，每人必须随时随地行动，甚易甚速。惟中国现在尚无法使个人行动容易，因古时大道既已废毁，内地尚不识自动车即摩托为何物。自动车为近时所发明，乃急速行动所必要。吾侪欲行动敏捷，作工较多，必须以自动车为行具。但欲用自动车，必先建造大路。吾于国际发展计划，提前一部已提议造大路一百万英里。是须按每县人口之比率，以定造路之里数。中国本部十八省约有县二千，若中国全国设县制，将共有四千县，每县平均造路二百五十英里。惟县内人民多少不同，若以大路一百万英里除四万万人数，则四百人乃得大路一英里。以四百人造一英里之大路，决非难事。若用予计划，以造路为允许地方自治条件，则一百万英里之大路将于至短期内制成矣。

As soon as the people of China decide to build roads, this International Development Organization can begin to put up factories for manufacturing motor cars. First start on a small scale and gradually expand the plants to build more and more until they are sufficient to supply the needs of the four hundred million people. The cars should be manufactured to suit different purposes, such as the farmer's car, the artisan's car, the business man's car, the tourist's car, the truck car, etc. All these cars, if turned out on a large scale, can be made much cheaper than at present, so that everybody who wishes it, may have one.

Besides supplying cheap cars, we must also supply cheap fuel, otherwise the people will still be unable to use them. So the development of the oil fields in China should follow the motor car industry. This will be dealt with in more detail under the mining industry.

中国人民既决定建造大路，国际发展机关即可设立制造自动车之工场。最初用小规模，后乃逐渐扩张，以供给四万万人之需要。所造之车当合于各种用途，为农用车、工用车、商用车、旅行用车、运输用车等。此一切车以大规模制造，实可较今更廉，欲用者皆可得之。

除供给廉价车之外，尚须供给廉价燃料，否则人民不能用之。故于发展自动车工业之后，即须开发中国所有之煤、油矿，是当于矿工业中详论之。

Part V The Printing Industry

This industry provides man with intellectual food. It is a necessity of modern society, without which mankind cannot progress. All human activities are recorded, and all human knowledge is stored in printing. It is a great factor of civilization. The progress and civilization of different nations of the world are measured largely by the quantity of printed matter they turned out annually. China, though the nation that invented printing, is very backward in the development of its printing industry. In our International Development Scheme, the printing industry must also be given a place. If China is developed industrially according to the lines which I suggested, the demand for printed matter by the four hundred millions will be exceedingly great. In order to meet this demand efficiently, a system of large printing houses must be established in all large cities in the country, to undertake printing of all kinds from newspapers to encyclopædia. The best modern books on various subjects in different countries should be translated into Chinese and published in cheap edition form for the general public in China. All the publishing houses should be organized under one common management, so as to secure the best economic results.

In order to make printed matter cheap, other subsidiary industries must be developed at the same time. The most important of these is the paper industry. At present all the paper used by newspapers in China is imported. And the demand for paper is increasing every day. China has plenty of raw materials for making paper, such as the vast virgin forests of the northwestern part of the country, and the wild reeds of the Yangtze and its neighboring swamps which would furnish the best pulps. So, large plants for manufacturing papers should be put up in suitable locations. Besides the paper factories, ink factories, type foundries, printing machine factories, etc., should be established under a central management to produce everything that is needed in the printing industry.

第五部 印刷工业

此项工业为以知识供给人民，是为近世社会一种需要，人类非此无由进步。一切人类大事皆以印刷纪述之，一切人类知识以印刷蓄积之，故此为文明一大因子。世界诸民族文明之进步，每以其每年出版物之多少衡量之。中国民族虽为发明印刷术者，而印刷工业之发达，反甚迟缓。吾所定国际发展计划，亦须兼及印刷工业。若中国依予实业计划发达，则四万万人民所需印刷物必甚多。须于一切大城乡中设立大印刷所，印刷一切自报纸以至百科全书。各国所出新书，以中文翻译，廉价售出，以应中国公众之所需。一切书市，由一公设机关管理，结果乃廉。

欲印刷事业低廉，尚须同时设立其他辅助工业。其最重要者为纸工业。现今中国报纸所用纸张，皆自外国输入。中国所有制纸原料不少，如西北部之天然森林，扬子江附近之芦苇，皆可制为最良之纸料。除纸工场之外，如墨胶工场、印模工场、印刷机工场等，皆须次第设立，归中央管理，产出印刷工业所需诸物。

[1] 司书：指掌管公文、书信及杂事的工作人员。

[2] 养气：今作“氧气”。

[3] 厘金：中国自清代至中华民国初年征收的一种商业税，因其初定税率为1厘（1%），故名厘金，又称厘捐、厘金税。

[4] 美国又方禁酒：指1920年1月美国宪法第十八号修正案，即所谓禁酒法案正式生效。该法令规定，凡是制造、售卖乃至运输酒精含量超过0.5%以上的饮料，皆属违法。

PROGRAM VI

The Mining Industry

Mining and farming are the two most important means of producing raw materials for industries. As farming is to produce food for man, so mining is to produce food for machinery. Machinery is the tree of modern industries, and the mining industry is the root of machinery. Thus, without the mining industry there would be no machinery, and without machinery there would be no modern industries which have revolutionized the economic conditions of mankind. The mining industry, after all, is the greatest factor of material civilization and economic progress. Although in the fifth part of the first program I suggested the development of the iron and coal fields in Chihli and Shansi as an auxiliary project for the development of the Great Northern Port, still, a special program should be devoted to mining in general. The mineral lands of China belong to the state, and mining in China is still in its infancy. So to develop the mining industry from the outset as a state enterprise would be a sound economic measure. But mining in general is very risky and to enlist foreign capital in its development in a wholesale manner is unadvisable. Therefore, only such mining projects which are sure to be profitable will be brought under the International Development Scheme. I shall formulate this mining program as follows:

- I. The Mining of Iron.
- II. The Mining of Coal.
- III. The Mining of Oil.
- IV. The Mining of Copper.
- V. The Working of Some Particular Mines.
- VI. The Manufacture of Mining Machinery.
- VII. The Establishment of Smelting Plants.

Part I The Mining of Iron

Iron is the most important element in modern industries. Its deposits are found in great quantities in certain areas and can be easily mined. The iron mines should be worked absolutely as a state property. Besides the Chihli and Shansi iron mines, the other iron fields must also be developed. There are very rich deposits in the southwestern provinces, the Yangtze Valley and the northwestern provinces in China Proper. Sinkiang, Mongolia, Manchuria, Kokonor, and Tibet also possess large deposits of iron. We have the Han Yeh Ping Iron and Steel Works in the Yangtze Valley and the Pen Chi Hu Iron and Steel Works in South Manchuria, both of which are largely capitalized by Japan and are working very profitably lately. There should be similar works in the vicinity of Canton, the Great Southern Port, and also in Szechuen, and Yunnan, where iron and coal are found side by side. The iron deposits in Sinkiang, Kansu, Mongolia, etc., must also be developed one after the other, according to the needs of the locality. Iron and Steel Works must be put up in each of these regions to supply the local demand for manufactured iron. What amount of capital should be invested in these additional iron and steel works must be thoroughly investigated by experts. But I should say that a sum equal to or double the amount to be invested in the Chihli and Shansi iron and steel works will not be too much, because of the great demand which will result in the development of China.

陆 第六计划

矿业

矿业与农业为工业上供给原料之主要源泉也。矿业产原料以供机器，犹农业产食物以供人类。故机器者实为近代工业之树，而矿业者又为工业之根。如无矿业，则机器无从成立；如无机器，则近代工业之足以转移人类经济之状况者，亦无从发达。总而言之，矿业者为物质文明与经济进步之极大主因也。在吾第一计划之第五部中，曾倡议开采直隶、山西两省之煤铁矿田，为发展北方大港之补助计划，但矿业为近代之重要事业，有不可不另设专部以研究之者。中国矿业尚属幼稚，惟经营之权素归国有，几成习惯。此所以发展中国实业，当由政府总其成，庶足称为有生气之经济政策。彼通常人对于矿业多以为危险事业，并谓借外资以为开采者亦非得计，其所见或未到也。故在此之矿业计划中，择其决为有利者先行举办，兹分别列于下之各种：

- 一、铁矿。
- 二、煤矿。
- 三、油矿。
- 四、铜矿。
- 五、特种矿之采取。
- 六、矿业机器之制造。
- 七、冶矿机厂之设立。

第一部 铁矿

在近代工业中，称为最重要之原质者，是为钢铁。钢铁产生于各地者，多见丰富，且易开采。故为国家谋公共利益计，开采铁矿之权，当属之国有。中国除直隶、山西两省经拟开采之铁矿外，其余各地铁矿亦须次第开采。中国内地沿扬子江一带与西北各省皆以铁矿见称丰富，新疆、蒙古、青海、西藏各地亦以铁矿著名。所可惜者，中国经营钢铁事业，现只有汉阳铁厂与南满洲之本溪湖铁厂，其资本又多为日本人所占有，虽云近来获利甚厚，亦不免有利权外溢之叹矣。广州将开为南方大港，应设立一铁厂。其他如四川、云南等地方之铁矿，亦可次第开采。而后多设钢铁工厂于各处内地，使之便利经营钢铁事业者之需要。至增设之铁厂，应用资本若干，可留为有经验者另行察夺。但以吾之见，因发展中国实业之结果，需铁孔亟，即以相等或加倍于直隶、山西铁厂所用之资本经营之，亦不为多也。

Part II The Mining of Coal

China is known to be the country most rich in coal deposits, yet her coal fields are scarcely scratched. The output of coal in the United States is about six hundred million tons a year. If China is equally developed she should, according to the proportion of her population, have an output of four times as much coal as the United States. This will be the possibility of coal mining in China which the International Development Organization is to undertake. As coal deposits are found in great quantities in certain areas so its output can be estimated quite accurately beforehand. Thus, the risk is of no consideration and the profit is sure. But as coal is a necessity of civilized community and the sinews of modern industries, the principal object for mining should not be for profit alone, but for supplying the needs of mankind. After the payment of interest and capital of the foreign loans for its development, and the securing of high wages for the miners, the price of coal should be reduced as low as possible so as to meet the demands of the public as well as to give impetus to the development of various industries. I suggest that besides the mining of coal for the iron and steel works, a plan for producing two hundred million tons of coal a year for other uses should be formed at the start. Mines should be opened along the seaboard and navigable rivers. As Europe is now seeking coal from China this amount will not be over-production from the beginning. A few years later when the industries of China will be more developed more coal will be needed. How much capital will be required and what mines are to be worked, have to be submitted to scientific investigation under expert direction.

第二部 煤矿

中国煤矿素称丰富，而煤田之开掘者，不过仅采及皮毛而已。北美合众国每年所采取之煤约六万万吨，如中国能用同一方法采取之，并依其人口之比例以为衡，则产出之煤应四倍于美国。此当为中国将来煤矿之产额，而国际发展实业机关宜注意经营者也。夫煤矿之产于中国各地既多所发见，而其产额亦可以预定，故开采者不特无失败之虞。而利益之厚可断言者。但煤为文明民族之必需品，为近代工业之主要物，故其采取之目的，不徒纯为利益计，而在供给人类之用。由此言之，开采煤矿之办法，除摊派借用外资之利息外，其次当为矿工增加工资，又其次当使煤价低落，便利人民，而后各种工业易于发展也。吾以为当煤矿开采之始，除为钢铁工厂使用外，开始计划当以产出二万万吨备为他项事业之用。沿海岸、河岸各矿，交通既便，宜先开采，内地次之。况欧洲各国现思取煤于中国，故吾所定煤之产额，虽当开采之始，亦无过多之虑。待至数年后，当中国工业愈加发达，需煤之数必渐增多，可无疑者。至开采需用之资本若干，与何处矿田应先开采，须留以待专门家用科学之眼光考察之。

Besides coal mining, the coal products industry must be developed under the same management. This is a new industry without any competition and has an unlimited market in China. Great profits will be assured on the capital invested.

Part III The Mining of Oil

It is well-known that the richest company in the world is the Standard Oil Company of New York, and that the richest man in the world is Rockefeller, organizer of this company. This proves that oil mining is a most profitable business. China is known to be a very rich oil-bearing country. Oil springs are found in the provinces of Szechuen, Kansu, Sinkiang, and Shensi. How vast is the underground reservoir of oil in China is not yet known. But the already known oil springs have never been worked and made use of, while the import of kerosene, gasoline, and crude oil from abroad is increasing every year. When China is developed as a motoring country, the use of gasoline will be increased a thousand-fold, then the supply from the foreign fields will not be able to meet the demands, as shortage of oil is already felt in Europe and America. The mining of oil in China will soon become a necessity. This enterprise should be taken up by the International Development Organization for the state. Production on a large scale should be started at once. Pipe line systems should be installed between oil districts and populous and industrial centers in the interior and also river and sea ports. What amount of capital should be invested in the project will have to be investigated by experts.

除煤矿以外，其他一切因煤而产出之工业，可用同一方法经理之。此之新工业，既无人与之竞争，且在中国又有无限之市场，故资本之投放，其利益之大可断言者。

第三部 油矿

世界中营业公司之最富者，以纽约三达煤油公司^[1]为著，世界中人之最富者，以该公司之创建者乐极非路为最著，于此可以证明开采煤油矿为最有利益之事业。中国亦以富于煤油出产国见称也，四川、甘肃、新疆、陕西等省已发见有油源，虽其分量之多寡，尚未能确实调查。而中国有此种矿产，不能开采以为自用，以至由外国人口之煤油、汽油等年年增加，未免可惜。如待至中国将来汽车盛行之时，煤汽之需用或增至千倍。当此欧美各国煤油正在日渐减缩，由外国输入之煤油、煤气，断不足以供中国之需要，此所以在中国以开采油矿为必要之图也。此种事业，须由国际发展实业机关为政府经营之，但当经营之始，规模亦当远大。如煤油区域、稠密居民、工业中心以及河岸、海港等地方，皆宜用油管办法互相联络，以使其输送与分配于各地者，更为便利。如此之筹划，须用资本若干方能开办，可留为对于此事业有经验者察夺之。

Part IV The Mining of Copper

The copper deposits, like iron ores, are found in great quantities in different places. So the quantity of ores in each mine can be accurately estimated before it is opened and its working generally runs no risk. Thus, the mining of copper should be taken up as a government enterprise, as was always the case in China, and financed and worked by the International Development Organization. The richest copper deposits in China are found along the border of Szechuen and Yunnan on the Yangtze River. The government copper mine in Chaotung, in the northeastern corner of Yunnan, has been working for many centuries. Cash, the standard currency of China, was made mostly of the copper from Yunnan province. The currency still absorbs an enormous quantity of copper. Owing to the difficulty of transporting the Yunnan copper, most of the metal for currency is being imported from foreign countries. Besides currency, copper is very commonly used for many other purposes and when the industries in China are developed the demand will increase a hundred times. So the demand for this metal will be very great in the market of China alone. I suggest that production on a large scale should be adopted and modern plants should be installed in copper mines. How much capital to be invested in this enterprise should be decided by experts after careful investigation.

第四部 铜矿

中国铜矿亦如铁矿之丰富，经已发见者，已有多处。至其矿产之分量，在未开以前均可预计，故办理可无危险。但开采之权，须依中国惯例，属之国有，而后由国际发展实业机关投资代为经营。四川、云南与扬子江一带，皆中国铜产最盛之区。由政府开采之铜矿在于云南北角之昭通者，经已数世纪之久矣。中国向来通用之钱币，几乎全赖云南铜矿以制造之，现今钱币需用之铜，仍称大宗。但因云南之铜，输运艰难，价格过高，故多购自外国。非中国缺此种金属，是中国对于此种金属之采取未能发达故也。况铜之为物，除用作钱币外，需用为他种目的者尚多。当中国将来之工业发达，用铜之途必增至百倍。故此种金属，即在中国市场，将必成为需要之大宗。此吾之所以为开采铜矿不可不适用近代机器，而冀其有大宗之出产也。此之事业，应投资若干以为之经营，可留为专门家察夺之。

Part V The Working of Some Particular Mines

In regard to the mining of various kinds of metal, some particular mines should be taken up by the International Development Organization. There are many famous mines in China which have been worked for many centuries by hand, such as the Kochui tin mine in Yunnan, the Moho gold mine in Heilungkiang, and the Khotan jade mine in Sinkiang. All these mines are known to have very rich deposits, -the deeper the richer. Hitherto only the surface parts of those mines have been worked and the larger deposits are still untouched, owing to the lack of means of getting rid of the water. Some of the mines are still in the hands of the Government, while others have been given up to private concerns. If modern machinery is adopted the mines should revert to the Government so as to secure economy in working. Many discarded mines of this kind should be thoroughly investigated, and if found profitable, work should be resumed under the International Development Scheme. All future mining, other than government enterprise, should be leased to private concerns on contract, and when the term is up, the government has the option to take them over, if found profitable as a state property. Thus all profitable mines will be socialized in time and the profit will be equally shared by all the people in the country.

第五部 特种矿之采取

国际发展实业机关对于各色特种之矿，有可以经营之者。如云南个旧之锡矿，黑龙江之漠河金矿，新疆之和阗玉矿，皆用人力采取，经已数世纪之久矣。此种之矿产皆以丰厚见称，现已开采者不过是矿中之上层，其余大部分因无法排除泉水，尚多埋藏地中。但向来对于此等特种矿产，有为人民采取者，有为政府采取者。如能行用近代机器，并由政府经营，是为最经济之办法也。其他多有已弃置之矿产。如此类者，须通行考察，如以为实有利益，即须依国际发展计划，再行开采。至于将来一切矿业，除既为政府经营外，应准租与私人立约办理，当期限既满，并知为确有利益者，政府有收回办理之权。如此办法，一切有利益之矿可以从渐收为社会公有，而通国人民亦可以均沾其利益矣。

Part VI The Manufacture of Mining Machinery

Most of the metal deposits of the earth are in small quantities and scattered far and wide in various places. Most of the mining enterprises resemble farming in that it is more profitable to work by individuals and small parties. As such is the case, most of the mining enterprises have to be worked out by private concerns. In order to accelerate the development of mining, more liberal laws should be adopted; education and information should be given freely by experts employed by the state; and encouragement and financial assistance should be given by the state and private banks. The part that the International Development Organization should take in general mining enterprises is to manufacture all kinds of mining tools and machinery, and to supply them to the miners at low cost, either on cash or on credit. By distributing tools and machinery to the surplus workers in China, the mining industry would be developed by leaps and bounds. And the more the mining industry is developed the more will be the demand for tools and machinery. Thus the profits for the manufacturing concerns would be limitless, so to speak. Of course, the factories should be started on a small scale and be extended gradually according to the ratio of the development of the mining industry. I suggest that the first factory of this kind should be established at Canton, the seaport of the southwestern mining region, where raw materials and skilled labor can be easily obtained. The other factories should be established in Hankow and the Great Northern Port afterwards.

第六部 矿业机械之制造

各种金属之埋藏于独一地域者，不过一小部分，而散产于各地者，广狭亦各有不同，故对于各种矿业之经营，有为政府不能自办，当留为私人办之。譬如农业，私人经营者利益常丰，矿业亦如是也。如欲望矿务之发展，国家必须采用宽大之矿律。政府所雇用之专门技师，应自由予以指导与报告。公司银行应予以经济之帮助。此国际发展机关对于普通矿业，只当为之制造各种矿业器具与机械，以供给业矿者之使用。至此器具与机械之出售者，无论其为现金，或为赊借，必须定以最低廉之价，而后能使之遍为分配于中国之多余工人，矿业自日臻发达。矿业既日臻发达，器具与机械之需要必日多。若依此办理，即制造矿业器具机械之利益，已无可限量矣。但此等工厂，在开始时期只宜至小经营，待从矿业日臻发达而后从渐推广。故吾以为此种之第一工厂须设立于广州，盖因广州为西南矿区之口岸，获取原料、延请技师亦较他处为便易也。至其他之工厂，应设立于汉口与北方大港各地。

Part VII The Establishment of Smelting Plants

Smelting plants for various kinds of metals should be put up in all mining districts to turn ore into metals. These smelting plants should be conducted under the coöperative system. At first, a reasonable price should be paid to the miner when the ore is collected. Afterwards, when the metal is sold, either at home or in foreign markets, the smelting works will take a share of the profit to cover the expenses, the interest, the sinking fund, etc. The surplus profit should be divided among the workers according to their wages, and among the capitalists according to the proportion of ore they contribute to the furnace. In this way we can encourage private mining enterprise which forms the root of other industries. All smelting works should be put up according to local needs and their scale should be determined by experts and managed under a central control.

第七部 冶矿厂之设立

各种金属之冶铸机厂，应遍设于各矿区，使之便于各种金属之化炼。此等冶铸机厂，应仿合作制度组织之。当其始也，生矿之收集，价格必廉。迨后金属之出售，无论其在中国或外国市场，而此种冶铸工夫，可以分享其一分之利益，用以抵偿各种费用、利息与冗费。其他之剩余利益，应按各种工人之工资并各资本家所供给于铸炉之生矿之多寡比例分配之。如此办法，对于私人之经营矿业者，既可以资鼓励，而工业之基础亦可因之以成立。但机厂之设立须依各区之需要，由专门家以定其规模之大小，而设中央机关以管理之。

[1] 三达煤油公司：今译美孚石油公司。乐极非路：今译洛克菲勒，1839—1937年，美孚石油公司创办人。

CONCLUSION

In this International Development Scheme, I venture to present a practical solution for the three great world questions which are the International War, the Commercial War and the Class War. As it has been discovered by post-Darwin philosophers that the primary force of human evolution is coöperation and not struggle as that of the animal world, so the fighting nature, a residue of the animal instinct in man, must be eliminated from man, the sooner the better.

International war is nothing more than pure and simple organized robbery on a grand scale, which all right-minded people deplore. When the United States of America turned the recent European conflict into a world war by taking part in it, the American people to a man determined to make this war end war forever. And the hope of the peace-loving nations in the world was raised so high that we Chinese thought that the "Tatung" or the Great Harmony Age was at hand. But unfortunately, the United States has completely failed in peace, in spite of her great success in war. Thus, the world has been thrown back to the pre-war condition again. The scrambling for territories, the struggle for food, and the fighting for raw materials will begin anew. So instead of disarmament there is going to be a greater increase in the armies and navies of the once allied powers for the next war. China, the most rich and populous country in the world, will be the prize. Some years ago there was great inclination among the Powers to divide China and Imperial Russia actually took steps to colonize Manchuria. But the then chivalrous Japan went to war with Russia and thus saved China from partition. Now the militaristic policy of Japan is to swallow China alone. So long as China is left to the tender mercy of the militaristic powers she must either succumb to partition by several powers or be swallowed up by one power.

However, the tide of the world seems to be turning. After centuries of sound slumber, the Chinese people at last are waking up and realizing that we must get up and follow in the world's progress. Now we are at the parting of the ways. Shall we organize for war or shall we organize for peace? Our militarists and reactionaries desire the former, and they are going to Japanize China, so that when the time comes they will start another Boxer Movement once more to defy

the civilized world. But as the founder of the Chung Hwa Min Kuo—the Chinese Republic—I desire to have China organized for peace. I, therefore, begin to utilize my pen, which I hope will prove even mightier than the sword that I used to destroy the Manchu Dynasty, to write out these programs for organizing China for peace.

结 论

世界有三大问题，即国际战争、商业战争与阶级战争是也。在此国际发展实业计划中，吾敢为此世界三大问题而贡一实行之解决。即如后达尔文而起之哲学家之所发明人类进化之主动力，在于互助，不在于竞争，如其他之动物者焉。故斗争之性，乃动物性根之遗传于人类者，此种兽性，当以早除之为妙也。

国际战争者，无他，纯然一简直有组织之大强盗行为耳。对此种强盗行为，凡有心人莫不深疾痛恨之。当美国之参加欧战也，遂变欧战而为世界之大战争。美国人民举国一致，皆欲以此战而终结将来之战，为一劳永逸之计焉。世界爱和平之民族之希望，莫不为之兴起，而中国人民为尤甚，一时几咸信大同之世至矣。惜乎美国在战场上所获之大胜利，竟被议席间之失败而完全推翻之。遂至世界再回复欧战以前之状况，为土地而争、为食物而争、为原料而争将再出见。因此之故，前之提倡弭兵^[1]者，今则联军列强又增加海军，以预备再次之战争。中国为世界最多人口之国，将来当为战争赔偿之代价也。

十余年前，列强曾倡瓜分中国，俄罗斯帝国且实行殖民满洲，后因激动日本之义愤，与俄战争^[2]，得以救中国之亡。今则日本之军国政策，又欲以独力并吞中国。如中国不能脱离列强包围，即不为列国瓜分，亦为一国兼并。今日世界之潮流，似有转机矣。中国人经受数世纪之压迫，现已醒觉，将起而随世界之进步，现已在行程中矣。其将为战争而结合乎？抑为和平而结合乎？如前者之说，是吾中国军国主义者与反动者之主张，行将以日本化中国。如其然也，待时之至，拳匪之变或将再见于文明世界^[3]。但中华民国之创造者，其目的本为和平，故吾敢证言曰：为和平而利用吾笔作此计划，其效力当比吾利用兵器以推倒满清为更大也。

During the course of my writing, these programs have been published in various magazines and newspapers time after time and are being spread all over China. They are welcomed everywhere and by everyone in the country. So far there is not a word expressed in disfavor of my proposition. The only anxiety ever expressed regarding my scheme is where can we obtain such huge sums of money to carry out even a small part of this comprehensive project. Fortunately, however, soon after the preliminary part of my programs had been sent out to the different governments and the Peace Conference, a new Consortium was formed in Paris for the purpose of assisting China in

developing her natural resources. This was initiated by the American Government. Thus we need not fear the lack of capital to start work in our industrial development. If the Powers are sincere in their motive to coöperate for mutual benefit, then the military struggle for material gain in China could eventually be averted. For by coöperation, they can secure more benefits and advantages than by struggle. The Japanese militarists still think that war is the most profitable national pursuit, and their General Staff keeps on planning a war once in a decade. This Japanese illusion was encouraged and strengthened by the campaign of 1894 against China, a cheap and short one but rich in remuneration for Japan; also by the campaign of 1904 against Russia which was a great success to the Japanese, and its fruit of victory was no less in value; finally by the campaign of 1914 against Germany which formed her part in the world war Japan took. Although Japan took the smallest part in the world war and expended the least in men and money, yet the fruit of her victory was Shantung, a territory as large as Roumania before the war, with a population as numerous as that of France. With such crowning results in every war during the last thirty years no wonder the Japanese militarists think that the most profitable business in this world is War.

The effect of the last war in Europe proves, however, just the contrary. An aggressive Germany lost entirely her capital and interests, plus something more, while victorious France gained practically nothing. Since China is awake now, the next aggression from Japan will surely be met by a resolute resistance from the Chinese people. Even granted that Japan could conquer China, it would be an impossibility for Japan to govern China profitably for any period of time. The Japanese financiers possess better foresight than their militarists as was proved during the dispute of the Manchurian and the Mongolian reservations when the former prevailed over the latter thus causing the Japanese Government to give up her monopoly of these territories to the new Consortium, in order to coöperate with the other powers. We, the Chinese people, who desire to organize China for peace will welcome heartily this new Consortium provided it will carry out the principles which are outlined in these programs. Thus, coöperation of various nations can be secured and the military struggle for individual and national gain will cease forever.

吾现所著之《实业计划》，经已登载各报、各杂志流传于中国者不止一次，几于无处无人不欢迎之，并未闻有发言不赞成之者。但彼等所虑者，谓吾所提议之计划过于伟大，难得如此一大宗巨款，以实行之耳。所幸者，当吾计划弁首之部寄到各国政府与欧洲和会之后^[4]，巴黎遂有新银行团之成立，思欲协助中国发展天然物产。闻此举之发起人出自美国政府，故吾等即当开办之始，亦不患资本之无着也。在列强之行

动如系真实协力为共同之利益计，而彼之主张军国主义者，俗为物质向中国而战争者，自无所施其伎俩，此无他，盖为互助而获之利益，当比因竞争而获之利益更为丰厚也。彼日本之武力派，尚以战争为民族进取之利器，彼参谋本部当时计划十年作一战争。一八九四年以一最短期之中日战争，获最丰之报酬，于是因之而长其欲。一九零四年日俄之役，获大胜利，所得利益亦非轻小。最后以一九一四年大战争，复加入联军以拒德国，而日本以出力最微，费财至少，竟获一领土大如未战前之罗马尼亚、人口众如法国之山东。由此观之，在近三十年间，日本于每一战争之结局即获最厚之报酬，无怪乎日本之军阀以战争为最有利益之事业也。

试以此次欧战最后之结果证之，适得其反。野心之德国，几尽丧其资本与利益与其他难于计算之物。法国虽以战胜称，实亦无所得。今中国已醒觉，日本即欲实行其侵略政策，中国人亦必出而拒绝之。即不幸中国为日本所占领，不论何时何处，亦断非日本所能统治有利。故以吾之见，日本之财政家当比日本之军阀派较有先见之明，此可以满洲、蒙古范围地之争持证之。以财政家得最后之胜利，如是日本即舍弃其垄断蒙古之政策，而与列强相合成立新银团。若此新银团能实行其所提倡之主义，吾中国人素欲以和平改造中国者，必当诚意欢迎之。故为万国互助者当能实现，为个人或一民族之私利者，自当消灭于无形矣。

Commercial war, or competition, is a struggle between the capitalists themselves. This war has no national distinction. It is fought just as furiously and mercilessly between countries as well as within the country. The method of fighting is to undersell each other, in order to exhaust the weaker rivals so that the victor may control the market alone and dictate terms to the consuming public as long as possible. The result of the commercial war is no less harmful and cruel to the vanquished foes than an armed conflict. This war has become more and more furious every day since the adoption of machinery for production. It was once thought by the economists of the Adam Smith school that competition was a beneficent factor and a sound economic system, but modern economists discovered that it is a very wasteful and ruinous system. As a matter of fact, modern economic tendencies work in a contrary direction, that is, towards concentration instead of competition. That is the reason why the trusts in America flourish in spite of the anti-trust law and the public opinion which aim at suppressing them. For trusts, by eliminating waste and cutting down expenses can produce much cheaper than individual producers. Whenever a trust enters into a certain field of industry, it always sweeps that field clean of rivals, by supplying cheap articles to the public. This would prove a blessing to the public but for the unfortunate fact that the trust is a private concern, and its object is to make as much profit as possible. As soon as all rivals are swept clean from the field of competition, the trust would raise the price of its

articles as high as possible. Thus the public is oppressed by it. The trust is a result of economic evolution, therefore it is out of human power to suppress it. The proper remedy is to have it owned by all the people of the country. In my International Development Scheme, I intend to make all the national industries of China into a Great Trust owned by the Chinese people, and financed with international capital for mutual benefit. Thus once for all, commercial war will be done away with in the largest market of the world.

商业战争，亦战争之一种，是资本家与资本家之战争也。此种战争，无民族之区分，无国界之限制，常不顾人道，互相战斗。而其战斗之方法即减价倾轧，致弱者倒败，而强者则随而垄断市场，占领销路，直至达其能力所及之期限而止。故商业战争之结果，其损失、其残酷亦不亚于铁血竞争之以强力压迫也。此种之战争，自采用机器生产之后，已日见剧烈。彼司密亚丹^[5]派之经济学者，谓竞争为最有利益之主因，为有生气之经济组织；而近代之经济学者，则谓其为浪费，为损害之经济组织。然所可确证者，近代经济之趋势，适造成相反之方向，即以经济集中代自由竞争是也。美国自有大公司出现，即有限制大公司法律，而民意亦以设法限制为然。盖大公司能节省浪费，能产出最廉价物品，非私人所能及。不论何时何地，当有大公司成立，即将其他小制造业扫除净尽，而以廉价物品供给社会，此固为社会之便利。但所不幸者，大公司多属私有，其目的在多获利益，待至一切小制造业皆为其所压倒之后，因无竞争，而后将各物之价值增高，社会上实受无形之压迫也。大公司之出现，系经济进化之结果，非人力所能屈服。如欲救其弊，只有将一切大公司组织归诸通国人民公有之一法。故在吾之国际发展实业计划，拟将一概工业组成一极大公司，归诸中国人民公有，但须得国际资本家为共同经济利益之协助。若依此办法，商业战争之在于世界市场中者，自可消灭于无形矣。

Class war is a struggle between labor and capital. The war is at present raging at its full height in all the highly developed industrial countries. Labor feels sure of its final victory while capitalists are determined to resist to the bitter end. When will it end and what will be the decision no one dares to predict. China, however, owing to the backwardness of her industrial development, which is a blessing in disguise, in this respect, has not yet entered into the class war. Our laboring class, commonly known as coolies, are living from hand to mouth and will therefore only be too glad to welcome any capitalist who would even put up a sweat shop to exploit them. The capitalist is a rare specimen in China and is only beginning to make his appearance in the treaty ports.

However, China must develop her industries by all means. Shall we follow the old path of western civilization? This old path resembles the sea route of Columbus' first trip to America. He set out from Europe by a southwesterly direction through the Canary Islands to San

Salvador, in the Bahama Group. But nowadays navigators take a different direction to America and find that the destination can be reached by a distance many times shorter. The path of western civilization was an unknown one and those who went before groped in the dark as Columbus did on his first voyage to America. As a late comer, China can greatly profit in covering the space by following the direction already charted by western pioneers. Thus we can foresee that the final goal of the westward-ho in the Atlantic is not India but the New World. So is the case in the economic ocean. The goal of material civilization is not private profit but public profit. And the shortest route to it is not competition but co-operation. In my International Development Scheme, I propose that the profits of this industrial development should go first to pay the interest and principal of foreign capital invested in it; second to give high wages to labor; and third to improve or extend the machinery of production. Besides these provisions the rest of the profit should go to the public in the form of reduced prices in all commodities and public services. Thus, all will enjoy, in the same degree, the fruits of modern civilization. This industrial development scheme which is roughly sketched in the above six programs is a part of my general plan for constructing a New China. In a nutshell, it is my idea to make capitalism create socialism in China so that these two economic forces of human evolution will work side by side in future civilization.

阶级战争，即工人与资本家之战争也。此种之战争现已发现于各工业国家者，极形剧烈。在工人则自以为得最后之胜利，在资本家则决意以为最苦之压迫，故此种之战争，何时可以终局，如何可以解决，无人敢预言之者。中国因工业进步之迟缓，故就形式上观之，尚未流入阶级战争之中。吾国之所谓工人者，通称为“苦力”，而其生活只以手为饭碗，不论何资本家若能成一小工店予他等以工作者，将必欢迎之。况资本家之在中国，寥若晨星，亦仅见于通商口岸耳。

发展中国工业，无论如何，必须进行，但其进行之方，将随西方文明之旧路径而行乎？然此之旧路径，不啻如哥伦布初由欧至美之海程。考其时之海程，由欧洲起向西南方，经加拿利岛至巴哈马群岛之圣沙路华打^[6]，绕程极远，与现行之航线取一直捷方向，路程短于前时数倍者，不可同日而语矣。彼西方文明之路径，是一未辟之路径，即不啻如哥伦布初往美国之海程，犹人行黑夜之景况。中国如一后至之人，可依西方已辟之路径而行之，此所以吾等从大西洋西向而行，皆预知其彼岸为美洲新大陆而非印度矣。经济界之趋势，亦如是也。夫物质文明之标的，非私人之利益，乃公共之利益。而其最直捷之途径，不在竞争，而在互助。故在吾之国际发展计划中，提议以工业发展所生之利益，其一须摊还借用外资之利息，二为增加工人之工资，三为改良与推广机器之生产，除此数种外，其余利益须留存以为节省各种物品及公用事业之价值。如此，人民将一律享受近代文明之乐矣。前之六大计划，为吾欲建

设新中国之总计划之一部分耳。简括言之，此乃吾之意见，盖欲使外国之资本主义以造成中国社会主义，而调和此人类进化之两种经济能力，使之互相为用，以促进将来世界之文明也。

[1] 弭兵：平息战事，停止战争。

[2] 与俄战争：指1904—1905年的日俄战争。这是一场为争夺中国东北和朝鲜的权益而进行的帝国主义侵略战争。

[3] 拳匪之变：指义和团运动。

[4] 欧洲和会：指第一次世界大战结束后，英、法等27国于1919年在巴黎举行的国际和会，也称巴黎和会。会后签订《凡尔赛和约》。

[5] 司密亚丹：今译亚当·斯密，1723—1790年，著有《国富论》、《道德情操论》等。

[6] 圣沙路华打：今译圣萨尔瓦多岛，位于西印度群岛中巴哈马群岛东部大西洋边缘上。

APPENDIX I

PRELIMINARY AGREEMENT PROVIDING FOR THE FINANCING AND CONSTRUCTION OF THE RAILWAY FROM CANTON TO CHUNGKING WITH EXTENSION TO LANCHOW

This Agreement is made at Shanghai on the fourth day of the seventh month of the second year of the Republic of China being the fourth day of July, 1913, and the contracting parties are: The Chinese National Railway Corporation (hereinafter termed "the Corporation") duly authorized in virtue of the Presidential Mandate of the ninth day of the ninth month of the Republic of China being the ninth day of September, 1912, and in virtue of the Charter of the Corporation duly promulgated by a Presidential Mandate of the thirty-first day of the third month of the second year of the Republic of China being the thirty-first day of March, 1913, on the one part and Messrs. Pauling and Company, Limited, of 26 Victoria Street, London, S. W. (hereinafter termed "the Contractors") on the other part.

NOW IT IS HEREBY AGREED by and between the parties hereto as follows:

ARTICLE I

The Contractors, or their Assigns, agree to issue on behalf of the Government of the Republic of China a sterling Loan, bearing interest at the rate of five per cent per annum, (hereinafter referred to as "the Loan") for such an amount as may be mutually estimated to be necessary for the completion of the Railway from Canton to Chungking.

The Loan shall be of the date on which the first series of Bonds are issued and shall be called "The Chinese National Railways Government five per cent Gold Loan of 1912 for the Canton Chungking Railway."

ARTICLE II

The proceeds of the Loan are designed for the construction and equipment of the Railway from Canton to Chungking (hereinafter called "the Railway") and for all necessary expenditure appertaining

thereto as may be arranged in the Detailed Agreement, referred to in Article 17.

附录一 关于广州至重庆与兰州支线之借款与建筑契约草案

此之契约，经于中华民国二年七月四日即西历一九一三年七月四日成立于上海。关于此契约之双方当事人，一为中国国家铁路公司，一为波令有限公司。中国国家铁路公司经于中华民国元年九月九日即西历一九一二年九月九日由总统命令委任，并于中华民国二年三月三十一日即西历一九一三年三月三十一日经大总统公布公司章程在案，故即以公司定名。波令有限公司现设立于伦敦城维多利亚街第二号，为立契约人等，现经双方当事人同意，议定契约条文如下：

第一条

立契约人承诺借巨款与中华民国，年息五厘，专为兴筑广州至重庆之铁路费用。其总额若干，须经双方预为议定。此借款开始所发行之债券，名曰“一九一三年中国国办广州重庆铁路五厘公债券”。

第二条

此借款之用途，专为由广州至重庆铁路之建筑与器具之费用。至其必要之用具，再详细列于第十七条之详细契约中。

ARTICLE III

The payment of the interest and the redemption of the Capital of the Loan are guaranteed by the Government of the Republic of China and by a special lien upon the Canton Chungking Railway.

This special lien constitutes a first mortgage in favour of the Contractors, acting on behalf of the Bondholders, upon the Railway itself, as and when constructed, and on the revenue of all descriptions derivable therefrom, and upon all materials, rolling stock and buildings of every description purchased or to be purchased for the Railway.

Should there be default in payments on the dates fixed of all or part of the half yearly interest or amortization payments, the Contractors shall have the right to exercise on behalf of the Bondholders all the rights of action which accrue to them from the

special mortgage.

ARTICLE IV

During the time of construction of the Railway the interest on the Bonds and on any advances made by the Contractors shall be paid from the proceeds of the Loan. The accruing interest from any proceeds of the Loan not used during the period of construction, and the earnings derived by the Corporation from the working of any sections of the Railway as they are built, are to be used to make up the amount required for the payment of the said interest, and if any deficiency remains it is to be met from the proceeds of the Loan.

When the construction of the Railway is wholly completed, the interest on the Bonds is to be paid from the income or earnings of the Railway received by the Corporation, in such manner and on such dates as may be provided for in the Detailed Agreement provided for in Article 17 of this Agreement.

If, at any time, the earnings of the Railway, together with the funds available from the proceeds of the Loan, are not sufficient to meet the interest on the Bonds and the repayment of the capital in accordance with the Amortization Schedule to be attached to the Detailed Agreement, the Government of the Republic of China, in approving of this Agreement, unconditionally undertakes and promises to pay the principal of the Loan and the interest of the Loan on the due dates to be fixed therefor in the Detailed Agreement provided for in Article 17 of this Agreement.

第三条

对于借款之摊还与利息之交付，则由中华民国政府并以广州重庆铁路之监察权为之担保。

此之监察权，为契约人对于该路为其债券所有者之援助应享有之第一抵押品。此之抵押品，即如当建筑铁路之时，各种费用与铁路材料、车料与屋宇等之买卖是。

如利息应偿还款项全数或一部分，不能有如所订之期限交付时，立契约人为其债券所有者援助计，有权将该项权利加入于特别抵押品内。

第四条

当铁路尚在建筑时期，凡债券与借款之利息立契约人订定者，应由借款项下支付。凡由借款所加入之利息，若当建筑时期尚未支出者，与铁路公司已成立之一部分铁路之收入，须移用为补偿应摊还利息之总数。若再有不足，则由借款补足。

当铁路全部建筑完工后，其债券之利息可由该铁路公司之铁路入息或其他项收入支付。但对于此项办法之详细契约，另详于此契约之第十七条。

不论何时，若铁路之收入与借入之存款合计之，尚不足偿还债券利息与载在详细契约中所借入期单应偿还之资本，中华民国政府为保证此契约起见，应正式承认将此借款之欠负与载在第十七条详细契约所偿还之利息一并交付。

ARTICLE V

The bonds shall be Bonds of the Government of the Republic of China.

ARTICLE VI

The Loan shall be issued to the public in two or more series of Bonds, the first issue to be made to the amount of from one to two million pounds sterling as soon as possible after the signature of the Detailed Agreement referred to in Article 17 of this Agreement. The issue price of the Bonds shall be fixed by the Corporation and the Contractors sometime before the issue, taking the last price of similar Bonds as a basis for fixing the market price. The price payable to the Corporation shall be the actual rate of issue to the public less a sufficient amount to cover the cost of stamps on the Bonds in the various countries of issue, provided always that at least fifty per cent of the Bonds shall be issued in England, plus floatation charges of four per cent retainable by the Contractors (that is to say, a charge of four pounds for every one hundred pound Bond issued).

After the Detailed Agreement referred to in Article 17 is settled, and pending the issue of the Loan, the Contractors shall deposit the sum of fifty thousand pounds with the issuing Bank to the Canton Chungking Railway account, and this amount can be drawn on by the Corporation for survey and other necessary expenses authorized by the Managing Director against certificates signed by the Chief Accountant and Chief Engineer. This sum of fifty thousand pounds shall bear interest at the rate of five per cent per annum and shall be refunded out of the proceeds of the Loan.

ARTICLE VII

The proceeds of the Loan shall be deposited with the issuing Bank, to be nominated and guaranteed by the Contractors, to the credit of a Canton Chungking Railway Account on such terms as may be mutually arranged in the Detailed Agreement referred to in Article

When the work of construction is ready to begin a sum equal to the estimated expenditure in China for six months shall be transferred to a Bank in China to be mutually agreed upon and there placed to the credit of a Canton Chungking Railway Account to be operated upon by the Corporation under certificates signed by the Chief Accountant and the Chief Engineer. This amount of estimated expenditure for six months shall be maintained by subsequent monthly transfers so that, as far as possible, there shall always be six months estimated expenditure in China on deposit in a Bank in China to be mutually agreed upon.

第五条

发行之债券，即作为中华民国政府之债券。

第六条

债券应分为二次或二次以上发售。第一次所发出之总额，须在金镑一百万至二百万之间，惟须当此契约第十七条之详细契约双方签名之后，即刻实行。此债券之发行价格。应由铁路公司与立契约人协同依同样债券为基础，以议定市面价格。此之价格，因包含债券发行于各国所需用之印花，故比其原定价格略低。此种债券至少须百分之五十在英伦发行，百分之四为立契约人抽收，即每一百金镑可照债券之发行之价抽收四镑。

当十七条详细契约既定、债券亦将发行时候，立契约人须先存贮五万金镑于银行，入为广州重庆铁路公司数目。此之总数，若经铁路总理之命令并总会计与总工程师之签名，可以随时提取作为测量及各种必需费用。至此五万金镑之总数，订定每年利息五厘，将来由借款项下拨出归还。

第七条

借款须存贮于银行，由立契约人声明并担保作为广州重庆铁路数目。如此办法，可再由第十七条之详细契约中商酌办理。

当建筑工程经已开始，一相等于在中国足充六个月用度之数额，须交付存贮于设立在中国之银行，入为广州重庆铁路数目，并可由该铁路公司支用。但须得总会计与总工程师会签方为有效。此六个月用度之总额，可接续依月递交，存贮于中国之银行。

ARTICLE VIII

Immediately after the signing of the Detailed Agreement, the Corporation will establish a Head Office at Canton for the Canton

Chungking Railway. This Office will be under the direction of a Chinese Managing Director to be appointed by the Corporation, with whom will be associated a British Engineer-in-Chief and a British Firm of Public Accountants, of recognized standing, whose representative shall be Chief Accountant (hereinafter called "the Chief Accountant"). These British Employees shall be nominated by the Corporation and the Contractors, jointly, and shall be appointed by the Corporation. Their dismissal shall take place, only, with the joint approval of the Corporation and the Contractors.

It is understood that the duties to be performed by these employees are intended to promote the mutual interests of the Corporation and the Bondholders respectively, and it is therefore agreed that all cases of difference arising therefrom shall be referred for amicable adjustment between the Corporation and the Representative of the Contractors. The salaries and other terms of Agreement of the Engineer-in-Chief and the Chief Accountant shall be arranged between the Corporation and the Contractors; and the amount of their salaries, etc., shall be paid out of the general accounts of the Railway.

For all important technical appointments for the operation of the Railway, Europeans of experience and ability shall be engaged and wherever competent Chinese are available, they shall be employed. All such appointments shall be made, and their functions defined, by the Managing Director and the Engineer-in-Chief in consultation, and shall be submitted for the approval of the Corporation; similar procedure shall be followed in the case of Europeans employed in the Chief Accountant's department. In the event of the misconduct, or the incompetency of these European employees, their services may be dispensed with by the Managing Director, after consultation with the Engineer-in-Chief, and subject to the sanction of the Corporation. The form of Agreements made with these European Employees shall conform to the usual practice.

The accounts of the receipts and the disbursements of the Railway's construction and operation, shall be in Chinese and English in the department of the Chief Accountant, whose duty it shall be to organize and supervise the same, and to report thereon for the information of the Corporation through the Managing Director, and of the Contractors as representing the Bondholders. All receipts and payments shall be certified by the Chief Accountant and authorized by the Managing Director.

第八条

当详细契约签押之后，此铁路公司即须于广东省城另设一广州重庆铁路事务所。此之事条所，应设中国总理一人，由铁路公司派委；英国总工程师及英国总会计各一人，由铁路公司与立契约人协同择定，而后由铁路公司任命。但所雇用英国职员，若得铁路公司与立契约人之同意，并可以革除。

此项职工应尽之义务，在增进铁路公司与债券所有者之共同利益，故每当有问题发生，必须有铁路公司与立契约人共同秉公处理。英国总工程师与总会计之薪金及期限，由铁路公司与立契约人订定，即由铁路数目项下支出。

凡关于管理铁路之重要人员，如有有经验、有技能之欧洲人与有能干之中国人，均须一体并用。如此等一切之任用与其权限之规定，须由总理与总工程师会商办理，呈请铁路公司核准。至雇用于总会计部之欧人，均须依同一方法办理。如欧洲职员有失德行为或不称职时，总理与总工程师会商呈请公司核准，可将该职员革除。至雇用欧洲职员所订之契约，须与普通所用者相同。

凡在总会计部之收入数目及铁路建筑与管理之支出数目，须用中英两国文字。总会计须依此办法办理报告，分呈于总理与代表债券所有者之立契约人。但此项数目之收入与支出，必须经总会计承认，并总理核准。

For the general technical staff of the Railway, after completion of construction, the necessary arrangements shall be made by the Managing Director in consultation with the Engineer-in-Chief, and reported to the Corporation in due course.

The duties of the Engineer-in-Chief shall consist in the efficient and economical maintenance of the Railway, and the general supervision thereof in consultation with the Managing Director. The duties of the Chief Engineer during construction shall be set forth in the Detailed Agreement, referred to in Article 17 of this Agreement.

The Engineer-in-Chief shall always give courteous consideration to the wishes and instructions of the Corporation, whether conveyed directly or through the Managing Director, and shall always comply therewith, having at the same time due regard to the efficient construction and maintenance of the Railway.

A school for the education of Chinese in Railway matters shall be established by the Managing Director subject to the approval of the Corporation.

ARTICLE IX

The Contractors shall construct and equip the Railway and shall receive as remuneration a sum equal to seven per cent on the actual

cost of the construction and equipment of the Railway. The term "Equipment" shall be held to include in its meaning all requirements necessary for the operation of the Railway and shall therefore include Rolling Stock and Locomotives sufficient for operation.

It is clearly understood that the term "Equipment" does not include any purchases made for the Railway after it has been completely constructed and equipped and handed over ready for operation.

It is further clearly understood that the cost of land purchased for the Railway, the salaries of the Managing Director, Chief Accountants, Chief Engineer, and the cost of their offices and staff shall not be included in the meaning of the terms "construction and equipment."

The Contractors shall have the option of constructing on the same terms the proposed extension of the Railway to Lanchow in the Province of Kansu, or a Railway of similar mileage in some other part of China to be mutually agreed upon, and this option shall be for seven years from the commencement of construction.

All other arrangements in connection with the construction and equipment of the Railway shall be settled in the Detailed Agreement referred to in Article 17.

当铁路建筑完工之后，凡关于铁路之通常应办事宜，须由总理与总工程师会商办理，并须随时报告于铁路公司。

总工程师之责任，在使铁路办理妥善，节省经费；至普通事宜，须会商总理进行。副工程师当建筑时期，其责任如何，再详示于本契约中第十七条之详细契约。

总工程师须遵奉铁路公司意思与命令。惟此项意思与命令，不论其为直接授予或经总理转达，均须一体照办。并须对于铁路之建筑与维持随时留心料理。

为养成中国铁路人才起见，总理若得铁路公司之核准，可设一铁路专门学校。

第九条

立契约人担认建造与完成此铁路，并得由该铁路所用之建筑物与器具之确实所值价格抽取百分七之数量。“器具”二字之意思，包含铁路用以驾驶之一切器用，如车料、车头为驾驶而用者皆是。

“器具”之名词，若明白解释之，凡对于铁路已建筑完全、经已购器使用之后，所购入之各物不包含在内。更为详明解释之，凡因建筑铁路买入之地价，与总理、总会计、总工程师及各办事人员之薪俸，不能列入建筑与器用之名词之意思内。

立契约人有权依章建筑支路至甘肃省之兰州。如或得双方之同意，并可建筑同长铁路至中国之他部地方。此种之权限，在由铁路兴工之始七年内有效。

其余一切关于建筑铁路与购办器具之事宜，遵照本契约第十七条之详细契约办理。

ARTICLE X

All land that may be required along the whole course of the Railway within survey limits, and for the necessary sidings, stations, repairing shops and car sheds, to be provided for in accordance with the detailed plans, shall be acquired by the Corporation at the actual cost of the land, and shall be paid for out of the proceeds of the Loan.

ARTICLE XI

The Contractors shall hand over to the Corporation each section of the Railway, when completed, for operation in accordance with the provisions of the Detailed Agreement.

ARTICLE XII

The Contractors shall be appointed Trustees for the Bondholders and shall receive such remuneration as may be fixed in the Detailed Agreement.

ARTICLE XIII

The Government of the Republic of China, whenever necessary, will provide protection for the Railway while under construction or when in operation, and all the properties of the Railway as well as Chinese and foreigners employed thereon, are to enjoy protection from the local Officials.

The Railway may maintain a force of Chinese Police with Chinese officers, their wages and maintenance to be wholly defrayed as part of the cost of the construction and maintenance of the Railway. In the event of the Railway requiring further protection by the military forces of the Government, the same shall be duly applied for by the Head Office and promptly afforded, it being understood that such military forces shall be maintained at the expense of the Government.

ARTICLE XIV

All materials of any kind that are required for the construction

and working of the Railway, whether imported from abroad or from the Provinces to the scene of work, shall be exempted from Likin or other duties so long as such exemption remains in force in respect of other Chinese Railways. The Bonds of the Loan, together with their coupons and the income of the Railway shall be free from imposts of any kind by the Government of the Republic of China.

第十条

一切沿铁路边旁之田地，经测量指定，系依详细计划用为旁路、车站、修理店与车房之用者，可由公司依确定之价值收买，并须由借款内照给。

第十一条

立契约人依照详细契约所规定，须将每段已完工之铁路交出铁路公司，以备使用。

第十二条

立契约人须派董事为债券所有者之代表。至其应领取之薪金，别以详细契约定之。

第十三条

中华民国政府对于现建筑或已驶行之铁路，与属于铁路之一切财产，并将雇用中国或外国人员，皆须飭各地方官极力保护。铁路得设立警察队与警察官，其薪金与费用须由铁路建筑费用项下支给。若铁路遇有事故，须要政府兵力时，须由铁路公司呈明，迅速派人驻守。但此等兵队，须由政府供给费用。

第十四条

凡用以建筑铁路之各种材料，无论其由外国购办抑由本省采取，若为铁路使用，且在免税限内者，须一律免除厘金与关税。凡债券、票据与铁路之入息，须由中华民国政府免除各种征抽。

ARTICLE XV

With a view to encouraging Chinese industries, Chinese materials are to be preferred, provided price and quality are suitable.

At equal rates and qualities, goods of British manufacture shall be given preference over other goods of foreign origin.

ARTICLE XVI

The Contractors may, with the approval of the Corporation, and subject to all their obligations, transfer or delegate all or any of their rights, powers, and discretions, to their successors or assigns.

ARTICLE XVII

As soon as this Preliminary Agreement is signed it shall be forwarded to the Government of the Republic of China for approval. When it has met with the approval of the Government of the Republic of China, a necessary Detailed Agreement shall be made embodying the principles of this Agreement with such amplifications and additions as may be mutually agreed upon between the parties hereto.

ARTICLE XVIII

On its approval of this Agreement, and acceptance of the obligations set forth herein, the Government of the Republic of China shall officially notify the British Minister at Peking of the fact, and this approval shall be taken as covering the Detailed Agreement referred to in Article 17.

ARTICLE XIX

This Agreement is executed in quadruplicate in English and Chinese, one copy to be retained by the Corporation, one to be forwarded to the Government of the Republic of China, one to be forwarded to the British Minister at Peking, and one to be retained by the Contractors, and should any doubt arise as to the interpretation of the Agreement the English text shall be accepted as the standard.

Signed at Shanghai by the contracting parties on this fourth day of the seventh month of the second year of the Republic of China being the fourth day of July nineteen hundred and thirteen.

第十五条

为奖励中国工业起见，若中国材料之价值与物质均称适宜，须一体劝用。英国制造货物与由他国运来之货物比较，若系同物质并同价值者，英国货物有优先权。

第十六条

立契约人得铁路公司之核准与承诺，可将全部或一部之利益、权利与事权转让与承受人或授予人。

第十七条

当此契约经已划押，即须送呈中华民国政府核夺。若经中华民国政府批准，然后将此契约由双方协定，另订详细契约。

第十八条

此契约既经批准与承诺，中华民国政府须将此事实照会驻京英国公使。但此之批准，必须将第十七条之详细契约统括之。

第十九条

此之契约须按照英中两国文字缮写四张，一送呈于中华民国政府，一送呈于驻京英国公使，一留存于立契约人。若对于此契约之解释有疑义发生时，英文底本即作为标准。

中华民国二年七月四日即一九一三年
关于契约双方当事人划押于上海

APPENDIX II

Legation of the United States of America
Peking, March 17, 1919.

Dr. Sun Yat Sen,
29 Rue Molière,
Shanghai, Kiangsu.

DEAR DR. SUN:

I have read with great interest your sketch project for the international development of China as embodied in your letter of February first to me. I congratulate you upon the broad and statesmanlike attitude with which you treat this very important subject. Your suggestion of united international participation in the development of China's resources deserves the support of all friends of China. It would be unfortunate indeed if the old régime of spheres of influence, struggles for concessions and activities flavoring of selfish exploitation should not, with the conclusion of the war, be relegated to the past. You are right in recognizing the necessity of a substitute for the old order and your proposal of a unified policy under international organization with Chinese participation for the larger development in China, naturally assuming that the inalienable rights of the Chinese people are to be amply safeguarded, meets this demand admirably.

We are hopeful that conditions in China may become such that the Chinese people themselves may be encouraged to put their money into productive enterprise and participate in the larger developments. We are hopeful that the day is not far distant when the Chinese Government may be able actively to interest itself in the encouragement of native industry to the end that native capital of which there is a very considerable quantity, may be induced to lend itself to productive enterprises, because of a confidence in constructive policy on the part of the government.

If you will permit a suggestion, I would be inclined to reduce your admirable program to one which would be in closer keeping with the limits of the present world's resources in capital. As we all know devastated Europe is calling for capital for rehabilitation and other nations want capital for development programs of considerable proportions. Thus it would seem that China's program of development must of necessity take cognizance of her most immediate and most pressing needs. We are all united in that transportation occupies a prominent place in such a program. 50,000 miles of railway and 100,000 miles of good roads would seem to be sufficient to engage our attention for any plans for the immediate future. This would allow ample opportunity to penetrate the great rich unoccupied regions in the North and West, which should be opened to colonization and development as soon as possible in order to relieve the economic pressure of over population in sections along the coasts and waterways, and to accord opportunities to bring the rich regions of West China into contact with the trade of the rest of China and the world at large.

附录二 驻京美国公使芮恩施复函

孙先生大鉴：

来函经于二月一日收到。函内手著《国际共同发展中国实业计划》，拜读之余，良深钦佩。先生对于此重要问题，能以宏伟精深之政策运用之，可喜可贺。尊意以为发展中国实业，须联合国际共同办理，凡命为中国朋友者，应当竭力赞助。前者列强每当战争告终，即施其所谓势力范围与割让、租借等手段，是不幸事，人皆知之。尊意以为革除彼向来恶习为必要之图，故提倡用一联合政策，由国际机关与中国共同发展中国之实业，所见甚是。若依此办法，中国应享之权利无不可保矣。

吾甚望中国情形有所变更，一切中国人民将利用其钱财为生利之事业，而共襄助此伟大之经营也。吾甚望中国政府奖励其本国工业，使其本国无限之资本用为生产，其日不远。盖因政府有建设之政策，信用自生也。

若先生许吾进言，吾欲将先生之伟大计划为之介绍，或可使世界原料与资本生一密切之关系。吾人皆知现残余之欧洲亟需资以恢复，而他国又以发展伟大计划而求资，如此之发展中国实业计划，必须认定其最急迫最密切之需要，而后共同联合整顿输运，使在如此之计划中占一永久位置。故为目前计，五万英里之铁路〔与十万英里之良好大路〕似可最敷需用。如此，可使中国西北部之丰富无人境域，交通便利，移民居住，既可以救济沿海岸一带人居过密之各省不至受经济之压迫，亦可以使中国西、北两部之丰富区域能与各部及世界各国有通商之机会也。

Along with transportation, China needs to develop its resources in iron and coal, the two great essentials to modern industrialism. Arrangements should be made whereby foreign capital can come to China's assistance in these two important industries, but care should be exercised so as to preserve to China the iron and coal necessary for its own uses, and prevent China's steel industry being mortgaged to foreign interests, in a way so as to jeopardize China's future in this important industry.

The reform of the currency and reforms in internal tax administrations are questions of immediate importance to China's economic and industrial development.

One of the greatest fields of potentiality in the immediate demands of the New China, is agriculture. The country depends in its final analysis upon the prosperity of its agriculture. At present probably as much as 80% of China's population is agricultural. China's greatest problem is the proper feeding and clothing of its vast population. Improved conditions in agriculture, opening of new lands to cultivation, irrigation and conservancy works, the encouragement of the cattle and sheep industries, the development of the cotton industry and the improvement of tea, silk and the seed crops of China, are timely subjects in any program of developments. There is a vast work to be done in agriculture in China, which will lead to prosperity generally, and make possible developments with native capital in other fields of activity, whereas if agricultural improvements are neglected, it will be difficult to insure prosperity in other directions.

Thus for the present, I hope the main thought may be centered on improvements in transportation, in currency and tax administrations, in the development of coal and iron industries, and in agriculture. Many of the suggested activities included in your very extensive program will follow as a corollary to the above.

In thinking of all these developments, I believe that we should always give thought to the fact that we are not dealing with a new country but with one in which social arrangements are exceedingly intricate and in which a long-tested system of agricultural and industrial organization exists. It is to my mind most important that the transition to new methods of industry and labor should not be sudden but that the old abilities and values should be gradually transmuted. It is important that the artistic ability existing in the silk and porcelain manufacture, etc. should be maintained and fostered, and not superseded by cheaper processes. It is also highly important that no export of food should be permitted, except as to clearly ascertained surpluses of production. It would produce enormous suffering were the food prices in China suddenly to be raised to the world market level. The one factor in modern organization which the Chinese must learn better to understand is the corporation, and the fiduciary relationship which the officers of the corporation ought to occupy with respect to the stockholders. If the Chinese cannot learn to use the corporation properly, the organization of the national credit cannot be effected. Here, too, it is necessary that the capital of personal honesty which was accumulated under the old system should not be lost but transferred to the new methods of doing business. So at every point where we are planning for a better and more efficient organization, it seems necessary to hold on to the values created in the past and not to disturb the entire balance of society by too sudden changes.

中国对于煤铁矿之发展，尤为要图。煤与铁，近代工业主要之两大原料也。如中国欲发展此两项工业，应设法利用外资，为之援助。但不可不注意者：一面当留存煤铁，为其本国之需；一面当阻止中国之钢铁事业抵押于外人。如此而后不至危及中国此项伟大之事业。

币制之改良与内地税率管理之改良，亦对于中国经济与工业之发展有大关系之问题也。

现在最大出产之土地，而又为中国急迫之需要者，是为农业。此无他，农产，一国之所赖以供养也。就现时计之，中国之人口几百分之八十为农业。中国之大问题在使人民衣食丰足，故改良农业、开辟新地、整顿灌溉与保护工人、奖励畜牧、发展棉业、改良丝茶及改良中国种子等事业，尚须注意者甚多。若从此开始，亦可导中国于繁盛，或可使其国人民投资于各项事业。若舍此不顾，欲保证实业之发达，盖亦难矣。

就现时言之，吾之所切望者，注重于改良输运、币制、税则、煤铁、农工等事业。然在先生大计划中所包括者，亦不外上列之各种具体办法也。

试就此发展实业计划言之，吾信以为吾等所应留意者，不在讨论新国家，而在讨论一社会秩序极错综而又为以农工商业立国久有经验之国家。在吾之意，至要者为工业。但工业变用新法不可过急，只要将旧艺术、旧习惯由渐改进。如制造丝与磁等工业之艺术技能，须设法保存，不可以省工廉价求售。如食物出口，若非确知为生产之剩余者，即须禁止。不然，若食物价格之在中国，起而与世界市场之食物价格相等，中国将必大受恐慌，可无疑者。近代机关之组织，中国人有不可不知者，是对于一公司办事员应用何权限，并该公司与股东有何关系是也。若中国人不知适用公司，国债机关之设立亦断无效果。兹更有进者，中国人素以诚实见称，尤不可因改用新法以经营事业，遂弃置其原有性质也。吾上所述之各点，亦不过欲使中国成一更良善之组织，前日之好习惯固当保当，而社会之秩序亦不至因急速改革而受搅扰也。

I wish again to congratulate you upon the statesmanlike view with which you consider the whole question of the development of your country, and the very timely suggestions you have to make in regard to a united policy of international participation in these developments. I am glad to note that the minds of the leaders among the Chinese people today are being centered more and more upon the constructive needs of the country and efforts are being made to meet these needs, in full appreciation of China's relations with the people of other nations, to the end that China's developments in the future may work in harmony with the world developments generally.

I should be glad to hear from you further and more in detail concerning development plans.

Believe me, with the highest regard,

Sincerely yours,
(Signed)
Paul S. Reinsch.

先生欲整顿中国，因而利用一最适时宜办法，成一国际共同发展实业计划。高言伟论，当为道贺。此亦足见今日为中国人民领袖之心理，已日渐趋重于国家建设之事业。若奋其能力以成此事业，将来中外人民日相亲密，使将来之发展得与世界之发展共同提携，此为最可喜者也。

先生发展实业计划有更详明者，请赐一纸，不胜铭感。

一九一九年三月十七日芮恩施敬上

APPENDIX III

Department of Commerce Office of the Secretary Washington
May 12, 1919.

Hon. Sun Yat Sen,
29 Rue Molière,
Shanghai, China.

YOUR EXCELLENCY:

I have read with the greatest interest the project for the International Development of China enclosed in your letter of March 17th, and agree with you that the economic development of China would be of the greatest advantage, not only to China, but to the whole of mankind.

The plans you propose, however, are so complex and extensive that it will take many years to work them out in detail. You doubtless are fully aware that it would take billions of dollars to carry out even a small portion of your proposals and that most of them would not be able to pay interest charges and expenses of operation for some years. The first question to be decided, therefore, is how the interest charges on the necessary loans could be met. The revenues of the Chinese Republic are already too heavily burdened with the interest charges on existing Government loans to warrant further charges, and hence it would seem necessary for the present to limit the projects for development to those which seem sufficiently remunerative to attract private capital. The government of the United States has consistently endeavored to manifest its disinterested friendship for the people of China and will undoubtedly coöperate in every proper way in proposals to advance their best interests.

Please accept my thanks for your kindness in submitting your proposals.

Respectfully,
(Signed)
William C. Redfield,
Secretary.

附录三 美国商务总长复函一通

孙逸仙大人阁下：

得奉三月十七日赐函，内附《国际共同发展中国计划》，披阅之下，兴味不穷。而阁下之所谓中国之经济发展将为人类全体最大利益，不特中国人食赐，尤所赞成也。以阁下所提计划如此复杂，如此溥遍^[1]，即令将其备细之点规划完竣，亦须数年。阁下亦明知书案中一小部分尚须数十万万金元，而其中多数在初期若干年间，不能偿其所投之利息与经费。是故，其必要之债所需利息如何清付，实为第一须决之问题。以中华民国收入负担现在国债，利息太重，难保新增之息必能清付。则今日似必要将此发展计划限制，以期显有利益足引至私人资本者为度。

合众国政府一致努力以表示无私之友谊于中国人民，并愿由各种正当之途径，以参与增进华人最上利益之计划也。

远承赐教，感谢无已，敬颂勋祺。

商务总长 刘飞尔 谨启
一九一九年五月十二日

^[1] 溥遍：普遍，宏大。

APPENDIX IV

Il Ministro Della Guerra
Rome, 17 Maggio, 1919.

Most Honorable

Sun Yat Sen,

29 Rue Molière,

Shanghai, China

HONORABLE SIR:

I thank you for having so kindly communicated to me the interesting project regarding how to employ through an International Organization the exuberant industrial activities created by the war, in order to exploit the great hidden riches of China.

Though aware of the practical difficulties which present themselves in the accomplishment of this project, it meets with my utmost appreciation, I assure you, for the modern spirit by which it is animated and for the depth of its conception.

Accept my best wishes for complete success, in the advantage of your noble country and for the interest of humanity.

Believe Me,
Faithfully yours,
(Signed)
General Caviglia.

附录四 意大利陆军大臣嘉域利亚将军复函

敬启者：蒙惠赐以关于如何以国际共同组织使用战时所产洋溢之制造能力，而开发中国最大宝藏之有兴味之计划，不胜感谢。虽在此计划亦有与相附丽^[1]之实际困难，稍须顾虑，而以其所造之深与其带有现代精神之活气，使我不禁为最高之评价也。

为人道之利益，为贵国之进步，吾愿阁下此计划之完全成功。专此布达悃诚^[2]。

嘉域利亚
一九一九年五月十七日

^[1] 附丽：附着，依附。

^[2] 悃诚：至诚，诚恳。

APPENDIX V

Peking, June 17, 1919.

Hon. Sun Yat Sen,
Shanghai.

DEAR SIR:

Permit me as a professional railway man to express my pleasure with your article appearing in the Far Eastern Review for June.

I will not at this time express approval or disapproval of the route which you have chosen but the idea of a line to connect up the great agricultural interior with the densely populated coast appeals to me strongly. I feel that you are making a definite contribution to railway economic theory in this respect, whereas the line itself would relieve congestion, open up a production area which would lower food costs, furnish employment to large numbers of soldiers to be disbanded, and put in circulation a large amount of hard money which would go far to correct the currency situation.

I am especially pleased to have your article appear at this time for I had already written one at the request of the publishers of the forthcoming "Trans-Pacific" magazine in which I touched upon the same line of thought. This will not appear until July and your opinions will have done much to prepare the minds of sceptics upon the subject by that time.

I trust that this intrusion of an entire stranger may be pardoned, and that you will continue to support the thought which you have so ably presented.

Very truly yours,
(Signed)
J. E. Baker.

附录五 北京交通部顾问之铁路专门家碧格君投函

孙逸仙先生阁下：

敬启者，得读《远东时报》六月号所载尊著论文，敢以一铁路专门家之资格，敬表喜忭之忱^[1]。在阁下所选定路线，仆在此时虽难遽言赞成、反对，但以一铁路联结广大之农业腹地与人口稠密之海岸之理想，感我实深。窃谓阁下于此已于铁路经济理论上致一具体之贡献。即此路线自身，已能蠲解滞积^[2]，开辟一生产区，使食料价可较贱，以职业授巨额之退伍兵卒，又能使大量之硬币得有流转，而通货之位置将循之以于正也。在仆尤有庆者，则大著正以此时发表，而仆适亦应《横贯太平洋杂志》社主之求，曾草一论，恰亦触及此种思想径路。此论非至七月不能发表，则阁下之意见，对于现在此点着想，使怀疑我者大足以开悟之矣。

冒昧致书，惟冀鉴原。又信阁下此种启沃思想敏妙之作，必将有继此而宣于世者也。专此敬颂勋祺。

碧格谨启

[一九一九年]六月十七日

[1] 喜忭：欢喜，喜乐。

[2] 蠲解：除去，解除。

APPENDIX VI

3, Piazza Del Popolo Roma
August 30, 1919.

Dr. Sun Yat Sen,
29 Rue Molière,
Shanghai, China.

MY DEAR DR. SUN YAT SEN:

I thank you for your very kind letter of June 19th which has just been forwarded to me from my office in Rome, also for your kindness in sending me your splendid project "To assist the Re-adjustment of Postbellum Industries," and the program for "The International Development of China."

I assure you I read your proposals and studied the maps in connection with your able and logical argument with the deepest interest. And I beg you to accept my hearty congratulations.

I am entirely convinced that your noble *ideals will be* realised, not only for the benefit of China and the welfare of your own people, but for the benefit and prosperity of the whole human race.

The Nations cannot continue to deny in the future as they have in the past, the unlimited natural resources of your rich fertile country, in foods, minerals, coal and iron, etc.; and your plans for development and activity, as well as your methods of communication for expanding and cultivating almost untouched miles of virgin soil, and bringing these products to the doors of the "World Market" by a practical and economic plan, scientifically studied out, places you at once among the very rare few unselfish humanitarian benefactors, and reveals so clearly your profound international sympathies.

The development of China's natural resources will give a new impetus and vitality to industry and commerce in your country and will not only be of incalculable benefit to your own people, but offer

undeniable and unlimited advantages to all people in all nations. Therefore Governments and foreign financiers should not hesitate in giving your plans their most careful consideration and support, and come to your assistance in the realisation of your grand humanitarian project.

The construction of a great "Northern Port" on the Gulf of Pechihli, and the building of a system of railways from this great Northern Port to the northwestern extremity of China, as well as the construction of canals to connect the inland waterways systems of North and Central China with the great "Northern Port," and the development of coal and iron fields in Shansi which would necessitate the construction of iron and steel works would not only offer employment to millions of your country people, but would open wider, and advantageously, the doors of thousands of well organised industries in many nations.

附录六 美国名士寓居罗马以世界中都计划 著名之安得生君复函

逸仙先生足下：

六月十九日赐书，已由罗马敝事务所转到此处，甚谢，甚谢。并承瑰伟之补助战后整顿实业之案与《国际共同发展中国计划》相贻，尤感。

奉读尊著计划，旁攀附图而及于先生所与理则的且有力的论据，觉其兴味深永。谨此布庆悦之忱。

吾完全确信先生之高尚理想必将实现，非惟以为中国国家人民之福利而已，又以为世界各人种之利益与繁荣计也。

以饶富之贵国，粮食、矿产、煤铁等等天然富源素称丰富，从前虽为各国所忽略，今则不然矣。而先生之活动发展计划与其展开培成，在使此全未触及之广大处女地，以最经济最实用之方法运其产物于世界市场之前。是先生绝无私心，专为人道求其利益，是为稀有之人，且明晰显出先生深重之国际同情也。

夫发展中国富源者，不特于贵国实业商务与之新刺激、新能力，且为贵国之人民谋其不可胜计之利路而已，又以不可否认且无限之利益付与一切国家之一切人民。此所以政府及外国财政家，对于先生之计划与以最深细之考查及援助，而襄同先生以实现此最大之人道的计划，不应更有所踌躇也。

凡此在北直隶建筑北方大港，由此港直通中国西北边陲，建一铁路系统，又浚一运河，构成中国北部、中部与此港联络之内地水路统系，且开发山西煤铁矿区，不仅其所需以作制铁炼钢工程者使贵国数百万人得其职役，抑且广开门户，随之以利益，以容多数国家组织完美之无数实业也。

It is very encouraging to me, dear Dr. Sun Yat Sen, to know that you look upon my plans of an "International World Centre of Communication" with favor, and that you will further the idea among your countrymen by writing about it in your magazine "The Construction."

This city, erected upon neutral grounds would offer at once the practical framework for the essential needs of a League of Nations and

could become its dignified "Administrative Centre" crowned by an International Court of Justice.

I have presented the plans and proposals of this World Centre to the Rulers and governments of all nations, and hope to be able to go to Washington in October to exhibit the large original drawings and personally explain the project from a practical and economic point of view before the foreign delegates who may meet there to assist in the formation of a League of Nations, and I have written to President Wilson, who after receiving the volumes containing the proposals and plans, wrote that "he valued them very highly."

I hope that in the very near future this International World Centre of communication may become a reality. It would be the means of clearly defining and bringing into focus the highest natural products as well as the most important industrial achievements of all countries. This accomplishment would be one of the first definite steps toward more friendly social and economic relations, and the practicability of establishing such coöperation cannot be disputed.

This City of Peace should rise and stand as an International Monument, erected by international contribution to commemorate the heroic struggle and noble sacrifice of millions who gave their lives on the battle fields, in the air and on the sea, that justice should triumph and open the ways for humanity to progress in peace, and free from tyranny in the future.

With the assurance, dear Dr. Sun Yat Sen, of my most profound sympathies for your noble project, and with my deep gratitude for your keen interest in my plans,

I beg to remain, with high esteem

Faithfully yours,
(Signed)

Hendrick Christian Andersen.

先生于我世界交通中心之计划辱予赞助，且将以先生所经营之《建设》杂志介绍此思想于贵国人民，使我益加奋厉矣。

此都市如建立于中立地区，则立可以应国际联盟之必然的需要，作为其实际之骨干，而能成为受治于国际司法法庭之下最庄严之行政中心矣。

吾已将此世界中都之图及案送与各国之政府及主权者，并拟于十月一日起赴华盛顿，以展览各图原本，并亲自由纯然实际经济的观察点说

明此种计划于各国代表之前。此等代表拟于此处集合，以助国际联盟之组织也。

吾又尝致函威尔逊总统，彼接吾图案之后，答吾谓彼视此计划之价值甚高。吾望此世界交通中心之计划，不久能为实现之中都，将以各国最高自然产物与最重要之实业成功致之于集中点，且使之确定意义，显出此种贡献，乃向于友谊的社会及经注关系为最初决定之一步，而建立此种联合之实用无可批难者也。

将纪念于此海上、空中、陆地战场，为求公道之战胜，为人道扫除榛秽以进于和平^[1]，为将来不受暴君压迫之自由而抛其生命之数百万人之英雄奋斗与高尚的牺牲，诸国应各有所献纳，共建造维持此和平都市，以为国际之为丰碑也。

对于先生高尚之计划，吾抱有最深厚之同情；而于先生对于我计划有此深切之兴味，尤吾所引以为庆者也。专布悃忱，藉申敬意。

[一九一九年]八月三十日
轩特力·安得生启于萨丁诺

“博雅双语名家名作”出版说明

1840年鸦片战争以降，在深重的民族危机面前，中华民族精英“放眼世界”，向世界寻求古老中国走向现代、走向世界的灵丹妙药，涌现出一大批中国主题的经典著述。我们今天阅读这些中文著述的时候，仍然深为字里行间所蕴藏的缜密的考据、深刻的学理、世界的视野和济世的情怀所感动，但往往会忽略：这些著述最初是用英文写就，我们耳熟能详的中文文本是原初英文文本的译本，这些英文作品在海外学术界和文化界同样享有崇高的声誉。

比如，林语堂的*My Country and My People*（《吾国与吾民》）以幽默风趣的笔调和睿智流畅的语言，将中国人的道德精神、生活情趣和中国社会文化的方方面面娓娓道来，在美国引起巨大反响——林语堂也以其中国主题系列作品赢得世界文坛的尊重，并获得诺贝尔文学奖的提名。再比如，梁思成在抗战的烽火中写就的英文版《图像中国建筑史》文稿（*A Pictorial History of Chinese Architecture*），经其挚友费慰梅女士（Wilma C. Fairbank）等人多年的奔走和努力，于1984年由麻省理工学院出版社（MIT Press）出版，并获得美国出版联合会颁发的“专业暨学术书籍金奖”。又比如，1939年，费孝通在伦敦政治经济学院的博士论文以*Peasant Life in China—A Field Study of Country Life in the Yangtze Valley*为名在英国劳特利奇书局（Routledge）出版，后以《江村经济》作为中译本书名——《江村经济》使得靠桑蚕为生的“开弦弓村”获得了世界性的声誉，成为国际社会学界研究中国农村的首选之地。

此外，一些中国主题的经典人文社科作品经海外汉学家和中国学者的如椽译笔，在英语世界也深受读者喜爱。比如，艾恺（Guy S. Alitto）将他1980年用中文访问梁漱溟的《这个世界会好吗——梁漱溟晚年口述》一书译成英文（*Has Man a Future? —Dialogues with the Last Confucian*），备受海内外读者关注；此类作品还有徐中约英译的梁启超著作《清代学术概论》（*Intellectual Trends in the Ch'ing Period*）、狄百瑞（W. T. de Bary）英译的黄宗羲著作《明夷待访录》（*Waiting for the Dawn: A Plan for the Prince*），等等。

有鉴于此，外语教学与研究出版社推出“博雅双语名家名作”系列。

博雅，乃是该系列的出版立意。博雅教育（Liberal Education）早在古希腊时代就得以提倡，旨在培养具有广博知识和优雅气质的人，提高人文素质，培养健康人格，中国儒家六艺“礼、乐、射、御、书、数”亦有此功用。

双语，乃是该系列的出版形式。英汉双语对照的形式，既同时满足了英语学习者和汉语学习者通过阅读中国主题博雅读物提高英语和汉语能力的需求，又以中英双语思维、构架和写作的形式予后世学人以启迪——维特根斯坦有云：“语言的边界，乃是世界的边界”，诚哉斯言。

名家，乃是该系列的作者群体。涵盖文学、史学、哲学、政治学、经济学、考古学、人类学、建筑学等领域，皆海内外名家一时之选。

名作，乃是该系列的入选标准。系列中的各部作品都是经过时间的积淀、市场的检验和读者的鉴别而呈现的经典，正如卡尔维诺对“经典”的定义：经典并非你正在读的书，而是你正在重读的书。

胡适在《新思潮的意义》（1919年12月1日，《新青年》第7卷第1号）一文中提出了“研究问题、输入学理、整理国故、再造文明”的范式。秉着“记载人类文明、沟通世界文化”的出版理念，我们推出“博雅双语名家名作”系列，既希望能够在中国人创作的和以中国为主题的博雅英文文献领域“整理国故”，亦希望在和平发展、改革开放的新时代为“再造文明”、为“向世界说明中国”略尽绵薄之力。

Appendix: Buddhist terms in Pāli, English and Chinese

附录：巴、英、汉佛教术语对照表

返回总目录

Editorial Notes

1. Most Buddhist terms in this book are given in both the original Pāli and English translations. Some Buddhist terms in Pāli or Sanskrit were given in the original Chinese text, and have been rendered into Pāli in this edition in compliance with Mr. Zhao Puchu's own wishes. The reason for this change is that Buddhist texts appeared earlier in Pāli than in Sanskrit. The Pāli language was popularly used in Magadha State in ancient India where the Buddha gave most of his sermons, and some scholars believe that the Buddha taught in Pāli. In the period of Aśoka (3rd century BC), Ven. Mahinda was dispatched to Sri Lanka as a missionary by his father, King Aśoka, and he brought the oral Pāli Tripitaka there. This was later recorded in Sinhalese script Pāli in the 1st century BC and handed down to this day. This Pāli Tripitaka has been preserved unaltered during 2,000 years and has become the most complete, systematic and oldest Buddhist canonical treasure in the world.
2. The two abbreviations are used in the text: S. (Sanskrit), and P. (Pāli).

编辑凡例

1. 本书出现的重要佛教术语都给出了对应的巴利文原词。本书的中文版本中原注有一些梵文或巴利文术语，此次出版前，根据赵朴初先生本人的意见，除个别词语外，一律改为巴利文。此项改动是出于佛教巴利语较之佛教梵语应世更早的原因。巴利语原是古印度摩揭陀国一带所使用的大众语，一些专家认为，这一带是佛陀弘法的主要地区，佛陀弘法使用的就是这种语言。在阿育王时期(公元前三世纪)派遣到斯里兰卡弘法的玛亨陀长老把用巴利语记述的三藏带到斯里兰卡，并于公元前一世纪结集为用僧伽罗字母书写的巴利三藏流传下来。这套巴利三藏历两千年而不变，成为当今世界保留得最完整、最系统、最古老的佛教宝典。梵语是古代印度婆罗门经典所使用的语言，或称为雅语，用梵语编定成书的佛教典籍目前已没有完整成套版本留存。
2. 本书译文所使用的缩略语：S.（梵语），P.（巴利语）。

Translator's WORDS

Answers to Common Questions about Buddhism is the fruit of a lifetime of study on Buddhism made by Mr. Zhao Puchu. The first three chapters give respectively a succinct exposition of the Buddhist Three Gems, i.e. Buddha, Dhamma (Buddhist doctrine), and *Sangha* (the Buddhist Order). Chapter One gives a historical, rather than mythological, account of the founder and the founding of Buddhism. Chapter Two gives in simple language a profound explanation of Buddhist doctrine, as well as its spread and the compilation of its canonical literature. Chapter Three gives a vivid account of the formation of the Saṅgha as well as their life and disciplines. The last two chapters are nothing short of a brief history of Indian and Chinese Buddhism. Chapter Four describes the rise and fall and resurgence of Buddhism in its birthplace—India, and Chapter Five is packed with detailed information, and expresses the innermost feelings of the author. By giving a thorough analysis of the spread, the development and evolution of Buddhism in China, and of the relationship between Buddhism and everyday life, the impact of Buddhism on social, intellectual and cultural development, the last chapter contends that we should carry forward the advantages of popular Buddhism, and make it serve contemporary social and cultural life.

In the form of questions and answers, the book addresses and answers practically all the questions raised by Buddhism over the past 2,500 years. The book may be regarded as Zhao Puchu's general survey of Buddhist studies, giving the laymen readers a proper introduction to Buddhism, while giving to the scholars inspiration and points of entry into in-depth study of Buddhism. It also furnishes non-Chinese native speakers wishing to learn about Buddhism, especially Chinese Buddhism, a comprehensive outline of the field.

The language is vivid and colloquial, and answers in an

enlightening way even those seemingly incomprehensible and abstruse points of Buddhism. Through the apt wording one detects the wisdom of a great philosopher, the sympathy engendered in one with intimate knowledge, the serious and magnanimous approach of a true scholar, and the orthodox stand of a true Buddhist, clearly demarcating it from superstition or heresy.

I began the translation in 1996 at the request of the China Institute of Buddhist Culture. At that time, I had no idea what a challenge this work would prove to be to my knowledge of Buddhism, my Chinese skills and my English proficiency. In order that the limitations of the translator do not detract from the splendor of the original work, over the course of translation I consulted a large number of reference books, strove to ensure that translations were made on a sound basis, and for most technical terms, sought out the original Pāli (or Sanskrit) terms, as well as those English forms most sanctioned by usage. For the convenience of the reader wishing to learn English or Pāli Buddhist terms, I compiled a Pāli, English and Chinese glossary (see appendix). When dealing with more complex ideas, I tried through reading works in the original Pāli, English or Chinese to arrive at a clear grasp of the ideas and the intentions of the author before setting pen to paper. The present translation is the culmination of work over three years and many revisions, and while it has been checked by the author, and earned his praise, I am aware that there remain many areas that fall short of total satisfaction. I earnestly beseech readers' indulgence and criticism.

Over the course of translation and revision, I have benefited from the help of many experts. In order that the translation would not lose its original flavour, from the very first I have consulted a range of foreign experts, including some who know neither Chinese nor Buddhism; some who do not know Chinese but know Buddhism, as well as some who know both Chinese and Buddhism. Here I wish particularly to thank Michael Crook, Helen Wiley, and Tissa Kariyawasam. If the translation brings satisfaction, it is they who have helped it do so. At the same time, through the course of translation, I

consulted translations of this work, in other languages as well. For the hard work of these translators, I would like to extend my heartfelt respect. And throughout the work, the constant trust, encouragement and support of Mr. Zhao Puchu and the China Institute of Buddhist Culture has made it a learning experience for me. For this, I am sincerely grateful to Mr. Zhao and the Institute of Buddhist Culture, who gave me this opportunity to better myself.

As FLTRP is republishing the book, I take this opportunity to make some revision to the work. This translation is the fruit of the labour and wisdom of many people. I make no claim to the credit—this is a point I wish to make clear.

Zhao Tong

September, 2012

译者前言

《佛教常识问答》一书是赵朴初先生一生对佛学进行研究的总结之作。本书的前三章按照佛、法、僧三宝的顺序精辟地阐释了何为佛、何为法、何为僧。第一章对佛教的创立及创始人作了历史的而不是神话的阐述；第二章深入浅出地阐释了佛法的基本内容，介绍了佛教典籍的形成及其流布；第三章对僧团的建立、僧侣的生活、戒律与仪轨作了生动的描述。本书的后二章不啻是一部印度佛教、中国佛教小史，第四章叙述了佛教在其发源地——印度的发展、衰灭和复兴；第五章是本书内容最详实、最能体现作者本怀的一章，其中深入论述了佛教在中国的传播、发展和演变，分析了佛教与人们日常生活的关系，佛教对于社会的思想与文化发展所起的作用，从而阐发了发扬人间佛教的优越性，使之服务于当今社会文化与生活的主旨。

本书用问答的方式实际上回答了佛教两千五百年来所涉及到的大多数问题，因此，这本书可以说是朴老提出的佛学大纲，对于一般人想全面了解佛教将起到正确导入的作用，对于学者要深入研究佛教与佛学将起到启发思路，找到切入点的作用，对于外国人想了解佛教，尤其是中国佛教的全貌提供了全方位的素材。

本书用活泼的、通俗易懂的、开启心智的方式回答了那些似乎莫测高深的佛学问题，妙语机锋间透露出一位大家的睿智，一位善知识的亲切，一位学者治学的严肃与公允的态度，以及一位真正的佛教徒对佛教正信的立场，因而与一切迷信、假信和伪信划清了界线。

译者于1996年受中国佛教文化研究所的委托，开始着手翻译此书。受命之时，万没想到这是如此艰巨的任务，是对译者佛学知识、中文修养，尤其是外语水平的全面挑战。为了不使译者的浅陋有损于原作的光辉，在翻译过程中参阅了大量参考书，务求做到言出有据。对于绝大多数佛教术语，尽量找出它们的巴利语（梵语）原词以及被广泛接受的英文译法，并且，为了方便广大信众、学者掌握佛学英语、巴利语，译者还编辑了《巴、英、汉佛教术语对照表》（附书后）。对于较为复杂的思

想、义理，力求在阅读巴利语、英语、汉语原典的基础上理清了思路，领会了作者的意趣之后再遣词运笔。历时三载，数易其稿，方成现在这个样子。此稿虽得到赵朴初先生亲自审阅，并予以嘉许，然自知还有许多不尽人意之处，祈请方家大德、广大善信施慧赐教。

在反复翻译、修改过程中，得到了各方专家的指教。译稿始成，便邀请了不懂汉语、不懂佛教，不懂汉语、但懂佛教，既懂汉语、又懂佛教的多位外国专家予以审读，听取他们的意见，尽量使译文风格不失去原作的原汁原味。在此，译者要特别向柯马凯先生、魏海伦女士、提瑟·嘎里奥桑姆先生致以最诚挚的谢意，如果译文尚令人满意，全都有赖于他们使之增色。同时，在翻译过程中还参阅了此书的其他几种译文，对于这些译家所付出的艰辛，译者表示由衷的敬意。在翻译过程中，始终得到了赵朴初先生、中国佛教文化研究所的信任、支持与鼓励，使翻译的过程成为我修习的过程，因此真诚地感谢朴老以及佛教文化研究所给了我这个提高与丰富自己的机会。

这次借外研社对此书进行再版的机会，对原译文进行了修订。这本译作是集中了许多人的智慧的成果，译者决不敢专擅其功，这一点也是要特别加以说明的。

赵桐

2012年9月

Preface

I began to write this book almost forty years ago. Owing to the heavy load of work, I could only write intermittently. In addition to the five chapters as they appear now, I intended to write three more chapters dealing with the history of relations between China and other countries in the Buddhist sphere. Since the Buddhist Association of China has undertaken to compile materials and write on this topic, there is no need to duplicate their work here.

When I finished writing the first chapter, it was published in installments in the *Journal of Modern Buddhism*. I used the pseudonym, "Yin Shui" (drink water), derived from the text *Śūramgama Sūtra* that reads "One perceives whether the water is cold or warm only when one drinks it." A friend of mine asked why I chose such an insignificant title. I replied, "I prefer to make a fuss about trifles rather than underplaying a big issue, not to mention completely ignoring significant subjects." The title of this book is in conformity with my wish.

A few years ago a young monk translated my book into Japanese. In the preface, which I wrote at his request, I referred to a story connected with the subject of this book. In 1957, I accompanied a Cambodian monk on a visit to Chairman Mao Zedong. Before the guest arrived I had the opportunity to chat with the Chairman. He told me, "There is a formula in Buddhism: Zhao Puchu is not Zhao Puchu (in the sense of Paramattha), but Zhao Puchu by name. Is this true?" "Yes." I replied. He added, "Why, then, do you affirm it before negating it?" "It is not affirmation before negation," I said, "but simultaneous affirmation and negation." Then the guest arrived and the conversation was interrupted. Later when I worked on Chapter II of this book, I recalled that unfinished talk. I think the idea of the voidness of nature because of Dependent Origination

(Paṭiccasamuppāda) in the book might constitute what I would have said to the Chairman at that time.

I have read a book written by Li Yinqiao, one of Chairman Mao's bodyguards. According to this book, when Chairman Mao was taking a walk with Li in Yan'an one day, Mao said to him, "Let's go see a Buddhist temple, shall we?" Li said, "What's the point? It is nothing but a symbol of superstition." "One-sided, one-sided your thinking is. It is culture." This also reminds me of a letter to me from Mr. Zhou Jianren after "the Cultural Revolution", in which he told me that in the early period of the turmoil, Mr. Fan Wenlan had sent word to him that he was making up for a missed lesson by reading Buddhist books. Fan said that Buddhism in China has lasted about twenty centuries, and that it had such a profound influence on Chinese culture that one can hardly understand the cultural history of China without some knowledge of Buddhism. Finally, in 1987, I visited a Buddhist historical site in Sichuan Province and found that anti-superstition slogans were visible everywhere. Therefore, on my return, I wrote a report. After reading the report Dr. Qian Xuesen wrote to me, "Religion is a part of culture".

It is noteworthy that all three of these men, the first, a great revolutionary, the second, a famous historian, and the third, a great contemporary scientist, shared the same view that Buddhism is a part of culture. Yet there are still many people today whose perception remains like that of Li Yinqiao at that time.

At the very beginning, I was impelled to write this book by the desire to help those interpreters who had difficulty in performing their work due to a lack of knowledge in Buddhism. In recent years, however, I have received kindly consideration and encouragement from many people at home as well as friends from abroad. This indicates that this pamphlet has made more than a negligible contribution towards enhancing the public comprehension of Buddhism and helping foreigners understand Chinese Buddhism.

I am indebted to the translator for her arduous endeavors in accomplishing this task. I sincerely look forward to forthcoming

comments on the book from friends all over the world.

Zhao Puchu

June, 1998

序

这本书是我近四十年前开始写的，因为事务冗忙，时作时辍。原来计划，除现在的五章外，还有三章是有关中国与外国佛教关系史的，因佛教协会已有这方面资料的编辑和著作，所以不重复了。

我写成第一章后，曾以楞严经“如人饮水，冷暖自知”这句话用“饮水”的笔名陆续在《现代佛学》杂志上发表。有一位朋友问我：“你为什么用这样一个小题目？”我说：“我喜欢‘小题大做’，而不愿‘大题小做’，更害怕‘有题空做’。”这本书名很合我的心意。

几年前，一位青年僧人用日文翻译这本书，我应他的要求写序时，曾记下与本书有关的一件事：1957年我陪一位柬埔寨僧人见毛泽东主席，客人未到之前，我先到了，毛主席便和我漫谈。他问：“佛教有这么一个公式——赵朴初，即非赵朴初，是名赵朴初，有没有这个公式呀？”我说：“有。”主席再问：“为什么？先肯定，后否定？”我说：“不是先肯定，后否定，而是同时肯定，同时否定。”谈到这里，客人到了，没有能谈下去。后来，我在写这本书的第二章时，想起这一次未谈完的问答，我想，书中谈到缘起性空的思想，可能补充了当时我在毛主席面前所想讲的话。

我曾看到一本毛主席的勤务员李银桥写的书。有一天，毛主席在延安出门散步，毛主席对李银桥说：“我们去看看佛教寺庙，好不好？”李银桥说：“那有什么看头？都是一些迷信。”毛主席说：“片面片面，那是文化。”我因而想起“文化大革命”结束后，周建人先生写信给我说：“文革”初期范文澜先生向他说，自己正在补课，读佛书。范老说，佛教在中国将近两千年，对中国文化有那么深厚的关系，不懂佛教，就不能懂得中国文化史。1987年，我到四川一个佛教名胜地方看到被人贴迷信标语的事实，回来写了一份报告，钱学森博士看见了，写信给我说：“宗教是文化。”

这三个人，一是伟大的革命家，一是著名的历史学家，一是当代的

大科学家，所见相同，都承认佛教是文化，而今天还有不少人的认识水平和当年李银桥的一样。

我最初写这本书的动机只是为了和外国朋友谈话时，翻译人员因缺乏佛教知识而感到困难，想为他们提供一些方便。但这许多年来，得到国内不少人的关怀、鼓励，也得到一些外国朋友的注意。事实说明，这一本小书对于增进人们对佛教的了解，增进国际朋友对中国佛教的了解，不无少许贡献。

我感谢译者为此书所付出的宝贵的心力。我虔诚期待国际朋友对于此书内容给予指教。

赵朴初

1998年6月

1 THE BUDDHA AND THE ORIGIN OF BUDDHISM

¹Q: What is Buddhism?

A: Buddhism, in a general sense, is a religion with its canonical literature, rites, customs, Saṅgha Order (congregational organization) etc.; more specifically, it is the Buddha's teachings, and with this specific meaning it should be termed the Buddha Dhamma.

²Q: What is "Dhamma"?

A: "Dharma" in Sanskrit ("Dhamma" in Pāli) means "retaining one's own nature, so that it can be recognized". That is to say, everything has its own attributes and appearance (S. prakṛti and lakṣaṇa, P. pakati and lakkhaṇa) and maintains its own properties, by which people can perceive it as what it is. For instance, water maintains its property of wetness and acts according to its fixed track, so people recognize it as water when they see it. Conversely, when something is devoid of wetness and obey different rules from water, there then can be no conception of water. Therefore, Buddhism views everything as "dhamma". The terms "all dhammas", "each dhamma" appearing in Buddhist canons indicate "all things" or "universal existence". According to this interpretation, the discourses delivered by the Buddha based on his own empirical comprehension of dhammas are also "Dhamma" since they hold true to the principle of "retaining its own nature, so that it can be recognized."

³Q: Is the Buddha a deity?

A: No, the Buddha is not a deity. He was a man who lived in the 6th century BC. He had his own given and family names, his given

name being Siddhattha (S. Siddhārtha) and his family name Gotama (S. Gautama). As he belonged to the Sākya clan, people also called him Sākyamuni, meaning a sage of the Sākyas.

⁴Q: Why is the Buddha called "Fo" in Chinese? What does it mean?

A: "Fo" is the abbreviation for "Fotuo" which was used to translate the word "Buddha". (The characters used for "Fotuo" were pronounced "buda" at the time of translation.) Buddha means "an enlightened one" or "an awakened one". The term "Buddha" existed in India from the earliest times, but Buddhism has attributed three additional connotations to the term. They are as follows: (1) enlightenment (Sambodhi, which means thoroughly realizing the properties and appearance of all dhammas as they are); (2) perfect enlightenment (Sammā-sambodhi, which means not only enlightening oneself but also equally and universally enlightening others); (3) supreme or paramount enlightenment (Anuttara sammā-sambodhi, which means one's wisdom and achievement have reached the highest and the most perfect sphere in enlightening both oneself and others).

⁵Q: Are there any other Buddhas besides Sākyamuni?

A: Buddhism claims that there were people who attained Buddhahood in the past, and there will be people to become Buddhas in the future. It is possible for everybody to achieve enlightenment. Therefore, "All living beings have the Buddha-nature, everyone with the Buddha-nature may attain Buddhahood."

⁶Q: Is the Chinese term "Rulai Fo" identical to Sākyamuni or is he somebody else?

A: "Rulai" was translated from the Sanskrit word "Tathāgata". "Ru" means "suchness" (tathatā), or "according to the reality" (Yathābhūtaṃ), i.e. the ultimate reality of all dhammas, while "lai" means "come". "Rulai" (Tathāgata) is interpreted in the Buddhist scriptures as "coming by the path of Tathāgata" or "coming according to the reality". Tathāgata is a general term and another name for "the Buddha". Thus Gotama Buddha can be called

Gotama Tathāgata, and Amita Buddha can be called Amita Tathāgata.

⁷Q: Are Amita Buddha and Gotama Buddha not one and the same?

A: No, Amita Buddha or Amitābha is the Buddha of another world. The Chinese term "Amituofo" is the transliteration from Sanskrit of "Amitābha", meaning "boundless light".

⁸Q: What is the meaning of "Nanmo Fo" (南无佛)? Why is it pronounced as "Namo Fo" (那摩佛)?

A: "Nanmo" is the transliteration of the Sanskrit "Namo". The Chinese characters "南无" were used since their pronunciation was similar with "namo" in ancient times when this term was introduced into China. Such a pronunciation is still preserved now in parts of China's Guangdong and Fujian provinces. "Namo" means salutation or homage. Even today, when Indians meet, they say "Namaste" to each other, that is "Homage to you".

⁹Q: What is known about the life of Sākyamuni?

A: Well, Sākyamuni lived around the 6th century BC, equivalent to the Spring and Autumn Period in China, and was a contemporary of Confucius. He was the eldest son of the King of Kapilavatthu. His father was named Suddhodana; his mother, Māyā. Queen Māyā gave birth to Prince Siddhattha on the way to her parents' home while taking a rest under a tree in Lumbinī Grove, since, according to the custom prevailing in India at that time, women should go back to their parents' home for child bearing.

¹⁰Q: Are there any vestiges of Lumbinī Grove remaining today?

A: During the 7th century AD, Tipiṭakācariya Xuan Zang (Hsuan Tsang) of China visited Lumbinī Grove. According to his account, he saw the stone pillar erected there by King Aśoka about 800 years before, marking the birthplace of the Buddha. The site at that time, however, was in a state of desolation, the pillar having been struck by lightning and the top having fallen down onto the ground. Subsequently, the birthplace of the Buddha sank into

oblivion because nobody could read the letters on the pillar. It was not until 1897 when the Aśoka pillar was re-discovered, archeologists deciphered the inscriptions and the ravaged ruins of Lumbinī Grove were excavated. Some ancient settlements were also excavated in the vicinity of that site, part of which may have belonged to the old city of Kapilavatthu. Today, the government of Nepal has proclaimed it as Holy Land and undertaken necessary reconstruction and protection.

¹¹Q: How was Sākyamuni educated in his childhood?

A: Queen Māyā died soon after giving birth. Young Sākyamuni was brought up by his aunt (his mother's sister) Princess Prajāpati. As a child he began to learn literature, philosophy, arithmetic and so on from Brahmin scholars and gained a broad and profound knowledge. He also learned martial arts from warriors and became a master at riding, shooting and fencing. Because of his great intelligence and striking features, his father, king Suddhodana, hoped that he would become a universal ruler (Rāja Cakkavattin, a king who could unify the whole world) and perform meritorious services after he succeeded to the throne.

¹²Q: Why didn't he succeed to the throne later on?

A: Prince Siddhattha in his childhood developed the habit of meditating. Many phenomena he observed touched him strongly and made him think hard: e.g. the hungry, thirsty and exhausted peasants working under the scorching sun, panting and sweating cattle being flogged as they plough, the struggle among snakes, insects, birds and beasts under the law of the jungle, weak and ugly old people, the moaning and suffering sick, the dead in funeral processions with their families and friends weeping behind. All these presented him with a problem: how to deliver the world from suffering. Neither the Veda he had read nor the knowledge he had acquired, nor his future throne and power could solve this problem. Therefore, he harbored the idea of renouncing the world in his early days, and finally he relinquished his throne.

¹³Q: How could his father agree to his renunciation?

A: Having found out what his son had in mind, King Suddhodana tried many ways to detain him, especially by surrounding him with worldly pleasures. When Siddhattha was only 16 years old, King Suddhodana arranged for him to marry Princess Yasodharā from a neighboring state. Yasodharā bore him a son named Rāhula. But all this was in vain. He finally slipped out of the capital city in the still of a night. He entered a forest, took off his princely clothes and, having shaven his head and beard, became a wandering mendicant. Regarding his age at the time of renunciation, there are two different accounts—one says nineteen, and the other twenty-nine.

¹⁴Q: What about his life after he renounced the world?

A: Having tried in vain to persuade him to return, his father chose five men from his clan to accompany him. They were Kauṇḍinya, Bhadrīka, Vāṣpa, Mahānāma, and Aśvajit (P. Koṇḍañña, Bhaddiya, Vappa, Mahānāma, Assaji). Prince Siddhattha and his followers successively paid visits to three famous scholars and learned from them, but none of them could satisfy his quest. When he realized that no real path of deliverance (or absolution) was to be found in the philosophical thought of that time, he left for a forest on the banks of the Nerañjarā river, now the Lilaian, and lived there with other ascetics. In his search for emancipation, he went through suffering and pain for six years. However, since it proved fruitless, he began to understand that austerities were to no avail. So he went to take a bath in the Nerañjarā River, cleaning off all the dirt of six years. Then, after accepting the milk gruel offered by a herdsman, his strength was restored afresh. When his five followers saw this, they thought he had abandoned his faith and spiritual efforts, so they left him for Benares City (P. Bārāṇasī) to continue their ascetic practices. The Prince then went alone to a Pippala tree and made a seat with auspicious grass (kuśa) under the tree. Sitting down with his legs crossed and facing the east he vowed, "Now should I fail to attain supreme enlightenment, I

would rather have my body decompose than rise from this seat." In such a manner, he commenced meditating on absolution, and finally one night defeated the moral affliction and Māra's temptations (kilesa and Māra), achieved complete enlightenment, thereby becoming a Buddha.

¹⁵Q: Are there any vestiges remaining of the site where Sākyamuni became a Buddha?

A: The site where Sākyamuni attained Buddhahood has been known as the Place of Enlightenment or Buddhagayā ever since. The Pippala tree there, as well as that kind of tree in general later became known as Bodhi tree. Bodhi means enlightenment. Buddhagayā is situated in the southern suburbs of Gayā City in Bihar Pradesh of India today. In the course of more than twenty centuries, the Bodhi tree was twice chopped down and once blown over, but always sprouted again. The present Bodhi tree is a great grandson of the original one. At the plot where the Buddha sat under the tree is a stone-carved diamond pedestal (Vajrāsana). To the east of the tree is a majestic thūpa (S. stūpa) temple known as Mahābodhi Ārāma with a history of over 18 centuries, and nearby are a number of traces of the Buddha and ancient carved stones and constructions. In 1956, the government of Bihar Pradesh appointed an international advisory committee to supervise the construction and administration of the Holy Land. At its invitation the Buddhist Association of China, sent two delegates to that committee.

¹⁶Q: Would you please give a brief account regarding his life after Sākyamuni attained Buddhahood?

A: There are different versions regarding the age at which Sākyamuni attained enlightenment, some quote it as thirty and some as thirty-five. For fifty (or forty-five) years after that, until the end of his life at the age of 80, he never stopped preaching his doctrine. He traveled widely, preaching to the public the truth he had perceived. At the outset, he went to Benares (P. Bārāṇasī) to look for his five departed followers and preached the truth to them. The first sermon of the Buddha is called "the initial turning of the

wheel of Dhamma" (S. Dharmacakra pravartana, P. Dhammacakkappavattana) in Buddhism.

¹⁷Q: What does "turning the wheel of Dhamma" (Dhammacakkappavattana) mean?

A: Cakka (wheel) was a wheel-like weapon used in wars in ancient India. There was an old legend in India that the rāja (king) that conquered the world would be the Rajacakkavattin, i.e. "The wheel-turning king". At the time of his birth, a wheel appeared in the sky, prophesying that he would be unconquerable in the future. In Buddhism the wheel is used as a metaphor of the Dhamma preached by the Buddha. Once the Buddha's Dhammacakka emerged, all the wrong thinking and evil things would be smashed and vanish. Hence the preaching of Dhamma is called Dhammacakkappavattana (turning the wheel of Dhamma). The Buddha's initial turning of the wheel of Dhamma took place at Sārnāth Mṛgadāva (Deer Park) in present-day Benares. Through the recent excavations, quite a few valuable relics have been discovered at Sārnāth, including the King Aśoka stone pillar, stone-engraved images of the Buddha's first turning of the wheel of Dhamma dating from the 4th century AD etc. Even the ruins of the ancient thūpa temple were unearthed. Buddhist temples, museums and a library now standing there were built over the last few decades. There are four places regarded as the holy places of Buddhism: (1) Sārnāth, where the Buddha initially turned the wheel of Dhamma, (2) Lumbinī Grove, where the Buddha was born, (3) Buddhagayā, where the Buddha attained enlightenment, and (4) Kusināra, where the Buddha passed away. It is worthy of note that modern scholars excavated and repaired the holy places and other historical sites mainly on the basis of the records of the ancient Chinese pilgrims like Fa Xian (Fa Hsien) and Xuan Zang (Hsuan Tsang).

¹⁸Q: Why is the site of the Buddha's first sermon looked upon as more important than other sermon sites?

A: The Buddha's initial turning of the wheel of Dhamma at Sārnāth

was a great event in Buddhism. At that time, Buddhism was established; and after that, the Three Gems (Tiratana) came into existence.

¹⁹Q: What are the Three Gems (Tiratana)?

A: The Three Gems are the Gem of the Buddha, the enlightened one, the Gem of Dhamma, the teachings given by the Buddha, and the Gem of Saṅgha, the Order of the Buddha's monastic disciples. These three are called gems (ratana) because they can lead people to stop doing evil and to perform kindness, to free themselves from suffering and to gain happiness. The title of "The Three Gems" also shows the great value placed on them. When the Buddha initially turned the wheel of Dhamma, Koṇḍañña and others, five of them in all, followed the Buddha, renounced lay life and became the Buddha's disciples, thus forming the Saṅgha Order. Therefore, the Three Gems have been cherished since that time.

²⁰Q: What is the meaning of "abiding by the Three Gems" ("Ti-saraṇaṃ gacchāmi")?

A: Ti-saraṇaṃ gacchāmi means that one abides by the Three Gems with one's heart and soul. Those who have gone to and relied on the Three Gems are Buddhists.

²¹Q: Were there many people who came and followed the Buddha during his lifetime?

A: Yes. On the way from Sārnāth to Magadha State after the Buddha's first sermon, many people were converted to follow his teachings. Among them were three brothers, Brahmins, by the name of Kassapa. They had been Zoroastrians, but were now converted and brought along with them more than one thousand of their followers to be converted to Buddhism. After the Buddha arrived in Rājagaha, the capital of Magadha, many more people were converted, including some who were to become prominent disciples, like Sāriputta, Mahāmoggallāna and Mahākassapa. Afterwards, when the Buddha returned to his native land, a number of his relatives: his younger half brother Nanda, his

cousins Ānanda and Devadatta, his son Rāhula became monastic disciples. Among them, there was a barber named Upāli, who had served the royal family, and later became a famous master of Buddhist disciplines (Vinaya bhāṇaka). The Buddha's aunt Prajāpati also followed to become the first female monastic disciple of the Buddha. Besides, even more devotees were converted to the faith without renouncing the home life. Therefore, the Buddha's disciples consist of Bhikkhu (monks) and Bhikkhunī (nuns), who form the Buddhist monastic order; and Upāsaka and Upāsikā, who are the male and female lay followers; together they are known as the four groups of disciples.

²²Q: Where did Sākyamuni travel and preach during his life?

A: According to historical records and excavations, the Buddha's own footprints mainly covered Central India. His disciples, dispersed in all quarters, might have gone further afield. There are also legends in Sri Lanka and Myanmar about the Buddha visiting and leaving his footprints there. During the Buddha's lifetime, he resided for the most part in Rājagaha, in the states of Magadha and Sāvattihī in the state of Kosala. Outside Rājagaha was a bamboo forest, donated to the Buddha and his disciples by King Bimbisāra, which later came to be known as Bamboo Grove Monastery (Veḷuvanārāmaya). In Sāvattihī, there was a garden given to the Buddha jointly by a rich merchant, Sudatta, and Prince Jeta of Kosala. This garden was known later as Jeta Grove Monastery (Jetavanārāmaya or Jetavana Anāthapiṇḍikassa-ārāma). Since the Buddha used to travel between the two places, both became important sites for the promotion of his doctrines. Gijjhakūṭa Hill, situated south of Rājagaha, was another place frequented by the Buddha and his disciples for preaching. Prior to his death, the Buddha went northward from Rājagaha to Vesālī (Bihar Pradesh in modern India). Then he turned northwest, and finally arrived at Kusināra (now Kasia in Uttar Pradesh, India) where he passed away (Parinibbāna). In modern times, excavations have uncovered the site of his cremation, and discovered a stone-carved image of

his nibbāna as well as other relics. In commemoration of the 2,500th anniversary of the Buddha's Nibbāna (S. Nirvāna), the government of India has done some essential repair and construction in the holy place.

²³Q: What is "Nibbāna"?

A: This will be fully explained later. It may be simply interpreted as death.

²⁴Q: What were the circumstances immediately before and after the Buddha's Nibbāna?

A: The Buddha had been very sick when in Vesālī. After the Rainy Season Retreat (Vassa) in Vesālī he went with his disciples towards the northwest. On the way he had food offered by the blacksmith Cunda and became seriously ill. Finally he reached the bank of a river in Kusiṇāra. After taking a bath he lay on his right side with his head resting on his right hand, on a hammock placed among four pairs of sala trees. Subsequently, all the recumbent (Sleeping) Buddha statues or the statues of the Buddha's Nibbāna have been modeled in this posture. The Buddha informed his disciples of the approach of his Nibbāna, and all his disciples watched over him. At night, a Brahmin scholar named Subhadda came to see the Buddha. When Ananda tried to stop him, the Buddha called Subhadda to his bedside and preached a discourse for him, so Subhadda became the last disciple of the Buddha's lifetime. From the time he left Vesālī on the journey, the Buddha preached to his disciples many times and at midnight when he was about to die, he told them for the last time, "You should not think that you no longer have a teacher. Rather you should regard the teachings (Dhamma) as your teacher. Be diligent in striving for salvation. Never be indolent."

After the Buddha's death, his body was cremated. The remains were divided into eight portions by Magadha, the Sākya, and other states and then enshrined in thūpas constructed in the eight states. By the 3rd century BC a portion of the Buddha's Sarīra enshrined

in Buddhagayā in Magadha was taken out by King Aśoka and was divided into many portions to be stored in thūpas in different places. In 1898, archeologists discovered a Sarīra thūpa on the southern border of Nepal when they excavated an ancient location of Kapilavatthu. Inside the thūpa they found stone vases, urns and other articles. One of the vases was kept in an urn made of layers of iron and crystal. In the vase there was a golden flower with the Buddha's bones placed on it. The inscription on the urn indicates that this is the Buddha's Sarīra enshrined by the Sākyas.

²⁵Q: What is "sarīra"?

A: "Sarīra" means the remains of the dead, but this term is generally confined to the remains of the Buddha and other virtuous priests only.

²⁶Q: What is the function of a thūpa?

A: Thūpa (S. stūpa), rendered into Chinese as "Ta", "Tabo" or "Sudubo", means "tower" or "tomb". Thūpas are usually built for keeping sarīra, though some are for commemorative purposes.

²⁷Q: Is there agreement over the year of the Buddha's Parinibbāna?

A: With regard to the year of the Buddha's Parinibbāna, the Buddhists in Southeast Asia generally put it in the year 545 BC, so in 1956 and 1957 many countries ceremoniously observed the 2,500th anniversary of the Buddha's Parinibbāna. In China, however, there are different opinions about the year of the Buddha's passing away, the generally acknowledged year being 486 BC, 59 years later than the Theravādin calendar of Southeast Asia.

²⁸Q: What is the date of the Buddha's Parinibbāna?

A: In China, the 15th of the second month of the lunar calendar is commonly accepted as the Day of the Buddha's Parinibbāna, the 8th of the fourth month as the Buddha's birthday, and the 8th of the twelfth month as the Day of the Buddha's enlightenment. In South and Southeast Asian countries, however, the full moon day of May of the Gregorian calendar (corresponding to the 15th of the

fourth month in the Chinese lunar calendar) is the Buddhist Holy Day called Vesākha (S. Vaiśākya), which is regarded as the Day of the Buddha's birth, enlightenment, as well as Parinibbāna.

²⁹Q: From what you have said we have learned the brief outline of the life of Sākyamuni Buddha. Would you now please give some historical background on the origin of Buddhism?

A: This is a rather difficult question, firstly, because there is a lack of materials on Indian history. Secondly, I haven't studied this area very deeply. Yet I would like to share whatever information I have, as well as clues and leads in my mind for your further reference, research and judgment.

³⁰Q: Good. I think all religions and ideologies are products of history. For better understanding of Buddhism, it would be helpful to learn something about the social circumstances of that time. I hope you can paint a sketch of its main points.

A: Let us begin with the situation of that time. Do you know there was a region called the Middle Kingdom (Madhya Deśa) in ancient India?

³¹Q: I am afraid I don't. In which part of India was it located?

A: About 3,500-4,000 years ago, with gradual migration from central Asia into the Indus Valley, the Aryans conquered the original inhabitants and settled there. They assimilated the aboriginal civilization and founded a number of states. For a long time afterward, this area was a political and cultural center of Brahmin civilization and of the Aryan people. Thus this region was called the Middle Kingdom (Madhya Deśa). As to the vast areas of the eastern and southern Ganges Valley, these were called uncivilized "frontier" areas. However, by the time of Sākyamuni, a tremendous change had taken place. The states in the original Madhya Deśa began to decline, while those in the south-eastern frontier began to prosper. Among them was Magadha, the newly emerging dominant state where Sākyamuni resided for the longest time and taught most extensively. The center of civilization by this time had

shifted to the new cities: Rājagaha in Magadha, Sāvattthī in Kosala and Vesālī in Vajji, among them Rājagaha being particularly important.

³²Q: Apart from being powerful and prosperous, were there any particular characteristics in respect to social, economic and cultural spheres in these newly emerging states?

A: According to my preliminary study, there are three conditions which are worthy of notice: (1) the increasing ethnic conflicts; (2) the development of social productivity in the economy; and (3) the emergence of a new anti-Brahmanist trend of thought. All these three were reflected in the caste system.

³³Q: What is the caste system?

A: The caste system was created with the entry of Aryans into India. The word "caste" is used to translate the Sanskrit word "Varṇa" (P. Vaṇṇa). Its original meaning was "color" or "quality". According to their theory, white-skinned Aryans were a superior race; the dark colored Dravidians and other aborigines were inferior races. At first, this system was used to distinguish between Aryan and non-Aryan peoples. Subsequently, with the developing division of trades and occupations, the caste distinction formerly used for separating Aryans from non-Aryans also found reflection among Aryans themselves. Hence the division of four castes: the highest caste was Brāhmaṇa, the class of priests who administered religious rites, and educational and cultural affairs (some of them later became kings). The next was Kṣatriya, the class of kings and warriors who administered military and political affairs; the third was Vaiśya, composed of merchants, artisans and peasants engaged in farm work; and the fourth was Śūdra, composed of farm laborers, herdsmen, servants and slaves. The first three castes were Aryan and the last one non-Aryan. Each caste had its own hereditary occupations and were not permitted to inter-marry, and in particular, any mixing between Śūdras and other castes was strictly prohibited. There were special laws governing the offspring of Śūdra males and females of other castes. For instance, the

shameful title of Caṇḍāla was given to the child born of a Śūdra male and a Brahmin female. The status of Caṇḍāla was the most degraded and since they were not allowed physical contact with others, they were known as the "untouchables". From generation to generation, these people took the humblest jobs such as corpse-carriers, butchers, and executioners. The caste system was not only enacted in laws but also unshakably regulated by religious doctrines and tenets. In Madhya Deśa, the caste system was most strictly enforced under the powerful influence of Brahmanism.

³⁴Q: Did the caste system exist in the newly emerging countries too?

A: With the extension of Aryan influence, these states could not but be affected by the Brahmanic culture. Although the caste system entered there, it encountered quite a lot of obstacles. Firstly, the original inhabitants were in the majority in these states. Secondly, miscegenation between Aryan and non-Aryan races was relatively common. Thirdly, in order to consolidate the Aryan domination in those areas, quite a few aboriginal chiefs were inducted into the caste of Kṣatriya through embracing rituals. Under the caste system, there were always rivalries between the ruling castes, Brāhmaṇas and Kṣatriyas. This was particularly strong between the non-Aryan Kṣatriyas and the Brāhmaṇas who held the superior position. Research shows that most people of Magadha came from miscegenation of Vaiśyas and Śūdras, therefore, they were regarded as an inferior race—semi-aryan and semi-barbarian—by Brahmanic code. It is said that King Aśoka of Magadha who later on unified India had Śūdra blood. In this environment any theories against the Brahmin ideas of the caste system would easily be accepted and welcomed. The doctrine advocated by Sākyamuni saying that "all four castes are equal," mirrored the resentment of people in the newly emerging states towards the caste system.

³⁵Q: Did the Sākyas belong to the Aryan race?

A: Concerning Sākyas's ethnic origin, there are different opinions. Some hold the view that it was of the Mongolian race, and others, Aryan. But as far as the geography of that time is concerned, Kapilavatthu

was located in a remote area and was a small state (some believe it was a dependency of Kosala). It is less likely that its royal family was of the Aryan race. Besides, in Buddhist scriptures there is more than one reference to Sākyamuni having a golden purple body, thus providing further grounds for arguing that the Sākyas were not a white Aryan race.

³⁶Q: Can it be said that caste contradictions at that time were simply a reflection of ethnic contradictions?

A: Not exactly. As I see it, it also reflected the contradictions brought about by the development of social productivity at that time.

³⁷Q: Was Indian society at the time of Sākyamuni a slave society?

A: Recent excavations in the Indus Valley show that as early as 3500-2750 BC, the aborigines there (probably the Dravidians) already had a remarkable urban civilization. They had city planning, with sewerage, two or three-storied brick buildings, and public or private baths. Along the streets, there were stalls and shops. A textile industry as well as a ceramics industry existed. This fact strongly refutes the suggestion of Western scholars that the Indian civilization was brought in by Aryans. As a matter of fact, it is the nomadic Aryans who accepted the higher civilization of the original inhabitants. In the light of the excavations, the aboriginal society at that time was a slave society, and it may be concluded that they had already considerably advanced agriculture. As to the period from the settling down of the Aryans, up to the establishment of the caste system (about 1,000 years), we need to study whether it was still a slave society. According to the Brahmanic code, Śūdra did not mean slave, only some members of that caste were slaves who were engaged in odd jobs, taking very little part in production. It is apparent that slaves were not the main labor power. Therefore, it is hard to assert that this was still a slave society.

³⁸Q: In your opinion, what was the prevailing social system at that time?

A: It is recorded in the Buddhist scriptures that there was a fixed time each year during which the king presided over a ploughing ceremony in the fields, and the people tilled for him. This agrees with the clause of the Brahmin codes, which stipulates that the Śūdras who lived off their own labor should pay taxes to the king through offering their labor. According to the notes made by the ancient Chinese translators, Kṣatriya originally meant "land owner". It may be inferred from this that by the time the caste system began to be well established, India had entered into a society of serfdom ruled by feudal lords. By the time of Sākyamuni, more changes had occurred in the newly emerging states. The Buddhist literature suggests that commerce at that time was flourishing with large-scale trade caravans and mercantile fleets. Thus merchants had solid economic strength. For instance, a very rich merchant named Sudatta, who made a gift of a garden to the Buddha, was of such great wealth that he compared riches with the prince of Kosala by paving the whole garden with gold. Handicrafts flourished too, with fine division of labor. Small enterprises of industry and commerce operated freely and played an important role in productive activities. At that time there emerged tax-paying free peasants as well as tenant farmers. It is conceivable that, in the newly emerging states where the majority was of the mixed castes of Vaiśyas and Śūdras, Kṣatriyas might not have been serf-owners, but representatives of a newly emerging landlord class. As early as 1,000 BC ironware appeared in India, and in this period, iron farm tools were widely used, and agricultural productivity was greatly increased. Under these economic circumstances, partitioning by feudal lords was unfavorable to the development of commerce, of handicrafts and of agriculture in particular. History shows that the centralized construction of water conservancy and irrigation works was important in King Aśoka's unification of India. Even during the Buddha's lifetime, 200 years before Aśoka, people had already cherished the ideal of "one world unified by the wheel-turning king" (Rāja Cakkavattin). In his childhood, the Buddha's father and

compatriots hoped he would become the wheel-turning king. The Buddha, though forsaking his throne, held the ideal of a wheel-turning king. The idea was indeed a reflection of the people's common aspiration to have a centralized government to replace the state of division by the feudal lords. This desire inevitably came into conflict with the caste system.

³⁹Q: What was the relationship between Sākyamuni and Brahmins, and between Sākyamuni and Kṣatriyas?

A: Sākyamuni publicly opposed Brahmanic doctrines, so he was subject to numerous attacks by the Brahmins during his lifetime. Nevertheless, a large number of Brahmin scholars and followers gave up their original beliefs and turned to the Buddha. The Brahmaṇas, in response to Buddhism, issued the Manu Code (Manu-Smṛti), which, while upholding the caste system, made some amendments to it. Although the Manu Code did not overtly attack Buddhism, the subsequent Manuals of Public and Domestic Rites (Sarvadarśana Saṃgraha) expressed an explicitly offensive attitude against Buddhism. As to the relationship between the Buddha and the Kṣatriyas, as you know, the Buddha came from the Kṣatriya caste. The kings of those states where he traveled and preached, such as Bimbisāra of Magadha, Prasenajit of Kosala and others were his faithful followers and strong supporters. At a later time after the Buddha, King Aśoka more energetically promulgated the Buddha Dhamma. It should be concluded that the Kṣatriyas of the newly emerging states had great esteem for and staunch faith in the Buddha. It is worth notice that in the Buddhist texts, whenever mention is made of the four castes, Brahman is put after Kṣatriya. That is contrary to the traditional order in which Brahmin came the first (i.e. Brāhmaṇa, Kṣatriya, Vaiśya and Śūdra). From this break with the tradition, one can see the Buddha's depreciation of the Brahmins' position.

⁴⁰Q: What was the relationship between Sākyamuni and the common people?

A: Sākyamuni's style of teaching was close to the common people.

Instead of the elegant language of the Brahmins, he used the vernacular language. As was mentioned earlier, Sākyamuni accepted a Śūdra named Upāli to be his disciple to whom the Buddha's brothers and son had to pay homage since their ranks in the Saṅgha were lower than his. The Buddha and his disciples accepted on equal footing the offerings contributed by the Caṇḍālas, or the untouchables, with whom other people were reluctant to make physical contact. The Buddha contrived to meet a Caṇḍāla and preach to him when he was too shy to come and see the Buddha. In the same way the Buddha treated all the unfortunates. Among his disciples were beggars and prostitutes. The Buddha, on one occasion, rejected an invitation from a king and went to take a dāna offered by an unfortunately degenerated woman. In ancient Indian society, the status of women was akin to that of slaves. The fact that the Buddha admitted women into the Saṅgha Order as his monastic disciples is considered a great revolution in religious history.

⁴¹Q: Although he had sympathy with the unfortunate and suffering people, isn't it true that the Buddha did not advise them to revolt against their rulers?

A: True. The Buddha did not instruct people what action to take against their rulers, and although on the one hand, it may be said he advocated forbearance in real life since he mainly taught people how to eliminate their inner worries and attain deliverance and said to them that desisting from evil and doing wholesome deeds in the present world would bring happiness to future life as effect; on the other hand, his thought played a positive role in society at the time because he repudiated the theory of Brahmin theocracy, proclaimed the equal position of all beings and revealed the truth of impermanence of everything (aniccā).

⁴²Q: What was the situation in the ideological domain in India at that time?

A: Similar to the Spring and Autumn and the Warring States Period in Chinese history, there was a period of "a hundred schools of

thought in contention". Generally speaking, there existed two major ideological trends: one was the school of orthodox Brahmanist thought, and the other, various schools of heretical anti-Brahman thought. Buddhism belonged to the latter.

⁴³Q: What were the fundamental ideas of Brahmanism?

A: Brahmanism was polytheism with monotheistic leanings. It worshipped various deities of nature, offered sacrifices and prayers for blessings and warding off calamities, but believed in Brahmā as the superior lord who created the entire universe. Brahmā gave birth to Brahmanas from his mouth, Kṣatriyas from his shoulder, Vaiśyas from his abdomen and Śūdras from his feet. Thus, the social standing of the four castes, noble or humble, was decided according to this. And thus people had to abide by the will of Brahmā and keep faith in Veda. Ordinary people had to serve Brahmins, and strictly obey the caste system. With the development of Brahmanist doctrines, on one hand Brahmā was recognized as the noumenon of the universe or the ultimate principle of origin of the universe in the abstract sense; on the other hand, viewed from the individual, Atta (S. Ātman, Ego) was considered the dominator and noumenon of the individual, the personal body as well as one's actions. Thus the phenomena of the external world also arise from Atta. Hence an inference: Brahmā and Atta should not be two but one and the same. So what people had to strive to reach was a state of harmony between Atta and Brahmā through self-cultivation. In this way, they could avoid the suffering of saṃsāra and attain ultimate emancipation.

⁴⁴Q: How many anti-Brahmanic schools were there at that time?

A: Buddhist texts mention as many as 96 anti-Brahman schools, six of which were outstanding and whose founders were known in the texts as the Six Teachers. One among the six was Nigaṇṭha Nātaputta, the founding father of Jaina. The other five were Pūraṇa Kassapa, Makkhali Gosāla, Ajita Kesakambala, Pakudha Kaccāyana and Saṅjaya Belaṭṭhiputta. Of all these schools only Jaina still exists and has texts one can research. The others have

no proper records, but fragments of information can be gleaned from the books of the rival schools, which challenged their doctrines. Some of them were sceptics denying the relations of cause and effect; some stood for carnal desires; while others advocated ascetic practices; and still others were materialists who believed that human beings were composed of four Mahābhūta (i.e. the four elements of earth, water, fire and air), which would decompose and vanish after death with no prospect of future life.

⁴⁵Q: What was the relationship between Buddhism and other religious schools or sects?

A: Buddhism not only repudiated the creeds of the Brahmanists but also opposed those of the various non-Brahmanic schools. However, Buddhism, Brahmanism and other religions had some common ideological sources. Although it adopted certain ideas from other schools, Buddhism rendered new interpretations according to its own theories of Dependent Origination (Paṭiccasamuppāda) and Kamma. For example, "cause and effect of three periods of time" (Hetu-phala of tayo addhā) teaches that actions in the past life lead to the present affect, and actions in the present life will produce an effect in future life; and the theory of "cycles of rebirth in the six realms", which teaches that on the basis of one's own wholesome or unwholesome deeds one might be reborn in heaven as a deity, or on earth as a human being, or become an asura—a bellicose deity-like creature, or an animal, or a ghost, or be born in hell; all sentient beings circulate perpetually up and down, just like a rolling wheel, through the six realms (gatis) of heaven (deva-gati), human world (manussa-gati), asura realm (asuratta), hell (naraka-gati), ghost realm (peta-gati) and animal world (tiracchāna-yonika), in endlessly repeated cycles of rebirth or reincarnation (saṃsāra); and the theory of the blending components of four elements (cattāri mahābhūta), which are earth, water, fire and air. Buddhism also accepted some traditional notions about astronomy and geography.

With regard to gods of Brahmanism, Buddhism did not deny their

existence, but degraded their status to that of sentient beings and believed that they also could not escape the sufferings of saṃsāra. As for Brahmā, Buddhism deemed it a deity in the deva-gati, who might fall into hell. We can return to these questions later.

壹 佛陀和佛教的创立

1问：什么是佛教？

答：佛教，广义地说，它是一种宗教，包括它的经典、仪式、习惯、教团的组织等等；狭义地说，它就是佛所说的言教；如果用佛教固有的术语来说，应当叫做佛法（Buddha Dhamma）。

2问：“法”是什么意思？

答：“法”字的梵语是达磨（Dharma）。佛教对这个字的解释是：“任持自性、轨生物解。”这就是说，每一事物必然保持它自己特有的性质和相状，有它一定轨则，使人看到便可以了解是何物。例如水，它保持着它的湿性，它有水的一定轨则，使人一见便生起水的了解；反过来说，如果一件东西没有湿性，它的轨则不同于水的轨则，便不能生起水的了解。所以佛教把一切事物都叫做“法”。佛经中常见到的“一切法”、“诸法”字样，就是“一切事物”或“宇宙万有”的意思。照佛教的解释，佛根据自己对一切法如实的了解而宣示出来的言教，它本身也同样具有“任持自性、轨生物解”的作用，所以也叫做法。

3问：佛是神吗？

答：不，佛不是神。他是公元前六世纪时代的人，有名有姓，他的名字是悉达多（S. Siddhārtha, P. Siddhattha），他的姓是乔达摩（S. Gautama, P. Gotama）。因为他属于释迦（Sākya）族，人们又称他为释迦牟尼，意思是释迦族的圣人。

4问：为什么称他为佛呢？佛的意义是什么？

答：“佛”字是“佛陀”的简称，是Buddha的音译（如果用今天的汉语音译，应当是“布达”），佛陀的意义是“觉者”或“智者”。“佛陀”是印度早就有了的字，但佛教给它加了三种涵义：（1）正觉（对一切法的性质相状，无增无减地、如实地觉了）；（2）等觉或遍觉（不仅自觉，即自己觉悟，而且能平等普遍地觉他，即使别人觉悟）；（3）圆觉或无上觉（自觉觉他的智慧和功行都已达到最高

的、最圆满的境地)。

5问：除释迦牟尼外，有没有另外的佛？

答：佛教认为过去有人成佛，未来也会有人成佛，一切人都有得到觉悟的可能性，所以说：“一切众生，皆有佛性，有佛性者，皆得成佛。”

6问：如来佛是不是释迦牟尼？还是另一人？

答：“如来”这个名词是从梵语Tathāgata译出来的。“如”字就是“真如”(tathatā)，即一切法(事物)的真实状况，它又包含“如实”(Yathābhūtaṃ)的意义。佛经对“如来”的解释是：“乘真如之道而来”，又说“如实而来”。“如来”是一个通用名词，它是“佛陀”的异名。如释迦牟尼佛，可以称释迦牟尼如来；阿弥陀佛，可以称阿弥陀如来。

7问：阿弥陀佛和释迦牟尼佛不是一个人吗？

答：不是。阿弥陀佛是另外一个世界上的佛。阿弥陀佛是梵语Amitābha的音译，意义是“无量的光明”。

8问：“南无佛”是什么意思？为什么读起来是“那摩佛”？

答：“南无”是梵语Namo的音译，念成“那摩”，是保持原来古代的读音。现代广东、福建一部分地区，仍保持这个古音。它的意义是“敬礼”。今天印度人相见，互道“那摩悉对”，就是说：“敬礼了”。

9问：释迦牟尼的一生可以简略介绍一下么？

答：可以。释迦牟尼的时代，约当公元前六世纪中叶，正是我国春秋时代，与孔子同时。他是当时迦毗罗国(Kapilavatthu)国王的长子。父亲名净饭(Suddhodana)，母亲名摩耶(Māyā)。摩耶夫人生产前，根据当时习俗，回到母家去，路过蓝毗尼花园(Lumbini)，在树下休息的时候，生下了悉达多王子。

10问：蓝毗尼花园现在还有遗址留存下来吗？

答：公元七世纪时，我国玄奘法师曾到过蓝毗尼。根据他的记载，他曾经看到在他之前八百多年阿育王(Aśoka)在那里建立的石柱，标志着佛陀诞生之处，但当时石柱已被雷击破，柱头倒在地下，已经是衰落的情景了。后来由于没有人能够识得柱上的文字，因此

佛陀诞生的地址久已湮没无闻。直到1897年才被人发现了阿育王的石柱，考古家认识出上面的文字，这才发掘出蓝毗尼园的遗址，在附近并且发掘出古代的市镇，其中有些可以相信是属于当时的迦毗罗城的。今天尼泊尔政府已经把这个地方作为圣地加以建设和保护。

11问：释迦牟尼幼年教养情况是怎样？

答：摩耶夫人产后不久就死了。幼年时代的释迦牟尼是由他的姨母波闍波提夫人（Prajāpati）养育的。他自小从婆罗门学者们学习文学、哲学、算学等等，知识很广博。又从武士们学习武术，是一个骑射击剑的能手。他父亲净饭王因为他天资聪慧，相貌奇伟，对他期望很大，希望他继承王位后，建功立业，成为一个“转轮王”（统一天下的君主）。

12问：那么，他后来为什么不继承王位呢？

答：悉达多王子在幼年的时候，就有沉思的习惯，世间许多现象，给他看到，都容易引起他的感触和深思：饥渴困乏、在烈日下耕田的农人，绳索鞭打、口喘汗流拖着犁头耕地的牛，蛇虫鸟兽弱肉强食的情景，衰丑龙钟的老人，辗转呻吟的病人，亲朋哭泣送葬中的死人，这些都促使他思索着一个问题——如何解脱世界的苦痛。他读过的吠陀书（Veda，婆罗门经典）不能解决他的问题。他学到的知识和他未来的王位、权力也都不能解决他的问题。于是他很早就有了出家的念头，后来终于舍弃了王位。

13问：他父亲怎么会让他出家呢？

答：净饭王发觉了他儿子的心思后，曾经想过各种办法防止他，特别是企图从生活的享受上羁縻他。悉达多王子十六岁时，净饭王便为他娶了邻国的王女耶输陀罗（Yasodharā）为妃，生了一个儿子叫罗怙罗（Rāhula）。但是这一切都没有能够阻止他，终于在一天夜深人静的时候，他偷偷地出了国城，进入一个森林中，换去王子的衣服，剃去须发，成为一个修道者。关于他出家时的年龄，有两种不同记载，一说是十九岁，一说是二十九岁。

14问：出家以后的情形怎样？

答：他父亲曾尽力劝他回去无效，只好在亲族中选派五个人随从他一起，这五个人的名字是：憍陈如（Kauṇḍinya, P. Koṇḍañña），

跋堤 (Bhadrika, P. Bhaddiya) , 跋波 (Vāṣpa, P. Vappa) , 摩诃男 (Mahānāma, P. Mahānāma) , 阿说示 (Aśvajit, P. Assaji) 。悉达多王子和他的侍者们先后寻访当时三个有名的学者, 从他们学道, 但都不能满足他的要求。于是他知道当时哲学思想中没有真正解脱之法, 便离开了他们, 走到尼连禅河 (Nairāṇjanā, P: Nerañjarā, 现在叫做Lilaian) 岸边的树林中, 和那里的苦行人 (极端刻苦修行的人) 在一起。为了寻求解脱, 他尝够了艰苦辛酸, 坚持不懈, 经历六年之久。但是结果徒劳无功, 方才悟到苦行是无益的。他于是走到尼连禅河里去沐浴, 洗去了六年的积垢, 随后受了一个牧女供养的牛奶, 恢复了气力。当时随从他的五个人见到他的情景, 以为他放弃了信心和努力, 便离开了他, 前往波罗奈城 (Benares) 去继续他们的苦行。王子于是一个人走到一棵毕钵罗 (Pippala) 树下, 铺上了吉祥草, 向着东方盘腿坐着, 发誓说: “我今如不证到无上大觉, 宁可让此身粉碎, 终不起此座。” 他便这样在树下思维解脱之道, 终于在一个夜里, 战胜了最后的烦恼魔障, 获得了彻底觉悟而成了佛陀。

15问: 释迦牟尼成佛处, 现有遗迹留存吗?

答: 释迦牟尼成佛处, 自古称为菩提场或菩提伽耶 (Buddhagayā) , 那里的毕钵罗树, 因为佛坐在树下成道的缘故, 得到了菩提树之名。从此, 所有毕钵罗树都叫做菩提树。“菩提”就是“觉”的意思。菩提伽耶在今天印度比哈尔省伽耶城 (Gayā) 的南郊。那棵菩提树在二千数百年中曾两次遭到斫伐, 一次遭风拔, 但都重生了新芽, 现在的菩提树是原来那棵树的曾孙。树下释迦牟尼坐处有石刻的金刚座。树的东面有一座宏伟庄严的塔寺, 名叫大菩提寺, 至今约有一千八百多年的历史, 附近还有许多佛的遗迹和古代石刻与建筑。1956年印度比哈尔省政府为了这个圣地的建设和管理, 设立了一个国际性的咨询委员会。中国佛教协会接受了邀请, 指派了两名代表参加该会。

16问: 释迦牟尼成佛后的事迹, 可以简略地谈一谈吗?

答: 释迦牟尼成佛的年龄, 也有不同的记载, 有的说三十岁, 有的说三十五岁。此后五十年 (或四十五年) 中, 直到他八十岁逝世前, 他没有间断过他的说法工作。他到处游行, 向大众宣示他自己证悟的真理。他最初到波罗奈城去找离开了他的五个侍者, 为他们说法。佛教把佛陀第一次说法, 叫做“初转法轮”。

17问：“转法轮”是什么意思？

答：“轮”（cakka），是印度古代战争中用的一种武器，它的形状像个轮子。印度古代有一种传说，征服四方的大王叫做转轮王，他出生的时候，空中自然出现此轮，预示他的前途无敌。这里以轮来比喻佛所说的法。佛的法轮出现于世，一切不正确的见解、不善的法都破碎无余，所以把说法叫做转法轮。佛初转法轮处是鹿野苑（Sārnāth），在今天波罗奈城（Benares）。经过近代的发掘，鹿野苑发现了不少有价值的文物。有阿育王的石柱，有公元四世纪石刻的佛初转法轮像等等，并且发掘到古代塔寺的遗址。鹿野苑现有佛寺、博物馆和图书馆，都是近几十年来陆续兴建起来的。佛初转法轮处的鹿野苑，和佛诞生处的蓝毗尼园、佛成道处的菩提伽耶、佛逝世处的拘尸那伽（S. Kuśinagara, P. Kusināra），是佛教四大圣迹。值得指出的是：近代学者们对这些圣迹以及其他一些古迹的发掘和修复，主要都是根据我国古代高僧法显、玄奘等的记载。

18问：佛初次说法的地方为什么要比其他说法的地方看得重要呢？

答：佛在鹿野苑初转法轮这件事是佛教的一件大事。从那时起，开始建立了佛教；从那时起，开始具足了三宝。

19问：“三宝”是什么？

答：佛陀是佛宝。佛所说的法是法宝。佛的出家弟子的团体——僧伽（Saṅgha）是僧宝。称之为宝，是因为它能够令大众止恶行善、离苦得乐，是极可尊贵的意思。佛初转法轮，憍陈如等五人都归依佛，出家为弟子，于是形成了僧伽。所以说，从那时起开始具足了三宝。

20问：什么叫做归依？

答：归依的意思是：身心归向它、依靠它。归依三宝的人是佛教徒。“归依”也可以写成“皈依”，“皈”与“归”的读音和意义相同。

21问：佛在世的时候，归依的人多吗？

答：是的，佛初转法轮后从鹿野苑到摩揭陀国（Magadha）去的一路上，受到他的教化而归依的人就很多。其中有拜火教的婆罗门姓迦叶的三兄弟，都改变了原来的信仰，率领他们的弟子一千多人归依了佛教。佛到了摩揭陀国首都王舍城（Rājagaha）后，归依

的人更多。其中最有名的出家弟子有舍利弗（Sāriputta）、摩诃目犍连（Mahāmoggallāna）、摩诃迦叶（Mahākassapa）等人。后来佛回到故乡去，他的异母弟难陀（Nanda）、堂兄弟阿难陀（Ānanda）、提婆达多（Devadatta）和他儿子罗怙罗等都随他出了家。还有宫廷中一个剃发工奴优波离（Upālī）也出家加入了僧团，后来成为有名的佛教戒律学大师。佛的姨母波阇波提也归依了佛，是第一个出家女弟子。至于不出家而归依三宝的弟子则为数更多。佛的出家弟子，男的叫比丘（bhikkhu），女的叫做比丘尼（bhikkhunī）；在家弟子，男的叫做邬波索迦（upāsaka），女的叫做邬波斯迦（upāsikā），合称为四众弟子。

22问：释迦牟尼一生游行教化的区域，是哪些地方？

答：根据记载和发掘的资料，佛自己足迹所到的地方，主要是中印度。他的弟子们分到四方游化，可能更远一些。但是斯里兰卡和缅甸都有佛曾经到过并留下足印的传说。佛居住的地方，以摩揭陀国的王舍城和拘萨罗国（Kosala）的舍卫城（Sāvattthī）的时间为最多。在王舍城外有一个竹林，是频毗娑罗王（Bimbisāra）献给佛和僧众居住的，后人称为竹林精舍。在舍卫城有一个林园是当地一个富商须达多（Sudatta）和拘萨罗国王子祇陀（Jeta）共同献给佛的，后人称为祇园精舍。佛常往来两处，所以竹林、祇园并为说法的重地。王舍城南面的灵鹫山（Gijjhakūṭa）也是佛常和弟子们说法的地方。佛逝世前由王舍城北行到毗舍离（Vesālī）城（今印度比哈尔省境内），又由毗舍离向西北行，最后到了拘尸那伽（今印度联合省伽夏城Kasia），佛是在拘尸那伽逝世的。现在佛逝世处，发掘出佛遗体火化的地方和石刻的佛涅槃像以及其他古迹。印度政府为了纪念佛涅槃二千五百年，曾对这个圣地予以必要的修复和建设。

23问：什么叫做“涅槃”？

答：现在暂不详细解答，这里可简单解释为“逝世”。

24问：佛涅槃前后的情形是怎样？

答：佛在毗舍离城的时候，已经有了重病，在那里度过雨季后，偕弟子们向西北走去，路上受了铁匠纯陀（Cunda）供献的食品，病更加剧。最后走到拘尸那伽一条河边，洗了澡，在一处四方各有两棵娑罗树的中间安置了绳床，枕着右手侧身卧着。后来所有卧佛像

（即佛涅槃像）都是这样的姿式。佛告知弟子们将要涅槃，弟子都守候着。夜间有婆罗门学者须跋陀罗（Subhadda）去见佛，阿难陀想挡住他，佛知道了，唤他到床前为他说法，于是须跋陀罗成了佛的最后的弟子。佛在毗舍离临出发前和在途中为弟子们作了多次的教诲，到了那天半夜逝世前又最后嘱咐弟子不要以为失去了导师，应当以法为师，要努力精进，不要放逸。

佛逝世后，遗体举行火化。摩揭陀国人和释迦族等八国将佛的舍利分为八份，各在他们的本土上建塔安奉。其中摩揭陀国安奉在菩提伽耶的一份，到公元前三世纪，被阿育王取出，分成许多份送到各地建塔。1898年，考古家在尼泊尔南境发掘迦毗罗国故址，发现一舍利塔，塔内藏有石瓶石函等物；有一瓶放在铁和水晶层迭的函内，里面有黄金花，花上安放佛骨。从函上刻的文字知道这就是释迦族供养的佛的舍利。

25问：舍利是什么？

答：舍利（Sarīra）就是遗体，但这个名称一般只用于佛和有德行的出家人的遗体。

26问：塔是作什么用的？

答：“塔”又称“塔波”，是梵语Stūpa（P. Thūpa）省略的音译，完整的音译是“窣堵波”，意义是“高显”或“坟”。塔一般是藏舍利的，也有不藏舍利而作为标志纪念之用的。

27问：佛涅槃的年代，有没有不同的计算？

答：关于佛涅槃的年代，东南亚佛教徒一般认为是公元前545年，所以1956年和1957年各国都举行佛涅槃二千五百年盛大纪念。我国关于佛涅槃年代有很多不同的说法，一般公认的年代是公元前486年，与南传佛历相差59年。

28问：佛的涅槃日是哪一天？

答：我国一般认为农历二月十五日佛涅槃日，四月初八日是佛诞生日，十二月初八日是佛成道日。南方各国则以公历五月月圆日（相当于我国农历四月十五日）为佛节日（Vesākha），认为佛诞生、成道、涅槃都在这一天。

29问：听了上面的谈话，对释迦牟尼佛的一生事迹已经有了轮廓的了

解。现在想请你谈一谈当时佛教创立的历史背景。

答：这是一个较难的问题，因为第一关于印度古代历史资料缺乏，第二我自己在这方面少研究。但是我仍然愿意将一些我所知道的材料和所想到的线索，提供你参考、研究和判断。

30问：很好。我认为，任何宗教和思想都是历史的产物，能够了解一些当时社会的情况，是有助于对佛教的了解的。希望你就几个主要的问题谈一谈，能说明一个大概就行了。

答：先从当时的形势谈起吧。你知道古代印度曾经有一个区域叫做“中国”吗？

31问：这倒不知道。那是在印度的什么地区？

答：大约三千五百年到四千年前，雅利安（Ārya）人逐渐由中亚细亚进入印度河流域，征服了那里的土著民族，并且吸收了他们的文明，在那里定居下来，建立了好些国家。因为长期成为雅利安人政治文化的中心（也就是婆罗门文明的中心），当时那个地区被称为“中国”（Madhya Deśa）。至于东方和南方的恒河流域的广大地区，则被称为是化外的“边地”。但是到了释迦牟尼时代，形势有了很大的改变。原来“中国”地方的国家已经开始衰落，而东南边地的国家则勃然兴起。释迦牟尼居住最久、教化最盛的摩揭陀国就是当时新兴的霸国。这时候，文明的中心已经转移到摩揭陀国的王舍城，拘萨罗国的舍卫城，跋耆国的毗舍离城等新都市，其中王舍城尤为重要。

32问：这些新兴国家除了实力强盛之外，在社会、经济、文化方面有没有什么特点？

答：据我初步地研究，有三种情况值得一提：（1）在种族问题上，矛盾的增多；（2）在经济问题上，社会生产力的发展；（3）在思想上，反婆罗门教义的新思想的兴起。这三种情况都反映在“种姓制度”问题上。

33问：什么是种姓制度？

答：种姓制度是雅利安人进入印度之后创立的。“种姓”这个词儿是从梵语“Varṇa”（P. Vaṇṇa）翻译过来的，它的原来的字义是“颜色”或“品质”。照他们的说法，肤色白的雅利安人是品质高贵的种族，深色皮肤的达罗毗荼（Dravida）族和其他土著民族是品质低

贱的种族。这种制度原来是用以划分雅利安人和非雅利安人的界限的。后来随着工作和职业的分化的发展，本来用以划分雅利安人和非雅利安人的种姓差别，也在雅利安人自己中间起了反映，于是有四姓（四个种姓）的划分。最高的种姓是婆罗门

（Brāhmaṇa），是掌握祭祀文教的僧侣阶级（到后来婆罗门也可以当国王）；其次是刹帝利（Kṣatriya），是掌握军政的国王和武士阶级；其次是吠舍（Vaiśya），是商人、手工业者，也有从事农耕的农民阶级；最下的种姓是首陀罗（Śūdra），是农人、牧人、仆役和奴隶。前三者是雅利安人，后者是非雅利安人。各种姓有它的世袭的职业，不许被婚姻混乱，尤其严禁首陀罗和别的种姓混乱。对首陀罗男子和别的种姓女子结合所生的混血种，特别订有法律，给予一种贱名，如首陀罗男子与婆罗门女子的混血种名为旃陀罗（Caṇḍāla）。他们的地位最低贱，不能与一般人接触，被称为“不可触者”。这种人世代操着当时认为下贱的职业，如抬死尸、屠宰、当刽子手之类。种姓制度不仅订在法律里面，而且神圣不可动摇地规定在宗教教义和教条中。在婆罗门教势力强盛的“中国”地方，种姓制度最严格。

34问：在新兴国家地方也有种姓制度吗？

答：随着雅利安人势力的扩展，这些国家都不能不受到婆罗门文化的影响，当然也都存在着种姓制度，但种姓制度所遇到的困难就比较多得多。第一，在这些国家里，土著人民占的比率大；第二，雅利安与非雅利安种族混合情况比较普遍；第三，为了巩固雅利安人在那些地方的统治，有不少土著部族的首领通过入教仪式被安排在刹帝利种姓之列。在种姓制度下，统治阶层的婆罗门和刹帝利之间一向存在着矛盾，尤其是非雅利安人的刹帝利对婆罗门的优越地位的反抗，更加显著。据研究，摩揭陀国的人多半是吠舍和首陀罗的混血种，婆罗门法典认为他们是半雅利安、半野蛮的下等种族。后来统一印度的摩揭陀国阿育王，据说就是首陀罗的血统。在这种环境中，反对婆罗门种姓制度教义的学说，容易为大众所接受和欢迎，而释迦牟尼倡导的“四姓平等”之说，事实上反映着当时那些新兴国家的人民对种姓制度的不满。

35问：释迦是不是雅利安种？

答：关于释迦的种族问题，有不同的说法，有的说是蒙古种，有的说是雅利安种。但是从当时的地理看，迦毗罗国地处僻远，又是小国

（有人研究，认为它当时是拘萨罗国的附庸国），因此它的王族不是雅利安种的可能性较大，而且佛经上不只一次说释迦牟尼的身体是紫金色，这可以为释迦族不属于白色的雅利安种的一个论据。

36问：能不能说当时种姓制度问题上的矛盾纯粹是种族的矛盾？

答：不能那么说。据我看，它还反映着当时社会生产力的发展所带来的矛盾。

37问：释迦牟尼时代印度的社会是不是奴隶社会？

答：近代在印度河流域的发掘，证明在公元前3500—公元前2750年之间，那里的土著民族（可能就是达罗毗荼族），早已有了惊人的城市文明。他们有城市规划，有下水道，有两三层砖建楼房，有公私浴室。街道上有货摊和店铺，有纺织业和陶业。这个事实推翻了西方学者们一向认定印度文明是雅利安人带来的说法。事实上是游牧民族的雅利安人接受了土著的高级文明。根据发掘的材料来看，当时土著民族已经进入了奴隶社会，而且可以断定他们有了相当发达的农业。至于雅利安人定居下来很长时期（约一千年）以后，到了种姓制度确立了的时期，那里的社会是否仍然是奴隶社会，值得研究。从婆罗门的法典看来，首陀罗并不是奴隶，只是有一部分人当奴隶，而奴隶只是从事杂役劳动，在生产部门很少参加，显然奴隶不是主要生产者，因此很难断定当时是奴隶社会。

38问：据你看当时是什么制度的社会呢？

答：佛经中的资料记载，当时国王每年有一固定的日期，在自己的田地里举行亲耕仪式，人民都在替他耕田。这与婆罗门的法典规定的靠自己劳动为生的首陀罗人要以劳动向国王纳税的条文相合。根据我国古代译师的注释，“刹帝利”的原来字义是“田主”。从这个线索来推断，似乎“种姓”制度开始完备地确立的时期，印度已经进入了封建领主统治的农奴社会。而到了释迦牟尼时代，在新兴的国家里，情形又有所演变。根据佛经的资料，当时的商业很发达，有相当规模的陆运和航运的商队，商人掌握着雄厚的经济力量，例如把一座林园送给佛的大富商须达多，他有力量以黄金布地和拘萨罗的王子比富。手工业也很发达，有细密的分工，自由经营的小工商业在生产上占重要地位。当时有了纳税的自由农民，有

佃农。可以设想，在吠舍人和首陀罗人混合种族的新兴国家里，刹帝利可能不是领主，而是新兴地主阶级的代表。印度在公元前一千年间已经有了铁器，到这时期，铁制农业器具更已普遍使用，农业上生产力有了很大的发展。在当时的经济情况下，封建领主的割据，是不利于商业、手工业、特别是农业的发展的。历史证明，统一兴修水利和灌溉系统是促成阿育王统一印度的重要原因。虽然阿育王是佛逝世二百年以后的人，但是佛在世时，人们就有“转轮王统一天下”的理想。佛幼年时，他的父王和国人曾期望他做转轮王。佛虽然舍弃了王位，但是他也推崇转轮王这样的理想人物。“转轮王”思想，实际是反映着当时一般人要求有一个中央集权政府来代替领主割据的愿望，这个要求和愿望必然和种姓制度发生冲突。

39问：释迦牟尼和婆罗门、刹帝利的关系怎样？

答：释迦牟尼是公开宣布反对婆罗门教义的，所以一生遭到婆罗门攻击的事很多。但是也有不少婆罗门教徒和学者改变了原来的信仰而归依了他。婆罗门人受了佛教的刺激，就有了《摩奴法典》的出现。这部法典一方面固然是为了维护种姓制度，一方面也可能作了一些修正。在《摩奴法典》里攻击佛教的文句虽不明显，但后出的《述记氏法论》则把攻击佛教的态度明白地表示出来。至于佛和刹帝利的关系，你知道，佛是出身于刹帝利种姓的。当时佛所游化的那些国家的国王们，如摩揭陀国的频毗娑罗王，拘萨罗国的波斯匿王等，都是他的信徒和有利的支持者。后来阿育王更大弘佛法。应当说，新兴国家的刹帝利对佛是极其尊重信仰的。值得注意的是，佛经中提到四姓时，改变了原来以婆罗门为首的次序（即婆罗门、刹帝利、吠舍、首陀罗），而把婆罗门放在刹帝利之后，这是违反传统习惯的，由此也可以看出他贬抑婆罗门地位的态度。

40问：释迦牟尼和平民的关系怎样？

答：释迦牟尼教化的方式是接近平民的。他说法不用婆罗门的雅语，而用当时平民的俗语，就是一个例子。前面说过释迦牟尼曾经接受一个首陀罗人优波离为弟子，佛的兄弟和儿子在僧团内行次在他之下，他们都得向优波离礼拜。对一般人不肯接触的旃陀罗人，佛和弟子们平等接受他们的供养。佛曾经设法和一个不敢见他的旃陀罗人相见，并为他说法。佛对待所有不幸的人都是这样。他

的弟子中有乞丐，也有妓女，有一次，佛谢绝了国王的邀请，而到一个不幸的堕落的女人那里去应供。在古代印度社会里，妇女的地位和奴隶差不多。佛接受妇女为出家弟子，让她们参加僧团的事实，被认为是宗教史上一个很大的革命举动。

41问：佛虽然对不幸的人们表示同情，但是他没有教他们向统治者进行反抗，不是吗？

答：诚然，佛没有教他们以怎样的实际行动反抗统治者。佛主要教导人们断除内心的烦恼，以求解脱，同时又说现世止恶行善的因，会获得来世安乐的果，在这方面可以说，佛对现实生活问题，是抱着容忍的态度的。但是，他在思想上推倒了婆罗门的神权，宣布众生平等，说出“诸法无常”的真理，对当时的社会起了进步的作用。

42问：当时思想界的情况怎样？

答：和我国春秋战国时代相仿佛，当时印度思想界也正处在一个“百家争鸣”的时期。总的说来，当时思想界有两大潮流，一个是正统的婆罗门教思想的潮流，一个是异端的反婆罗门教思想的潮流，佛教属于后者。

43问：婆罗门教的基本思想是什么？

答：婆罗门教是多神教而又带着一神教的色彩，崇拜各种自然的神祇，盛行祭祀祈祷以招福禳灾，而以梵（Brahmā）为创造宇宙万物的主宰。梵从口生出婆罗门，从肩部生出刹帝利，从腹部生出吠舍，从足部生出首陀罗，以此定四姓的贵贱，这就成为种姓制度的根据。人应当服从梵天的意旨，因此应当信奉《吠陀经》，奉事婆罗门，严格遵守种姓制度。后来婆罗门教义有所发展，它把“梵”抽象起来做为宇宙的本体，或宇宙生起的最高原理，一方面又从个人观察，认为“我”是个人的主宰和本体，人的身体由“我”而生，人的活动由“我”而起，外界万物也都因“我”而存在，由此推论出“我”与“梵”本来不二，人所应当努力的就是经过修行以达到梵我一致的境地，这样才能免去轮回之苦而得到大自在。

44问：当时反婆罗门教的思想有多少派别？

答：根据佛经所说有九十六种之多，最特出的有六个教派，佛经称这些教派的创立者为六师。其中一个就是耆那教（Jaina）的始祖尼乾

子（Nigaṇṭha Nātaputta），其余五人是富兰那迦叶（Purāṇa Kassapa）、末迦梨（Makkhali Gosāla）、阿耆多（Ajita Kesakambala）、婆鸠多（Pakudha Kaccāyana）、散若夷（Saṅjaya Belaṭṭhiputta）。除耆那教现还存在、有典籍可考外，其余五人没有正式记载，现在只能从反驳他们学说的其他教派典籍中看到一鳞一爪。他们有的是否认因果关系的怀疑论者；有的主张纵欲；有的主张苦行；有的认为人由四大（地、水、火、风四个元素）组合而成，死后四大分散，归于断灭，否认来世，是唯物论者。

⁴⁵问：佛教和各教派的关系怎样？

答：佛教一方面批判婆罗门教义，同时也反对非婆罗门教的各教派。但是佛教和婆罗门教以及各教派的思想都有渊源，佛教接受了他们的某些思想，而根据“缘起”和“业”的理论，予以另一种解释。如“三世因果”（前世造因，今世受果，今世造因，来世受果）、“六道轮回”（随着自己善恶行为，或生天界而为天人，或生人界而为人，或为阿修罗——一种和天人差不多的好战斗的神，或为畜生，或为鬼，或堕地狱。一切众生永远升沉于天、人、阿修罗、地狱、鬼、畜生六道中，犹如车轮没有始终地转着，所以叫做轮回）、“四大和合”（地、水、火、风四元素）等等，并接受了关于天文地理的某些传统说法。

对婆罗门教的神祇，佛教也没有否定他们的存在，只是贬抑他们的地位，当作一种众生看待，认为他们也不免轮回生死之苦，如对于梵天，认为只是天界中的天人，将来也会堕地狱。关于这些，以后还可以谈。

2 THE ESSENCE OF THE BUDDHA DHAMMA AND THE BUDDHIST CANONICAL LITERATURE

¹Q: What are the essentials of the Buddha Dhamma?

A: As was mentioned before, the purpose of Sākyamuni's renouncing the world was to strive for a way of deliverance from the sufferings of birth, old age, illness and death. Many contemporaneous religious schools in India also strove for the ideal of final deliverance. Simply put, the essentials of Buddhist doctrines may be summarized as the Four Noble Truths (Cattāri-ariya-saccāni): the Suffering of All Existence (Dukkha-sacca), the Cause of Suffering (Samudaya-sacca), the Extinction of Suffering (Nirodha-sacca) and the Path Leading to the Cessation of Suffering (Maggā-sacca). In fact, all the numerous and voluminous Buddhist texts do not go beyond the Four Noble Truths. However, the fundamental principle on which the Four Noble Truths are based is the Theory of Dependent Origination (Paṭiccasamuppāda). All Buddhist doctrines flow from this fountainhead—the Theory of Dependent Origination.

²Q: What is the meaning of Dependent Origination?

A: Dependent Origination means that all dhammas arise through causes or conditions (hetu or paccaya). In brief, all things or phenomena arise out of mutually dependent relationship and conditions. Nothing exists without interdependent relationship and condition. Hetu and paccaya, generally speaking, are cause and condition. The Buddha defined "Dependent Origination" as follows:

When this exists, that exists.

Because this arises, that arises.

When this does not exist, that does not exist.

When this ceases, that ceases too.

These four sentences express the coexistent relationship, both simultaneous and non-simultaneous (sequential).

³Q: What is a simultaneously interdependent relationship?

A: Let me illustrate this with a plain example, the relationship between teacher and student: If there are teachers, there must be students, and if there are students, there must be teachers; without teachers, there are no students, and without students, there are no teachers. This is a simultaneously interdependent relationship.

⁴Q: What is a non-simultaneously interdependent relationship?

A: Take, for example, the relationship between seed and sprout: With the previous existence of seeds, sprouts can come into existence as a consequence; likewise, the coming into existence of the sprouts depends on the previous state known as seeds. This is a non-simultaneously interdependent relationship. From another perspective, the cessation of the state of being seeds coincides with the coming into being of the sprouts. Here the phenomena of the birth of the sprout and the extinction of the seed also form a simultaneously interdependent relationship. In conclusion, all phenomena (dhammas) exist necessarily in certain interdependent relations, whether simultaneous or non-simultaneous. Nothing can be said to exist in the absolute or of itself.

⁵Q: Is a non-simultaneous interdependent relationship identical to causality?

A: According to Buddhist doctrine, all interdependent relations are causality. In the case of non-simultaneous interdependent relationship, the seed is the cause, and the shoot the effect. This is non-simultaneous causality. In the case of simultaneously interdependent relationship, if the teacher is the subject, then the teacher is the cause and the student the effect; if the student is the subject, then the student is the cause and the teacher the effect;

this is simultaneous causality. Of course, these are simple examples. In fact, causality is extremely complicated. From one point of view, a certain cause produces a certain effect, while from another angle, the very same cause may lead to a different effect. For instance, A may be B's teacher in terms of teacher-student relationship; at the same time, he may be C's father in terms of father-son relationship; then he may be D's husband in terms of husband-wife relationship. So if A is taken as the cause, then B, C, D and all others are the effects. From this, we see one cause with a multitude of effects. If all the others are causes, then A is the effect. From this we see a multitude of causes with one effect. In reality, there is no absolute cause, nor absolute effect. The universe is thus a boundless net knitted by uncountable sequential causalities in terms of time, and mutually dependent relations in terms of space.

⁶Q: It is said that on the Pagoda (Sarīrika-thūpa) of the Buddha's Tooth Relic in the Western Hills of Beijing, Buddhist texts pertaining to the doctrine of causality were inscribed on the bricks and water-dish crest. Is this true?

A: Yes, that thūpa was first built in the Liao Dynasty. On its walls are carved the Gāthā (verse or ode) of Dependent Origination which reads: "All dhammas proceed from causes and conditions (Hetu-paccaya), they will cease with the cessation of their conditions, my teacher, the Great Samaṇa, thus teaches frequently." On its water-dish crest (kalasa) was the Sanskrit version of this Gāthā inscribed:

Ye dharmā hetu-prabhavā
hutuṃ teṣaṃ Tathāgato hy avadat,
teṣaṃ ca yo nirodho
evaṃ vādi mahā-śramaṇaḥ.

In fact, this Gāthā was generally inscribed not only on this pagoda, but on all ancient Buddhist pagodas, as a tribute to the Sarīra. Thus this Gāthā is called the Dhammakāya Sarīra Gāthā, since the

Buddha said: "Those who see Dependent Origination, see the Dhamma; those who see the Dhamma, see the Buddha." Hence the importance of the doctrine of Dependent Origination (Paṭiccasamuppāda) in Buddhism. In recent years, when an ancient thūpa was renovated in Myanmar, the Pāli version of this Gāthā was also found inscribed on bricks:

Ye dhammā hetu-ppabhavā
tesaṃ hetuṃ Tathāgato āha,
tesaṃ ca yo nirodho
evaṃ vādi mahāsamaṇo.

⁷Q: Who was the author of the Gāthā of Dependent Origination?

A: It was uttered by the Buddha's disciple Assaji. (Assaji, meaning "Victory of Horse", was one of the first five Bhikkhus.) One day, when Bhikkhu Assaji was begging with his alms-bowl, he ran into Sāriputta, the great Brahmanic scholar. The latter was attracted by his venerable countenance which was out of the common run, so he inquired of Assaji who was his teacher and what doctrine he was professing. Thereupon, Bhikkhu Assaji uttered this Gāthā. Sāriputta was delighted to hear this and went to tell Moggallāna on his return. Then both of them became followers of the Buddha. There are several Chinese translations of this Gāthā. "My teacher, the great Samaṇa" refers to Sākyamuni. In general, Samaṇa may be simply rendered as ascetics (or mendicant friars) who renounced the family life. At that time, all ascetics regardless of religious sects (except in Brahmanism) were called samaṇas.

⁸Q: Was the Theory of Dependent Origination (Paṭiccasamuppāda) confined to Buddhism and exclusive of other religions at that time?

A: Yes. Buddhist scriptures elaborate eleven implications of Dependent Origination. They say that all things come into being

(1) without a creator,

- (2) from causes,
- (3) free from sentient beings,
- (4) dependent upon other conditions,
- (5) without an actor,
- (6) with the nature of impermanence,
- (7) extinguishing in every instant (khaṇa),
- (8) with causes and effects continuously connected without interruption,
- (9) with various causes and effects falling into different types,
- (10) with cause and effect leading into each other in harmony and in compliance with each other, and
- (11) with cause and effect functioning in order without confusion.

All these are different from the doctrines of other religions.

⁹Q: Would you please explain briefly the eleven implications?

A: The eleven meanings may be summed up into four cardinal points:

- (1) There is no god-creator,
- (2) There is no ego,
- (3) Everything is impermanent,
- (4) Causes and effects proceed continuously.

¹⁰Q: What does "no god-creator" mean?

A: It means to deny that there is a lord of creation who created the entire universe. This is the first of the eleven doctrines above. If it is accepted that "All dhammas arise from *hetu-paccaya*", it would be inconsistent to recognize the existence of a separate creator. Every cause (*hetu*) is generated by other causes, and every condition (*paccaya*) is generated by other conditions. Each cause has its own preceding cause, and each condition has its own conditions. Viewed vertically, there is neither beginning nor end,

and viewed horizontally, there is neither boundary nor limit. Thus one comes to the conclusion that there is no absolute cause. Believers of the theory of Dependent Origination (Paṭiccasamuppāda) should deny not only the personified creator who gave birth to Brahmins from its mouth, but also the existence of any rationally conceived creator of the cosmos. On the other hand, though believers of Paṭiccasamuppāda deny the existence of any absolute initial cause, they also oppose the point of view that everything is fortuitous. They maintain that no phenomenon emerges without cause, it is subject to inevitable laws—the laws of causation. This is what is meant by "Everything arises from causes".

¹¹Q: From what you have said, Buddhism seems to be atheist, but why are there so many gods enshrined in Buddhist temples?

A: As I have said earlier, Buddhism does not deny the deities of Brahmanism, but regards them as some kinds of sentient beings. Some deities were afterwards adopted into Buddhism as guardians of Dhamma. On the other hand, we must acknowledge the fact that the Buddha was deified later. However, according to Buddhist doctrine, the Buddha is not a creator, nor can he decide weal or woe, joy or suffering of human beings, though he has superhuman wisdom and ability. The Buddha is also subject to the law of causality.

¹²Q: What is meant by "there is no ego", or "egolessness" (anattā)?

A: "Free from sentient beings", "dependent upon other conditions" and "without an actor", all elaborate the theory of Egolessness. "Sentient being" is "Satta" in Pāli, which includes human beings and all other sentient creatures. Brahmanism and other schools maintain that every satta possesses an immortal and determinant Ego or soul (atta). The theory of Dependent Origination holds that sattas are nothing but the aggregation of various material and spiritual elements. As far as the constitution of body is concerned, satta is composed of the Six Great Elements (cha dhātuyo), namely: earth (pathavī), water (āpo), fire or heat (tejo), air (vāyo),

space (ākāsa) and consciousness (viññāṇa). The first five elements are responsible for the mechanism and functions of the body—with earth as bones and flesh, water as blood, heat as warmth, air as breath, space as all sorts of body cavities. With the last element, consciousness, various mental activities become manifest. If we look at psychological constituents, satta are composed of five aggregates (khandhas), that is, corporeality (rūpa), feeling or sensation (vedanā), perception (saññā), mental formations (saṅkhāra) and consciousness (viññāṇa). The word "Khandha" means heap or group. All phenomena are classified into different groups, which are named khandhas. In brief, rūpa refers to all parts of corporeality, which includes the Five Roots (Pañc' indriyāni) or five physical sense organs of human beings, namely, eye, ear, nose, tongue and body; and the five objective sources of sensation (Pañcāyatana)—Visible objects, sound, odor, taste and tangible objects. The remaining four khandhas—Vedanā, Saññā, Saṅkhāra and Viññāṇa constitute important spiritual factors. Vedanā is feeling or sensation (feeling sad, happy, or neither; P. dukkha, sukha, or adukkha-m-asukha). Saññā means perception (to perceive the appearance of things, e.g. blue, yellow, red or white; long or short; square or round; suffering or happy). Saṅkhāra means mental formations (it is so called because it is seen as the driving force of physical and mental activities). Viññāṇa means the ability of judgment and inference. According to the analysis above, Buddhism holds that satta is not a fixed single (independent) entity, but a composition of various factors which arise and cease with their hetu-paccaya every instant (khaṇa). Hence there is nowhere an independent and permanent "Satta" or Ego, dominating body and mind. This is a simple explanation of Egolessness.

¹³Q: Excuse me, another question here. According to your explanation, is the Buddhist notion of the constitution of satta a form of dualism?

A: On the whole, Buddhism divides the constituents of satta into two

categories, spiritual and material. Combination of the two brings about satta, which, in Buddhist terminology, is called "Nāmarūpa" (name and form). Nāma refers to the mental factors, i.e. vedanā, saññā, saṅkhāra and viññāṇa of the five khandhas, or in other words, the viññāṇa dhātu (mind) of the six Mahā-bhūta (great elements). Rūpa refers to the material factors consisting of earth, water, fire, wind and space, all of which can not arise independently, but must change and integrate with each other. In brief, nāmarūpa is the combination of body and mind. From this respect, some regard it as dualism, some as parallelism (i.e. spiritual-physical parallelism). While some others say nāmarūpa is neither dualism nor parallelism since Buddhism maintains that all spiritual and material elements can not exist as independently. Thus, how this matter should be viewed remains to be studied. What is evident is that it is by no means materialism.

¹⁴Q: What is the meaning of "no actor"?

A: "No actor" means that there is nothing coming and going between a cause (hetu) and its effect (phala). Believers of the theory of Dependent Origination hold that cause gives rise to effect but deny that cause turns into effect. Take, for example, the passing of light or fire from one lantern to another. The flame of lantern B is engendered by that of lantern A. It is not that, the flame of A transferred to B. Thus, though Buddhism holds to the doctrine of reincarnation within the six-fold path (saṃsāra), Buddhism denies that there is a soul moving or transferring from one animate being to the seed of another. This idea is an extension of the principle of Anattā (egolessness) and will be elaborated later.

¹⁵Q: What is "Impermanence" (Anicca)?

A: All phenomena in the universe exist in mutually dependent interrelationships, so that when this arises, that arises; when this ceases, that ceases. There is no permanent existence at all. Therefore, all phenomena are impermanent in nature, arising and ceasing from instant (khaṇa) to instant. This is what is meant by the "nature of impermanence" and "extinction in every Khaṇa"

mentioned in the eleven implications of Paṭiccasamppāda, and also meant by the canonical saying: "Impermanent are all component things; subject are they to birth, and then decay." ("Aniccā vata saṅkhāra, Uppādavaya dhammino"). "All Saṅkhāra" denotes all things or phenomena. The word "Saṅkhāra" means flux and change. Since all phenomena are in fluid and changing, they are named "Saṅkhāra". The term itself implies the meaning of impermanence. The words "birth" and "cessation" actually cover three meanings: origination, destruction and cessation, or four meanings: origination or arising (uppāda or jāti), maintenance or existence (ṭhitika), destruction or decay (jarā or aññathatta) and cessation (nirodha). Each of the four denotes a characteristic or a state of a phenomenon: the birth of a phenomenon is called origination, the moment when it exists and functions is called maintenance, the moment when it functions but begins to decay is called destruction and the perishing of a phenomenon is called cessation. A khaṇa is a very short moment. According to the description in Buddhist texts, the flicking of a finger spans 60 khaṇas. "Extinguishing in every khaṇa" means that origination, maintenance, destruction and cessation are all completed within one khaṇa. Some people ask "why do we speak of 'instantaneously arising and ceasing' when the life-span of a person is usually about a few decades?" The Buddhist answer is that a human being's life from birth to death is a process consisting of a succession of khaṇas. A human life-span, on the whole, also goes through origination, existence, decay and extinction, i.e. birth, ageing, sickness and death; but each constituent part consists of continuous arising, existence, destruction and cessation, khaṇa by khaṇa. Buddhist scriptures hold that the human body is completely renewed every 12 years. An entity's arising, existing, decay and ceasing or a world's origination, maintenance, destruction and cessation actually consist of instantaneous originations and cessations. Buddhist theory holds that all phenomena, without exception, originate and cease in every Khaṇa, and that any admission of permanent or unchanging entity,

which is called the eternity belief (*sassata diṭṭhi*), is wrong.

¹⁶Q: Then may I ask this question: Is Buddhism itself also subject to the law of "impermanence"?

A: Yes. According to the Buddha, the Buddha Dhamma covers three successive periods: First, the Period of True Dhamma (*Saddhamma*), i.e. the period of arising and flourishing of Buddhism; Second, the Period of Image Dhamma (*Saddhamma-paṭirūpaka*), i.e. the evolution period, in which the Buddha's images began to appear; Third, the Period of Termination (*Saddhamma-vippalujjati*) or the period of decay. The Buddha even discussed the circumstances of Dhamma extinguishing in future. "All dhammas are impermanent", Buddhism itself is no exception.

¹⁷Q: What is meant by "cause and effect continuously connected without interruption"?

A: All dhammas are produced by *Hetu-paccaya*. Though impermanent, constantly arising and ceasing, they are continuously connected without interruption, just like flowing water. The preceding one, passing away, is followed by the succeeding one, causes producing effects in continuous series without interruption. This is looking at dhammas in a vertical sense in time. Horizontally, there are infinite differences among the varied types of causes and effects. Despite the complicated relationships between various types of causalities, they are bound by orderly rules without the least confusion. Each category of causes produces effects of the same type. For instance, a good cause leads to a good effect. Causes give rise to concordant effects, and effects correspond to causes. One type of cause can not give rise to another type of effect. For instance, if one sows melon seeds, one reaps the fruit of melons, and not beans. Buddhism believes that the law of causality is determined and unalterable even by the Buddhas of the successive epochs (past, present and future). This is the simple explanation of "causes and effects continuously connected without interruption", "various causes and effects falling into different categories", "cause

and effect transferring in harmony and in compliance with each other" and "cause and effect functioning in order without confusion". Again, Buddhism also opposes the view that after its cessation, a phenomenon can not arise again, and terms this "the Annihilation-view" (Uccheda-diṭṭhi). As to Buddhist analyses of cause, condition and effect, there are theories such as Six Causes, Four Conditions and Five Effects, which I shall not discuss in detail here.

¹⁸Q: Regarding the Theory of Dependent Origination mentioned above, is there any sutta or treatises available for further study?

A: There are many suttas and abhidhamma texts which discuss the Theory of Dependent Origination. For example, the fore-mentioned Eleven Meanings of Paṭiccasamuppāda were quoted from *Fenbie Yuanqi Chusheng Famen Jing*", which is worth reading. Also, relevant parts of *Abhidharmakośa-sāstra* (Abhidharma Storehouse Treatise), which is translated into Chinese by Xuanzang, and the *Mahāprajñāpāramita-sāstra* (Treatise on the Great Perfection of Wisdom) translated into Chinese by Kumārajīva, are also instructive.

¹⁹Q: After your explanation of the Eleven Meanings of Dependent Origination, based upon the four cardinal points of "no creator, egolessness, impermanence and succession of cause and effect", a basic understanding of the theory of Dependent Origination is achieved. Can this be said to be the Buddhist interpretation of universal existence or the Buddhist cosmology?

A: The four cardinal points are virtually summed up in two points—"Impermanence" and "Egolessness". "Impermanence" means the continuity of arising and ceasing, which includes the notion of "arising and ceasing from instant to instant", as well as "continuity of cause and effect". "Egolessness" means no dominating power either inside oneself or of the universe. So the meaning of "no creator" is virtually included in the concept of "Egolessness". "All phenomena are impermanent, all dhammas are devoid of self" (sabbe saṅkhārā aniccā, sabbe dhammā anattā) sum up the

Buddhist interpretation of universal existence. It can also be called the general law of all dhammas. That is the reason why the doctrines of "Impermanence" and "Egolessness" are referred to as the Seals of Dhamma (Dhamma-lakkhaṇa).

²⁰Q: What is the meaning of Dhamma-lakkhaṇa?

A: Lakkhaṇa means mark or seal. An imperial seal certifies the authenticity of documents, allowing for passage without hindrance. Here, it is used in analogy for the principal doctrines of Buddhism. If any doctrine is in line with the "Seals of Dhamma", it can be regarded as authentic teaching of the Buddha. (If it has been mastered, all Dhammas will be grasped without obstruction.) That is why they are called the "Seals of Dhamma". If, after "All phenomena are impermanent, all dhammas are devoid of self", we add "Nibbāna is serene", we have what are called the Three Seals of the Dhamma. With the addition of "All defiled (sāsava) dhammas lead to suffering", we have the Four Seals of Dhamma.

²¹Q: Could you please explain the meaning of "All sāsava dhammas lead to suffering"?

A: Āsava means distress or mental affliction (kilesa). The Buddhist belief is that, because ordinary beings do not understand the truth that all dhammas arise and cease conditionally, with the nature of impermanence and egolessness, they greedily cling to things which are impermanent, and persistently seek for "me" or "mine", in spite of the dhammas of egolessness. This is called illusion, which leads to mental affliction (kilesa), so it is also named mental affliction (kilesa). There are many kinds of afflictions, such as lust or greed (rāga), anger or hate (dosa), and delusion (moha or avijjā, ignorance of the truth of Impermanence and Egolessness). These three are regarded as the three poisons. Together with arrogance (māna), skepticism or doubt (vicikicchā), and wrong views (micchā-diṭṭhi, such as the belief in permanence or sassata-diṭṭhi, the belief in discontinuity or uccheda-diṭṭhi), they make up the six fundamental afflictions (kilesa). Kilesas give rise to various kammās. Kamma denotes actions of the body (kāya-kamma),

speech (Vacī-kamma) and mind (mano-kamma). Kilesa and kamma lead to future rebirth of the body and mind (nāma-rūpa) either as a deity, or a human being, or a being in hell, or a ghost or an animal. There, again, afflictions arise, kammas are recreated, and body and mind are regenerated. This cycle of life and death (saṃsāra) is endless, and constitutes suffering. In terms of human life, there are, it is generally believed, eight kinds of sufferings (dukkha)—sufferings of birth (the pain suffered in the womb as well as during birth), old age, illness, death, separation from loved ones, association with hated ones, inability to obtain what one desires, and clinging to the five aggregates (Khandhas). (Clinging to the five khandhas is affliction which gives rise to corporeal things, feeling, perception, mental formation and consciousness, the five aggregates in turn give rise to kilesa, and thus are called grasping khandhas. The five khandhas are in the instantly changing fluid which is filled with the sufferings of birth, old age, illness and death. So the five khandhas are suffering.) In sum, as the Buddha says that there is infinite suffering in the world, which is neither self-generated, nor dispensed by some god-creator, nor does it arise by chance. The suffering arises out of causes and conditions. As was stated above, kilesas give rise to kammas, kammas give rise to sufferings of birth and death. This is the Buddhist explanation of the Dependent Origination of suffering. For a comprehensive analysis, there are "Twelve Links of Dependent Origination".

²²Q: Please give a brief account of the "Twelve Links of Dependent Origination".

A: The Buddhist theory of Dependent Origination is centered around the problem of human life. There are, it is generally believed, ten or twelve Links of Dependent Origination. The twelve Links are: Ignorance (Avijjā), Mental Formation (Saṅkhāra), Consciousness (Viññāṇa), Name and Form (or corporeality and mentality, Nāma-rūpa), Six Sense Organs (Saḷāyatana), Contact between sense organs and sense objects (Phassa), Sensations (Vedanā), Desire

(Taṇhā), Clinging (Upādāna), Coming into Existence (Bhava), Birth (Jāti), and Old Age and Death (Jarā-maraṇa). Let me explain them briefly:

(1) Old Age and Death: This is the starting point from which to observe an individual's life. Old age, death, worrying, and sorrow are inevitable in a person's life. What is the origin of aging, death, sorrow and worrying? It is (2) Birth (Jāti). If a person is not born there are no old age and death, nor sorrow and worrying. Though the conditions for birth are numerous, the most important one is (3) Process of coming into existence (Bhava, meaning existence). In brief, bhava is a kind of latent force created by the wholesome and unwholesome kammās of one's body, speech and mind which determines one's future. Given the force of kamma, birth and death are the inevitable outcome. What is the condition for Bhava's arising? It is (4) Grasping or Clinging (Upādāna). Upādāna means craving and clinging, craving for visible objects, for sounds, odors, tastes, and tangible objects, clinging to the possession of lovely things. This is grasping. Because of this self-centered grasping and clinging, activities of body, speech and mind are produced. Grasping arises from (5) Desire (Taṇhā). Taṇhā can be simply explained as the desire for existence or survival. It is the driving force of the activities of life. It is this desire for life that leads to grasping and clinging, which bring about the activities of body, speech and mind, which form the force of kamma that results in birth and death. Therefore, Taṇhā, Upādāna and Bhava together are said to be the causes of birth and death. The above explains the cause-and-effect relationship between illusion, kamma and suffering. In order to further investigate the origin of the desire for life, it is necessary to explain the relationship between (6) Sensation (Vedanā), (7) Contact (Phassa) and (8) Six Sense Organs (Saḷāyatana). Sensation refers to the feelings associated with the objective existence which can be classified into three groups: pleasant (sukha vedanā), unpleasant (dukkha vedanā) and neither pleasant nor unpleasant (upekkhā vedanā). When pleasant and unpleasant sensations are experienced, the desire for existence is

stimulated and given impetus. Sensation is the response to the stimuli of the outside world. Thus it depends on contact (phassa) between the sense organs and sense objects. Contact is thus the starting point of the mental coordination of sense organs, sense objects and consciousness. Take, for example, the eye (eye-indriya) contact with the red color (object). When the red color stimulates the eye, the eye-consciousness, which is in charge of vision, comes into play. With the interaction of organ, object and consciousness, contact with (reaction to) red color occurs. In this way, contact depends upon the six sense organs (Saḷāyatana). The six sense organs are eye, ear, nose, tongue, body and mind, which have the functions of perceiving the six sense objects, namely, visible objects, sound, odor, taste, tangible objects and dhamma (Dhamma here refers to the impression left from the first five elements, or the object of the mental organ).

Furthermore, when investigation is made concerning the origin of the six sense organs, we come to (9) Name and Form (Nāma-rūpa). The meaning of nāma-rūpa, as mentioned above, is the composition of body and mind (or the five aggregates). The existence of the six sense organs is dependent upon the whole body and mind, or in other words, nāma-rūpa is the basis of the six organs. What condition does nāma-rūpa depend upon? It depends upon (10) Consciousness (Viññāṇa). Consciousness is a part of nāma-rūpa. But when the nāma-rūpa is taken as the object of comprehension, consciousness becomes the kernel of the nāma-rūpa. Consciousness has the functions of recognition and judgment with relation to the objects, which thus make the objects more distinctive, and enhance the abilities of the organs, so that the sensations, perceptions and speculation are governed. Therefore, the unity of body and mind depends upon consciousness, consciousness in turn depends on body and mind. Consciousness can not stand alone without the functioning nāma-rūpa because its occurrence is based on the stimuli of the objects to the sense organs and the help of sensations, perceptions and speculations. In conclusion, nāma-rūpa and viññāṇa have a relation of mutual

dependence.

The foregoing discussion was of the ten links of Dependent Origination. With regard to the present activities of human beings, the ten links of Dependent Origination would be quite comprehensive. However, to explain the endless cycles of birth and death, two more links, Mental formation (Saṅkhāra) and Ignorance (Avijjā) must be added. Together with the above ten, they constitute the twelve Links of Dependent Origination.

(11) Mental formation (Saṅkhāra) has the same meaning as (3) Existence (Bhava). When considering the Kamma created by body, speech and mind in the present, it has a potential power to lead to the future fruit that is known as "Bhava" ("coming into existence"). Whereas, when considering the ripe fruit (result) of today, what was formed by past kamma (or actions) is known as "Saṅkhāra" ("formation"). Consciousness and the name and form are the ripe fruits of today, depending upon the past formations. Owing to the cycles of past "formations" with its beginning unknown, habit becomes second nature. Just as there is a latent power governing human beings' actions, so the phenomena of birth and death, suffering and worrying occur endlessly. Saṅkhāra in turn depends on (12) Ignorance (Avijjā). Ignorance refers to being unable to see things as they actually are, or unable to see the reality of impermanent and selfless dhammas which arise when the conditions arise and cease when the conditions cease. An ignorant person especially does not understand the fact that one's own body and mind are merely formed by causes and conditions, while he holds the idea that there is an eternal, unique and dominant self. Because of the affirmation of "self" (atta-abhinivesa), he feels the sensations of pleasant, unpleasant and neutral, and thus has the afflictions of greed, hatred and ignorance, which result in various wholesome and unwholesome kammās. Therefore, the root cause of the sufferings of birth and death of human beings lies in Ignorance (Avijjā).

To sum up, the twelve Links of Dependent Origination are no more

than the relationships between illusion, kamma and suffering. Ignorance and mental formations are the result of the illusions and kammās from the endless past, which have incurred the present bitter fruits of consciousness, name and form, six sense organs, contact, and sensation. Desire, grasping and becoming existence are the present illusions and kammās, which will lead to the future bitter fruits of birth, aging and death. All these mentioned above are implied in the sentence "All āsavas are suffering", which also covers "the Truth of Suffering" (Dukkha-sacca) and "the Truth of the origin of Suffering" (Samudaya-sacca)—two of the four "Noble Truths" (Ariya-sacca).

²³Q: Could you now please explain the meaning of "Nibbāna is serene"?

A: "Nibbāna is serene" is the opposite to "All āsavas are suffering". The term Nibbāna means no flux or no-defilement (anāsava), which is the elimination of the cause and effect of suffering, and the cessation of the Twelve Links of Dependent Origination. The basis of the Twelve Links is the principle of "When this exists, that exists. Because this comes into being, that comes into being." The cessation of the twelve links follows from the principle. "If this does not exist, that does not exist, if this ceases, that ceases." Sufferings of old age, death, worrying, and sorrow are dependent upon the condition of birth (jāti), so the cessation of birth can result in the cessation of the sufferings of old age, death, worrying and sorrow. Likewise, the cessation of desire, grasping and becoming existence results in the cessation of old age and death. And so, ultimately, the cessation of ignorance results in the cessation of mental formations or the cause of all bitter fruits. When the cessation of ignorance, mental formations, consciousness and so on finally result in the cessation of old age and death, then Nibbāna has been attained. To be more explicit, as soon as the complete cessation of impure and defiled causes and conditions has been completed, ignorance will be turned into undefiled and pure wisdom (suddha-nāna), through which the truth and reality

of all dhammas can be seen. This is Nibbāna, which is also called Nibbāna with corporal remainder (Sopadhi-sesa-nibbāna). The meaning of Nibbāna is perfect peace or tranquility, or an eternally happy and joyous state in which wisdom, happiness and virtue are perfectly achieved. Buddhists view this state as attainable only by holy ones, and thus can not be judged by experienced conceptions like existence, non-existence, coming and going. It is an inconceivable state of emancipation. As I mentioned above, Nibbāna can be interpreted as passing away. Actually, Sākyamuni attained Nibbāna and became a Buddha at the age of 30, yet his corporal body remained as the residual fruit of his former illusion and kamma. This is Nibbāna with remainder. It was not until his death at the age of 80, that he entered Nibbāna without remainder (Nirupadhi-sesa-nibbāna).

²⁴Q: How can the realm of Nibbāna be reached?

A: The Nibbāna discussed above is the Truth of the Extinction of Suffering (Nirodha-sacca). Your question on how to reach the realm of Nibbāna falls under the category of the Truth of the Path Leading to the Extinction of Suffering (Magga-sacca). Magga-sacca takes Nibbāna as its goal, the elimination of the basic distresses of birth and death as its objective and uses as its method the Threefold Learning (Ti-sikkhā), which consists of morality or moral precepts (Sīla), concentration (Samādhi) and wisdom (Paññā).

(1) Morality aims at preventing faults in the three kammās of body, speech and mind. There are three levels of moral precepts to follow: the five precepts, the ten precepts and the complete precepts for the higher ordained (upasampadā). The five precepts are followed by both lay believers and monastic disciples, that is, abstinence from taking life, from stealing, from illicit sexual conduct, from false speech and from intoxicants. The ten precepts are followed by novices (sāmaṇeras) who have just renounced lay life. (Novices are usually under the age of 20 and will get higher ordination to become monks or nuns at the age of 20.) The

complete precepts are followed by monks and nuns (bhikkhus and bhikkhunīs). At the beginning of the establishment of the Saṅgha Order, there were no fixed rules set for the whole Order. Afterwards, precepts were laid whenever problems arose. By the time of the Buddha's Parinibbāna, there were more than 200 rules. The Bhikkhu precepts now number 227 in Theravadin countries, 253 in Tibet and 250 in Han-inhabited regions of China. They are mostly the same, with slight differences in grouping of certain items. There are 348 rules for bhikkhunīs in the Han regions.

(2) Meditation or concentration (Samādhi) is a peaceful and tranquil state of mind neither drowsy nor perturbed. It is a necessary practice for general religious practitioners in India, especially for Buddhists in their cultivation. With concentration, the practitioner can distance himself from coarse distinctions of rapture and joy in the body and mind, depart from sense desire (kāma), and gradually develop ease and peace of body and mind, and finally place mind or thought in any chosen state, tranquil, stable and undisturbed. Such meditation can lead to the acquisition of a pure and correct wisdom. Regarding meditation, there are four stages of trance (cattāri jhānāni) and four higher stages of non-material trance (cattāro arūpa-samādhi) within this world; and there are nine stages of meditation (nava anupubbavihāra samāpattiyo) and three kinds of meditation (tayo samādhi) beyond this world. Through meditation or concentration, wisdom can be acquired.

(3) Wisdom enables one to distinguish the self-nature (sabhāva) of all dhammas from their common characteristics (samañña), to fully understand the theory of the Four Noble Truths, and thus has the function of dispelling illusions (pahīna-kilesa) and attaining truth (adhigama).

The Threefold Learning of morality, concentration and wisdom are emphasized in the practice of the thirty-seven ways to enlightenment (Bodhipakkhiya-dhamma), which are the four Foundations of Mindfulness (satipaṭṭhāna), the four Right Efforts

(padhāna), the four Roads to Power (iddhi-pāda), the five Spiritual Faculties (indriya), the five Mental Powers (bala), the seven Factors of Enlightenment (bojjhanga) and the eight-fold Path (magga). I will not discuss each in detail here, but I will say something about the eight-fold Path:

(1) Right View (sammā-diṭṭhi) is to see manifest in every dhamma the theories of Impermanence, Egolessness, Dependent Origination and the Four Noble Truths and make them as one's own knowledge;

(2) Right Thought (sammā sankappa);

(3) Right Speech (sammā vācā);

(4) Right Bodily Action (sammā kammanta) means to be guided by the right view in daily life and behavior, so the body, speech and mind are in a conformity with the law of Dhamma;

(5) Right Livelihood (sammā ājiva) means to make one's living in proper ways and oppose the vicious life of supporting oneself by swindling and defrauding others of their properties;

(6) Right Effort (sammā vāyāma) is to strive after the goal shown by the right view without let-up in actions of body, mouth and mind;

(7) Right Mindfulness (sammā sati) is to always keep the Right View in mind, bring it to mind frequently and never forget it;

(8) Right Concentration (sammā samādhi) is to practice under the guidance of the Right View, to enter the state of pure and undefiled meditation.

²⁵Q: According to the Four Noble Truths described above, it seems that Buddhism has no positive ideal and takes no positive measures towards the world, can we say Buddhism is a world-weary philosophy?

A: Concerning the attitude of Buddhism towards the tainted world, one can say that Buddhism is world-weary. But still, Buddhism,

which originated from dissatisfaction with the temporal life, cherishes a kind of ideal for the human world. It is recorded in the *Ekottarikāgama* that when talking about the social life under the rule of the wheel-turning King (Rāja cakkavattin), the Buddha says that, at that time, the land will be level and bright as a mirror, the crops abundant; trees hanging with sweet and delicious fruits will grow everywhere; the weather will be fine and seasons favorable; the people, healthy and happy without much sickness and worry, will be rich and satisfied, having abundant food to eat; when they go to relieve their bowels, the ground will open automatically and close afterwards; gold, silver and treasures scattering everywhere like tiles and stones; people, old and young, will be on an equal footing and hold the same opinions; they will greet each other cheerfully and in kind words, speaking the same language without difference. From this passage, one can see a kind of ideal similar to that of the Great Harmony dreamed of by the Chinese people in ancient times. Efforts made to realize this ideal society are aimed at "glorifying the country and benefiting the sentient beings." Such an idea was particularly developed by Mahāyāna Buddhism. But due to the limitations of circumstances at the time, there was no political or social measure advanced by Buddhism.

²⁶Q: What is Mahāyāna Buddhism?

A: Mahāyāna and Hīnayāna are the two major sects of Buddhism.

²⁷Q: What are the differences between Mahāyāna and Hīnayāna?

A: The major difference is that Mahāyāna stresses altruism (conduct for benefit of others), whereas Hīnayāna stresses salvation for oneself. Mahāyāna has scriptures different from those of Hīnayāna, and has augmented and developed Buddhist doctrines as well. Here are a few points:

Firstly, in the Truth of Extinction of Suffering, Mahāyāna further maintains the possibility of "active nibbāna" (*apraṭiṣṭhita-nirvāṇa*). According to this theory, with the extinction of the Twelve Links of Origination, it is not the dhammas arising and ceasing based on

causes and conditions that cease, but only the ignorance and moral afflictions not in conformity with Dependent Origination that are eliminated. Since "between nibbāna and the temporal world, there is little difference", upon reaching the realm of the Buddha's perfect enlightenment, one can live beyond the cycles of birth and death and never enter extinction, so one can always work ceaselessly for the cause of "glorifying the country and benefiting the sentient beings" in the conditional world, while abiding peacefully in the nibbāna state anywhere at any time.

Secondly, the Theory of Dependent Origination expounds the theory that one dhamma arises with all other dhammas as its conditions, and in reverse, is itself a cause for others. Thus a single person stands in relationship of homogeneity with other beings, just like the homogeneous relationship between one drop of water and the ocean. Hence the saying "All beings are my parents", and "regard all beings as one's only son". This produces a heart of great loving-kindness (mettā) and compassion (karuṇā). Mettā means identifying oneself with all others' joy and happiness, and Karuṇā means sympathy with others' grief and sorrow. With such a heart, one should indefatigably serve all beings. Mahāyāna Buddhism especially advocates this "pusa" (Bodhisatta) outlook of life, and particularly encourages the conduct of "Six Perfections" (Pāramitā) and "Four all-embracing virtues" (cattāri saṃgaha-vatthūni).

²⁸Q: What is "Pusa" (S. Bodhisattva, P. Bodhisatta)?

A: "Pusa" is short for "putisaduo", the Chinese transliteration of Bodhisatta. Briefly, any one who cherishes the lofty aspiration to deliver oneself and all beings from misery and sufferings, and attain ultimate happiness (salvation of oneself and of others), and to release oneself and all beings from ignorance into perfect enlightenment (self-enlightenment and enlightenment of others) is called in Chinese "Pusa", i.e. Bodhisatta.

²⁹Q: What are the Six Perfections (Pāramitā)?

A: The Sanskrit (or Pāli) word "Pāramitā" literally means "gone to the

other shore", that is to cross from this shore of moral affliction to the other shore of enlightenment. Six Pāramitā are six ways to the other shore. The first Pāramitā is Liberality or Charity (Dāna), which is of three kinds: (1) giving material things to others including worldly possessions, even one's own head, eyes, hands, feet and life, known as material Dāna; (2) giving protection to all beings and to free them from terror, called the free-from-fear givings (abhaya Dāna); (3) giving all beings the truth, is the Dhamma Dāna. The second Pāramitā is morality or abiding by the precepts (Sīla), This also consists of three categories, (namely,) to avoid evils, to cultivate and accumulate wholesomeness and to benefit sentient beings. The most fundamental sīla for Bodhisattas is to benefit sentient beings, i.e. all being done is for the public interest, while the other precepts are subordinate to it. The third Pāramitā is Patience (Khanti), which means that in service of sentient beings one should be able to endure slander, abuse, attack, the sufferings of hunger and cold etc., "Do what is hard to do, bear what is hard to bear", and never give up the vow to save beings. The fourth Pāramitā, Effort or Energy (Viriya), is to make every effort and strive constantly for salvation not only for oneself but for all other beings and enlightenment not only for oneself but for all other beings. The fifth is Meditation or Contemplation (Samādhi). The sixth, Wisdom (Paññā), is to practice meditation and to gain knowledge for the sake of enlightening oneself and other beings.

³⁰Q: What are the four All-embracing Virtues (cattāri saṃgaha-vatthūni)?

A: Saṃgaha-vatthu are the qualities that ensure public unity. The first is liberality or charity (Dāna). The second, kindly speech (Peyyavajja), is to speak kind words in a kind manner. The third, beneficial conduct (Atthacariyā), means to serve the public welfare. The fourth, equality (Samānattatā), is to live the same life as the ordinary people. These four are the means whereby Bodhisattas carry out their work among human beings.

³¹Q: In order to benefit the public welfare and to identify with others, is it necessary for a bodhisatta to acquire various kinds of worldly knowledge?

A: For the interest of human beings, it is necessary for a bodhisatta to study extensively and to be well informed. Buddhism requires bodhisatta aspirants to learn the Five Vidyā (S. Vidyā or P. vijja, meaning knowledge), these are:

(1) Śabda-vidyā, viz. phonology and philology;

(2) Śilpakarma-vidyā, viz. all technology, techniques, crafts, arithmetic, calendar, etc.;

(3) Cikitsā-vidyā, viz. medical science and pharmacology;

(4) Hetu-vidyā, viz. logic;

(5) Adhyātma-vidyā, viz. Buddhist studies.

The five vidyās must be mastered by scholars. "To be broadly erudite, and sincerely compassionate" is the requirement for bodhisattahood. Mahāyāna Buddhism particularly calls for learning whatever is difficult to learn, and all that should be learned.

³²Q: Please tell us more of the features of Mahāyāna Buddhism.

A: Next, I will talk about the theory of the empty nature (suññatā) of all dhammas, which follows from the notion of Dependent Origination. It holds that all dhammas are simply the cooperation of relative causes and conditions. Therefore, there is no substance in them. In other words, all dhammas are nothing but the phenomena of cooperation of causes and conditions. Apart from phenomena there is no noumenon as their dominator. When I said previously that "There is no ego within all dhammas", I was speaking of the absence of "self" (atta) of human beings. And now I add the absence of self of all dhammas. The former is to deny self in human beings, and prove "non-substantiality in beings", while the latter is to deny the self in dhammas, and prove "non-substantiality in dhammas".

³³Q: Somewhere in the Buddhist scriptures, it says "Rūpa (matter) is none other than suññatā (emptiness). Suññatā is none other than rūpa." What does this mean?

A: It just means that all dhammas are suññatā by nature according to Dependent Origination. "Rūpa", meaning matter or substance, is one of the five aggregates, namely, rūpa, vedanā, saññā, saṅkhāra and viññāṇa. Every material phenomenon is a product of the combination of causes and conditions. Though it has its own form and functions, it has no perpetual and unchangeable entity inside as its dominator. Hence it is empty. This emptiness does not refer to the empty space beyond matter (or the emptiness outside an object), nor does it refer to the emptiness after existence (or the emptiness after the extinction of an object). In other words, emptiness is not apart from matter, but "the object itself is empty." Now since matter arises according to the law of Dependent Origination, it can't possess an unchangeable material existence in each material object. Hence "matter is no different from emptiness". And since dhammas have no material existence, it can arise upon the meeting of adequate conditions. Therefore, "emptiness is no different from matter". This is a simple interpretation of the phrase "Rūpa is none other than suññatā, and vice versa".

Likewise, spiritual phenomena such as vedanā, saññā, saṅkhāra and viññāṇa are also emptiness by nature, for they also arise from Dependent Origination. Emptiness, on the basis of Dependent Origination is the true nature (lakkhaṇa) of all that exists in the universe, i.e. the reality of all dhammas. In Mahāyāna Buddhism this reality is regarded as the impress or seal of truth. This doctrine is called the "One Seal of Dhamma". All Mahāyāna doctrines are corroborated with this "One Seal". The aforesaid Buddhist doctrines—"active nibbāna" (appaṇihita-vihāra-nibbāna) and Bodhisattas' "Six Perfections" (Pāramitā) and "Four all-embracing virtues"—are all on the basis of the theory of Emptiness by nature in terms of Dependent Origination.

³⁴Q: What else can you tell us about Mahāyāna Buddhism?

A: I have mentioned some of the common features of the various sects of Mahāyāna Buddhism. There are still differences between them, since each sect has its own speciality. However, I will not go into the details here.

³⁵Q: Were the Buddhist texts written by Sākyamuni himself?

A: No, they were recited and recorded by his disciples after the Buddha's death. In the year of the Buddha's Parinibbāna, his five hundred disciples headed by Ven. Mahākassapa held an assembly at Saptaparṇa Cave (P. Sattapaṇṇī-guhā) near Rājagaha to compile and edit the Buddha's teachings for posterity. At the assembly Ven. Ānanda recited the Suttas preached by the Buddha, Ven. Upāli recited the Vinaya established by the Buddha, and Ven. Mahākassapa recited, and later supplemented, the Abhidhamma which is an exposition and study of the Buddhist creeds. The Sutta, Vinaya and Abhidhamma comprise Tipiṭaka. The word Piṭaka originally meant basket for containing things. The compilation of Sutta, Vinaya and Abhidhamma into Tipiṭaka is something like the designation of Jing (classics), Shi (history), Zi (academic schools) and Ji (miscellany) as the "Four Treasures" in China. This Buddhist council was termed the First Saṃgīti. Saṃgīti is generally rendered as "Jieji" in Chinese, while its original meaning in Sanskrit or Pāli is "saṅgha meeting". The ancient Chinese translators used the word "Jieji" to mean "recital", which implies both the collection of Dhamma, and the assembly of people. The Tipiṭaka was not written down at that time, so it was passed on by oral recital.

³⁶Q: Were there any more assemblies besides the first one?

A: Yes. At that time, besides the five hundred bhikkhus who gathered at Saptaparṇa Cave (P. Sattapaṇṇa guhā), there were a number of bhikkhus who did not join the Mahākassapa group. Some bhikkhus, headed by Vappa (one of the first five Bhikkhus), assembled at another place not far from the Cave. So the Rājagaha

Samgīti is composed of two parts, one compiled inside the cave and the other outside the cave, the two compilations together forming the Hīnayāna Tipiṭaka. Tradition has it that the Mahāyāna Tripiṭaka was compiled at Cakkavāḷa-pabbata by Bodhisattas including Mañjuśrī, Maitreya, and Ānanda. Hīnayāna Buddhists, however, deny that the Mahāyāna scriptures are authentic Dhamma imparted by the Buddha.

³⁷Q: What about the Sixth Buddhist Council (Samgīti) held in Myanmar a few years ago?

A: 110 years after the Buddha's death, there was a controversy over some of the Buddhist precepts among the monks in Vaiśālī. Thereupon Ven. Yasa Thero (elder priest) summoned 700 learned and virtuous elders and they determined that 10 of the issues involved were violations of the Vinaya. This council was known as the Second Samgīti.

According to the records of the Southern Buddhist canon, 235 years after the Buddha's death, in the Aśoka Era, many heretics infiltrated into the Buddhist Order and confused Buddhist doctrines. Thereupon, Ven. Moggaliputta Tissa, with the support of King Aśoka, convened a Buddhist council with 1,000 participants in Pāṭaliputta (now Patna, Capital of Bihar Pradesh, India) to recite the Tipiṭaka for the purpose of clearing out the heretical adulterations. This was known as the Third Samgīti.

According to the Northern Buddhist records, around 400 years after the Buddha's death, at the time when King Kaniṣka of Kuṣāṇa ruled in west India, 500 bhikkhus under Ven. Vasumitta composed commentaries for the Tipiṭaka. These commentaries totaled some three hundred thousand gāthas, more than nine million words. One of these was the *Mahāvibhāsā*, a very important commentary work (aṭṭhakathā). This was generally known as the Fourth Samgīti.

About 80 years ago, King Mindon of Myanmar invited numerous bhikkhus to collate the Pāli Tipiṭaka and engrave the full texts and

an account of the collations on stone tablets which are still kept in Mandalay today. This was called the Fifth Saṃgīti.

From 1954 to 1956, the federal government of Myanmar, in commemoration of the 2,500th anniversary of Sākyamuni's Parinibbāna, sponsored the Sixth Saṃgīti, and invited 2,500 bhikkhus from Myanmar, Cambodia, Ceylon (Sri Lanka), India, Laos, Nepal, Pakistan and Thailand to participate. They worked for two years and meticulously collated various editions from different countries as well as the collation of Pāli Tipiṭaka from King Mindon's Fifth Saṃgīti and finally they produced the most complete edition of Pāli Tipiṭaka in print. This is called the Sixth Saṃgīti.

³⁸Q: What is Pāli?

A: Pāli is a language used in ancient India. To be more specific, it was a popular dialect in Magadha at the time of the Buddha. The Buddha was said to have preached his sermons in this language, so his disciples used this language to memorize and recite his teachings. Although it is no longer a living language now, Pāli has been preserved through the Buddhist scriptures. The word "Pāli" means "classics". The ancient Indians were in the habit of reciting and passing on canonical texts orally instead of in writing. According to *The History of the Island of Ceylon* (Dīpavaṃsa), Buddhist texts began to be written down during the 1st century BC in Ceylon. By the 5th century AD, Ven. Buddhaghoṣa, Tipiṭakācariya from Magadha, came to Ceylon and made a copy of the whole Pāli Tipiṭaka in the Sinhalese script. (According to another account, when Buddhaghoṣa was in Ceylon, he translated a great many Sinhalese commentaries of Tipiṭaka to Pāli.) As the original Pāli alphabet is no longer in existence, the current Pāli Tipiṭaka of Myanmar, Cambodia and Thailand are all recorded in the indigenous alphabets. Recently India too has been engaged in recording and publishing the Pāli Tipiṭaka in the Hindi alphabet.

³⁹Q: Are there Buddhist scriptures recorded in other languages besides Pāli?

A: Yes, there is another system in Sanskrit. Buddhism falls into Southern and Northern traditions. The canon of the Southern tradition was recorded in Pāli, and belongs to Hīnayāna Buddhism, while the texts of the Northern tradition were in Sanskrit, mostly being of the Mahāyāna Schools, with a few being Hīnayāna. Pāli was a popular spoken language in ancient India, while Sanskrit a refined one.

⁴⁰Q: Were Chinese Buddhist canons and Tibetan ones translated from Pāli or from Sanskrit?

A: The Chinese Buddhist canon was mostly translated from Sanskrit, with a few texts from Pāli. The Tibetan texts seem to have been translated all from Sanskrit.

⁴¹Q: In how many languages do the Buddhist texts appear at present?

A: Many countries have been translating Buddhist texts to their own languages. In Europe, there are texts in Russian, German, English, French, Italian, Finnish, etc., but none of them is complete. Most of these texts are translated from three source languages: (1) Pāli, (2) Chinese and (3) Tibetan. Besides a small part preserved in Nepal and Tibet of China, very few of the Sanskrit canonical texts remain. Thus Buddhist scriptures of the Northern tradition are mostly preserved in China in the Chinese and Tibetan languages.

⁴²Q: Can the Buddhist canons be classified into three systems according to the languages employed?

A: Yes, the division into three groups conforms to the actual situation. Buddhist circles today all acknowledge the division into three systems. Generally speaking, Buddhism in the southern countries—Sri Lanka, Myanmar, Cambodia, Laos, India, Pakistan and Thailand as well as in the minorities of China's Yunnan Province such as Dai, Benglong (now De'ang) and Bulang—falls under the Pāli system, of Hīnayāna Buddhism, or more precisely, Theravāda Buddhism, as they refer to themselves. There used to be sectarian disputes between Mahāyāna and Hīnayāna, but the tendency to blend is increasingly apparent at present. Many people advocate

that the terms, Hīnayāna and Mahāyāna, be dropped with a view to strengthening the unity and mutual respect among the Buddhists and peoples of different countries. Hence it is more appropriate to call Southern Buddhism Theravāda Buddhism. The Buddhism of the Hans in China, as well as of Korea, Japan and Vietnam belongs to the Chinese system. The Buddhism of Tibet, Inner Mongolia, Tujia, Qiang, and Yugu and other nationalities of China, as well as that of Mongolia, Siberia and northern India, belongs to the Tibetan system. The latter two systems belong to Mahāyāna Buddhism.

⁴³Q: How many volumes, or fasciculi, are there in the Chinese Tipiṭaka?

A: There are 1,692 books, totaling 6,241 volumes. Besides, over 1000 volumes composed by Chinese scholars are collected in the Chinese Tipiṭaka. In the Ming Dynasty, the Jiaxing edition of the Chinese Tipiṭaka collected some 5,600 volumes of Chinese scholars' writings to add to the Tipiṭaka as a sequel. In modern times, sequels have also been compiled in Japan, which are all drawn from Chinese writings. These total 1,750 books, 7,140 volumes.

⁴⁴Q: How many editions are there of the Chinese Tipiṭaka?

A: The first block-printed edition of the Tipitaka in Chinese appeared in 971 AD or the 4th year of the Kaibao Era of the Song Dynasty. In the following 1,000 years, through the dynasties of Song, Liao, Jin, Yuan, Ming and Qing, more than 20 block-printed editions were published. In 1936, a block-printed edition of the Tipitaka from the Jin Dynasty (12th century) was discovered at Guangsheng Temple in Zhaocheng County, Shanxi Province, so it was named the Zhaocheng Tipitaka. When the Japanese imperialists invaded China, they attempted to rob China of this treasure, but thanks to the Eighth Route Army troops, at the cost of the lives of eight soldiers, it was saved and is now kept in the National Library. In the Kaiyuan and Wolong Temples in Xi'an, there is a block-printed Qisha edition from the Song Dynasty (12th

century), of which a photolithograph has been published recently. In addition, there are the Southern edition (block-printed in Nanjing in 1372) and the Northern edition (block-printed in Beijing from 1410) as well as the thread-bound edition of Tipitaka (commonly known as the Jiaxing edition) block-printed in the Wanli Era, all of which were commissioned by the government of the Ming Dynasty. Printing blocks of the Tipitaka made during the Yongzheng and Qianlong Eras of the Qing Dynasty (1735-1738) (commonly known as Dragon Collection) are still in existence.

Hand-written copies of the scriptures made in the Jin, Wei, Sui, and Tang Dynasties which are preserved in the Dunhuang Grottoes of China are valuable Buddhist treasures discovered in the early 20th century, but a great portion of them have been stolen (by foreigners) and taken abroad. About 8,000 volumes are now preserved in the National Library. There are also many stone-engraved Buddhist texts in our country. The most important among them are those stored in the caves of Shijingshan (Stone-carved Scriptures Hill) in Fangshan, Beijing. The engraving of these texts was started by Ven. Jing Wan during the 7th century AD in the Sui Dynasty, and was kept up for about 1,000 years. The blocks are all stored in 9 caves, or buried beneath thūpa. In 1956, the Chinese Buddhist Association, with the support of the government, took all of the blocks out and made seven sets of rubbings in two years. These are being catalogued and studied. In total, there are more than 1,000 Suttas, nearly 3,500 volumes engraved, and the texts carved in the Liao Dynasty are found by textual research to be based upon the Qidan (Khitan) edition which was long lost. The Fangshan stone-carved scriptures are very rare Dhamma treasures.

⁴⁵Q: Could you please tell me about the Tibetan Tipiṭaka?

A: The Tibetan Tipiṭaka consists of two parts: (1) The Proper Collection, called "Bkaḥ-ḥgyur". Bkaḥ means teachings and Ḥgyur means translation. So it is a translation of the Buddha's teachings, including the Sutta and Vinaya preached by the Buddha. (2) The

Appended Collection, called "Bstan-ḥgyur". Bstan means śāstra or commentary. So it is a translation of śāstras. Bkaḥ-ḥgyur consists of 1,108 suttas and Bstan-ḥgyur of 3,459 śāstras.

⁴⁶Q: Are there any block-print editions of the Tibetan Tipiṭaka?

A: Yes, there are. Early in the 12th century AD the first block-print of the Tipiṭaka was made in Naitang and is thus known as the Naitang edition. In the 15th and 16th centuries, during the Ming Dynasty, two block-print editions were made. In Kangxi and Yongzheng Eras of the Qing Dynasty (17th century), another block-print was made in Beijing, called the Beijing edition. In the meantime, other blocks known as the Dege edition, Zhuoni edition, etc. were made in Xikang and elsewhere. In Tibet, a new Naitang edition was prepared between the 8th and 10th year of the Yongzheng Era, about the same as the Beijing edition, but with certain supplements to overcome its imperfections. Around 1921, the 13th Dalai Lama had another edition of the Tipiṭaka made in Lhasa, known as the Lhasa edition. Recently, a photo-offset reprint of the Beijing edition of the Tibetan Tipiṭaka has appeared in Japan.

⁴⁷Q: What are the contents of the Pāli Tipiṭaka?

A: The Pāli Sutta-piṭaka (the "Basket of the Buddha's Discourses") consists of five parts:

(1) Dīgha-nikāya (the Long Discourses), corresponding to the Dīghāgama in Chinese Tipiṭaka;

(2) Majjhima-nikāya (the Middle Length Discourses), corresponding to the Madhyamāgama in the Chinese Tipiṭaka;

(3) Saṃyutta-nikāya (the Discourses Organized according to Content), corresponding to the Saṃyukktāgama in Chinese;

(4) Aṅguttara-nikāya (the Discourse Collection in Numerical Order), corresponding to the Ekottarikāgama in the Chinese Tripiṭaka;

(5) Khuddaka-nikāya (Minor Anthologies), without complete

translation in Chinese.

There are only four Āgamas of Hīnayāna Sutta Piṭaka translated to Chinese (Āgama literally means collection, or collection of the Buddha's Discourses).

The Pāli Vinaya-piṭaka (the "Basket of Disciplines") consists of 3 parts:

- (1) Sutta vibhaṅga (all of the Precepts);
- (2) Khandhaka (Procedures for Assemblies and Rules for Daily Life in the Saṅgha);
- (3) Parivāra (Interpretation of the Rules or Appendix).

The Pāli Abhidamma-piṭaka (the Basket of Commentaries) consists of 7 parts:

- (1) Dhammasaṅgaṇi (Enumeration of Dhammas or Buddhist Psychological Ethics);
- (2) Vibhaṅga (The Book of Analysis);
- (3) Dhātukathā (Discourse on Elements);
- (4) Yamaka (Book of Pairs);
- (5) Paṭṭhāna (Book of Causality);
- (6) Puggalapaññatti (Description of Human Types);
- (7) Kathāvatthu (Points of Controversy).

These 7 Śāstras are important works dealing with the states of mind, analysis of the universal existence, the theory of cause and effect, etc.

⁴⁸Q: We have taken up much of your time. You have explained to us the fundamentals of the Buddha's Teachings and the Buddhist canonical works. That is enough for the time being, we will surely consult you again later.

A: I may not have satisfied your requirements. I have just provided some basic materials.

貳 佛法的基本内容和佛教经籍

1问：佛法的基本内容是什么？

答：我前面说过释迦牟尼当初出家的目的是为了寻求解脱生老病死等痛苦之道。当时印度许多教派都是有最后解脱的理想的。佛教教义的基本内容简单地说来，就是说世间的苦（苦谛Dukkha-sacca）和苦的原因（因谛或称集谛Samudaya-sacca），说苦的消灭（灭谛Nirodha-sacca）和灭苦的方法（道谛Magga-sacca）。佛教经籍非常繁多，其实不超出这四圣谛（Cattāri-ariya-saccāni，谛的意义就是真理），而四谛所依据的根本原理则是缘起论（Paṭiccasamuppāda）。佛教的所有教义都是从缘起论这个源泉流出来的。

2问：缘起是什么意思？

答：“缘起”即“诸法由因缘而起”。简单地说，就是一切事物或一切现象的生起，都是相待（相对）的互存关系和条件，离开关系和条件，就不能生起任何一个事物或现象。因（Hetu）、缘（Paccaya），一般地解释，就是关系和条件。佛曾给“缘起”下了这样的定义：

若此有则彼有，若此生则彼生；

若此无则彼无，若此灭则彼灭。

这四句就是表示同时的或者异时的互存关系。

3问：什么是同时的互存关系？

答：举一个简单例子来说明。如师生关系：有老师则有学生，有学生则有老师，无老师则不成其为学生，无学生则不成其为老师。这是同时的互相依存的关系。

4问：什么是异时的互存关系？

答：如种子和芽的关系：因为过去先有了种子，所以今天才能有芽生；

也因为今天有芽生，过去的种子才名叫种子，这是异时的互相依存的关系。从另一方面看，种子灭的时候也正是芽生的时候，芽生的时候也正是种子灭的时候，在这里，芽和种子的生与灭现象又是同时的互存关系。总之，无论其为同时或异时，一切现象（法）必然是在某种互相依存的关系中存在的。没有任何一个现象可以说是绝待（绝对）的存在。

5问：异时的互存关系是否就是因果关系？

答：照佛教的说法，所谓互存关系，都是因果关系。从异时的互存关系来说，种子是因，芽是果，这是异时因果。从同时的互存关系来说，如以老师为主，则老师是因，学生是果；如以学生为主，则学生是因，老师是果，这是同时因果。这当然是简单地举例，其实因果关系是极其错综复杂的。从这一个角度看，这样的因产生这样的果；从另一个角度看，同是这个因会产生另外的果。如某甲，从师生关系看，他是乙的老师；从父子关系看，他是丙的父亲；从夫妻关系看，他是丁的丈夫。以甲为因，则乙丙丁和其余一切都是果，由此而看出一因多果；以其余一切为因，则甲是果，由此而看出多因一果。实际上，没有绝待的因，也就没有绝待的果。世界就是这样由时间上无数的异时连续的因果关系，与空间上无数的互相依存关系组织的无限的网。

6问：听说北京西山佛牙舍利塔，砖上和露盘上刻有经文，都是讲缘起的教义的，是吗？

答：是的。那是辽代建的塔。砖上刻着一首缘起偈（偈，是偈陀Gāthā的简称，意思就是诗或颂）：

诸法因缘生，缘谢法还灭，

吾师大沙门，常作如是说。

露盘上刻的是这首偈的梵文。其实，不只是这座塔，古代佛塔一般都刻着这首偈当作舍利供奉。因为佛说过“见缘起即见法，见法即见佛”。所以这首偈被称为法身舍利偈，这也是说明缘起教义在佛教中的重要地位。缅甸近年拆修一座古塔，砖上也刻着这首偈的巴利文：

Ye dhammā hetu-ppabhavā

tesaṃ hetuṃ Tathāgato āha,

tesaṃ ca yo nirodho

evaṃ vādī mahāsamaṇo.

7问：缘起偈是谁作的？

答：是佛的弟子阿说示（Assaji，最初五比丘之一，意译是“马胜”）说出的。有一天马胜比丘在托钵行乞的时候，遇见了婆罗门大学者舍利弗。舍利弗看见他容貌威仪，不同常人，便问他向谁学道，教义如何。马胜比丘便说出了这首偈，舍利弗听了很欢喜，回去向目犍连说了，两个人便一起归依了佛。这首偈我国有几种译文，偈中“吾师大沙门”，是指释迦牟尼，沙门（Samaṇa），简单地意译就是出家修道者。当时婆罗门教之外各教派的出家修道者都称为沙门。

8问：在当时各教派中，缘起论是不是佛教特有的教义？

答：是的。佛经中说缘起有十一个意义：

- （1）无作者义，
- （2）有因生义，
- （3）离有情义，
- （4）依他起义，
- （5）无动作义，
- （6）性无常义，
- （7）刹那灭义，
- （8）因果相续无间断义，
- （9）种种因果品类别义，
- （10）因果更互相符顺义，
- （11）因果决定无杂乱义。

这些意义都是不同于其他教派的教义的。

9问：可否请你把这十一义简单解释一下？

答：十一义归纳起来，有四个重要的论点：

- (一) 无造物主，
- (二) 无我，
- (三) 无常，
- (四) 因果相续。

10问：无造物主是什么意思？

答：是否定创造宇宙万物的主宰，即十一义中的“无作者义”。因为既承认“诸法因缘生”，就不能承认有个独立的造作者。任何一个因都是因生的，任何一个缘都是缘起的，因又有因，缘又有缘，从竖的方面推，无始无终，从横的方面推，无边无际。由此而得出结论：没有绝待的一个因。缘起论者，不仅应当否认“从口生出婆罗门”的人格化的造物主，而且也应当否认作为宇宙本源的理性化的存在。从另一方面说，缘起论者固然不承认有一个绝待的第一个因，但同时又反对认为一切出自偶然的观点。他主张任何现象的生起，都不是无因的，而是受必然的因果律支配的，这便是“有因生义”。

11问：照你这样说，佛教很像是无神论，但是何以佛教寺庙中又供有很多的神呢？

答：我前面说过，佛教并没有否定婆罗门教的神祇，只是看做是一种众生，后来有些神祇被吸收到佛教中来成为护法神，这是一方面情况。另一方面，也应当承认到后来佛陀被神化了的事实。但是根据佛教教义，佛不是造物主，他虽然有超人的智慧和能力，但不能主宰人的吉凶祸福，佛也是受因果律支配的。

12问：什么是“无我”？

答：“离有情义”、“依他起义”和“无动作义”，都是说明无我的道理的。“有情”的巴利语是“萨埵”（Satta），人和一切有情感的生物都叫做有情。婆罗门教和其他各派主张一切有情都有一个常住的（固定不变地存在的）、起主宰作用的自我（Atta，意义与“灵魂”相当）。缘起论则认为所谓“有情”，无非是种种物质和精神的要素的聚合体。从身体的组织来说，有情是由地、水、火、风、空、识六大（六种元素）所构成的，依借前五大而有身体的机关及其作用——地为骨肉，水为血液，火为暖气，风为呼吸，空为种种的空隙；依借后一大（识）而表现种种的精神活动。再从心

理的要素来说，有情的组织分为色（Rūpa）、受（Vedanā）、想（Saññā）、行（Saṅkhāra）、识（Viññāṇa）五蕴。蕴

（Khandha）就是堆，把种种不同的现象分类，每类做为一堆，这就是蕴。简单地解释，“色”就是各种物质，眼、耳、鼻、舌、身五根（根就是人的感觉器官）和色、声、香、味、触五境（境就是感觉对象）等都属于色。受、想、行、识四蕴包括重要的精神要素：受是感觉（感觉苦、乐或不苦不乐等）；想是印象（摄取事物的相貌，知道是青、黄、赤、白，是长、短、方、圆，是苦是乐等）；行是思维（思维是推动身心活动的力量，所以叫做行）；识是了别（对于所认识的对象，予以判断和推理）。佛教根据以上两方面的分析，说明有情不是固定的单一独立体，而是种种要素的聚合体，而任何要素又是刹那刹那依缘而生灭着的，所以找不到一个固定的独立的“有情”在支配着身心，也就是找不到“我”的存在。这便是无我的简单解释。

13问：请允许我插一句。照你所说佛教关于有情的组成要素的说法，它是不是二元论？

答：大体来说，佛教把组成有情的要素分为精神和物质两类，两者结合便是有情的成立。佛教对此有一个专门术语叫做“名色（Nāmarūpa）”。名，是精神的要素，即五蕴中受、想、行、识四蕴，也就是六大中的识大；色，就是地、水、火、风、空物质的要素。地水火风空诸要素，都不能单独生起，而必须是互相结合变化的。简单地说，“名色”就是身心合成的存在。从这方面看，有人说它是二元论，有人说它是一种平行论（即心理生理平行），也有人说佛教认为精神物质诸要素都没有独立的单元，所以与二元论和平行论都有所不同。究竟应当怎样看，可以研究，但是它不是唯物论则是明显的。

14问：“无动作义”如何解释？

答：“无动作义”，就是不承认因果之间有来去。缘起论者承认由因生果，而反对因变成果的说法。譬如以灯传灯，是乙灯的火由甲灯焰生，而不是甲灯的火跑到乙灯去。根据这个道理，佛教虽然也讲六道轮回，但是不承认有个灵魂从这个有情的身体投入另一个有情的胎里去。这个道理是从无我的教义引伸出来的，以后还可以谈。

15问：什么是“无常”？

答：宇宙一切现象，都是此生彼生、此灭彼灭的相待的互存关系，其间没有恒常的存在。所以任何现象，它的性质是无常的，表现为刹那（Khaṇa）刹那生灭的。这就是十一义中“性无常义”和“刹那灭义”。佛经中说：“诸行无常，是生灭法”，就是这个意思。“诸行”，就是指一切事物或一切现象。“行”是迁流变动的意思，一切现象都是迁流变动的，所以叫做“行”。这个字的本身就包含了无常的意义。“生灭”二字，实际上包括着“生、异、灭”三字或“生、住、异、灭”四字。这里每个字表示着一种相状：一个现象的生起叫做“生”；当它存在着作用的时候叫做“住”；虽有作用而同时在变异叫做“异”；现象的消灭叫做“灭”。刹那是极短的时间，佛经中说弹一下指头的时间有六十刹那。刹那生灭，就是一刹那中具足生、住、异、灭。有人问，一个人的寿命一般有几十年，怎么是刹那生灭呢？佛教把人的一生从生到死叫做一期，一期是由刹那刹那相续而有的。对一个人的整体来说，他有一期的生住异灭，即生、老、病、死；但从他的组成各部分来说，则是刹那刹那的生住异灭。佛经说人的身体每十二年全部换过一次。一个物体的生住异灭，一个世界的成住坏空，实际都是刹那生灭相续的存在。照佛教的教义，一切现象没有不是刹那生灭的。佛教把主张“有常恒不变的事物”的见解叫做“常见”，认为是错误的。

16问：请允许我插一句，佛教本身是不是也受“无常”法则的支配？

答：是的。根据佛说，佛法分三个时期：一是正法时期，即佛教兴起时期；二是像法时期，即演变时期，这时期开始有佛像，所以称像法；三是末法时期，即衰坏时期。佛并且曾经说过将来法灭时的情况。“诸行无常”，佛教也不例外。

17问：什么是“因果相续”？

答：因缘所生的一切法，固然是生灭无常的，而又是相续不断的，如流水一般，前前逝去，后后生起，因因果果，没有间断，这是就竖的方面来说的。从横的方面看，因果的品类有种种无量的差别。种种品类差别的因果关系固然错综复杂，但其间又有井然的法则，一丝不乱。一类的因产生一类的果，如善因得善果，因与果相符，果与因相顺；一类的因不能生另一类的果，如种瓜只能得瓜，不能得豆。佛教认为因果的法则是决定的，虽三世（过去、

现在、未来）诸佛也不能加以改变的。这就是“因果相续无间断义”、“种种因果品类别义”、“因果更互相符顺义”和“因果决定无杂乱义”的简单解释。佛教把主张“现象灭了就不再生起”的见解叫做“断见”，也是反对的。关于因、缘、果的分析，佛教有六因、四缘、五果等说法，这里不一一介绍了。

18问：关于上面所说的有关缘起的理论有什么经论可供研究？

答：佛教经论谈缘起道理的地方很多，如上面所说的十一义，出自《分别缘起初胜法门经》（玄奘译），可以一看。又玄奘译的《俱舍论》和鸠摩罗什译的《大智度论》里有关部分，也可以一看。

19问：听了你根据“无造物主、无我、无常、因果相续”四个论点来说明缘起十一义之后，对于缘起的理论，大致有所了解。是否可以说这就是佛教对于宇宙万有的解释？

答：四个论点实际只是两个论点——“无常”和“无我”。“无常”就是生灭相续，它不仅包括“刹那生灭”的意义，而且包括“因果相续”的意义。“无我”就是没有主宰，没有一身之内的主宰，也没有宇宙万有的主宰，所以无造物主的意义，实际包含在“无我”里面。“诸行无常、诸法无我”，是佛教对宇宙万有的总的解释，也可以说，是一切法的总法则。所以“无常”和“无我”的教义被称为“法印”。

20问：“法印”是什么？

答：印就是印玺。国王的印玺可以证明文件的真实（有通行无阻的作用）。借以比喻佛教的主要教义，也以符合“法印”而证明其为真正佛法（掌握了它，便能对一切法通达无碍），所以称为法印。“诸行无常，诸法无我，涅槃寂静”，并称三法印，或者加上“有漏皆苦”，亦称四法印。

21问：请解释一下，“有漏皆苦”的意义。

答：“漏”就是烦恼。佛教认为众生不明白一切法缘生缘灭，无常无我的道理，而在无常的法上贪爱追求，在无我的法上执着为“我”，或为“我所有”，这叫做惑，惑使人烦恼，所以又叫做烦恼。烦恼种类极多，贪（贪欲）、嗔（嗔恨）、痴（不知无常无我之理等等叫做痴）是三毒，加上慢（傲慢）、疑（犹疑）、恶见（不正确的见解如常见、断见等）为六根本烦恼。由于烦恼而造种种业（Kamma），业就是行为（身业）、言语（口业）、思想（意

业)的活动。烦恼和业引生未来或为天人，或为人，或为地狱、鬼、畜生的身心；于是又起烦恼，又造业，又生身心，这样的生死轮回(Saṃsāra)，没有休歇。而生死轮回是苦的。以人生而论，一般地说有八苦：生苦(婴儿在胎出胎时苦)、老苦、病苦、死苦、爱别离苦(与所爱的分离)、怨憎会苦(与所怨憎的聚会)、所求不得苦、五取蕴苦(五取蕴即五蕴，取就是烦恼，人的色受想行识以烦恼为因而生，又能生烦恼，所以叫取蕴。五蕴刹那迁流变坏，为生老病死等苦所集，所以是苦)。总之，佛说世间有无量的苦，苦不是孤立的自己生起来的，也不是造物主给予的，也不是偶然的，而是有因缘的。上面所说因惑而造业，因业而有生死苦，就是佛教对苦的缘起解释。全面分析起来有“十二缘起”。

22问：请简单谈一谈“十二缘起”。

答：佛教的缘起论主要是以人生问题为中心来谈的。对人生问题一般说十缘起或十二缘起。十二缘起是：无明缘、行缘、识缘、名色缘、六入缘、触缘、受缘、爱缘、取缘、有缘、生缘、老死缘。现在简单地解释一下：

(1)老死(Jarā-maraṇa)，这是观察人生的起点，老死忧悲苦恼是人生不可避免的。缘何而有老死忧悲苦恼呢？是由于有(2)生(Jāti)。如果没有生，则没有老死，也没有忧悲苦恼。生的条件虽有种种，但是最重要的条件是(3)有(Bhava)。“有”就是存在的意思。简单地说，身口意所造的善业恶业对招引自己的后果潜伏着一种力量叫做“有”。有了业力为缘，必然有后果的生与死。“有”又是缘什么而起的呢？有的缘是(4)取(Upādāna)。取是追求执着的意思，追求色、声、香、味、触五欲，执着可爱事物为我所有，这叫做取。由于以自我为中心追求执着，就能引发身口意三业的活动。取又以(5)爱(Taṇhā)为缘。爱的简单解释就是生命欲，它是生命活动的本源力。有生命欲才有追求执着，有追求执着才有种种身口意的活动而有业力的存在，招引生死之果。所以爱、取、有同是生死的因。说到这里，已经说明了惑、业、苦的因果关系。为了进一步考察生命欲(爱)之所以发生，则必须说明(6)受Vedanā、(7)触Phassa、(8)六入Saḷāyatana的关系。受是感觉，即对客观境物所起的快感(乐受)、不快感(苦受)或不苦不乐感(舍受)。由于苦乐的感

觉，激发和冲动着生命的欲求。感觉来自外界事物刺激的反应，所以依存于触。触是根、境、识三者会合而有的心理活动的开始。如眼（根）对红色（境）时，红色刺激眼根，因而司掌视觉的眼识生起活动。根境识三者会合，才发生红色的触（反应），所以触依存于六入。六入，就是眼、耳、鼻、舌、身、意的六根，是传递色、声、香、味、触、法（法，即前五种事物遗存下来的印象，是意根的对象）六境的机能。

再进一步考察六入依何存在的问题，因而说到（9）名色Nāma-rūpa。名色的意义前面已经讲过，即身心（色、受、想、行、识五蕴）合成的组织。六根是依存于身心全体组织的東西，有名色所以有六入。名色又以何为缘呢？名色又依存于（10）识Viññāṇa。识虽是名色中一部分，但是如果把名色当作认识体来看，识乃是它的中心的东西。识对境（认识对象）有总了别作用，使境增加明显，使根增长功能，使受、想、思有所领导。所以名色全体的成立，依存于识，但是识又依存于名色。因为有境对根的刺激，和受、想、思的帮助发生，才有识的现起，识不能离开名色而独立。所以识与名色的关系，是互相依存的关系。

以上所说是十缘起，如果就人们现实的活动的条件来观察，十缘起已经全面了，但如果说明生死何以无穷的原由，则又有行和无明二缘，共十二缘起。

（11）行Saṅkhāra，“行”的意义与“有”相同。从现在身口意造作的业来看它潜伏着引生后果的力量叫做“有”，从现在已经成熟的果来看过去所造的业叫做“行”。识与名色，是现在已熟的果，是依存过去的行而生起的。由于过去无始以来“行”的反复，积习成性，隐然有种力量支配着行为，所以生死苦恼现象联绵不断。行又依存于

（12）无明Avijjā。无明是对一切法缘生故生、缘灭故灭、无常、无我的真实相不认识，特别对自己身心只是因缘所生的道理不能自觉，以为其中有常住的、唯一的、作主宰的我。由于“我”的执着，所以对境而有乐受、苦受、舍受，而起贪嗔痴等烦恼，而造种种善恶业。所以人们的生死痛苦的本源毕竟在于无明。

十二缘起归纳起来仍不外乎上面所说的惑、业、苦的关系。无明、行是过去无始以来的惑和业，招致现在识、名色、六入、触、受的苦果；爱、取、有是现在的惑和业，招致未来的生、老死的苦果。这些都是“有漏皆苦”一句所包括的内容，也就是四谛中苦谛和

集谛的内容。

23问：现在请解释一下“涅槃寂静”的意义。

答：“涅槃寂静”和“有漏皆苦”相反。涅槃是无漏，是苦果苦因的消灭，也就是十二缘起法的止灭。十二缘起是根据“此有则彼有、此生则彼生”的道理。十二缘起法的止灭则是根据“此无则彼无、此灭则彼灭”的道理。老死忧悲苦恼，既是由于生缘，消灭生缘则生死忧悲苦恼灭；消灭爱、取、有缘，则生死苦灭。这样推上去直到最后，消灭无明缘则苦果之因“行”灭。无明灭、行灭、识灭，乃至生老死灭，就是涅槃。更明确的来说：凡是属于不清净的污染的缘尽灭，无明转成为不污染的清净智慧，一切法上为清净智慧所照见的实相谛理，这就是涅槃，也叫做“现法涅槃”。涅槃Nibbāna的意义是圆寂，就是说：智慧福德圆满成就的，永恒寂静的最安乐的境界。佛教认为这种境界“唯圣者所知”，不能以经验上有、无、来、去等概念来测度，是不可思议的解脱境界。我前面说过可以把涅槃解释为逝世，其实释迦牟尼三十岁的时候，便已经证得涅槃而成佛，不过当时他的肉体还是过去惑、业之果的剩余，所以称为“有余涅槃”。直到他八十岁逝世，方是入“无余涅槃”。

24问：如何能达到涅槃的境界呢？

答：上面所说关于涅槃的道理属于灭谛。现在你提的如何达到涅槃的境界的问题属于道谛。道谛以涅槃为目的，以生死根本的烦恼为消灭对象，以戒（Sīla）、定（Samādhi）、慧（Paññā）三学为方法。

（1）戒，是防止身口意三业的过失，有五戒、十戒、具足戒三级。五戒（Pañca Sīla）是不杀、不偷盗、不邪淫、不妄语、不饮酒类。这是出家在家弟子共持的戒。十戒是沙弥（Sāmaṇera）持的戒（出家男子受十戒的叫做沙弥，一般是不满二十岁的人，满二十岁才能受具足戒为比丘）。具足戒是比丘、比丘尼持的戒。当初僧伽成立时，没有约制团体的一定规律。其后随着问题的发生而随时制戒，到佛逝世前，已制定了二百多条。南方国家所传比丘戒二百二十七条，我国西藏二百五十三条，汉地二百五十条，大体相同，仅有某些条款分开和合并的不同，汉地比丘尼戒三百四十八条。

（2）定，是精神上既不昏沉（即不瞌睡），又不纷驰的安和状

态。这是印度一般宗教徒所必习的，尤其是佛教徒修持的必要条件。由于定，身心远离爱欲乐触等的粗分别，逐步发得身心轻安，终于能够把心——精神思想集中于任何一境之上，宁静安稳不受扰乱，进而引发一种无漏的智慧。定有世间的四禅和四无色定，有出世间的九次第定、三三昧等。从定而后能引发慧。

(3) 慧，是分别一切法的自相（特殊性）与共相（一般性），通达四谛的道理而有断除迷惑证悟真理的作用。

戒、定、慧三学包括四念住、四正勤、四神足、五根、五力、七觉支、八正道等修行法门，共称三十七道品。这里不一一介绍，仅简略介绍一下八正道：

(1) 正见，就是于一切法上见到无常无我缘起四谛之理而明确认识它，使成为自己的知见；

(2) 正思维；

(3) 正语；

(4) 正业，是使自己的生活行动受正见的指导，使身口意合于法的法则；

(5) 正命，是正当的生活方法，反对诈欺仗势骗夺他财以养自己的邪命生活；

(6) 正精进，使身口意毫不松懈地努力向正见所指的目的前进；

(7) 正念，经常忆念着正见，使正见不忘失而经常现前；

(8) 正定，在正见指导下修习进入无漏清净的禅定。

25问：根据上面所介绍的四谛内容，可不可以说佛教是厌世主义，因为看不出它对世界有任何积极的理想和采取任何积极的手段？

答：从对待有漏的世界来说，可以说是厌世主义，但是佛教当时的创立，反映着对现实生活的不满，它对人间世界也是有一种理想的。例如《增一阿含经》记载，佛陀谈到转轮王统治的社会情况时，他说：那时候世界上土地平整，如镜清明；谷物丰饶，遍地皆生甘美果树；时气和适，四时顺节，人身康乐，少病少恼；富足如意，食不患苦；欲大小便时，地自然开，事已复合；金银珍宝，散在各地，与瓦石同流；人民大小平等，皆同一意，相见欢

欣，善言相向；言辞一类，而无差别。从这段话里面，看出一种类似我国古人大同的理想。为实现这种理想社会的各种努力，就是“庄严国土、利乐有情”。这方面的理论在大乘佛教中特别得到发挥，但为当时各种条件所局限，佛教没有提出政治的和社会的措施。

26问：什么是大乘佛教？

答：大乘Mahāyāna和小乘Hinayāna是佛教的两大宗派。

27问：大乘小乘有什么分别？

答：大小乘的分别，主要在于大乘着重利他（利益大众的行为），小乘着重自己解脱。大乘有不同的经典，在教义上有所发挥和发展。这里可以举几个特点：

首先大乘在灭谛上进一步说“无住涅槃”。从理论上说，十二因缘灭，灭的只是不合缘生缘灭真理的无明烦恼，而不是缘生缘灭的法。“涅槃与世间，无有少分别”。所以到了佛的圆满觉悟的境界，就能不住生死，不住涅槃，就能在因缘生灭的世界中，永无休歇地做“庄严国土、利乐有情”的事，而随时随处安住在涅槃的境界。

其次根据缘起的道理，说明一法以一切法为缘而生起，同时又是生起一切法之缘，所以任何人与一切众生都有同体的关系，好像海里面一个小水泡和整个大海水是同体关系一样。所以说，“一切众生是我父母”，又说“视众生如一子”（独子），这样地兴起大慈悲心（慈是同情人之喜乐，悲是同情人之忧苦），“无有疲厌”地“为众生供给使”。大乘佛教特别发扬这种菩萨行的人生观，并且特别鼓励“六度”和“四摄”的行为。

28问：什么是菩萨？

答：菩萨是菩提萨埵（Bodhisatta）的简称。简单地解释，凡是抱着广大的志愿，要将自己和一切众生一齐从苦恼中救度出来，而得到究竟安乐（自度度他），要将自己和一切众生一齐从愚痴中解脱出来，而得到彻底的觉悟（自觉觉他）——这种人便叫做菩萨。

29问：什么叫做六度？

答：“度”的梵语是“波罗蜜多（Pāramitā）”，字义是“到彼岸”，就是从烦恼的此岸度到觉悟的彼岸的意思。六度是六个到彼岸的方法。

第一是布施（Dāna），有三种：凡以物质利益施与大众的叫作“财施”，包括身外的财物和自身的头目手足和生命；凡保护大众的安全使他们没有怖畏的叫作“无畏施”；凡以真理告知大众的叫作“法施”。第二是持戒（Sīla），戒也有三种，即防止一切恶行，修集一切善行和饶益有情。菩萨最根本的戒是饶益有情戒，就是一切为了利益大众，其余所有戒条都要服从这一条。第三是忍（Kṣanti），即为利益有情故，忍受毁骂打击，以及饥寒等苦，所谓“难行能行、难忍能忍”，终不放弃救度众生的志愿。第四是精进（Vīrya），即不懈怠地努力于自度度他、自觉觉他的事业。第五是禅定（Samādhi），第六是般若（Paññā即智慧），为自觉觉他而修禅定和智慧。

30问：什么是四摄？

答：摄（Saṃgaha-vatthu）的意义就是大众团结的条件。第一是布施；第二是爱语（Peyyavajja），慈爱的言语和态度；第三是利行（Atthacariyā），为大众利益服务；第四是同事（Samānattatā），使自己在生活和活动方面同于大众。四摄法是菩萨在众生中进行工作的方法。

31问：菩萨为了利行同事，是否应当学习世间各种学问？

答：菩萨为了利益众生，必须广学多闻。佛教要求菩萨行者学习五明（Vidyā就是“学”）：

- （1）声明，即声韵学和语文学；
- （2）工巧明，即一切工艺、技术、算学、历数等；
- （3）医方明，即医药学；
- （4）因明，即逻辑学；
- （5）内明，即佛学。

五明是学者必须学习之处。“学处广大，悲心恳切”是菩萨的条件。大乘佛教号召难学能学，尽一切学。

32问：请再讲一讲大乘佛教的其他特点。

答：其次是根据缘起的道理而说法性空。这就是说，一切法既是因缘和合而起，所以都没有实体；换句话说，一切法都只是因缘和合的

现象，在现象上找不到作为主宰的本体。前面所说的“诸法无我”是指人的“我”，现在进一步说法的“我”也没有。前面是破“人我执”，说“人空”；现在是破“法我执”，说“法”空。

33问：佛经中有两句话，“色不异空，空不异色”是什么意思？

答：这就是说一切法“缘起性空”。“色”，就是色、受、想、行、识五蕴中的色，是指物质。任何物质现象都是缘起，它有相状，它有功用，但是它的相状和功用里面没有常恒不变的指挥它的主宰，所以说是空。所谓空，不是指的色外空（物体之外的空），也不是指的色后空（物体灭了之后的空），换句话说，并不是离开色而另外有一个空，而是“当体即空”。色是缘起所起，色法上不能有个不变的实性，所以说“色即是空”；唯其没有实性，所以能遇缘即起，所以说“空即是色”。这也就是“色不异空，空不异色”的简单解释。

受、想、行、识等精神现象也同样地是缘起性空。“缘起性空”是宇宙万有的真实相状，即所谓“诸法实相”。大乘佛教以实相为法印，称为“一法印”，一切大乘经教，都以实相的道理来印证。如前面所说“无住涅槃”和“菩萨六度四摄”等教义，都是以缘起性空的理论为基础的。

34问：关于大乘佛教的特点还有什么可以介绍的吗？

答：上面所说的是大乘佛教各宗派的几个共同的特点。各宗派又有其特点，这里就不谈了。

35问：佛经是释迦牟尼亲自写的吗？

答：不是，是佛逝世后，他的弟子记诵出来的。佛逝世的那一年，佛的弟子，以摩诃迦叶为首的五百人集会在王舍城外的七叶窟，将佛一生所说的言教结集起来，以传后世。当时由阿难陀诵出佛所说的经（Sutta）；由优波离诵出佛所制的僧团戒律（Vinaya）；由摩诃迦叶当时诵出，后来又补充结集的关于教理的解释和研究的论著（Abhidhamma）。经、律、论为三藏Tipiṭaka。藏的原语Piṭaka，是一种可以盛放东西的竹筐。把经、律、论分为三藏，同我国把经、史、子、集分为四库有差不多的意思。这一次结集称为第一结集。照我国通常解释，结集两个字含有编辑的意义。但这个字的梵文Saṃgīti（巴利语同）却是僧众大会的意思。古代译

师用结集二字是含有“会诵”的意思，一方面固然着重在法的结集，同时也包含着人的结集的意思在内。这时还没有用文字记录，只凭口头传诵。

36问：第一次结集之外，还有其他结集吗？

答：当时除在七叶窟的五百比丘外，还有未加入摩诃迦叶团体的许多比丘，以跋波（Vappa最初五比丘之一）为上首，在窟外不远的地方另行结集。所以王舍城结集分窟内窟外二部。所结集的都是小乘三藏。大乘三藏相传是文殊师利（Mañjuśrī）、弥勒（Maitreya）等菩萨和阿难陀等在铁围山结集的。小乘佛教则不承认大乘经典是佛所说。

37问：缅甸前几年举行第六次结集，是怎么一回事？

答：佛逝世一百十年后，在毗舍离国僧团中有关于戒律上的争论，于是长老（僧龄高的称长老）耶舍（Yasa）召集七百位学德兼优的僧众，依据律藏，断定当时争论问题中有十件事为非法，这是第二次结集。

根据南方佛典记载，佛逝世二百三十五年后，阿育王时代，有很多外道（佛教之外的教派）的人混入佛教徒中，混乱了教义，于是在阿育王支持下，以国师目犍连子帝须（Moggaliputta Tissa）为首的一千比丘在波吒利弗城（Pāṭaliputta，即今天印度比哈尔省省城八纳Patna）诵出三藏，以清除外道掺杂进去的东西，这是第三次结集。

根据北方佛教记载，佛逝世后四百年左右，在大月氏国迦腻色迦（Kaniška）统治西印度时代，以世友菩萨（Vasumitta）为首的五百比丘造论解释三藏，共三十万颂，九百多万言，其中一部就是《大毗婆沙》（Mahāvibhāṣā），是一部重要的论。这是第四次结集。

距今八十多年前，缅甸明顿王邀集众多比丘校勘巴利文三藏，并将三藏全文和校勘记刻在石碑上，现仍保存在曼德勒城。他们称为第五次结集。

1954—1956年缅甸联邦政府为了纪念释迦牟尼佛涅槃二千五百年，发起第六次结集，邀请缅甸、柬埔寨、锡兰、印度、老挝、尼泊尔、巴基斯坦、泰国等国的比丘二千五百人参加。他们进行

了两年工作，根据各国的各种版本和明顿王第五次结集的校勘记，对巴利文三藏进行严密的校勘，印成了最完善版本的巴利文三藏。被称为“第六次结集”。

38问：什么是巴利文？

答：巴利（Pāli）是古代印度一种语言，是佛陀时代摩揭陀国一带的大众语。据说佛就是用这种语言说法的，所以弟子们也用这种语言记诵他的经教。巴利语虽然早已不通用了，但是靠了佛经而保存了下来。巴利就是经典的意思。古代印度人民有一种传统习惯，就是把典籍用口口相传的方式背诵下来，而不重视书写。根据《锡兰岛史》记载，公元前一世纪时候，才在锡兰开始传写。到公元五世纪，摩揭陀国三藏法师（通达三藏学者的称号）觉音（Buddhaghosa）到锡兰，重新用锡兰的僧伽罗文字母把巴利文三藏全部记录下来（一说觉音在锡兰时将当时保存很多的用僧伽罗文写的注疏译成巴利文）。原来的巴利文字母已经不存在，现在缅甸、柬埔寨、泰国的巴利文三藏也都是用他们本国字母记录的。最近印度也正在从事用印地文字母记录并印行巴利文三藏的工作。

39问：除巴利文之外，还有哪几种文字记录的佛经？

答：还有梵文（Sanskrit）。佛教分南传和北传，传到南方去的用巴利文，是小乘佛教经典；传到北方去的用梵文，多数是大乘佛教经典，也有小乘经典。巴利语是古代俗语，梵文则是古代雅语。

40问：中国汉译、藏译佛教经典是从巴利文翻译的，还是从梵文翻译的？

答：汉译佛经，从梵文翻译的居多，也有从巴利文翻译的。藏译佛经则似乎全是从梵文翻译的。

41问：现在佛经一般有几种文字？

答：许多国家都用他们自己的文字翻译了佛经。欧洲有俄文、德文、英文、法文、意大利文、芬兰文等，但是都不齐全，其来源不外乎三大系：（1）巴利文，（2）汉文和（3）藏文。梵文经典现在残存的已很少，尼泊尔和我国西藏还有部分古梵文本留存。北传佛教经籍，大部分保存在我国汉文和藏文藏经里。

42问：世界佛经是否可以按照语文分为三大系？

答：三大系的划分，是合乎实际情况的。现在佛教界都承认三大系的说法。一般说来，南方国家斯里兰卡、缅甸、柬埔寨、老挝、印度、巴基斯坦、泰国和我国云南省傣、崩龙 [1]、布朗等民族的佛教属于巴利语系，是小乘佛教，比较精确的说，应当称为上座部佛教（Theravāda他们自称的派名）。大小乘过去一直有宗派争执，近来渐有融合的倾向。为了加强各国佛教徒和人民的团结和互相尊重，有许多人主张不再用大小乘的名称，因此称南传佛教为上座部佛教较为合适。我国汉族和朝鲜、日本、越南的佛教属于汉语系。我国藏、蒙、土、羌，裕固等民族以及蒙古、苏联西北利亚 [2] 地方和印度北部地方的佛教属于藏语系。这两系都属于大乘佛教。

43问：汉译三藏有多少卷？

答：有1,692部，共6,241卷，此外中国学者撰述收入藏内的有一千多卷。明代嘉兴版大藏经又收集中国学者撰述5,600卷编为续藏。近代日本也编印续藏，收集的也都是中国撰述的，共1,750部，7,140卷。

44问：汉文大藏经有多少版本？

答：我国第一次刻本汉文大藏经是公元971年宋开宝四年刻本。在此以后，历宋、辽、金、元、明、清几个朝代，一千年之间先后有二十余次刻本。1936年在山西赵城县广胜寺发现金代（公元十二世纪）刻本大藏经，因此称为赵城藏。日本帝国主义侵略中国时，企图劫走这部法宝，为八路军抢救，牺牲了八位战士，才保护下来。这部经现藏在北京图书馆。西安开元、卧龙寺藏有宋刻（公元十二世纪）碛砂版藏经，近代有影印本。明代政府刻的南本大藏经（1372年开始在南京刻的）和北本大藏经（1410年开始在北京刻的），还有万历年间刻的方册大藏经（通称嘉兴藏）现在还有留存。清代雍正、乾隆年间（1735-1738）刻的大藏经（通称龙藏），尚有经板留存。

我国敦煌石窟所藏晋、魏、隋、唐人的写经，自二十世纪初被发现后，很大部分被盗劫到国外，都是贵重的法宝，北京图书馆还藏有八千多卷。我国还有很多石刻佛经，最重要的是房山县石经山上的石经。那是公元七世纪初我国隋代静琬法师开始刻的，一直继续了千年之久。所刻经板，封存在九个石洞里和埋藏在塔下。

1956年，中国佛教协会在政府支持下，费了两年时间，将那里的经板全部取出拓印了七份，现正在整理和研究中，计划经一千余部，近三千五百卷；并考证发现辽刻石经是以《契丹藏》为底本，也就是久已失传的《契丹藏》的复刻。房山石经是一部稀有的法宝。

⁴⁵问：藏文大藏经内容请介绍一下。

答：藏文大藏经分两部分：（1）正藏，名“甘珠尔”，“甘”的意思是“言教”，“珠尔”是翻译，就是言教的翻译，包括经和律，因为经和律都是佛的言教；（2）副藏，名“丹珠尔”，“丹”的意思是论著，就是论著的翻译。甘珠尔共1,108部；丹珠尔共3,459部。

⁴⁶问：藏文大藏经有无刻本？

答：公元十三世纪初年在奈塘刻的大藏，称为奈塘版，是第一次刻本。十五、六世纪明代曾翻刻过两次。十七世纪清康熙、雍正年间在北京翻刻一次，称为北京版，同时西康等地又各翻刻为德格版、卓尼版等。西藏在雍正八年到十年重刻奈塘新版，大体与北京版一致而增订其未尽善之处。约在1921年间十三世达赖喇嘛重刻大藏经，称拉萨版。最近日本印行的西藏大藏经，就是北京版的影印本。

⁴⁷问：巴利文三藏内容是什么？

答：巴利文经藏分五部：

- （1）长部（Dīgha-nikāya），相当于我国长阿含经；
- （2）中部（Majjhima-nikāya），相当于我国中阿含经；
- （3）相应部（Saṃyutta-nikāya），相当于我国杂阿含经；
- （4）增支部（Aṅguttara-nikāya），相当于我国增一阿含经；
- （5）小部（Khuddaka-nikāya），我国缺。

我国小乘经藏只有四阿含（Āgama的字义是集，就是佛的言教集）。

巴利文律藏分三部：

- （1）分别部（Sutta-vibhaṅga），是戒的条文；

(2) 犍度 (Khandhaka)，是僧团中一切生活制度；

(3) 附篇 (Parivāra)，是戒条的解释。

巴利文论藏有七部论；

(1) 法聚论，

(2) 分别论，

(3) 界论，

(4) 双论，

(5) 发趣论，

(6) 人施設论，

(7) 论事。

这七部论是关于心理状态，宇宙万有的分析，因果论等重要著作。

⁴⁸问：费了你很多时间。关于佛法基本内容和关于佛教经籍的一些主要情况都承你作了介绍，现在就谈这一些，以后再请教。

答：不见得能够满足你的要求，只能说是提供一些初步材料罢了。

[1] 崩龙族 (Benglongzu)，德昂族的旧称。

[2] 西北利亚 (Siberia)，现通用译名为“西伯利亚”。

3 THE SAṄGHA AND THE BUDDHA'S DISCIPLES

¹Q: Why do some Buddhists need to renounce the lay life?

A: Before answering this question, it is necessary to explain the Buddhist doctrine of Pañca-yāna (Five Vehicles). Yāna means a vehicle which can carry passengers to their destinations, far or near. It is used here as a metaphor of the Buddha's teachings. The doctrine of Pañca-sīla (Five Pre-cepts: abstaining from taking life from sentient beings, taking things not given, sexual misconduct, false speech, the use of intoxicants) enables the practitioners to be reborn in the human world, so it is called Manussa-yāna (human-vehicle). The doctrine of Dasa-kusalānī (Ten meritorious acts—avoidance of the ten evils: 1. killing, 2. taking things not given, 3. sexual misconduct, 4. irresponsible speech, 5. speech inciting discord, 6. harsh speech, 7. licentious talk, 8. covetousness, 9. anger and 10. heterodoxy, i.e. denial of the doctrine of cause-effect) enables the practitioners to be reborn in heaven, so it is called Deva-yāna (heavenly vehicle). The doctrine of Four Noble Truths (ariya-sacca, namely, the truth of Suffering, of the Origin of suffering, of the Extinction of suffering, and of the Eight-fold Path leading to the extinction of suffering) enables the people to discard wrong views (diṭṭhānusaya or micchā-diṭṭhi) such as ego-illusion (atta-diṭṭhi), eternity-belief (sassata-diṭṭhi), annihilation-belief (uccheda-diṭṭhi), etc., and defiled thought (micchā-saṅkappa) such as greed (lobha), hatred (dosa) and delusion (moha), finally, to attain nibbāna(enlightenment). So it is called sāvaka-yāna (voice-hearer vehicle). Voice means the Buddha's teachings. Those who hear the Buddha's teachings, realize the Four Noble Truths and are free from sufferings are called sāvakā. Before the advent of the Buddha-Dhamma, people who independently came to the

realization of the Theory of Paṭiccasamupāda (Dependent Origination) and obtained emancipation, but were unable to speak out their self-enlightened truth were called Pacceka-Buddha (Independently Enlightened One). That is why the Dhamma of Dependent Origination is called the vehicle of self-enlightenment (pacceka-yāna). The doctrine of Six Perfections (cha pāramitā) enables the practitioners to act in the way of Bodhisatta, to undergo the countless difficulties and hardships in cycles of birth and death, and to finally attain Buddhahood. So this teaching is called the vehicle of Bodhisatta (Bodhisatta-yāna).

²Q: What is the relation between the doctrine of Five Vehicles (Pañcayāna) and renunciation of the world (pabbajjā)?

A: The Human Vehicle and Heavenly Vehicle do not require leaving home. The Pacceka Buddhas (self-enlightened ones), living in the absence of the Buddha Dhamma, led lives of hermits in the mountains and forests, but went through no ceremony of renunciation. As for Bodhisattas, some lived at home, and some did not. In their case, it is not necessary to leave home. Whether or not they leave home depends upon the conditions (hetu-paccaya) of their maintaining the Buddha Dhamma and benefiting all living beings. For example, at the time of Sākyamuni Buddha, both Bodhisattas Mañjuśrī and Maitreya (P. Metteyya) were Bhikkhus, whereas Vimalakīrti, though a great Bodhisatta, was a layman (a scholar studying Buddhism at home). So it is only in sāvaka-yāna those who seek to achieve Nibbāna by becoming Arahats need to leave home and lead a homeless life.

³Q: What does Arahāt mean?

A: Arahāt is the status attained by a Buddhist practitioner upon enlightenment. There are four stages to reach this goal: The first stage is to dispel wrong views. That is called Sotāpanna (the fruition of stream winning), i.e. the initial fruition. The second stage, Sakadāgāmi (the second fruition of once return), and the third, Anāgāmi (the third fruition of non-return) are gradually reached by casting off erroneous thought according to their

different dimensions and subtleties. When the fourth stage of Arahat is reached, both wrong views and erroneous thought have been completely wiped out and Nibbāna attained. Such an Arahat is worthy of receiving offerings from man and deity alike. So, one of the meanings of Arahat is "deserving offerings". It is the highest status attained by Sāvakas.

⁴Q: Why does the Voice-hearer Vehicle (sāvaka-yāna) require renunciation?

A: According to the doctrine of Voice-hearer Vehicle, due to numerous obstacles, it is more difficult to cultivate oneself intently and purely at home. Such a practitioner can only achieve the initial fruition of casting off wrong views theoretically, or at most, achieve the third fruition by casting off misleading thoughts of the sensuous world (kāmaloka), and he can never achieve Nibbāna in this life. A homeless life is free and detached. It is easier to concentrate one's mind and energy on self-cultivation to achieve the state of egolessness (anattā) and desirelessness. So it is impossible to attain the status of Arahat without renunciation of the home life.

⁵Q: Was the institution of renunciation initiated by Buddhism?

A: No, it was not initiated by Buddhism. By the time of the Buddha, religious mendicancy (paribbājaka) had become common practice in India. But as a prince, the Buddha's renunciation set an example to inspire his followers to discard the attachment to home life. Therefore, there are those who renounce home life and become itinerant or monastic disciples, both male and female, as well as lay followers, both male and female among Buddhists. The itinerant or monastic Buddhists are generally called Buddhist monks or nuns (Bhikkhus and Bhikkhunīs).

⁶Q: Do Buddhist monks and nuns constitute a clergy?

A: Buddhist monks and nuns are merely those who renounce the world to cultivate themselves only for the sake of emancipation. They are not intermediaries between deities and human beings. As

a Buddhist monk, he should not and can not bless, or prevent disaster befalling human beings, nor can he grant blessing or exemption from punishment on behalf of any deity.

⁷Q: What style of life should a Buddhist monk (or nun) maintain?

A: According to the Buddha's rules, a Bhikkhu should lead a pure and frugal life, and strictly observe the precepts of abstaining from killing, stealing, sex (including sex with his former wife), irresponsible speech, speech inciting discord, harsh speech, lewd talk, alcoholic drinks, taking untimely food (i.e., taking food after noon), the use of perfumes and adornments, singing, dancing and watching others sing and dance, sitting or sleeping on high luxurious seats or beds, accepting treasures like gold, silver, elephants, horses, etc. He should not own private property except robes, alms bowl, razor, water-filter, needle, and thread and such necessary articles, nor should he do business, fortune-telling, displaying of magic wonders. He must not confine, plunder or threaten others and must observe some other prescriptions as well. During the six daily periods (three for day, i.e. morning, noon, dusk; and three for night, i.e. nightfall, midnight and dawn) he should devote all his time to the zealous pursuit of study and cultivation after allowing time for sleeping, alms begging, eating, drinking, sweeping and cleaning, and water carrying.

⁸Q: What are the contents of the study and cultivation?

A: The contents of the study of Dhamma and the practice of meditation (bhāvanā) are simply the 37 requisites for enlightenment (Bodhipakkhiya-dhamma). The basic practice among the 37 is the "Four Stations of Mindfulness" (cattāro satipaṭṭhānā), i.e. contemplation of the four views: the body is impure, feelings are suffering, mind and mind-objects are impermanent, every dhamma is without self. Prior to the practice of contemplation of the Four Stations of Mindfulness, the beginners should first learn the five systems of meditation, namely, contemplation of impurity (asubhā-bhāvanā), contemplation of mercy (mettā-bhāvanā), contemplation of cause and effect

(nidāna-bhāvanā), contemplation of distinction (vibhaṅga-bhāvanā), and contemplation of breath (ānāpāna-sati). In sum, there are many ways to practice concentration and wisdom (samādhi and paññā), which need not be expanded upon here.

⁹Q: Are Buddhist monks (or nuns) obligated to serve the lay Buddhists in any way?

A: Generally speaking, the Buddhist monks and nuns serve as models of moral virtue for the laity; advise them to do good and to avoid evil; preach the Buddha Dhamma to them; console the sick and the poor and if necessary, participate in the relief work for people in calamities; be merciful and benevolent to promote the welfare of all beings.

¹⁰Q: As you have said, the practice of renunciation was encouraged in Buddhist circles. Is it then the Buddhist ideal to call for everybody to do the same?

A: In terms of Buddhist doctrine and institutions, renunciation should be only for a minority of Buddhists. Firstly, their motives for renunciation and cultivation must be pure and genuine, seeking for deliverance and forsaking worldly craving (tanhā) with determination. Secondly, after renouncing the world, they are required to live up to the standard both in doctrines and in conduct. If they have the desire to get married, they should go back to laity voluntarily. Once they break the four fundamental rules (Pārājika) against murder of a human being or abetting a murder, theft, sexual intercourse and exaggeration of one's supernatural power, they should be ostracized from the Saṅgha Order. Thirdly, there are many restrictions for renunciation. The candidates, for instance, should have their parents' permission, should be over 20 years of age (for ordination of Bhikkhu and Bhikkhuni), should not be deformed or mentally deficient, should not be escaping criminal penalty or debt liabilities, etc. Fourthly, higher ordination (Upasampadā) must be recommended, certified and approved by a council of more than ten elder Bhikkhus (Theras), each with 10 years or more of Upasampadā. On the other

hand, it is much easier to return to laity, one needs only inform another monk or nun. The Buddhist community is composed of four groups: male and female monastic orders with the responsibility of maintaining the Buddha Dhamma, and male and female laity with the duty of protecting and bolstering the Buddha Dhamma. Together, they form a dual congregation. Therefore, Buddhism does not require everybody to renounce his lay life. Many of the Buddhist scriptures, particularly those of Mahāyāna, such as *Vimalakīrti-nirdeśa* and *Upāsaka-sīla-sutta* are eulogies of laymen who undertake Buddhist practice at home.

¹¹Q: What are the prerequisites for the followers to practice Buddhism?

A: The prerequisites for lay followers are to take refuge in the Three Gems (Tiratana), being firmly convinced that the Three Gems, namely, Buddha, Dhamma and Saṅgha, are the only resort to turn to and rely on physically and mentally. Nor should they turn to other religions or gods as their refuge. Next, they should observe the Five Precepts (Pañca-sīla) and Eight Precepts of Uposatha. Uposatha means fasting or abstinence on certain days every month, that is, refraining from: eating after midday; using perfume and wearing adornments; singing, dancing and watching entertainment shows; and sitting or sleeping on high comfortable beds. The dates of fasting are generally set on the 1st, the 8th, the 14th, the 15th, the 23rd and the 29th of the lunar calendar. Taking refuge in the Three Gems (Tiratana), observing the Five Precepts (Pañca-sīla), practicing Uposatha, striving to do good for others and keeping one's own body and mind pure—all of these are the demands for self-cultivation for lay Buddhists. In reality, some fall below the above standards and some surpass them. The Buddha taught a lot of worldly laws (loka-dhamma) to the lay followers. For instance, he explained in detail to Siṅgālaka (in Siṅgālovāda Sutta) how to properly deal with relations between parents and children, between mentor and disciple, between husband and wife, between friends, between master and servant and between Saṅgha

and laity. He also talked to a young man Dīghajāṇu (or Ujjaya) about the four ways of seeking comfort and balance (Cattāro Dhammā), namely, Uṭṭhānasampadā (perfection of professional training), Ārakkhasampadā (protection of one's own property, frugality without waste), Kalyāṇamittatā (making worthy friends), and Samajīvitā (leading a decent life). He also talked to the kings (rājas) of his time about how to deal with problems of domestic politics and good-neighborly relations. The Mahāyāna codes, on the other hand, discourse generally on how lay Bodhisattas should practice the Six Perfections (cha-pāramitā), Four Embracing Dhamma (Cattāri saṃgaha vatthūni), and so forth.

¹²Q: Admission to the Saṅgha Order actually is not always as strict as you described above, is it?

A: In fact, in certain periods and in certain regions, there has been excessive acceptance of disciples and indiscriminate ordination of Saṅgha. This has long caused apprehension in the Buddhist circles of China. History shows that the most flourishing periods of Buddhism have not been the times with the largest number of monks. On the contrary, periods with too many monks were usually times of the decline of Buddhism. For instance, in the early Tang Dynasty a large number of monks were dismissed. At the time of Dhammācariya Xuanzang, the conditions for renunciation and ordination were very strict. Candidates were required to pass examinations. Even Xuanzang himself had to undergo difficult procedures to fulfill the qualifications to be a monk. Yet it was precisely at that time, Buddhism came into its most splendid era. The same was true not only in China, but also in other countries. In the 15th century, for instance, there was a high monk named Dhammasiddhi in Myanmar who later returned to lay society and became a king. In view of the excessive number of monks, he issued an edict ordering that all monks of the country should be reordained. Owing to his rigorous reformation, the number of Buddhist monks in Myanmar was reduced from a few hundred thousand to ten thousand or so. All the rest, unable or unwilling to

meet the requisite qualifications for being reordained, were forced to leave the Saṅgha. Buddhism in Myanmar thus came to a renaissance. This instance indicates that Saṅgha should not be developed unrealistically.

¹³Q: It is said that in some countries, every one is obliged to experience monastic life once in his lifetime. Is that true?

A: Yes, it is a custom prevailing in Myanmar, Thailand and some other countries. So it was formerly in the Dai-inhabited region in China. But it is not a regulation laid down by Buddhism. In these regions, children of seven or eight years of age are usually sent by their parents to temples where they learn to read Buddhist scriptures and lead a monastic life. After a certain period, they can return to the lay life. The duration of their stay in the temple varies from only a few days to a few months, or even a few years. One who has not undergone monasticism during childhood is required to do so for some period during adult life. Unlike the volunteers who determine to renounce the lay life for a long time, these temporary practitioners do not receive pabbajjā (junior ordination) as sāmaṇeras (novices).

¹⁴Q: Is it true that Japanese monks may get married?

A: Originally, Japanese monks did not have wives and children. In 12th century, Shinran (親鸞), the founder of Jodo Shinshū (the True Sect of Pure Land)—a branch of the Pure Land Sect, advocated that people could take up Buddhist practice along with their wives. This initiated a way of life among monks of getting married and having children. But for centuries, this custom was confined to this sect alone. After the Meiji Reformation (1868), the custom of marriage became popular among other sects of the day. Today with the exception of a few monks of minor sects, who keep celibacy, the overwhelming majority of monks get married, their Buddhist profession passing on to their offspring. Thus the institution of popularizing the Buddhist cause by lay Buddhists came into existence. However, this state of affairs applies to male priests only, while the nuns in Japan today continue to lead

monastic life with abstinence as before.

¹⁵Q: Why are the Buddhist monks termed "Heshang" in China? What does it mean?

A: The word "Heshang" was derived from the Sanskrit Upādhyāya, (P. Upajjhāya), meaning teacher or mentor. The word was pronounced as Pwājḥhaw or Khosha in the regions to the West of China. From there to the Han-inhabited area it was changed into Heshang. Originally it was an honorable title only for those who were capable to be masters, and not to anybody else. This title at first had not been confined to Buddhist monks but might equally be applied to qualified Buddhist nuns. Later on, this word came to be used to address any male who is leading a monastic life. It is not in conformity to the original meaning.

¹⁶Q: What is the meaning of "Lama"?

A: "Lama" is a Tibetan word, with the same meaning as "Heshang". This word was misused too since it, in its original sense, was not applicable to everyone leading a monastic life. Properly speaking, the title for those who have received ten precepts (pabbajjā) is Sāmaṇera, while for those who have been given the higher ordination (upasampadā) it is Bhikkhu; in the same way, the title for female acceptors of ten precepts is Sāmaṇerī and for the female acceptors of the higher ordination it is Bhikkhunī.

¹⁷Q: In the Han regions, monks are usually called "Seng", and nuns "Ni". Are they correct titles?

A: "Seng" is an abbreviated form of Saṅgha meaning community. Saṅgha is a congregation of Buddhist monks and nuns, with at least four members. So an individual can not be entitled Saṅgha, but only a Saṅgha member, just as a single soldier can not form an army, but only be a military man. Both monks and nuns are included in the Saṅgha, they are Saṅgha members. It is a mistake to distinguish between monks and nuns in terms of "Seng" and "Ni". As to the term Ni (nun), it derived from the suffix of Bhikkhunī, being an abbreviation for the Buddhist nuns by the

Han people of China. Another common term for them is "Ni-gu".

¹⁸Q: What is a Dhammācariya?

A: Dhammācariya was originally the title of an academic degree, conferred on those with a comprehensive knowledge of the Buddha Dhamma and capable of preaching it. It should not be applied to any one else. There are other high degrees: Suttācariya for those who have mastered Sutta-piṭaka, Vinayācariya for those with mastery of Vinaya-piṭaka, and Abhidhammācariya for those with a thorough knowledge of Abhidhamma-piṭaka. Even higher is the Tipiṭakācariya—the title for those with a comprehensive mastery of the knowledge of all the three piṭakas (Tipiṭaka). Both Xuanzang and Yijing in the Tang Dynasty were awarded the title.

¹⁹Q: What is a Living Buddha?

A: In Mongolian and Tibetan Buddhism, those who achieve exceptional cultivation and are able to reincarnate (get rebirth) according to their own will are called "hpbrulsku" (Tibetan) or "Hobilghan" (Mongolian) meaning reincarnater or incarnation. In the Han-inhabited regions, however, they are commonly called Living Buddhas. The title probably has something to do with the fact that the emperors of the Ming Dynasty conferred the title of "Western Buddha of Great Goodness and Freedom" on Dhammarāja (religious leader) of the Bkah-brgyud-pa Sect who was the ruler of Tibet at that time, and that the same title was conferred on the Dalais by the emperors of the Qing Dynasty. In fact such titles do not make sense according to Buddhist doctrine. Besides, there is no such term as Living Buddha in Tibetan and Mongolian Buddhism. Similarly, the Buddhist Bhikkhus of Dai nationality are called by Han people "Foye" (Buddha). This is a misnomer and is not used by the people of Dai nationality themselves.

²⁰Q: What is Saṅgha-rāja?

A: In certain countries such as Thailand, the Saṅgha leader elected by the nation is called King of Saṅgha (Saṅgha-rāja). In Sri Lanka, a Mahā-nāyaka is elected from each Buddhist sect, and a Nāyaka

from each province or municipality. The Saṅgha-rājas or Mahā-nāyakas administer national Buddhist affairs, while the Nāyakas administer local Buddhist affairs.

²¹Q: Why is it necessary for monastic Buddhists to have congregations of Saṅgha?

A: For an individual monk or nun, it is necessary to lead a collective life in the Saṅgha in order to learn from and help each other. Buddhism, as a whole, also needs congregations to undertake the responsibility of "maintaining the Buddha Dhamma". The Saṅgha has been playing such an important role in the Buddhist cause that it is called one of the Three Gems (Tiratana).

²²Q: Are there any principles and systems in the organization of the Saṅgha?

A: There are six principles known as "the six points of harmony (or unity)", i.e., harmony or unity among disciplines, harmony of views, of interests, in bodily actions, in speech and in mind. To explain briefly, the six points mean: (the Saṅgha as a whole is) to observe identical commandments, to hold same views when studying side by side, to share equally in the community's goods, to help each other in daily life, to mutually advise to do good and to avoid mistakes, to fraternally love and respect each other in matters of faith. Through these six, the harmony and unity of the whole Saṅgha can be reached. In order to carry out the above six principles, the Buddha devised a number of rules or regulations for the Saṅgha.

²³Q: What are some of the important rules?

A: The most important is the Vinaya rules of Kamma. Kamma originally meant action. Since among Saṅgha, everything is settled through Saṅgha meetings, so its complete meaning is "action (or settlement of things) through Saṅgha assembly". For example, if there is something to be done, all the monks in a certain area should gather together to discuss and make a decision. Those who are unable to attend the meeting due to illness or other

engagements have to send word through others to ask to be excused and signify willingness to accept the decision of the meeting. Prior to the meeting, presiding chairman (master of Kamma) inquires if all monks have come and if any novice or non-ordained (who is not supposed to attend the meeting) are present. The meeting can not be opened until all the monks are present and outsiders excluded. Then the opening address is made, and purpose and proposals of the meeting are tabled for the participants to discuss and decisions are finally made by voting. Voting is generally by oral consent. Those in agreement would remain silent, while those in dissent would speak out their opinions. If all remain silent, the proposal is passed. On some matters, decisions are made by going through the procedure just once. For more important issues, the procedure must be repeated twice for a decision to be made. As to even more important issues (such as ordination or punishment), the procedure must be gone through three times for a decision to be made. Finally the presiding chairman says: "Inasmuch as all monks remain silent, the resolution is passed." Another way of voting is to cast chips (using differently colored bamboo chips to signify for or against, equal to casting ballots). Some Buddhist Canons, with full descriptions of these regulations, are the oldest laws on conference in the world, and are an important creation and contribution of Buddhism.

²⁴Q: Are there regular meetings of the Saṅgha?

A: A recitation assembly (Upasatha Kamma) is held every half-month. The monks assemble to recite the text of precepts (Pātimokkha), and to examine, according to Vinaya, everyone's conducts in the past fortnight. The procedure is through confession and exposure by others. At the end of the annual rainy season retreat, a ceremony known as Pavāraṇa is held. Pavāraṇa means satisfaction with self-criticism and others' exposure. By this means, each expresses repentance for his own faults. It is, in fact, also a meeting for reviewing the monastic life. As to consultation on other matters, meetings are called whenever necessary.

²⁵Q: Is it correct to say that Sākyamuni adopted certain institutional aspects of the primitive commune into the Saṅgha community?

A: It is a tenable position given its democratic system and the system of financial distribution (equally sharing community property without personal possession). During the early days of the Saṅgha, Bhikkhus were not engaged in production. However, in the Han-inhabited regions of China monks are used to being engaged in farm work, and advocate a combination of farm work with Buddhist practice. This is an excellent feature of the Chinese Saṅgha.

²⁶Q: Is the kamma system still in operation now?

A: Both Uposatha and Pavāraṇa systems are still in practice in the southern Buddhist nations. So are other kammic ceremonies, such as the Ordination Kamma. Yet it seems that, for the most part, they are preserved as religious rites. Today in China, there are also some temples which still maintain the systems of Uposatha and Pavāraṇa. But the democratic spirit of the kamma has long been lost owing to the fact that a number of feudalistic systems were introduced into the monasteries during the long period of feudalism, particularly owing to the fact that the monastery rules (Conglin Qinggui) were revised and enforced by the feudal court in accordance with their needs.

²⁷Q: What is the meaning of "Conglin Qinggui"?

A: The original meaning of "Conglin" is grove or forest. A thickly populated monastery is just like a forest with plenty of trees, so it is called "conglin", meaning great monastery (Mahāvihāra). "Qinggui" means the rules or regulations daily observed by the monks or nuns in monasteries, which are laid down according to the Vinaya enacted by the Buddha and adapted to prevailing conditions, including climate, geography, social customs, laws and regulations of the state, as well as sectarian characteristics, etc. The earliest monastery rules in China were initiated by Dao'an of the Eastern Jin Dynasty in the 4th century. After that each sect in

subsequent dynasties created its own monastery institutions. For example, in the Tang Dynasty a set of codes for monks of the Zen School was created by Master Baizhang. Then it was lost. Later on, a "Royal Revised Baizhang Code" was created by an emperor of the Yuan Dynasty. This was actually in conformity with the need of feudal rulers, and had nothing to do with Baizhang himself. Subsequently this code was enforced by imperial orders through the Hongwu and Yongle Eras of the Ming Dynasty, and became a universal system observed by all monks and nuns throughout China, in place of all sorts of original monastic regulations and codes.

²⁸Q: Would you please give some account of the etiquette and life style of a monastic community?

A: These were stipulated in detail in the Vinaya text. Many stipulations have been preserved intact by Buddhist communities in the southern countries, while in the northern countries, owing to climatic, conventional and other differences as well as historical transitions, the monastic life has undergone a lot of changes. Details are not easy to list here. If you have specific questions, we can talk about them briefly.

²⁹Q: What is the etiquette between senior and junior monks?

A: In the monastic community, senior or junior does not refer to older or younger in age, but the number of years since ordination. The title "Thera" (Elder) is conferred on Bhikkhus 10 years after ordination, and "MahāThera" 20 years after ordination. Juniors should salute seniors. Seniors precede juniors while walking along. As to sitting, the upper seats are given to the seniors and the lower seats to the juniors, and juniors should not sit unless asked to sit by seniors. So in the southern Buddhist countries, the inquiries about ordination time are necessary for monks when they meet each other. Normally when ordinary bhikkhus meet a MahāThera, they are required to take off their shoes, and expose their right shoulders, and then make salutation.

³⁰Q: What is the etiquette of lay Buddhists towards monks and nuns?

A: In the southern countries, when a lay Buddhist enters a monastery or a monk's room he should take off his shoes before worshipping bhikkhus. At the bhikkhu's request to sit down, he should take a lower seat or sit on the ground, and he must not sit on the bhikkhu's bed. He should not eat together with bhikkhus at the same table. If a bhikkhu comes to a layman's home, the host should place a piece of clean cloth over the chair, and invite the former to sit down before salutation. Even if a son becomes a bhikkhu, his own parents should salute him likewise. According to the Southern Buddhist customs, whatever the occasion, when a lay Buddhist comes to visit or enters the meeting hall, the bhikkhus never stand up, nor do they return the greetings, or sometimes they merely say "good luck". When offerings are given to them, they do the same. Likewise, senior bhikkhus do not return the greetings from junior bhikkhus and sāmaṇeras. In China, bhikkhus may return the greetings from lay Buddhists or junior bhikkhus and sāmaṇeras by bringing their palms together in courtesy, and ranking of seats is not strictly observed, except during formal religious ceremonies.

³¹Q: Would you please say something about dietary habits, such as abstaining from taking food after midday and vegetarianism?

A: There are two reasons for monastic Buddhists not to eat after midday according to Buddhist regulations, they are: 1. Abstaining from taking food afternoon reduces the burden on the laity since they provide the food; 2. It is conducive to practicing contemplation (bhāvanā). In the southern countries, this institution is still in common practice today. The strictest adherents only drink water, without taking milk, tea, coconut juice or anything else, while others may drink tea, soda water or fruit juice, as well as take candies after midday. In China, the Han monks of the Zen Sect have been used to doing farm work since ancient times, and due to their physical work, they have to eat something in the evening. So in most monasteries, this regulation

is relaxed, but supper is regarded as part of a "medicinal diet". Even so, many monks continue to observe the rule of abstention from eating after midday.

³²Q: Can the rules (sīla) ever be broken?

A: Among the precepts in Pātimokkha, apart from the four fundamentals of no killing, no stealing, no sexual conduct and no lying on spiritual attainment, all the rest should be maintained in general, but can be relaxed under certain circumstances. According to the Bodhisatta Rules, all must serve the needs of benefiting sentient beings (Sattvārtha-kriyā sīla). Thus for lay Bodhisattas, even the four fundamentals may be relaxed as required for benefiting sentient beings. "Maintain" and "relax" are the terminology used in Vinaya texts. For instance, abstention from eating after midday must be observed in normal times, yet in case of illness, it can be broken if the afflicted need to take food after midday. The Chinese monks have to relax the precept of not eating after midday because they take part in farm work. In the temples of the Zen Sect, supper is called "chamber meal", since it was originally provided to the laborers in their rooms instead of in the dining hall. However, in later times, those who did not take part in labor also began to have supper.

³³Q: The monks of southern countries eat meat. Do they break the Vinaya rules?

A: The food of monks in the southern countries is obtained by begging from door to door with alms bowls or provided by nearby families in turn, so they eat whatever is offered to them, regardless whether it is vegetarian. In the Bhikkhu's Vinaya, there is no rule prohibiting meat-eating. While in Chinese Mahāyāna scriptures there are clauses against meat-eating. The Chinese Han monastics, keeping faith in Mahāyāna Buddhism, accept not only Bhikkhu's precepts but also Bodhisatta sīlas, so Han monks, nuns and even many lay followers abstain from eating meat. Historically, the custom of vegetarianism among the Han Buddhists became popular with the advocacy of Emperor Wu of Liang (the Southern

and Northern Dynasties). As for the Mongolian and Tibetan Buddhists, though they follow Mahāyāna Buddhism, they can't live without eating meat since there is a great shortage of vegetables in their regions. Nevertheless, all the Buddhists in the southern countries as well as in Mongolia and Tibet highly praise the habit of vegetarianism of Han Buddhists. As to the Chinese word "hun", it refers to things with strong and pungent smells like garlic and onion. They are proscribed by both Mahāyāna and Theravāda Vinayas, which is observed by both Southern and Northern Buddhists. It is a mistake to confuse the term "hun" with simply eating meat.

³⁴Q: It is said that in the southern countries, when the dāyakas (lay-Buddhists) offer food to the monks they have to put the bowls into the hand of the latter, otherwise the monks can't take it. Is it true?

A: Yes. Because the monks should observe the rule of "abstaining from taking what is not given" (i.e. the rule against stealing). Not only in the case of alms-giving, whatever is offered by laity must be put into the hands of monks. Or they can't take it.

³⁵Q: It is also said that some monks never touch or hold money with their hands. Is that true?

A: Yes. There is indeed such a clause among the precepts for monks, which is to prevent them from keeping private property and giving rise to greed. Today it is still observed by some monks. In the southern countries when such monks travel, they are accompanied by a lay follower who can handle money for them. Owing to certain inconveniences, however, this rule is not very strictly observed today even in the southern countries.

³⁶Q: Could you please say something about the clothing of monks?

A: According to the Buddhist rules, monks should possess three robes: a large, a medium and a small. The small one, made of five strips of cloth, known as Five-strip Robe in China, is for doing manual and cleaning work. The medium one, made of seven pieces of cloth, commonly called Seven-strip Robe in China, is the normal

form of dress. The large one, usually made of nine to twenty five strips of cloth, commonly called "ancestral robe" in China, is the ceremonial dress for traveling or visiting elders. The three suits are collectively called *jiasha* (kasāya). Kasāya originally was the name of a tincture used to dye robes, because the Buddhist monks had to dress in dyed robes of mixed color, or Kasāya color, to avoid five pure colors of indigo, yellow, red, white and black. The kasāya color, which was said to be reddish in ancient Chinese translations, and saffron in the southern Buddhist canons, is presumably a mixed color of red and yellow. The Chinese Buddhist scriptures record that, with the division of Buddhist sects in India, the colors of robes of different sects varied from each other, some being red, some yellow, and some indigo. However, according to the Buddhist master, Ven. Paramattha, who came to China in the 6th century from India, the robe colors of different sects were basically red with minute differences. Today in Myanmar, Sri Lanka, Thailand, Cambodia, Laos, India and Nepal the robes of monks are all yellow in color, with slightly different shades. As to the robes worn by the Han monastics in China, the ceremonial robe is red, the five-strip and seven strip robes are generally yellow. Of the Mongolian and Tibetan ones, the large robe is yellow and the medium, worn at ordinary times, is close to red. Because of the cold climate in the north, the three robes are not warm enough, so monks in China wear an additional suit underneath the kasāya called common garb, which is simply ancient Chinese layman's clothing with a slight variation. The color of common garb was stipulated by an emperor of the Ming Dynasty, that is, for monks who were practicing meditation, it should be teabrown; for the Dhamma-preaching monks, it should be blue, and for the monks of the Vinaya Sect, it should be black. After the Qing Dynasty, there were no official regulations. Yet, with the restoration of the temples of the Vinaya School in the early Qing Dynasty by the Vinaya master, Ven. Jianyue, the common garb of the rank and file monks of this sect were yellow. Burmese monks particularly avoid wearing black since a group of heretic monastics in ancient

Myanmar who dressed in black committed many crimes, were later strictly banned. Mongolian and Tibetan monks also avoid black clothes.

³⁷Q: What about the practice of tonsure for Buddhist monks?

A: According to Buddhist regulations, a shaved head, dyed garments, and ordination are the prerequisites for gaining the monkhood. The purpose of the tonsure and dyeing of garments is to signify giving up beautification and leading a frugal and austere life. The monks generally do not wear beards, except some monks in China who shave their beards upon ordination, but believe that beards can be kept afterwards. No monks in the southern countries grow beards. Regarding burning dot-scars on the top of head at the time of ordination, the monastics of other nationalities do not have such regulations. It is only the Han monks who do. This tradition may be related with *Brahmajāla Sutta-Bodhisatta Sīla* which mentions burning one's own body (or parts of body) in dedication to the Buddha. In the Tang Dynasty there was already a custom of scarring the top of the head with moxa cone. This was said to have become common practice during the Yuan Dynasty, when the Yuan rulers tried to distinguish the false monastics from the genuine ones in an attempt to prevent the law-breaking people from fleeing into the Saṅgha. This explanation remains to be verified.

³⁸Q: Now that you have told us about the monastic lifestyle, could you please tell us about some of the chief figures in the Saṅgha at the time of the Buddha? Who were the most distinguished disciples of Sākyamuni?

A: There were ten distinguished disciples: Sāriputta, Moggallāna, Mahākassapa, Subhūti, Puṇṇa, Mahākaccāna, Anuruddha, Upāli, Rāhula and Ānanda. Each of them had a special distinction. For example, Sāriputta was known as the chief in wisdom; Moggallāna, the chief in psychic power (*abhiññā*); Upāli, the first in observing vinaya rules, and Ānanda, the chief of learning (*bahu-Śruta*). Sāriputta and Moggallāna, the two foremost disciples in the

Saṅgha, were most highly regarded by the Buddha. They died before the Buddha's passing away. After the Buddha's Parinibbāna, it was Mahākassapa who acted as the leader of the Saṅgha, and then Ānanda.

³⁹Q: There generally are two images standing at each side of the Buddha's statue in the Buddhist monasteries. Who are they?

A: If the images are one old and one young, the old is Mahākassapa, and the young Ānanda. If they look about the same age, one is Sāriputta and the other Moggallāna. However, these images exist only in Han Buddhist temples, while in temples of the southern tradition, the Buddha's image is enshrined alone, unaccompanied by any of his disciples.

⁴⁰Q: Are there any relics of the Buddha's disciples remaining today?

A: Sir Alexander Cunningham, an Englishman, (Director of the Indian Archeological Bureau) excavated several ancient thūpas in 1851 at a locality named Sanchi, 549 miles northeast from Bombay, India. In one of the thūpas, they found two large stone caskets with the names of Sāriputta and Moggallāna engraved respectively on the covers and their divine skeletons inside. The skeletons were stolen by the British and preserved in the Victoria and Albert Museum in London. After the independence of India, through negotiations with Britain, they were returned and once again enshrined at Sanchi. In Sanchi, not a well-known place then, a wealth of Buddhist relics have been discovered in modern times. A big thūpa built under King Aśoka's edict in the 3rd century BC still exists today in good condition, and is said to be the only one surviving among the 84,000 thūpas Aśoka built. On the four sides of the thūpa are exquisitely engraved stone gates. Owing to the discovery of numerous valuable relics, particularly of the sarīras of the two great arahats, Sanchi has become one of the most important Buddhist holy sites in India today.

⁴¹Q: In the Han Buddhist temples, usually the images of eighteen Arahats can be seen. Who are they?

A: In fact, there should be sixteen arahats, or sixteen āyasmās (Arahat is transliterated into Chinese as Aluohan, or simply Luohan). According to the Buddhist canons, under the Buddha's instructions, sixteen of his disciples would not enter into Nibbāna. In *Nandimittāvadāna* written by Āyasma Nandimitra of Siharatta (now Sri Lanka) in the 2nd century AD, the names of the sixteen arahats and localities of their residences were recorded. After the book was translated into Chinese by Dhammācāriya Xuan Zang, the sixteen Arahats were held in universal esteem by the Chinese Buddhists. By the time of the Five Dynasties, with the growing popularity of paintings and sculptures, representation of sixteen arahats was gradually superseded by representations of eighteen arahats. Presumably the painters intended to add Nandimitra and Xuan Zang, the writer and the translator of *Nandimittāvadāna* into the list. However, when later generations put the names of Arahats on the paintings, Nandimitra was mistakenly listed as the seventeenth resident Luohan, and the name of the first Arahat was repeated as the eighteenth. Though this mistake was already found out in the Song Dynasty, the formulation of the Eighteen Luohans became widespread in China, probably because of the many inscriptions and paintings made by famous calligraphers and painters as well as men of letters such as Guan Xiu, Su Dongpo, and Zhao Songxue.

⁴²Q: In many Chinese Buddhist temples, there are images of 500 Luohans. Who are they?

A: In ancient India, the figures "500", "84,000", etc. were often used to indicate multitudes, just as the ancient Chinese were in the habit of using 3 or 9 to denote large numbers. 500 bhikkhus, 500 disciples and 500 arahats frequently appeared in the Buddhist canons. Frequent as they were, they do not mean definite figures. Along with the veneration to the Sixteen Arahats, however, the images of 500 Luohans, too, began to appear in paintings and sculptures during the period of the Five Dynasties, and before long Halls of 500 Luohans were built in a number of temples.

Subsequently, the 500 Luohans were given names without any basis. With regard to the statues of 500 Luohans appearing in many temples in recent times, many of them were created out of craftsmen's imagination, or adapted from fairy tales. So they appeared grotesque, and inconsistent with the dignified posture requested by Vinaya, which should be duly upheld by the Buddha's disciples.

⁴³Q: In Buddhist temples, there are many images of Bodhisattas. Who are they?

A: In Han Buddhist temples, the Bodhisatta images enshrined are mainly Mañjuśrī, Samantabhadra, Avalokiteśvara (or Guanyin), and Kṣitigarbha.

⁴⁴Q: You have said before, any one who aspires to deliver himself and others and to awaken himself and others can be called Bodhisatta. Why then are the four worshipped like deities?

A: The ideal of releasing not only oneself but also others and of awakening not only oneself but also others is known as the lofty aspiration, or "bodhicitta". All men who begin to be imbued with bodhicitta may be called Bodhisattas, but they remain as worldly men until they acquired certain attainments. This involves many steps from making the great vow to gaining Buddhahood, there are the Three Virtuous States, the Ten Excellent Positions or stages (dasa-bhūmi) and the Fifty-two Stages. From the day of arising of bodhicitta, one should practice the Three Studies (Tisikkhā) of discipline (sīla), concentration (samādhi), and wisdom (paññā), carry out the Six Perfections (pāramitā) and the Four Fundamental Virtues (cattāri sangaha-vatthūni), and go through countless cycles of birth and death until finally achieving Buddhahood. Mañjuśrī and the others have reached the highest state of being Bodhisatta, or Sammā-sambodhi Bodhisatta. The Mahāyāna scriptures particularly eulogize the great wisdom of Mañjuśrī, the great conduct of Samantabhadra, the infinite compassion and pity of Avalokiteśvara and the great vow of Kṣitigarbha. Therefore, the four Great Bodhisattas command particular veneration of

Buddhists. In China, the Wutai Mountains is regarded as the sermon place of Mañjuśrī, the Emei Mountains as that of Samantabhadra, the Putuo Mountains as that of Avalokiteśvara and the Jiuhua Mountains as that of Kṣitigarbha. They are known collectively as the Four Famous Holy Mountains, an indication of the significant positions of the four Bodhisattas in the hearts of Chinese Buddhists.

⁴⁵Q: Are the Four Holy Mountains also well-known in the world?

A: The Wutai Mountains as the preaching place of Mañjuśrī was recorded in Mahāyāna Buddhist scriptures, so in ancient times, it was worshipped by quite a few eminent monks from India and Central Asia. There was even an old legend in Nepal saying that the Kathmandu Valley (where the capital of Nepal is located) used to be a large lake. It was Mañjuśrī, after he arrived there from the Wutai Mountains, China, who cleaved apart a mountain, drained off the lake water, and settled down with his followers, thus founding the State of Nepal. That is why the Nepalese people hold Mañjuśrī and the Wutai Mountains in particular affection. As to how the Putuo Mountains became the preaching place of Avalokiteśvara and how the Jiuhua Mountains became that of Kṣitigarbha, they are said to be related with the Buddhist monks from Japan and Korea.

⁴⁶Q: In the front hall of the Han Buddhist temples, there is usually a statue of a monk with a smiling face enshrined. Who is he?

A: He is Maitreya Bodhisatta. According to Buddhist prediction, long after the extinction of the teachings of Sākyamuni Buddha in the far future, Maitreya Bodhisatta would become the Buddha and preach in the world. For this reason, he has been held in universal esteem as well. In Chinese history, there were instances in which peasants were called to rebel under the pretext that Maitreya was born, for example, the Maitreya Cult of the Yuan Dynasty. As to the statue of the smiling monk, however, it is not the true image of Maitreya, but the image of a monk named Qici of the Five Dynasties. He usually carried a bag made of a piece of cloth on his

shoulder, so he was known as the Cloth-bag Monk. He was said to be an embodiment of Maitreya. That is why later people chose his form to be enshrined as Maitreya. Some believe that this tradition may have developed under the influence of the Maitreya Cult, which originated in Fenghua, Zhejiang Province, since this area was the home town of the Cloth-bag Monk. So it is logical to infer that the image of the Cloth-bag Monk spread under the influence of the Maitreya Cult.

叁 僧伽和佛的弟子

1问：为什么一部分佛教徒要出家？

答：要说明这个问题，先要谈一谈佛教的五乘教法。乘就是车子，能运载行人到远近不同的目的地，借以比喻教法。五戒的教法（戒杀、盗、淫、妄、酒的五条戒）能令修持者得生人间，叫做人乘。十善的教法（不犯十恶即是十善。十恶是指：一、杀；二、盗；三、淫；四、妄语；五、两舌，即挑拨离间；六、恶口，即粗恶伤人的言语；七、绮语，即邪淫言语；八、贪；九、嗔；十、邪见，即否认因果的见解。）能令修持者得生天界，叫做天乘。四谛的教法，能令人断除见惑（我见、常见、断见等错误见解）和思惑（对世间事物而起的贪嗔痴等迷情），证得涅槃，叫做声闻乘。“声”是言教的意思，听闻佛的言教，悟四谛之理而得到解脱的人叫做声闻。在没有佛法的时代，有人独自悟到缘起之理而得到解脱，但他不能把自己悟到的真理说出来，这种人叫做独觉，因此十二因缘法叫做独觉乘。六度的教法，能令修持者行菩萨道，经过无数世的难行苦行，最后达到佛的果位，叫做菩萨乘。

2问：五乘教法与出家有何关系？

答：人乘、天乘不要求出家；独觉生在没有佛法之世，虽是山林隐逸而没有出家的仪式；菩萨包括出家的和在家的人，不一定要出家，看住持佛法的因缘和利益众生的因缘可以出家，可以在家。如佛陀时代，文殊师利菩萨和弥勒菩萨都是出家的比丘，维摩诘也是大菩萨，则是居士（在家学佛之士）。只是声闻乘中为了证得现法涅槃，成阿罗汉的目的，要求修行者出家。

3问：阿罗汉是什么意思？

答：阿罗汉（Arahat）是修行者得到证悟的果位。到达这个果位有四个阶段：断除了见惑的叫做须陀洹果，即初果；进而断除思惑，按照其浅深粗细不同而有斯陀含果（二果）和阿那含果（三果）；

到了阿罗汉的果位（四果），见惑思惑都已断尽，证得涅槃，堪受人天供养。所以阿罗汉的意义之一就是“应供”，这是声闻乘中的终极地位。

4问：声闻乘为什么要求出家？

答：根据声闻乘教法，在家修行障碍多，心意难以专纯，只能在理论上断除见惑证得初果，至多断除欲界思惑证得三果，不能证得现法涅槃。出家生活自由无累，容易集注精力从事于无我无欲的修养，所以要证得阿罗汉果，非出家人做不到。

5问：出家的制度是佛教创始的吗？

答：出家制度不是佛教创始的。在佛陀的时代，出家修道在印度已成为风气，但是佛陀本人以王子出家的榜样，使出家风气在佛教中得到了鼓励。因此佛教徒中便有出家男女二众和在家男女二众。出家佛教徒一般称为僧人或僧侣。

6问：佛教僧侣是不是神职人员？

答：佛教僧侣仅仅是为求得解脱而出家修行的人，不是担任什么神与人之间的神职。他不应当，也不可能代人祈福禳灾，或代神降福免罪。

7问：佛教僧侣平时生活应当是怎样的呢？

答：根据佛的制度，一个比丘应当过着清静而俭约的生活，严格遵守不杀、不盗、不淫（包括在俗家的妻子）、不妄语、不两舌、不恶口、不绮语、不饮酒及不非时食（过午不食）、不涂香装饰、不自歌舞也不观听歌舞、不坐卧高广床位、不接受金银象马等财宝，除衣、钵、剃刀、滤水囊、缝衣针等必须用品外不蓄私财，不做买卖，不算命看相，不诈示神奇，不禁闭、掠夺和威吓他人等等及其他戒律。平日昼夜六时中（晨朝、日中、日没为昼三时，初夜、中夜、后夜为夜三时）除一定时间睡眠、托钵、饮食、洒扫、挑水外，其余时间都应当精勤地用在学修方面。

8问：学修的内容是什么？

答：教理的研究和禅定的修习，内容不外乎前面说过的三十七道品。三十七道品中基本修习的是四念处观（观身不净、观受是苦、观心无常、观法无我），在修四念处观之前，初入道者先学五停心

观，即不净观、慈悲观、因缘观、界分别观和数息观。总之，修定修慧的方法很多，这里不一一列举了。

9问：佛教僧侣对在家佛徒有什么义务吗？

答：一般说来，在德行上为他们树立模范；教导他们，劝善止恶；为他们讲说佛法；安慰病苦，必要时得参加社会灾难的救济；慈悲柔和，促进众生的福利。

10问：照你所说出家风气在佛教中得到鼓励，那么，佛教的理想是不是要求人人都出家呢？

答：根据佛教教义和它的制度来说，出家应当是佛教徒中少数人的事。

第一、出家的动机要求真纯——即确是为求解脱，决心舍弃世间贪爱而出家修道。第二、出家后要求对教理及行持都够标准，如果有室家的欲望，应当自动还俗；如果犯杀盗淫妄四根本戒，则应当摈斥在僧伽之外。第三、出家有许多限制，例如：要得父母允许，要年满二十（求比丘戒、比丘尼戒的），不是肢体不全或精神上有缺陷的，不是逃避刑法、债累的等等。第四、出家受戒要得戒龄满十年的僧侣十人以上介绍、证明和会议通过，舍戒还俗则很容易，只须告知一个人便行。佛教徒本有四众，有出家男女二众，有在家男女二众。出家二众负住持佛法的责任，在家二众负护持佛法的责任，合成为双重的教团，所以佛教并不是要求人人都出家。很多佛教经典，特别是大乘经典如《维摩诘经》、《优婆塞戒经》都是称赞在家学佛的。

11问：在家佛教徒修道的条件是怎样？

答：皈依三宝，确信佛法僧三宝为身心归向依靠之处，更不皈依佛教以外的其它宗教与神庙，这是在家佛教徒的必要条件。其次是奉行五戒和持斋。持斋是在每月一定的日子里实行一种克己的生活，即过午不食，不涂香装饰和歌舞观剧，不坐卧高广床座。持斋的日子一般是阴历朔日、初八、十四、望日、二十三、二十九（晦日）。遵守三归、五戒和持斋，对人努力行善，对自己清净身心，这就是佛教在家信徒修持的标准。实际上有不及这个标准的，也有超过这个标准的。佛陀对在家信徒有许多世间法的教导，如对善生童子详细讲了父母子女之间、师弟之间、夫妇之间、朋友之间、主从之间、僧人与居士之间的关系如何善处的问题；对青年跋闍迦谈到方便具足（职业修养的完备），守护具足

（节约不浪费财物），善知识具足（交结善友），正命具足（正当的生活）四种安乐法；对当时的国王们讲到如何处理国内政治与睦邻问题。大乘经典则广说在家菩萨应当怎样修六度、四摄等等。

12问：事实上出家不是像你前面所说的那样严格吧？

答：事实上在某些时期、某些地区，僧伽中存在着滥收徒众、滥传戒的现象。这种现象，在我国久已引起佛教界的忧虑。从历史的情况来看，佛教最兴盛的时代，并不是僧众最众多的时代；相反的，僧徒太多的时代，往往是佛教衰坏的时代。如唐代初年曾大量淘汰僧众，玄奘法师时代出家很严格，要经过考试，当时玄奘为取得出家资格，还曾经过了困难的手续，但是佛教当时最为灿烂。这不仅我国如此，其他国家也是如此。例如，十五世纪缅甸有一位本来是高僧后来还俗做了国王的达磨悉提，他鉴于当时僧众之滥，曾经通令全国僧众重新受戒加入僧伽。由于他的严格整理，当时缅甸僧侣人数从数十万人减到一万多人，其余不够资格和不愿再度受戒的，均勒令还俗，缅甸佛教因此得到复兴。这件事说明僧伽是不应当盲目发展的。

13问：听说有些国家的人民，人人都要出一次家，是吗？

答：缅甸、泰国等都有这个风俗，我国傣族地区过去也是如此。这并不是佛教规定的制度。这些地方一般儿童到七八岁时候，父母便送他们到寺庙出家，在寺庙中识字学经，过僧团生活，过了一定时期可以还俗。出家时期最短的只有几天，有的几个月，有的几年。如果儿童时未出过家的，长大后总要有个时期出一次家。这种临时出家的人并不受沙弥戒，与发愿长期出家的不同。

14问：听说日本僧人都有家室，是吗？

答：原来日本僧人都是没有家室的。公元十二世纪时期，净土宗的一派——净土真宗的创始者亲鸾倡导带妻修行，开始娶妻生子。其后几百年中这个制度只限于这一宗派。到明治维新后，僧人结婚的风气便在其它各宗派中流行起来。现在除少数宗派的少数僧人仍然过独身生活外，绝大多数僧人都有家室。他们的子孙世袭僧人的职业。这便形成了以在家佛教徒担任弘传佛教事业的制度。但是这种情况只是属于男僧人，今天日本的尼众还是出家如律持戒的。

15问：出家男子为什么称为和尚？和尚是什么意思？

答：“和尚”原来是从梵文Upādhyāya (P. Upajjhāya) 这个字出来的，这个字到了西域被读成“乌阇”，到了汉地又读成“和尚”，它的意思就是“师”。和尚本是一个尊称，要有一定资格堪为人师的才能够称和尚，不是任何人都能称的。这个称呼并不限于男子，出家女众有资格的也可以称和尚。但是后来习俗上这个字被用为对一般出家人的称呼，而且一般当作是男众专用的名词，这是和原来的字义不合的。

16问：喇嘛是什么意思？

答：喇嘛是藏语，它和“和尚”是一样的意思。这个字也被滥用了，本来并不是每个出家人都能称为喇嘛的。正确的称呼是：出家的男人受十戒的称沙弥，受具足戒的称比丘；出家的女人受十戒的称沙弥尼，受具足戒的称比丘尼。

17问：汉族地区习惯地称出家的男子为“僧”，出家女子为“尼”，这是否是正确的称呼？

答：僧是僧伽的简称，它的字义就是“大众”。僧伽是出家佛教徒的团体，至少要有四个人以上才能组成僧伽。所以一个人不能称僧伽，只能称僧人，正如一个兵士不能称军，只能称军人一样。出家男女二众都在僧伽之内，都能称僧人。把“僧”和“尼”作为男女的区别，是错误的。至于“尼”字是从沙弥尼、比丘尼的字尾而来的，是汉族对出家女众的简称。还有在尼字下加上姑字的，则是习俗的称呼。

18问：什么叫做法师？

答：法师 (Dhammācariya) 本是一种学位的称号，要通达佛法能为人讲说的人才能称法师，不是任何人都可以称的。还有较高的学位，精通经藏的称为经师 (Suttācariya)，精通律藏的称为律师 (Vināyācariya)，精通论藏的称为论师 (Abhidhammācariya)。更高的是三藏法师 (Tīpiṭakācariya)，是遍通经律论三藏者的学位，如唐代玄奘、义净都受到这个称号。

19问：什么叫活佛？

答：蒙藏佛教对修行有成就，能够根据自己的意愿而转世的人称为“朱毕

古”（藏语）或“呼毕勒罕”（蒙语）。这个字的意义就是“转世者”或“化身”。“活佛”乃是汉族地区的人对他们习俗的称呼，这可能与明朝皇帝封当时西藏地方掌政的噶举派法王为“西天大善自在佛”和清朝皇帝给达赖的封号也沿用了这一头衔多少有些关系，这种封号和称号在佛教教义上都是说不通的，其实蒙藏佛教中并没有“活佛”这个名词。又傣族佛教比丘被称为“佛爷”，这也是汉人习俗上错叫出来的，他们自己并没有这种称呼。

20问：什么叫做僧王？

答：有些国家如泰国等，全国选出一位僧伽的领袖叫做僧王（Saṅgharāja）。在斯里兰卡则每一僧派选出一位“大导师”（Mahānāyaka），每一省或一市选出一位导师（Nāyaka）。僧王或大导师管理全国的僧务，导师管理地方的僧务。

21问：为什么出家佛教徒要有僧伽这样的教团？

答：对个人来说，为了在学修上和生活上互相切磋、互相帮助，出家人必须过僧伽的团体生活。对整个佛教来说，要有出家佛教徒组织的教团来担负起“住持佛法”的责任。僧伽所以被称为三宝之一，就是因为它在佛教事业中的重要性。

22问：僧伽的组织有没有什么原则和制度？

答：有六项原则，就是“六和”：戒和、见和、利和、身和、口和、意和。简单地解释一下：和就是和谐一致的意思，遵守共同的戒律（戒和），见解一致的共同修学（见和），平等受用合法的财物（利和），生活上互相照顾（身和），言语上互相劝善止过（口和），思想上彼此友爱敬重（意和），通过这六项来达到僧伽中的和谐一致。为了实现六和的原则，佛陀曾经为僧伽制定了许多制度。

23问：有哪些重要的制度？

答：最重要的是“羯磨”（Kamma）制度。羯磨本是办事的意思，但僧伽中办事的方法是通过会议，所以它的完整的意思就是“会议办事”。比方有什么事情要办，要一定地界内全体僧众集会讨论决定，因事因病不能参加的人必须委托别人代为请假，并表示愿意接受大众的决定。会议开始前，执行主席（羯磨师）询问僧众是否已经齐集，是否有未受戒的人在场，知道僧众已经到齐，外人已经出

场后，然后开会。首先报告开会目的，提出议案，大众讨论，做出决定。表决的方式，一般是口头问答，征求同意，同意的不说话，不同意的表示意见，如果大家都不说话，便是通过。有一种事经过这样一次征问，便作决定；有一种较重要的事要经过两次征问，才作决定；有一种更重要的事（如授戒，或给某人以处分）要经过三次征问，才作决定。最后执行主席说：“僧人默然故，是事如是持”（既然大众都没有意见发表，这件事就是这样办了）。另外还有一种表决方式，就是投筹（用颜色的竹筹表示可否，等于投票）。关于这些，佛教典籍中有详细规定。这是世界上最古老的会议法，可以说是佛教的一个重要的创造和贡献。

24问：僧伽中有没有定期的会议？

答：每半个月举行一次布萨羯磨（诵戒的集会）。僧众齐集念诵戒本，根据戒律，检查每个人半月中的生活。方式是自己发露（坦白说出过失），别人举过。每年雨季安居期满后，举行集会。这个集会名叫“自恣”，“自”的意思是自己发露，“恣”的意思是恣别人举出自己的罪过，从而忏悔，这仍然是检查生活的集会。至于商办事情是临时召集会议。

25问：可不可以说释迦牟尼在僧伽组织中采用了某些原始公社的制度？

答：从它的民主制度和财务分配制度（平均分配、个人不蓄私财）来看，可以这样设想。但是在原始僧伽中，比丘是不事生产的。我国汉族僧人有从事农耕的习惯，提倡农禅生活，这是我国僧伽一个优良的特点。

26问：羯磨制度，现在还实行吗？

答：布萨和自恣的制度在南方佛教国家中仍然实行，其他宗教性的如传戒羯磨也仍然实行，但是似乎大部分是作为宗教仪式保存着。今天我国也还有寺庙保存着布萨和自恣制度的。至于羯磨的民主精神，由于在长期封建社会中许多封建制度被引用到佛寺中来，特别是由于丛林清规被封建朝廷按照自己的意图加以修改推行，因而久已失去了本来面目。

27问：什么叫做丛林清规？

答：丛林就是大寺庙。僧众集合在一处，好像树木丛集成为森林一样，所以叫做丛林。清规就是丛林的僧众日常遵行的规制。这种规制

是依据佛所定的戒律结合当时当地的实际情况，包括天时、地理、社会风习、国家法令以及宗派特点等等而定的。中国最古的清规创自四世纪东晋时代的道安，后来各代各派都定有僧制。唐代百丈禅师创立禅宗僧众的清规，久已失传。后来元代皇帝《敕修百丈清规》，那是根据封建统治者的需要而假托百丈之名修出来的东西，与百丈并无关系。后来这个清规经过明洪武、永乐先后下旨推行，于是代替了原来的各种僧制和清规而成为全国僧众遵行的规制。

28问：关于僧众的礼节和生活习惯，可否请你谈一谈？

答：戒律中对于这些都有详细的规定，这许多规定南方国家的僧众保持得比较完整。北方佛教僧侣，由于气候、风土等等的差别以及历史的变迁，生活上有了许多改变，这里不能详细列举。请你提出所需要了解的问题，我们可以简单地谈一谈。

29问：关于礼节问题，僧众中长幼之间的礼节怎样？

答：僧众的长幼是依受戒的年龄分别的。受比丘戒十年以上的称上座或长老（Thera），二十年以上的称大上座或大长老（MahāThera）。戒龄小的应当礼拜戒龄高的。行路时长者先行，幼者后行；坐时长者坐上座，幼者坐下座，或长者不教坐不坐。所以南方国家僧人相见，必须问戒龄。一般比丘见大长老，必须脱鞋，偏袒右肩，然后礼拜。

30问：在家佛教徒对僧人的礼节如何？

答：南方国家，在家佛教徒进入佛寺僧房，首先要脱鞋，见比丘礼拜。比丘教坐时，坐低座或席地坐，不能坐比丘的床位，不能和比丘同桌吃饭。如果比丘到居士家，主人应当以干净的布铺在座椅上，请比丘坐下，然后礼拜。如果自己的儿子当比丘，父母也要礼拜。根据南方佛教习惯，在任何场合，比丘见到居士来访问或入会场，他们从不起立，居士向他们礼拜时，也不回礼，有时仅说一句：“愿你吉祥。”向他们送供品时，也是如此。小比丘和沙弥礼拜大比丘时，大比丘也不答礼。在我国比丘受居士或小比丘、沙弥礼拜时，可合掌答礼，座位高下除正式宗教仪式外不甚严格。

31问：请你谈一谈关于饮食问题，如过午不食问题，吃素吃荤问题。

答：按照佛制，比丘午后不吃食物。原因有两个：1、比丘的饭食是由居士供养，每天只托一次钵，日中时吃一顿，可以减少居士的负担；2、过午不食，有助于修定。这个制度，今天南方国家仍普遍实行。最严格的只喝白水，连牛奶、茶、椰子水都不喝。但一般的僧人午后可以喝茶、汽水、果汁，也可以吃糖。我国汉族禅宗僧人从古有自己耕种的习惯，由于劳动的缘故，晚上非吃东西不行。所以在多数寺庙中开了过午不食的戒，但是被视为“药食”，持过午不食戒的僧人数也仍不少。

32问：戒条是可以开的吗？

答：比丘戒中除了不杀不盗不淫不妄四根本戒外，其余戒条平时应当“遮护”，在一定的情况下可以“开”（菩萨戒，一切服从“饶益有情戒”，在家菩萨为饶益有情故，四根本戒也可以开）。“开”与“遮”是戒律上的术语。如以过午不食为例，平时应当遮，但遇有某种疾病，必须午后进食的人则可以开。我国僧人因劳动的缘故必须开过午不食的戒。禅宗寺庙把吃晚饭叫做房餐，本来是给参加劳动者在房里吃的，而不是在斋堂中大家吃的，但是后来不劳动的人也吃起晚饭来了。

33问：南方国家的僧人吃“葷”，是否也是开戒？

答：南方国家僧人的饭食，或是到别人家托钵乞食，或是由附近人家轮流送饭，所以他们有什么吃什么，不论素食或肉食。比丘戒律中并没有不许吃肉的规定。我国大乘经典中有反对食肉的条文，我国汉族僧人是信奉大乘佛教的，他们受比丘戒外，并且受菩萨戒，所以汉族僧人乃至很多居士都不吃肉。从历史来看，汉族佛教吃素的风习，是由梁武帝的提倡而普遍起来的。蒙藏族僧人虽然也信奉大乘，但是他们的地方蔬菜极少，不食肉不能生活，所以一般都吃肉。但他们和南方国家佛教徒一样，对汉族佛教吃素的习惯，都是很赞叹的。至于“吃葷”的“葷”字，是专指大蒜、葱这些气味浓烈、富于刺激的东西，是大小乘戒律所同遮禁，南北佛教徒所共同遵守的。我们把“吃葷”和“吃肉”混同起来说，那是错误的。

34问：听说南方国家居士们供饭，必须将盘碗送到比丘手上，不这样，比丘就不能吃，是吗？

答：是的。因为比丘要守“不与不取戒”（即不偷盗戒），不仅是饭菜，

供养任何东西都是这样，不交到他们手上，他们便不能取。

35问：听说还有比丘手不捉持银钱的，是吗？

答：是的。比丘戒中本有这一条，这是为了防止蓄私财，起贪念。现在还有人遵行。南方比丘旅行时须带俗人随从替他管银钱的事。但是为了种种不便，这个戒条在南方国家中现在也不太严格了。

36问：请谈一谈僧人的衣服问题。

答：根据佛教的制度，比丘衣服有大中小三件：一是用五条布缝成的小衣，我国俗称为五衣，是打扫劳作时穿的；一是七条布缝成的中衣，我国俗称七衣，是平时穿的；一是九条乃至二十五条布缝成的大衣，我国俗称祖衣，是礼服，出门或见尊长时穿的。三衣总称为袈裟（Kasāya）。袈裟本是一种颜色的名称，因为佛制僧人必须穿染衣，避用青黄赤白黑五正色，而用一种杂色，即袈裟色。我国旧译袈裟色是赤色，南方佛教典籍则说是一种橙黄色，可能是一种赤黄混合色。根据我国佛典记载，佛教在印度分了部派后，各部派衣色便有了区别，有的是赤色，有的是黄色，有的是青黑木兰色。但据六世纪印度来华高僧真谛法师说，各部派衣色实际都是赤色，所谓青黑木兰，仅是些微的差别。现在缅甸、斯里兰卡、泰国、柬埔寨、老挝、印度、尼泊尔诸国的僧服都是黄色，仅有深浅的不同。我国汉族僧人的袈裟，祖衣是赤色，五衣七衣一般都是黄色。蒙藏僧人的袈裟，大衣是黄色，平时所披的中衣近赤色。北方气候寒冷，僧众三衣不够，所以我国僧众在袈裟里面另穿一种常服，这种常服是就古代俗人的服装略加改变的。常服的颜色，明代皇帝曾作过规定，修禅僧人常服为茶褐色，讲经僧人蓝色，律宗僧人黑色。清代以后，没有什么官方规定，但律宗寺院自清初见月律师重兴后，一般僧人常服均为黄色。缅甸佛教徒特别忌穿黑衣，因为在缅甸古代曾有一种邪教僧人穿黑衣，多行非法之事，后来严行禁绝。蒙藏教徒也忌穿黑色衣服。

37问：请谈一谈关于僧人剃发的问题。

答：根据佛制，剃发、染衣、受戒是取得僧人资格的必要条件。剃发染衣的用意是为了舍弃美好装饰，实行朴素无华的生活。一般出家人也不留胡须，但我国有一部分僧人留须，他们认为出家时应剃须，此后可以留。南方国家的僧人则一律不留须。至于受戒并不

需要在头顶上烧戒疤。除汉族外，其他民族僧人没有烧戒疤的规矩。这可能与《梵网经菩萨戒本》燃身供养之说有关。唐朝已有炼顶（以艾燃顶）的习俗，这个习俗形成普遍的制度，据说是在元代。当时异族统治者想借以识别真假，防止抗拒法令的人民逃到僧众里面去。这话尚待查考。

38问：关于僧人生活习惯的问题，已经知道了一些了。现在想请你谈一谈佛陀时代僧伽中一些主要的人物。请问释迦牟尼的弟子中最著名的有哪些人？

答：有十大弟子：舍利弗（Sāriputta），目犍连（Moggallāna）、摩诃迦叶（Mahākassapa）、须菩提（Subhūti）、富楼那（Purāṇa）、摩诃迦旃延（Mahākaccāna）、阿那律（Anuruddha）、优波离（Upāli）、罗怙罗（Rāhula）和阿难陀（Ānanda）。这十大弟子各有特长，其中如舍利弗被称为智慧第一，目犍连神通第一，优波离持戒第一，阿难陀多闻第一。舍利弗、目犍连二人最为佛所器重，是僧众的上首，他们都在佛涅槃前逝世。佛涅槃后，代佛统率大众的是摩诃迦叶，其后是阿难陀。

39问：一般佛寺中，立在释迦牟尼像两旁有两位比丘像，他们是谁？

答：有一老一少的像，老的摩诃迦叶，少的是阿难陀。也有两比丘像是年龄相若的，则是舍利弗和目犍连。这种像只是我国汉族佛寺中有的，南方国家的佛寺一般只供释迦牟尼佛像，供弟子像的很少。

40问：佛的弟子中有什么遗迹留存吗？

答：1851年英国人孔宁汉（当时的印度考古局长）在印度孟买东北五百四十九英里一个名叫山奇（Sanchi）的地方，对那里的几座古塔进行发掘。在一座塔里面，掘得两个大石函，函盖上分别刻着舍利弗和目犍连的名字，里面藏着他们两位的灵骨。这两份灵骨被英国人劫走，存置在伦敦维多利亚爱尔保博物馆。印度独立后，才向英国交涉取回，现仍供在山奇。山奇这个地方过去不甚知名，但是近代发现很丰富的佛教文物。公元前三世纪阿育王所造的大塔仍然完整的存在，据说他所造的八万四千塔中唯一留存的一座。塔的四面各有雕刻的石门，极为精美。由于许多宝贵的古迹，特别是由于两位大阿罗汉舍利的发现，山奇现在已经成为印

度重要的佛教圣地之一。

41问：汉族佛寺中常见到十八罗汉像，那是什么人？

答：应当是十六罗汉（罗汉即阿罗汉的简称，又称十六尊者）。据经典说，有十六位佛的弟子受了佛的付嘱，不入涅槃。公元二世纪时师子国（今斯里兰卡）庆友尊者作的《法住记》中，更记载了十六阿罗汉的名字和他们所住的地区。这部书由玄奘法师译出之后，十六罗汉便普遍受到我国佛教徒的尊敬。到五代时，绘画雕刻日益普遍起来。后来画家画成了十八罗汉。推测画家原意可能是把《法住记》的作者庆友和译者玄奘也画在一起。但后人标出罗汉名字时，误将庆友列为第十七位住世罗汉，又重复了第一位阿罗汉的名字成为第十八位。虽然宋代已经有人指出了错误，但因为绘画题赞的人有的是名书画家和文学家，如贯休、苏东坡、赵松雪等人，所以十八罗汉便很容易地在我国流传开来。

42问：我国许多佛寺中有五百罗汉像，他们是什么人？

答：印度古代惯用“五百”、“八万四千”等来形容众多的意思，和我国古人用“三”或“九”来表示多数很相像。五百比丘、五百弟子、五百阿罗汉，在佛教经典中固然是常见的，但并不意味着是固定的数字。可是随着十六罗汉的崇奉，五百罗汉像也便在五代时期见于绘画和雕塑，不久便有许多寺庙建立了五百罗汉堂。后人又附会地列举五百罗汉的名字，其实都是没有根据的。至于近代某些寺院中塑造的五百罗汉像，许多形象都是出自匠人的臆造，或者采自神话小说，以至流于怪诞，失去了佛的出家弟子应有的合乎戒律的威仪。

43问：佛教寺庙中有许多菩萨像，他们是什么人？

答：汉族寺庙中供的菩萨像，主要的是文殊师利（Mañjuśrī）、普贤（Samantabhadra）、观世音（Avalokiteśvara）、地藏（Kṣitigarbha）。

44问：你前面不是说过，任何志愿自度度他、自觉觉他的人都可称为菩萨，为什么这些菩萨被当做神一般地崇拜呢？

答：志愿自度度他、自觉觉他，叫做发大心，又叫做发菩提心。初发大心的人固然也可以称为菩萨，但没有得到实证以前仍然是在凡夫的地位。发了大心，依照戒定慧三学修习，实行六度四摄，经过

无数生死，最后才能成就佛果，其间有三贤十地五十二位等阶梯。文殊师利等是居于菩萨的极地的，是等觉位菩萨。大乘经典特别称道文殊师利的大智、普贤的大行、观世音的大悲、地藏的大愿，所以这四大菩萨特别受到教徒的崇敬。我国五台山被认为是文殊师利的道场，峨嵋山是普贤的道场，普陀山是观世音的道场，九华山是地藏的道场，称为四大名山。由此可以看出四大菩萨在我国佛教徒心目中的重要地位。

45问：四大名山国际上也知名吗？

答：五台山是文殊师利道场，这是见于大乘经典的，所以古代有不少从印度和西域来的高僧来朝拜。尼泊尔并且有这么一个古老的传说：加德满都（尼泊尔首都所在地）山谷地区，原来是一个大湖，文殊师利由中国五台山到那里去，劈开了一座山岭，将湖水排去，让随他同去的人们安居下来，这才建立了尼泊尔国。所以尼泊尔人民对文殊师利和五台山特别有亲切的感情。至于普陀山之成为观世音道场、九华山之成为地藏道场，则和日本、朝鲜佛教僧人有关系。

46问：汉族寺庙的前殿一般供着一个笑面和尚像，他是谁？

答：是弥勒菩萨。佛教预言，将来释迦牟尼佛的教法灭尽了之后，经过很久远时期，弥勒菩萨将在这个世界上成佛说法。由于这个原因，弥勒菩萨也受到普遍的崇敬。中国历史上常有假托弥勒降生以号召农民起义的事，如元代弥勒教之类。至于笑面和尚像，并不是弥勒像，而是五代一个和尚名叫“契此”的像，这个和尚经常背着一个布袋，人称为“布袋和尚”，相传是弥勒化身，所以后人塑他的像作为弥勒来供奉。有人认为，汉族寺庙供奉布袋和尚像，可能受了弥勒教的影响，因为弥勒教的产生地就是布袋和尚的家乡，浙江奉化，所以有理由推断布袋和尚的形象是因弥勒教而普遍流行开来的。

4 THE DEVELOPMENT, DECLINE AND RESURGENCE OF BUDDHISM IN INDIA

¹Q: Please give me a general introduction to the history of Buddhism in India.

A: During the 1,600-odd years after the Buddha's passing away, Buddhism in India underwent a process of schism, development and decline in organization and thinking. Finally it vanished from India in the 12th century AD.

²Q: Buddhism still exists in India today, doesn't it?

A: Yes, it does. But the Buddhism of India today was re-transmitted from Sri Lanka in the late 19th century. About 700 years before this, Buddhism disappeared from India.

³Q: What were the important stages in the 1,600-odd-year history of Indian Buddhism?

A: In the development of its doctrines, Indian Buddhism can be divided into 5 periods: first, the primitive period of Buddhism—the first 100 years or so after the Buddha's Parinibbāna; second, the period of Nikāyas' Schism—about 400 years following the first; third, for about 4 centuries after that—the period when the Mādhyamika School of Mahāyāna flourished; fourth, for another 4 centuries after that—the period when the Mahāyāna Yogācāra School flourished (in the later part of this period, the Tantric School became popular); fifth, for the final 3 centuries roughly—the period of the prevalence of the Tantric School.

⁴Q: What was the primitive period of Buddhism like?

A: In this period, the Buddha's disciples generally maintained the facilities and conventions of Saṅgha life as they were in the

Buddha's lifetime, and practiced the fundamental creeds of the Four Noble Truths and the Eight-fold Path on self-cultivation with little dissension. Thus this period was, in Buddhist terms, the period of harmonious unity. But the "harmonious unity" was merely a general consensus which did not mean there were no differences in thought and opinions. Take the First Buddhist Council for example, which was held at the beginning of this period, in which there were disagreements over what the "lesser and minor precepts" (*khuddānukhuddaka sikkhāpada*) were and whether or not they should be abolished. As a matter of fact, most Bhikkhus were unable to take part in the *Samgīti*, and even some of the chief disciples scattered everywhere were unable to attend because of time and distance, and they were sure to have had proposals for additions or revisions to the Dhamma, which resulted from the Council. For example, Pūrṇa (P. Puṇṇa, one of the ten eminent Disciples) declared, "The Dhamma I had heard from the Buddha in person must be upheld too", though he had agreed with the Vinaya and the Dhamma recited at the *Samgīti*. When he discussed the disciplines with Mahā-kassapa, they differed on eight rules, for example, the precept against "keeping food in a monastic bedroom". He thought that the rules were enacted by the Buddha first and then were loosened; while the latter thought that the rules were reinstituted after being broken. Eventually each of them followed his own way.

In the Buddhist archives, there were also records about Vappa (one of the first five bhikkhus) holding another *Samgīti* outside the Cave. These facts show the discrepancy in the unity at that time. The Buddha, during his lifetime, preached different teachings to different people at different times. It is conceivable that his disciples might have had different understanding due to their different occasions of listening and had different comprehension owing to the differences of their nature, specialties and methods of self-cultivation.

After the First Council, the Mahātheras (senior monks) led their

followers to do missionary work separately in different areas. With the disciples succeeding their own masters, each group eventually formed its own lineage of succession. The Dhamma and Vinaya passed on by each group, thus, had differences as well as similarities. Each tradition naturally gained its own sphere of influence according to geographical divisions, and its own distinctive features relevant to the local circumstances in the course of time. In the area of theory and doctrines, some tended to be liberal and progressive, adopting the general ideas of the Buddha's teachings and being elastic in observance of disciplines; while some were obstinate and conservative, strictly abiding by dogmas without even slight deviation; and some were between the two. The situation was going on and inevitably led to Nikāyas' schism.

⁵Q: What was the situation like in the period of Nikāyas' Schism?

A: The Buddhist community was initially divided into two major sects: Theravāda and Mahā-saṃghika. This happened about 100 or more years after the Buddha's passing away. The direct cause of the schism was the controversy over the issue of sīla among monks. It is said that there was a bhikkhu from Bārāṇasī (Kasi) named Yasa, who traveled to Vesālī in the east and saw the Vajjian monks inducing the laity to donate money to the Saṅgha so that they could buy their necessities. Considering the acceptance of gold and silver a violation of the rules in the Vinaya, Yasa raised an objection, but as a result he was excommunicated by the Vajjians. Thereupon, he went to various places in the west and appealed to orthodox bhikkhus to assemble at Vesālī. As a result, the verdict of the assembly declared the conduct of Vajjian monks to be unlawful. (According to Theravāda records, apart from receiving alms of gold and silver, they committed another nine offenses.) This was the Second Saṃgīti or the Council of the Seven Hundred, since there were 700 participants in the assembly. Most of the Vajjian bhikkhus refused to obey the decision and held another Saṃgīti, which was attended by ten thousand monks. This

contributed to the schism in the Buddhist Order.

⁶Q: Why was this sort of assembly, which passed judgment, also called *saṃgīti*?

A: Because both assemblies engaged in the recital of Sutta (Piṭaka) and Vinaya (Pāli). The *Saṃgīti* of 700 lasted for about eight months, the duration of the "*Saṃgīti* of 10,000" was presumably not very short, though there is no record. It can be seen that the parties sought not only to resolve the issue of acceptance of gold and silver, but to validate their ideas by revising the Sutta and Vinaya. Comparative study of the two vinayas of these two sects shows that the *Mahāsaṃghika*-vinaya was simpler and more accommodating, whereas the *Sabbatthivāda*-vinaya was more comprehensive and strict; the *Mahāsaṃghika*-vinaya cut out some of the minor precepts and loosened some rules (including alms begging for gold and silver), whereas the *Sabbatthivāda*-vinaya took a diametrically opposite position. Obviously, the second *Saṃgīti* was the inevitable outcome of the development of the contradictions inside the Buddhist Community in the 100 years after the First *Saṃgīti*. As most of the participants of the *Saṃgīti* of 700 were orthodox Theras, the sect formed by them was named *Theravāda*. Today, Buddhists in southern countries call themselves *Theravādins* for they inherited their teachings from this tradition. Since the *Vajjian Bhikkhus* held the assembly of 10,000, the sect of this majority was known as *Mahāsaṃghika*.

⁷Q: Was the dispute between the two sects confined to the matter of discipline?

A: At first, the dispute was confined to discipline, but its chief cause was the different approach to the cultivation and study between the two sects. The *Theravādins* strictly observed and maintained the Vinaya precepts, engaging themselves in study and practice *bhāvanā*, and paying much attention to their own spiritual cultivation, while the *Mahāsaṃghikas* sought for large-scale learning, and engaging in propagating the Buddha Dhamma and guiding the masses. These two different orientations not only led

to the dispute over the commandments but also impelled subsequent variant developments in Buddhist doctrines and philosophy at different times.

⁸Q: Were there any other schisms after the Second Saṃgīti?

A: The first split resulted in Theravāda and Mahāsaṃghika. These were known as the two basic sects. Later on, as Buddhism spread far and wide in the course of time, there were different traditions in different localities. Thus changes in propagation and institutions inevitably occurred to meet the needs of the local conditions and customs. This gradually resulted in the emergence of various schools of Buddhism. From the Second Saṃgīti to about four centuries after the Buddha's passing away, the two basic sects of Theravāda and Mahāsaṃghika were successively divided into 18 or 20 subgroups. There are different traditions regarding the sequence, time, and names of each schism. The largest branch directly split from Theravāda was Sabbatthivāda (S. Sarvāstivāda), the other rather important subsects were Vajjiputtaka and Mahiṃsāsaka. According to Mahāsaṃghika tradition, the Vibhajjavāda was the first to split from Theravāda. It adopted some Mahāsaṃghika ideas and became an independent sect, standing apart from both Theravāda and Mahāsaṃghika. However, according to Theravāda tradition, the Vibhajjavāda was a variation of Theravāda. The three sects which broke away from the Mahāsaṃghika in earlier times were Ekavyohārika, Lokottaravāda and Gokulika. Afterwards, the Cetiyavāda was the largest sect that split away from Mahāsaṃghika.

⁹Q: Were there significant differences in the doctrines of various sects?

A: There were considerable differences between the doctrines of Theravāda and Mahāsaṃghika. As to the subgroups, they generally had only minor differences from their basic sect. The doctrine of Theravāda could be represented by Sarvāstivāda's as it was the earliest and largest sect among Theravādins, and bequeathed a wealth of canons of Abhidhamma Piṭaka. Of the Mahāsaṃghika, on the other hand, few works were preserved,

only some of its doctrines being known through historical accounts.

¹⁰Q: Would you please explain some of the doctrines of Theravāda and Mahāsaṃghika?

A: Let me cite a number of issues for discussion.

First, pertaining to the interpretation of dhammā (all things). Before dealing with the issue, two terms should be defined. (1) Conditioned Dhamma (Saṅkhata Dhamma): Anything that comes into being, or ceases from being, by causes and conditions (hetu-paccaya) is called Conditioned Dhamma. (2) Unconditioned Dhamma (Asaṅkhata Dhamma): Items that do not depend on other causes and conditions for their existence, which exist in and of themselves without arising and cessation are Unconditioned Dhammas, such as Nibbāna and Space (Ākāsa). (Everything arises and ceases within space, while space itself exists bearing the nature of infinity, free from hetu-paccaya.) Both Sarvāstivāda and Mahāsaṃghika held that Unconditioned Dhammas exist. As to the Conditioned Dhammas, Mahāsaṃghika believed that the Conditioned Dhammas arise and cease depending on causes and conditions that the past has no real existence since it has ceased, nor has the future, as it is yet to be born, and that only the present dhammas existing in an instant (Khaṇa) have real existence and function. Sarvāstivāda believed that all Conditioned Dhammas, if they have not arisen and existed, can not arise at all even given necessary conditions, just as the tortoise can not grow hair and the rabbit can not grow horns. Therefore, the ultimate essence of every Dhamma constantly exists, and only the manifestations vary: those functions which have not yet manifested are called the future, those functions which have already manifested are the past, those which are functioning are the present. So this sect holds that the essence of the dhammas exists at all times (past, present and future), the dhammas of the three times really exist. Although the essence of dhamma is there, the arising of its function depends on the aggregation of various dhammas as well as their causal

relations (hetu-paccaya), and it is by no means able to function independently. Inasmuch as the self-essence of dhammas can not function by itself, there is no "ego" (atta) as a permanent dominator. This is the theory of non-substantiality of ego and substantiality of dhamma, while the Mahāsaṃghikas held a theory close to non-substantiality of both ego and dhamma.

Secondly, pertaining to the conception of the Buddha, the Mahāsaṃghika held the view that what was born, lived and died in the human world was Sākyamuni Buddha's phenomenal body (Nimmāna-kāya) rather than his noumenal body (Saṃbhoga-kāya), the Buddha's noumenal body came into being with the accumulation of merits over a very prolonged period; that the Buddha's body (rūpa-kāya), length of life and power were boundless, the Buddha tirelessly teaches and rescues all beings, all of his words are teachings in a modified form, by the Buddha' every utterance is a sermon covering all dhammas. The Sarvāstivāda, on the other hand, denied the thesis that Sākyamuni was the temporal body of the eternal Buddha, asserting that not all words of the Buddha were teachings and that the Buddha didn't preach all dhammas with every utterance.

Thirdly, in their conceptions of the Sāvaka and the Bodhisatta, the Mahāsaṃghika stressed the Bodhisatta's power of metta-karuṇā to enlighten sentient beings, and attached less importance to the Sāvakas. The Sarvāstivāda did not believe there was any difference between the liberation attained through the Buddha and that attained through Sāvakas and the Pacceka-buddhas, though they admitted the differences in the capability and path of cultivation among them.

Besides the above, there were differences in their perceptions of certain problems and on the method of cultivation, which I shall not enumerate here.

¹¹Q: Did any other important events take place during the period of schisms in Buddhism?

A: One of the most important events in the history of Buddhism took place in this period, namely, King Aśoka's promulgation of the Buddha Dhamma. Prior to King Aśoka, the spread of Buddhism had been confined to the Ganges Valley in Central India. Owing to King Aśoka's efforts, Buddhism became a world-wide religion, not only spreading over the five parts of India (Eastern, Western, Southern, Northern and Central India) but also extending to many countries in Asia, North Africa and Greece.

¹²Q: What kind of man was King Aśoka?

A: Aśoka (meaning Sorrow-free) was the King of Magadha in the 3rd century BC. His grandfather, Chandragupta, was a national hero in ancient India (on the basis of his name, some suggest that he was of the Chandra Caste. King Aśoka was also known as Chandrasoka). Chandragupta, who lived in Magadha in the 3rd century BC, was exiled to Northwest India. At that time, Alexander the Great invaded India, occupied the region of the Five Rivers (Punjab), and threatened the Ganges plain. Chandragupta rose in opposition, rallying the northwestern people to drive the Greek invaders out. Returning to magadha he overthrew the Nanda Dynasty to become the first monarch of the Maurya Dynasty of Magadha. During his reign he unified Central, West and North India, and made Magadha a mighty empire. In 273 BC, the talented and bold strategist Aśoka succeeded his father Bindusāra to the throne. He carried forward his ancestors' aspirations and feats, and accomplished the unification of the whole of India for the first time in Indian history. Yet, when he witnessed the tragic scenes of the war in his conquest of the Kāliṅga Kingdom he repented greatly and decided to undertake no further military campaigns, becoming a staunch follower of Buddhism. On the one hand, he carried out the political ideal of Rāja Cakkavattin (universal king), set up huge irrigation projects, built the international road from Magadha to Iran, and developed the domestic economy and international trade. On the other hand, he vigorously disseminated Buddhism. He established a high official

post, entitled "Saddhamma Minister", to be in charge of religious affairs and charity. He dispatched these officials together with missionaries to propagate Buddhism in various places. Both his son Mahinda and daughter Saṅghamittā (Buddhist bhikkhu and bhikkhunī respectively) were sent in turn to the State of Lion (now Sri Lanka). In his lifetime Buddhism expanded as far as Myanmar in the east, Sri Lanka in the south, and Syria, Egypt and Greece in the west.

¹³Q: An ancient Chinese tradition holds that at the time of the First Emperor of Qin, known as Qinshihuang, 18 Indian monks, headed by Shilifang, came to China on a mission. Is that true?

A: It is not recorded in the official Chinese history, but it is possible that King Aśoka dispatched a group of missionaries to China, as Qinshihuang and King Aśoka were contemporaries. At the time of Aśoka's grandfather, a document had already mentioned Chinese silk products (in Sanskrit, words relating to silk, such as Cīnapaṭṭa, meaning bundle of silk, and Cīnasukka, meaning silk clothes, bear the root "cīna" as their component). Thus it can be seen that even before Qinshihuang there had been intercourse between China and India.

¹⁴Q: What was the reason for King Aśoka's promulgation of Buddhism?

A: Magadha was the base area where Sākyamuni proclaimed Buddhist teachings. From the outset, Buddhism was supported by the kings of Magadha and its neighboring countries, Aśoka's grand-father Chandragupta being one of them. This was a reflection of the conflict between the Kṣatriyas (P. Khattiya) (kings) and Brāhmaṇas (priests) in India at that time. In my opinion, it also reflected the confrontation of the newly emerging landlords and merchants with the rule of the local lords in the new-born nations of the Ganges Valley at the time. Some scholars suggest that the kings of the Maurya Dynasty were themselves great merchants skilled in the conduct of business. The rule of the hereditary local lords supported by the Brahmin theocracy and the caste system seriously hindered the construction of the irrigation system in

agricultural areas and the smooth running of domestic and foreign trade. Therefore, Buddhism which stood against theocracy and the caste system and stood for the equality of all sentient beings was supported by the masses of people, and especially favorably received by the newly-emerging landlords and merchants. On the other hand, the rulers of the Magadha Empire viewed the Buddhist tenets of compassion and forbearance as helpful, not harmful, to the consolidation of unity at home and the development of friendly relations with other nations. When he saw the consequences of Alexander's militarism and the stubborn resistance he experienced during his conquests, King Aśoka learned that he had to change his military campaign into a more moderate one, so he decided on the Wheel of Dhamma (Dhammacakka) as his political weapon.

¹⁵Q: What was the impact on learning and culture of King Aśoka's propagation of Buddhism?

A: The spread of Buddhism at that time played a far-reaching role in the cultural exchange among Asian countries and between the Orient and Greece, Syria, Egypt, etc. In the course of his pilgrimages to the Buddhist holy places, King Aśoka had many stone pillars engraved and had people inscribed on mountain cliffs many decrees of Dhamma (decreeing policies and teachings according to the Buddha Dhamma). Many remain even today and more are discovered from time to time, providing very important information about ancient history.

¹⁶Q: Did King Aśoka's promulgation of Buddhism have an effect on the emergence of the Buddhist sects?

A: At the time of Aśoka, Buddhism was probably already divided into four sects. Since each of the sects sent missions to various places and were, therefore, influenced by different circumstances, variations in forms and in doctrines appeared in each of them. Such a variety in turn gave rise to further growth of sects.

¹⁷Q: Would you please say more about the Third Council (Saṃgīti)

held at the time of King Aśoka?

A: As to the proceedings of the Third Saṃgīti, I have already mentioned it while talking about the Buddhist Canons. According to the southern Buddhist accounts, King Aśoka's spread of Buddhism took place immediately after that saṃgīti. Recently, the ruins of a magnificent monastery commissioned by King Aśoka have been excavated at Pāṭaliputta (King Aśoka's capital, Patna of today). Inside the monastery was an auditorium (pāsāda) with 100 stone pillars as well as many monastic chambers and pools. Some believe that this was the very site where the 3rd Saṃgīti was held. However, there was nothing recorded about the 3rd Saṃgīti in the northern Buddhist classics.

¹⁸Q: What great events took place after King Aśoka's time?

A: For more than 300 years after King Aśoka's propagation of the Buddha Dhamma, Buddhism took a firm hold in all nations in Central Asia and extended eastward to China, spreading in increasingly wider areas. However, within India itself, Buddhism met adversity. In less than half a century after King Aśoka's death, the Maurya Dynasty was replaced by the Śuṅga Dynasty. King Puṣyamitra, who usurped the throne with the aid of a Brahmin Imperial preceptor, upheld Brahmanism and rigorously suppressed Buddhism by destroying stūpas and vihāras, slaughtering Buddhist monks and finally plunged Indian Buddhism into a dark age. Fortunately, the reign of the Śuṅga Dynasty was confined to Central India only, so its anti-Buddhist movement didn't spread to South and Northwest India. At that time, most of the Buddhists took refuge in the Northwest, and some to the South. Thus they promoted the flourishing of Buddhism in the North as well as its development in the South. The ruler of that time in North India was King Milinda (a Greek) of Bactria, who was converted to Buddhism by Bhikkhu Nāgasena. The dialogues on Buddhism between Milinda and Nāgasena have been preserved to this day, the Chinese translation being entitled *Nāgasena Bhikkhu Sutta* and its Pāli version *Milinda Pañhā*. The well-known Buddhist art of

Gandhāra also began at that time and gradually flourished.

¹⁹Q: What was southern Buddhism like at that time?

A: References to southern Buddhism at that time are scarce. What we have learned is that the mission sent to South India by King Aśoka was of Mahāsaṃghika, so the doctrines of Mahāsaṃghika prevailed in the South and were accepted by the local Dravidians, who were emerging there. In 28 BC, the Andhra (P. Andhaka) Kingdom founded by the Dravidians overthrew the Kaṇva Dynasty (the successor of the Śuṅga Dynasty) in Central India, and occupied its territory. Consequently, Buddhism picked up slightly in Central India. At the same time that the Andhakas gained dominance in Central India, the Kuṣāṇas overthrew the Bactria Dynasty in Northwest India, and founded the Kṣāṇa Dynasty. After that the history of India entered into a period of the Northern and Southern Dynasties until its reunification by the Gupta Dynasty in the 4th century AD. Scarcely any detail is known about Buddhism in the South in that period. On the other hand, Buddhism in the North reached its peak in the 2nd century AD under the reign of King Kaniṣka.

²⁰Q: Who was King Kaniṣka?

A: Historical records about King Kaniṣka are few, but he was known as "the Second King Aśoka" for his patronage and upholding of Buddhism. It was said that his early life resembled that of King Aśoka, with widespread bloodshed, and that later he was converted to Buddhism by the Bhikkhu Pārśva. Architectural ruins show that, in Kaniṣka's era, many stūpas, vihāras and sculptures of the Buddha were built and magnificent progress made in the arts. For example, the form of the stūpa evolved from the traditional Indian domed style (like an inverted alms-bowl) to the 5-storied terraced tower, while in sculpture the Greek and Indian styles were blended to form a new distinct style that brought the Gandhāra Buddhist arts to a climax. King Kaniṣka also invited the great Buddhist writer Assaghosa from Central India to Kasmīra, which helped bring about a brilliant development of Buddhist

literature. The flourishing of Buddhism at the time is evidenced by a number of facts. One of King Kaniṣka's greatest contributions to Buddhism was the convocation and support of an important council. It was said that he inquired of a number of people about the Dhamma and received different answers. Considering the varied opinions and being unable to come to a conclusion, he followed Bhikkhu Pārśva's advice to summon 500 learned bhikkhus headed by Vasumitta to Kasmīra to compile and edit the Tipiṭaka with commentaries, which resulted in 300,000 stanzas totaling more than 9,000,000 words, and took 12 years to complete. Among these works was the *Mahāvibhāṣā-śāstra*, an important work of Sarvāstivāda which has two versions, new and old, in Chinese translation.

²¹Q: What about the development of other Buddhist sects in this period besides the Sarvāstivāda?

A: At that time, in the Kasmīra area, the Sarvāstivāda Sect was the most flourishing one, while other sects also developed considerably. The Mahāyāna doctrine, which was related to the Mahāsaṃghika and opposed to the Sarvāstivāda, prevailed in various parts of India and had extensive influence in intellectual circles. Assaghosa, who was held in esteem by King Kaniṣka, was imbued with Mahāyāna ideas. This period may be the era in which the Mahāyāna doctrines came into maturity after a protracted incubation. However, the high point of Mahāyāna Buddhism was not reached before the appearance of the great master Nāgārjuna, who came shortly afterwards.

²²Q: Who was Nāgārjuna?

A: Nāgārjuna, a South Indian who lived in the 2nd-3rd centuries AD, was at first a Brahmanic scholar and later converted to Buddhism and became a monk. He received the Mahāyāna sūtras from an old bhikkhu in the Himālaya Mountains, after which his wisdom was boundless. His eloquence persuaded many philosophers at the time. He thought that although the Buddhist scriptures he had read were profound, they left much to be expounded. So he got

more Mahāyāna texts to read and wrote quite a number of theoretical treatises to elaborate upon the meanings of the scriptures. His philosophy quickly spread over all parts of India. Thus the flourishing era of Mahāyāna Buddhism came into being.

²³Q: What are the main elements of Nāgārjuna's philosophy?

A: What Nāgārjuna argued for was "the ultimate reality of all dhammas". As was mentioned before, with regard to the cognition of the existence of all things, the Sarvāstivādins believed that the self-nature (*sabhāva*) of all dhammas exists eternally, with their functions arising dependent upon causes and conditions (*hetu-paccaya*). Nāgārjuna held the contrary view that all conditioned dhammas are nothing but phenomena originating out of the concordance of causes and conditions, without perpetual, unchangeable and independent self-essence. For instance, a forest, being composed of many trees, has no identity of itself apart from the many trees, and "forest" is only a term without self-substance or self-nature. Therefore, Nāgārjuna said: "All dhammas arising out of *hetu-paccaya*, I regard as *Suñña* (emptiness), or a false name, or the meaning of the Middle Path (P. *Majjhima-paṭipadā*, S. *Madhyamā-pratipad*). There is no dhamma which does not arise from *hetu-paccaya*, so all dhammas are nothing but *Suññatā*." "*Suññatā*" is the ultimate reality of all dhammas.

²⁴Q: Is this theory a kind of skepticism negating everything?

A: In order to make a judgment, further explanations are needed: (1) The theory that all dhammas are *suñña* is based on the interdependent causality of all dhammas. Therefore it does not refute the law of causation. (2) The above-mentioned emptiness (*suñña*) is not in the sense of nothingness. It is considered, in the ultimate sense, as neither existent nor non-existent, neither arising nor ceasing. All empirical conceptions such as existence and non-existence, arising and ceasing, coming and going etc. are irrelevant, since to see the reality is beyond the power of our sensation and differentiation. It is said to be neither existing nor empty, neither arising nor ceasing, and all dhammas are *suñña*

(emptiness), and therefore "suñña means unobtainable". (3) In regard to the understanding of worldly things, Nāgārjuna propounded the double Truth, or Two Levels of Truth, referring to the two aspects of everything: the phenomenon is referred to as "conventional truth" (relative truth) and the noumenon (essence) is referred to as the first truth (absolute truth). In terms of the Conventional Truth (Sammuti-sacca), there exist countless phenomena in the universe, which present the multitude of differences, the variety of appearances, all kinds of functions, all manifestations arising and ceasing, coming and going, identity and diversity, right and wrong, gain and loss, etc., all kinds of phenomena and causalities can be distinguished, hence exist. However, in terms of the First Truth (Paramattha-sacca), despite the multitude of manifestations, the entity itself is empty and unobtainable. Existence and non-existence (bhava and suñña) are united in terms of dhammas which arise out of causes and conditions (hetu-paccaya), so the Conventional Truth and the First Truth are "different, yet not different". This is the theory of "yielding the ultimate reality (paramattha) without breaking with the empirical concepts (paññatti)", and is Nāgārjuna's meaning of the Middle Path.

²⁵Q: What development was made in Mahāyāna Buddhism after Nāgārjuna?

A: Nāgārjuna's disciple Deva was a competent successor and propagator of this theory, who also wrote many books, chiefly refuting heresies (Buddhism termed all non-Buddhist religions and philosophies heresies). For this he was murdered. Yet, the Mahāyāna doctrine flourished all the more. In the meantime Sarvāstivāda, Sautrāntika and the other sects, which were all along in opposition to Mahāyāna also made headway. Mahāyāna Buddhism and the other sects, due to their debates and mutual challenges, all developed their own doctrines. By the Gupta Dynasty in the 4th to 5th centuries AD, another new Mahāyāna school—Yogācāra came into being. Together with the original

school—Mādhyaṃika, they made up the two main trends of Indian Mahāyāna Buddhist thought.

²⁶Q: Could you please give a brief overview of the Gupta Dynasty?

A: The Gupta Dynasty was founded by Candragupta in Central India around 320 AD, and can be compared to the glorious Maurya Dynasty in Indian history. His son, King Samudragupta, the second monarch in the lineage, unified five Indian states, making the country a very strong power. The third ruler of the Gupta Dynasty, Candragupta II, further expanded westward, and developed overseas trade and communications as far as Egypt. Along with the flourishing of politics and economy, culture and scholarship in India also displayed dazzling brilliance. The sculptures of the Buddha images of this period are regarded as the consummation of Indian sculpture. Remarkable achievements were also made in the spheres of arts and literature. It was during the reign of Candragupta II that the Chinese monk, Ven. Fa Xian, visited India in the early 5th century. In his work *Records of the Buddhist Countries*, he gave an account of the grand spectacles he saw and heard in person. Meanwhile, in respect of religious philosophy, Brahmanic theology showed a great development, and other schools like Sāṃkhya, Vaiśeṣika (P. Viśeṣikā), etc. thrived too. Buddhism in this time also made important advances with the emergence of many great scholars, the two brothers Asaṅga and Vasubandhu who created Yogācāra system being the most eminent among them.

²⁷Q: Who were Asaṅga and Vasubandhu?

A: Asaṅga, born in North India, was originally a Sarvāstivādin monk. According to a legend, being dissatisfied with Sarvāstivādin doctrine, he ascended to the Tusita Heaven (where Bodhisattva Maitreya resided), to consult Maitreya about the Suññatā theory of Mahāyāna and gained a thorough comprehension of it. (Another story says that Maitreya descended from Heaven to preach Dhamma to him.) He then brought out Maitreya's Five Śāstras, and wrote many works to expound the Mahāyāna thought. Some

scholars hold that the Maitreya who instructed Asanga was probably a Mahāyāna scholar from the Yogācāriyas (those Sarvāstivādins who engaged in jhāna were known as "Yogācāriyas" or "Jhāyins") rather than the Maitreya of the Tusita Heaven. Vasubandhu, a younger brother of Asanga, was also a Sarvāstivādin scholar at first and later converted to Mahāyāna under Asanga's influence. He advocated Asanga's doctrine enthusiastically and was honored with the title of Thousand-volume Ābhidhammika due to his great many works.

²⁸Q: What are the main points of Yogācāra doctrine?

A: Yogācāra doctrines have a very comprehensive content, encompassing a wide range of spheres. Here I shall only say a little about its cosmology. On this question, Yogācāra School built up and developed the Theory of the Reality of All Dhammas. It holds the view that the reality of dhammas has two sides: on the one hand, self-nature (sabhāva) can not be said to exist. Yet on the other hand, all is not nothingness. Only with such a conception can one realise a detachment from existence and non-existence, and arrive at the Middle Path. Yogācāra maintains that the nature of all dhammas falls into three levels ("Trisvabhāva"): that all dhammas arise from causes and conditions is the Paratantra-svabhāva (the nature of being dependent in origin); that ordinary beings attribute to the dhammas produced by cause and conditions all kinds of illusory imaginations and judgments (false imaginations in their minds which do not correspond to reality), is the Parikalpita-svabhāva (the nature of regarding the seeming as real); that the completely true nature, or tathatā (the absolute reality) can be attained by eliminating the illusory inventions is the Pariniṣpanna-svabhāva (the absolutely true nature). The above three can be illustrated with a metaphor: Parikalpita is like one walking at night and mistaking a rope by the road for a snake. There seems to be a snake but actually there is not. Paratantra is like the rope with its substance arising from causes and conditions, which is only the hypothetical existence. The

perfectly true reality resembles the jute, the substance of the rope, which is real in an ultimate sense. Further observation through the three natures shows that there are another three natures presenting non-existence (Trividhā-niḥsvabhāvatā): 1. The parikalpita inventions are not real. This is the nature of non-existence in form (lakṣaṇa-niḥsvabhāvatā); 2. The worldly things that ordinary beings take to exist are just produced by causes and conditions. This is the nature of non-origination (utpatti-niḥsvabhāvatā); 3. The reality of all dhammas is empty and unattainable. This is the nature of emptiness in the highest sense (paramārtha-niḥsvabhāvatā).

²⁹Q: How does the Theory of Trisvabhāva and Trividhā-niḥsvabhāvatā compare with Nāgārjuna's Double Truth?

A: The theory of Trividhā-niḥsvabhāvatā and Trisvabhāva is also based on the theories of Dependent-origination and the nature of emptiness. However, Nāgārjuna's theory that all is nothing but emptiness explains only one side in terms of Trividhā-niḥsvabhāvatā, while Yogācāra simultaneously stands for trisvābhāva as well and elaborates this in detail. Yogācāras adopted a great deal of Sarvāstivādin terminology and fit them together to analyze and explain the classification and relation of all dhammas, pointing out in particular that all dhammas are mere transformations of consciousness and should be understood through the investigation of the Dependent-origination. This is what is meant by "All dhammas are nothing but consciousness" (Vijñapti-mātratā), which is not mentioned in Mādhyamika System.

³⁰Q: Since Buddhism believes that consciousness arises from the combination of sense organs (indriya: e.g. eye, ear) and sense objects (visaya: e.g. colors, sound), how can the theory of Vijñapti-mātratā hold true?

A: The Yogācāras believe that the color seen by the eye, the sound heard by the ear, the scent smelt by the nose, the flavor tasted by the tongue, and the hardness, wetness, warmth and action felt by

touch do not constitute the things themselves, but are the mirror images of the five forms of consciousness transformed on the basis of the interaction between five faculties and external substance. Thus consciousness (viññāṇa) has two functions: the objective function which gives rise to changing images entitled "the conception of objects", and the other, the subjective function which discerns the images called "the capability of signifying". All our sensations are simply our differentiation of the subjective function from the objective one within consciousness itself.

³¹Q: This can only explain our subjective reflection of the objective world, but not the principle of consciousness-only (Viññāṇavāda). Because, according to Yogācāras, the object of perception must be preceded by the existence of external matter, and the subject of perception must be preceded by the existence of the object of perception. In other words, it is true that consciousness originates from the combination of the sense organs and the environment, both of which exist independently of consciousness. Conversely, it is impossible for consciousness to exist without the faculties and the environment.

A: Besides the six consciousnesses, the Yogācāras developed another two consciousnesses: the seventh, manas and the eighth, Ālaya-viññāṇa. Manas translates as "mental consciousness" and is the root on which the sixth consciousness depends. It has the single function of maintaining a constant presence of the ego-sense, which gives rise to varied mental activities in people, including love and hate, distinguishing of good and bad, right and wrong, this and that, etc., when they come into contact with external matter. Ālaya-viññāṇa means "storehouse consciousness", which can preserve the "seeds" of all dhammas from loss and deterioration. "Seed" used here is a metaphor which, in its true sense, refers to ability or latent force. There are two types of seeds in Ālaya. One is the conceptual type of seeds or what we call "concepts" in modern terms. The objects perceived by the seven senses leave traces in Ālaya-viññāṇa, in the way that clothes

perfumed with incense retain a fragrance. So this is called, in a Yogācārin term, *Vāsanā*, meaning perfuming, the result of which is seeds in the form of latent forces. The other type is the Karmic Seeds accumulated through the former kusala and akusala karmas possessed from mental volition. These two types of seeds in *Ālaya* give rise (*pariṇāma*) to the five sense faculties (*indriya*), the external world (*bhājana-loka*) and the preceding seven forms of consciousness. (Thus, as the perceived *Ālaya*, both the five organs and the external world arise from *Ālaya-viññāna*.) Such a genesis of sense-faculties, mind and universe is known as *Abhisamskāra* (presenting activity). The *Abhisamskāra* again perfumes the conceptual and karmic seeds to reach the future maturity (*vipāka*) of the faculties, mind and universe. This is the Yogācārin theory of genesis from *Ālaya-viññāna*.

³²Q: Buddhism does not acknowledge the existence of soul. But is it right to say that *Ālaya* is a soul in another guise?

A: There is controversy over this question in the Buddhist circles. Even certain Yogācārin scholars in later times only referred to the six forms of consciousness while omitting the 7th and 8th ones. However, those who stand for Dependent Origination on *Ālaya* believe that *Ālaya-viññāna* is not eternally unchangeable but an ever-changing flux. It is thus different from the general meaning of soul. It would be wrong to regard the *Ālaya-viññāna* flux with its rapid and subtle changes as indicating the existence of an eternal ego or soul, just as it would be wrong to take a waterfall for a piece of white cloth hanging down when seen from a distance. Actually, this misconception is *Manas* (ego-centered mind). The Yogācārin theory also aims to eliminate the ego-grasping (*P. attagāha*, *S. ātma-grāha*) and to turn the defiled consciousness (*sāsava-viññāna*) into pure wisdom (*anāsava-paññā*).

³³Q: What else did the Yogācāra School accomplish apart from establishing a complete idealist system of thought?

A: The Buddhist science of logic—*Hetu-vidyā*—had also made considerable achievement by the Gupta Era (5th century AD).

Special contributions were made by the Yogācārin scholars in this area. The further developments were attributed to Dinnāga in the 6th century and Dharmmakīrti in the 7th century, both of whom were great Yogācārin scholars.

³⁴Q: Are there any other Mahāyāna schools of thought in India besides Mādhyamika and Yogācāra?

A: Mādhyamika and Yogācāra are the two that evolved into full-fledged academic schools of thought in main-stream Mahāyāna doctrine in India, though there were controversies pertaining to doctrines between the two sects and new trends of development within each of them. Besides, there were also doctrinal substreams different from the two major ones and this remains to be discussed later.

³⁵Q: What happened after the Gupta Dynasty?

A: In the later period of the Gupta Dynasty (end of the 5th century) the Ephtalites (Some take the Ephtalites to have been Huns, but this may not be correct. The Ephtalites were also known as the White Huns, but were not the same as the Huns) came down to the south from Amu Daria River, occupied the northwestern part of India and set up a kingdom. Buddhism in this area was severely disrupted. Eventually, with the collapse of the Gupta Dynasty and many invasions by other races, India was plunged into a phase of disunion or disintegration. In the meantime, an eastern Indian kingdom invaded Central India and also disrupted Buddhism in this part. Thus it was not until later, when King Śīlāditya of the Vardhana Dynasty in Central India defeated his enemies and unified Central India, that Buddhism made a slight revival. The Nālandā-saṅghārāma which had been in construction in the Gupta Era was further expanded, becoming increasingly larger in scale during the Vardhana Dynasty. Mahāyānin scholars used to assemble there for lectures and studies, making it the highest educational institution of that time in India. The one hundred years from the mid-6th century to the mid-7th century was the Golden age in the history of Nālandā. When Dhammācariya Xuan

Zang from China went there to study (in the 30's of the 7th century AD), Ābhidhammika Śīlabhadra of the Yogācāra School and Ābhidhammika Jñānaprabhā of the Mādhyamika School were both teaching there. King Śīlāditya used to hold Pañcavārṣikamaha (mass meeting) in his capital Kanyakubja (P. Kaṇṇakujja, today's Kannauj) to debate philosophical doctrines. Such was the splendid atmosphere of Buddhist teaching at that time.

³⁶Q: What happened after that?

A: With the death of King Śīlāditya, Central India once again fell into a chaotic situation. The kingdoms in all parts of India turned to Brahmanism, and Buddhism gradually declined. However, in Eastern India, the rulers of the Pāla Dynasty, which arose in the mid-7th century, and lasted till the end of the 11th century believed in and patronized Buddhism. They ruled over the territory to the east of Magadha, with Nālandā-saṅghārāma in their domain. They built a larger temple, Vikramaśīla, near Nālandā. During this period, Tantric Buddhism developed gradually and flourished after the 9th century, while Buddhism in general declined in the academic sphere.

³⁷Q: How did Tantric Buddhism arise?

A: Tantric Buddhism, or the Mantra-dhāraṇī Sect, or Tantrayāna (meaning Esoteric Buddhism, in contrast to other Mahāyāna sects which are termed Exoteric Buddhism or Pakāsaniyayāna), is said to have been founded by Nāgārjuna after he obtained secret scriptures when he opened up the Iron Pagoda in south India. In fact, ever since the time of Nāgārjuna, elements of Tantrayāna (dhāraṇī) have been creeping into the Mahāyānin classics, but it was not until long after Nāgārjuna that independent Esoteric Buddhism came into being.

³⁸Q: What is Mantra-dhāraṇī?

A: Mantra-dhāraṇī means mystical incantation. According to the Tantrayāna theory, these are words of wisdom demonstrating the

Buddha's own grasp of the truth, as well the genuine language capable of demonstrating the reality of dhammas. Therefore, this language is named Mantra, meaning "true language". Dhāraṇī means "keep holding". Each word or sound of the secret incantation always contains the infinite truth of Dhamma, and possesses infinite might and wisdom. Through reciting the incantation, one can achieve far quicker and greater results than through the practice of the Exoteric sects. The Esoteric School emphasizes the practicing of rites. According to certain rituals, the practitioners set up maṇḍala, offer sacrifice, assume postures (mudrā) with hands or body, recite mantras and meditate etc., so as to unite their own physical, oral and mental karmas with those of the Buddha (whose functions are so subtle as to be unimaginable, and therefore called the three Mysteries), thereby quickly attaining wisdom (ñāṇa) and psychic power (abhiññā), or even sudden enlightenment. To practice Mantra-dhāraṇī also helps avert calamities, enhance happiness, overpower one's opponents, etc.

³⁹Q: Why is it that many statues of the Esoteric School take the form of multi-headed and multi-handed figures, some of them having horrible appearances, even inhuman in form?

A: All statues of the Esoteric School denote definite meanings. For example, the image of Avalokiteśvara's four or six arms denotes the Bodhisatta's Four All Embracing Virtues (catu-saṃgaha-vatthūni) and Six Transcendent Virtues (cha-pāramitā) and the Almighty Virtuous Vajra's 34 arms plus body, tongue and mind represent the 37 conditions (Bodhipakkhiya-dhamma) leading to enlightenment. Again, the lotus on the Buddha's pedestal stands for nekkhamma-citta, the crescent (moon) for Bodhi-citta, the sun's disk for the wisdom leading to suññatā-ñāṇa (the awareness that all is emptiness). The various kinds of instruments held in their hands represent different vows, merits, etc. of Buddhas and Bodhisattas. The fierce-faced ones are generally the images of Vajra deities with tremendous might representing their ability to

overpower demonic forces. Besides these, there are many other images of deities.

⁴⁰Q: Did the Esoteric School assimilate much from the content and forms of Brahmanism?

A: Yes, historically, Buddhism was at first opposed to Brahmanic doctrines and sacrificial ceremonies. When Buddhism became the national religion of the Maurya Dynasty, it was the exclusive teaching of the day. However, with the changes of dynasties it soon met with rejection. In the subsequent years, despite the support rendered by certain local dynasties, it continually suffered from adversity. For the sake of accommodating itself to prevailing circumstances and customs, Buddhism was obliged to take certain "expedient measures" to facilitate the propagation of its doctrine. In the meantime, Brahmanism, in spite of its political superiority, could not but be affected by the development of Buddhist philosophy and called for a reform of its theory. Therefore, it became a natural tendency that the two adversaries were affected by each other even while repelling each other. By the time of the Gupta Dynasty, with the creation of the Theory of Brahma-ātma Identity, Brahmanism expanded and augmented its influence. In the late 7th century, the Brahmanic scholars, Kumāṛila and Śaṅkara, absorbed Buddhist theories to develop its theology tremendously, so Brahmanism began to flourish with a new face (Western scholars refer to Brahmanism after this period as Hinduism). In contrast, owing to a shortage of intelligent apologists, Buddhism fell into an inferior position and became increasingly marginalized. Meantime, it is true that the Esoteric School, which emerged in response to these conditions, took many "expedient measures" in its ceremonies and assimilated a lot of Brahmanic elements, and endowed them with its own interpretations. Nevertheless, its doctrine continued to be based upon the theory of Emptiness and Selflessness.

⁴¹Q: What happened to Buddhism in India finally?

A: Beginning from the mid-7th century, Turks following another

religion invaded Northwestern India from Central Asia. By the 2nd half of the 10th century they gradually advanced to the Pañjāb area, and began aggression to the central areas. Wherever they went, indigenous religions of India were devastated. By the 11th century, during the Pāla Dynasty and the following Sena Dynasty, the invaders' forces gradually reached all parts of Eastern India. The Buddhist high priests dispersed and took refuge in Tibet of China via places like Nepal and Kasmīra. Finally, the royal family of the Sena Dynasty also changed their creed and important education institutions like Vikramasīlavahāra were demolished one after another, with very few monks remaining. Buddhism disappeared from Indian soil soon thereafter. This took place at about the end of the 12th century.

⁴²Q: Would you say something about the revival of Indian Buddhism in modern times?

A: At the end of the 19th century, a lay Buddhist of Sri Lanka named Dhammpāla visited the Buddhist holy-land in India on pilgrimage. Witnessing the spectacle of desolation in those places, he embarked himself on the task of rehabilitating Indian Buddhism. Buddhist organizations with their activities were started anew in India. In recent decades Buddhists from China, Myanmar and Japan have successively built a few monasteries in various holy places in India, such as Buddhagayā (Bodhimaṇḍa), Mṛgadāva (Sārnāth), and Kusināra. Some Indian people gradually converted to Buddhism and some even went to Sri Lanka to take monasticism and receive ordination, but only in limited numbers. In 1956, all of a sudden, a large-scale movement to convert to Buddhism sprang up among the "untouchable" masses, and it was a great event in the modern history of Buddhism. It was made possible by Dr. B. R. Ambedkar, leader of India's untouchables, who at a mass meeting held at Nagpur in Oct. 1956 announced his conversion to Buddhism, and proclaimed the Buddhist doctrine that "human beings are not created by God" and that "all living beings are equal". Half a million untouchables taking part in the meeting

responded to his call, and at the same time announced their conversion to Buddhism by giving up their Hindu faith. Ambedkar died abruptly in Dec. 1956. Yet the movement to convert to Buddhism did not come to an end, but conversely brought forth a towering and tumultuous wave spreading all over India, with tens of thousands of people converted to Buddhism en masse. According to the *World Buddhism* magazine of May 1962, 20 million out of 70 million untouchables in India have converted to Buddhism, and the movement is still keeping its momentum today.

肆 佛教在印度的发展、衰灭和复兴

1问：请简略地介绍一下佛教在印度的历史概况。

答：佛陀逝世后一千六百余年中，印度佛教在组织上和思想上经过分化、发展和衰坏的过程，最后消灭于公元十二世纪时代。

2问：印度今天不是还有佛教吗？

答：印度今天的佛教是公元十九世纪后期才由斯里兰卡重新传入的。在此之前七百年中，印度没有佛教。

3问：印度佛教在它的一千六百多年历史中有哪些重要的阶段？

答：从学说的思想发展来看，可以把印度佛教分为五个时期：第一，佛逝世后约一百年之间为原始佛教时期；第二，在这之后约四百年之间为部派分裂时期；第三，此后约四百年为大乘中观学派兴盛时期；第四，此后又约四百年为大乘瑜伽学派兴盛时期，这一时期的后期，密宗颇为流行；第五，最后约三百年为密宗盛行时期。

4问：所谓原始佛教时期的情况是怎样？

答：在这一时期中，佛弟子们在教团生活上一般维持着佛在世时一向的设施和惯例，在学修上奉行着四谛、八正道的根本教义，没有什么重大的争论。这一时期，用佛教的话说，是“和合一味”的时期。但是所谓和合一味，仅能说是大体上的一致，不是没有见解上和主张上的歧异。即以这一时期开始时的第一结集为例，在结集中就曾有关于“小小戒”（微细的戒律）是什么和要不要废除的不同意见。另一方面，由于时间和地点的条件，多数僧众没有能够参加结集，分散在各地的大弟子们也有未能参加的，他们不会没有认为需要补充或修正的意见。如富楼那（十大弟子之一）除在事后承认结集的佛法外，又声明：“我从佛得闻之法，亦当受持”。他和摩诃迦叶讨论戒律时，对“内宿”（僧人住处留藏食物）等八条戒

条，他认为那是佛制定之后又开了的，迦叶则认为是开了之后又重制定的，终于各行其是。

典籍中又有跋波（最初五比丘之一）在窟外另行结集的记载。这些事实说明当时的统一之中存在着差异。佛在世时，于不同的时机，对不同的人，说不同的教法。弟子们或因佛说法的时机不同而有听受的不同，或因各人的根性、专长和学修方法的不同而有了解和悟入的不同，这也是可以想见其然的。

在第一结集之后，长老们分别率领僧众在各方弘化，师弟相承，渐渐各自形成传承的系统。他们传授的教法和戒律互有异同。各个传承系统很自然地按照地域划分其势力范围，日久之后，不能不受到各地环境的影响而具有各自的特色。在学说思想方面，有的态度偏于自由进取，对佛所说的教法，但取大意，对戒律的受持，也有所通融；有的偏于固执保守，拘泥教条，不敢出入；有的介乎二者之间。这种情形，发展下去，势必引起后来部派的分裂。

5问：部派分裂时期的情况怎样？

答：佛教教团最初分裂为上座部和大众部两大派，这是佛陀逝世后约一百或一百余年的事。当时直接引起分裂的原因是由于僧众们在戒律问题上的争执。据说有一位西方波利族比丘名叫耶舍的，游化到东方的毗舍离城，看见跋祇族比丘们劝令在家信徒布施金钱作僧众购买所需之用。耶舍认为比丘乞受金银不合戒律，于是提出异议，遭受到跋祇僧众的摈斥。耶舍便往西方各地邀请上座比丘们到毗舍离集会，结果判决跋祇比丘们为非法（根据上座记载，除乞受金银外，尚有其他九事非法）。这便是第二结集，因为集合的有七百人，所以又称“七百结集”。跋祇比丘们大多数不承认这个判决，他们另外召集了一万比丘举行结集。这便造成了教团的分裂。

6问：为什么这种判断是非的集会也称为结集呢？

答：两个集会都进行了经律的结集。七百比丘的结集，费时八个月之久。万人结集的时间虽未见记载，想也不会很短。可见两派要求解决的不只是关于乞受金银这一问题，而是要求通过经律的再一次编定来贯彻自己一派的主张。拿两派的戒律两相比较，大众部的僧祇律较简略而多通融，上座部的十诵律则繁密而严格；僧祇

律对微细戒条多有舍弃，对于开戒（包括乞受金银在内）多有方便，十诵律则与此相反。显然，第二结集是第一结集之后百年间教团内部矛盾发展的必然结果。七百结集的参与者多数是上座长老，所以这一派被称为上座部（Theravāda）。今天南方国家的佛教徒自称为上座部，因为他们出自上座部的传承。跋祇族比丘举行万人大会，这一派人数众多，所以称为大众部（Mahāsaṃghika）。

7问：两派的矛盾是否仅是戒律问题？

答：最初主要是戒律问题上的争论，但是两派为学的精神不同是其主导原因。上座部严格持守戒律，致力于修习禅定，注重自己内心的修持。大众部则广学多闻，致力于弘传教法，注重接引群众。这两种不同的精神，不仅引起了戒律问题的争论，而且促使后来佛教在教理上、学说上在各个时期不同的发展。

8问：在第二结集之后，还有没有部派分裂的事？

答：最初分立的上座、大众二部称为根本二部。后来由于佛教流传地区日广，各地的传承既有不同，而各地风土人情的不同又必然要求说法和制度的改变，因之学派渐渐繁多起来。从第二结集到佛陀逝世后约四百年之间，上座、大众的根本二部又先后分裂为十八部或二十部。关于诸部派分裂的次第、年代乃至名称有不同的传说。由上座部直接分出的最大的一部是说一切有部（Sabbatthivāda），此外较重要的是跋子部（Vajjiputtaka或称犍子部）和化地部（Mahimsāsaka）。据大众部传说，上座部最初分出分别说部（Vibhajjavāda），它采取大众部的一些学说，成为独立的部派，与上座、大众成鼎足之势。但根据上座部的说法，分别说部乃是上座部的异名。大众部早期分出的三部是一说部（Ekavyohārika）、说出世部（Lokottaravāda）和鸡胤部（Gokulika或称牛王部）。大众部后期分出的制多山部（Cetiyaavāda）是最大的一个部派。

9问：各部派的学说有很大的不同吗？

答：上座、大众根本两部在教义上有较大的差别，至于支末部派，一般地说，与根本部差别不大。上座部学说可以拿说一切有部为代表，因为说一切有部是上座部中最早的和最大的一个部派，它传下来丰富的论藏典籍。大众部没有什么论著留传下来，只是从某

些史籍记载中看到它的一些论点。

10问：可否把上座部和大众部的学说简略地介绍一下？

答：可以举几个问题来谈。

第一、对于事物（法）的认识问题。在未谈之前，先要介绍两个术语：（1）有为法，一切依借因缘而有造作生灭的事物都叫做有为法；（2）无为法，不依借因缘，本来不生灭的事物是无为法，如涅槃、虚空（万物都在虚空中生灭，而虚空的无碍性则不依借因缘而本自存在）等，都是属于无为法。说一切有部和大众部都认为无为法是实在的。至于对有为法的看法，大众部认为一切有为法依借因缘而生灭，过去的已经灭了，没有实体，未来的没有生起，也没有实体，仅仅现在一刹那中有体和用（作用）。说一切有部认为一切有为法，如果本来没有，即使具备了条件，也不能生起，如龟不能生毛，兔不能生角，所以任何一法，它的体都是永恒存在的，只是作用没有生起的名为未来，作用已经生起的名为过去，作用正在生起名为现在。因此这个部派的主张是三世（过去、未来、现在）实有与法体恒有。法体虽有，但是它的作用的生起要依借于诸法的集合以及前后的关系（因缘），决没有单独能起作用的。既然各各法的自体没有作用，所以没有常一主宰的我。这一种说法是我空法有论，而大众部说法接近于我法两空论。

第二，对于佛陀的认识问题。大众部认为生灭于人间的释迦牟尼佛是化身而不是实身，佛陀的实身是积累极长时期的修行而成的；佛陀的色身、寿命和威力都是无边际的，佛陀永远化度众生无有疲厌；佛所说的一切语言都是随机说法，佛以一音说一切法。说一切有部不承认释迦牟尼是化身佛之说，认为佛所说的语言并不全部都是经教，佛并不是以一音说一切法。

第三、对于声闻和菩萨的认识问题。大众部强调菩萨广度众生的慈悲愿力，轻声闻而贵菩萨。说一切有部虽承认声闻、缘觉、菩萨能修行的根性和所修行的道路有差别，但认为佛与二乘（声闻与缘觉）所得的解脱是没有差异的。

此外，在其他一些问题的认识上和修行实践的方法上都有不同之处，这里不列举了。

11问：在部派分裂时期中还有什么其他重大的事件发生吗？

答：佛教史上一件关系极为重大的事发生在这个时期，那便是阿育王大弘佛法。在阿育王之前佛教的传播只局限于中印度恒河流域一带，由于阿育王的努力，佛教不仅传遍五印度（东、西、南、北、中印度），而且传到亚洲、北非、希腊许多国家，一跃而成为世界性的宗教。

12问：阿育王是怎样的一个人物？

答：阿育王（Aśoka，或译为阿输迦王，或意译为无忧王）是公元前三世纪摩揭陀国的国王。他的祖父是印度古代著名的民族英雄旃陀罗笈多（有人根据他的名字而考证他是有旃陀罗种姓的血统的，阿育王也曾被称为旃陀罗阿输迦）。旃陀罗笈多是公元前四世纪摩揭陀国人，被国王放逐流徙在西北印度。当时亚历山大侵入印度，占领五河一带，威胁恒河平原。旃陀罗笈多举起义旗，聚合西北民众赶走了希腊驻军，然后回到摩揭陀国，推翻了难陀王朝，成为摩揭陀国孔雀王朝第一代君主。他统一中、西、北印度，使摩揭陀国成为强大的帝国。公元前273年，雄才大略的阿育王继承他父亲宾头沙罗登了王位。他发扬光大了先人志业，在历史上第一次实现了全印度的统一。他征服南印度羯陵伽国的时候，看到了战争的惨状，大动悔悟之心，从此放弃了由武力征服的办法，而归依了佛教。他一方面实行转轮王理想的政治，兴办巨大的水利灌溉工程，修筑从摩揭陀国到伊朗的国际大道，发展国内经济和国际贸易；一方面大力传播佛教。他设置一种司掌宗教工作和慈善事业的官职，名叫“正法大官”，派遣他们和传教师们到各地宣传佛教，他的儿子摩晒陀（Mahinda）、女儿僧伽密陀（Saṅghamittā）（两人都出了家为比丘、比丘尼），也先后被派往狮子国（斯里兰卡）。当时东至缅甸，南到斯里兰卡，西到叙利亚、埃及、希腊等地，都有佛教的传播。

13问：我国旧时传说，秦始皇时代曾有印度僧人室利房等十八人来华传教，有没有这件事？

答：这件事不见我国的正史记载，但是秦始皇和阿育王是同时代的人，当时阿育王派遣一批传教师来到中国也是可能的事。阿育王的祖父时代一部文献中曾提到中国丝织品（梵文里有关丝的字，如Cīnapaṭṭa即成捆的丝，Cīnasukka即丝织衣服等，都有Cīna“支

那”这个字作组成部分），可见秦始皇之前，中国与印度已经有了往来。

14问：阿育王弘扬佛教的原因是什么？

答：摩揭陀原来是释迦牟尼教化的根据地。佛教最初就得到摩揭陀国及其邻国国王们的支持，阿育王的祖父笈多王也是一位佛教的护持者。这个事实反映着当时印度的刹帝利（国王）和婆罗门（僧侣）的冲突，而且，据我看，也反映着当时恒河流域的新兴国家中新兴地主们和商主们对领主割据势力的冲突。历史事实证明，孔雀王朝的国王们本身就是善于经营的大商主。婆罗门神权和种姓制度所支持的领主割据势力严重阻碍着农业上灌溉系统的兴建和商业上国内外贸易的畅通，因此，反对神权及种姓制度、主张众生平等的佛教受到当时民众的拥护，尤其是受到新兴地主阶级和商人们的欢迎。另一方面，佛教慈悲安忍的教义，在摩揭陀帝国统治者看来，对国内统一事业的巩固和国际友好关系的发展，是有利无害的。当阿育王从亚历山大穷兵黩武的后果中，从他自己征伐时遭到顽强抵抗的经验中，认识到必须改变武力政策而采用怀柔政策的时候，他便选择了“法轮”作为他的政治武器。

15问：阿育王弘扬佛教在学术文化上起了一些什么影响？

答：当时佛教的传播对亚洲各国以及东方和希腊、叙利亚、埃及等国家文化交流，起了深远巨大的作用。阿育王生前巡礼各地佛迹时铭刻了许多石柱，他又在各地崖壁上刻了许多法诰（根据佛法而颁布的各种教诰），这些遗物至今还有留存和陆续发现的，对古代历史提供了极为重要的资料。

16问：阿育王传布佛教之举对当时部派的兴起有没有影响？

答：阿育王时代，佛教大约已经分为四个部派。各部派分往各地传教后，受到了各地不同环境的影响，在形式上和学说上有了不同的发展，这便促成了更多部派的产生。

17问：关于阿育王时代举行的第三次结集的情况可否再谈一些？

答：关于第三次结集的经过，我在前面谈到佛教经籍时，已经讲过了。根据南方佛教记载，阿育王大弘佛教之事，就在结集之后。最近在八纳（阿育王故都）发掘出阿育王建筑的一座宏大寺院的遗址，里面有一百根石柱的大讲堂，并有许多僧房和水池。有人说

这可能就是第三结集的处所。但是关于第三结集的事，北方所传典籍中没有记载。

18问：阿育王之后又有什么大事发生？

答：阿育王大弘佛法后，三百年中，佛教在中亚各国获得坚固的根据地，更向东发展而传来中国，流布地域日见推广。但是在印度境内，佛教却遭遇了厄运。阿育王逝世后不到五十年，孔雀王朝为巽伽王朝所代替。受到婆罗门国师的助力而篡得王位的富奢蜜多罗王崇拜婆罗门而严厉地排斥佛教，毁坏塔寺，杀戮僧众，使印度佛教一时陷于黑暗的时代。幸而巽伽王朝的统治权力仅限于中印度，他的排佛运动没有波及到南印度与西北印度。当时佛教徒多避难于西北，也有逃到南方的，因而促进了北方佛教的兴盛和南方佛教的发展。当时统治北印度的是大夏国弥兰陀王（希腊族），弥兰陀受了那先比丘的教化归依了佛教。至今传存着他和那先比丘关于佛教的问答，汉文译本称《那先比丘经》，巴利文本称为《弥兰陀问经》。大家都知道的犍陀罗佛教美术，就是从这时候开始逐渐兴起的。

19问：当时南方佛教的情况怎样？

答：关于当时南方佛教情况，缺乏资料。可以知道的是：由于阿育王派到南印度去传教的是大众部僧众，所以大众部学说在南方盛行而为兴起于南方的达罗维荼民族所接受。达罗维荼人建立的案达罗国在公元前28年灭了中印度的康发王朝（巽伽王朝的后一朝代）而并有其土地。此后，中印度的佛教似乎稍稍有了起色。与案达罗人入主中印度同时，大月氏人灭了西北印度的大夏王朝而创立贵霜王朝，印度历史自此进入南北朝时代，直到公元四世纪笈多王朝时才再统一。在此时期中，南朝佛教情况很难知道其详，北朝佛教则在公元二世纪迦腻色迦王（Kaniṣka）时期最为兴盛。

20问：迦腻色迦是怎样的人物？

答：关于迦腻色迦的事迹很少有纪载，但是在护持佛教方面，他有阿育王第二之称。据说他从前也像阿育王初期那样多所杀伐，后来得到胁比丘（Pārśva）的教化，归依佛教。从遗迹看来，迦腻色迦时代建造的塔寺和佛像很多，而且在艺术上有很大发展。如在佛塔的形式方面，改变了印度向来的复钵式，而创建了五层楼阁式的佛塔；在造像艺术方面，参酌希腊、印度两地不同形式而自成风

格，使犍陀罗佛教美术发展到高峰。迦腻色迦王又由中印度罗致当时佛教大文学家马鸣（Assaghosa）到迦湿弥罗（Kasmira），使佛教文学获得辉煌的发达。从这些事实中可以想见佛教在这时代兴盛的情况。迦腻色迦王对佛教贡献最大的就是在他发起和护持下举行了一次重要的结集。相传他曾向一些人询问教理，所得到的解答各有不同。他感到学说纷纭，莫衷一是，于是依从胁比丘的指导，招集世友（Vasumitta）以下的硕学比丘五百人在迦湿弥罗纂辑三藏，并加以编述注释，共三十万颂，九百多万言，历时十二年方始完成。其中一部分就是《大毗婆沙论》，是属于说一切有部的一部重要的巨著，我国有新旧两种译本。

21问：这时期，除了有部得到提倡弘扬之外，其他部派的情况怎样？

答：当时迦湿弥罗地区，有部最为兴盛，但其他各部派也都很发达。与大众部有关而和有部对立的大乘思想这时流行于印度各地，在思想界中有着广泛的影响。迦腻色迦王所尊事的马鸣就是一个具有大乘思想的人。这时期可以说是大乘学说经过长期酝酿而趋于成熟的时期，但是大乘佛教的大兴，还有待于稍后一个时期的龙树大师。

22问：龙树是怎样一个人？

答：龙树（Nāgārjuna）是公元二、三世纪间的南印度人，原来是一个婆罗门学者，后来归依佛教，出家受戒，在雪山从一位老比丘受到大乘经典，由此智慧无碍。当时许多哲学家们都被他的雄辩所折服。他感到所读到的佛经虽然深妙，但是道理还有未尽发挥的，随后又从别处得到许多大乘经典，他便造了许多论著以阐明发挥经义。他的学说迅速地流布印度各地，从此大乘佛教便大为兴盛起来。

23问：龙树学说的主要内容是什么？

答：龙树主张的是“诸法实相论”。前面说过，在对于事物的认识问题上，有部认为一切法的自体是永恒存在的，只是它的作用的生起，要依借于因缘。龙树则与此相反，认为一切有为法只是因缘和合所生的现象，没有常住不变、单独存在的自体。譬如众木聚生而为林，林只是个假名，除众木外，别无自体（无自体也叫做“无自性”）。所以龙树说：“因缘所生法，我说即是空，亦为是假名，亦是中道义。未曾有一法，不从因缘生，是故一切法，无

不是空者。”“空”乃是一切法的真实相状。

24问：这是不是一种否定一切的怀疑论？

答：为了便于判断，需要再作些说明：（1）一切法空的理论是建立在一切法互相依存的因果律的基础之上的，所以它不是否认因果律的。（2）这里所说的空，不是空无之空，它是绝待的，不能认为是有，也不能认为是无，不能认为是生，不能认为是灭，一切经验上有无、生灭、来去等等概念都说不上，不是我们的觉知分别所能得其实际，所谓非有非无，非生非灭，一切皆空，所以说是“空不可得”。（3）对于事物的认识，龙树说有二谛，这是就一件事物的两面来说的：从现象来说为世俗谛（相待的世间真理），从本质来说为第一义谛（绝待的真理）。从世俗谛来看，宇宙万有，无量差别，种种相状，种种功用，种种生灭、来去、同异、是非、得失等现象和因果关系，历历分明而有；从第一义谛来看，虽有万象差别，而当体空不可得。空与有在因缘所生法上是统一的，因此世俗谛与第一义谛是二而不二的，这便是“不坏假名，而说实相”的道理，这也便是龙树的“中道义”。

25问：龙树之后，大乘有什么发展？

答：龙树之弟子提婆是龙树的得力的继承者和弘扬者。提婆也有许多著作，着重于破斥外道（佛教对非佛教的宗教和哲学，均称为外道），因此遭到杀害，但是大乘学说更为发达，同时，有部、经量部和其他部派始终与大乘相抗衡，也都很发达。大乘佛教和部派在互相争论辩难中，都在思想上有所发展。到了公元四、五世纪的笈多王朝，大乘佛教产生了一个新的学派——瑜伽系（Yogācāra）与原来龙树的学派——中观系（Mādhyamika）并称为印度大乘佛教的二大思潮。

26问：请简略介绍一些笈多王朝的情况。

答：笈多王朝在印度史上是与孔雀王朝媲美的一個王朝。它是公元320年左右在中印度兴建起来的，月护王是这个王朝的创始者。第二代海护王统一了五印度，国势大盛。第三代月护二世王更向西方扩展，并发展了海外贸易交通，远及埃及诸地。随着政治与经济的兴隆，当时印度的文化学术也呈现着灿烂的光彩。笈多时代的佛像雕刻被认为是印度历代雕刻中很完美的作品。其它艺术、文学方面都有很高的成就。我国法显法师五世纪初西游印度时，正

是月护二世王在位时期，他的《佛国记》中曾记载他当时见闻的盛况。至于宗教哲学方面，当时婆罗门教神学有很大发展，其他学派如数论、胜论等颇为兴盛；佛教在这时期也有了重要的建树，出了不少大学者，其中无着（Asanga）和世亲（Vasubandhu）两兄弟是最为特出的人物，他们就是瑜伽系的创立者。

27问：无着和世亲是怎样的人物？

答：无着是北印度人，原来是有部的僧人。传说，他因为对有部教理感到不满足，乃上升兜率天（弥勒菩萨所居住的天上），向弥勒菩萨请问大乘空义（一说弥勒下降为他说法），于是大得悟解。他传出了弥勒的五大部论，并且写了许多著作，以阐明大乘教义。有人考证，无着所师事的弥勒，大概是一位属于瑜伽师（有部中专修禅定的人，称瑜伽师，即禅师）的大乘学者，而不是兜率天的弥勒。世亲是无着之弟，原来也是有部的学者，后来听从无着的劝导，改学大乘，大弘无着的学说。世亲著作极多，被称为千部论师。

28问：瑜伽系学说的主要内容是什么？

答：瑜伽系的学说，内容极为繁博，包括方面甚广，现在只就宇宙观问题简略地介绍一些。在这个问题上，瑜伽系继承诸法实相论而加以补充和发展。它认为实相应该有两方面，既不是有自性，又不是一切都无所有，这样的认识才是离开有与无的执着，才是中道。瑜伽系说诸法自性有三种：一切法都是依众缘而起，这便是“依他起性”；依他起的万物由于凡夫的种种虚妄思量分别（周遍计度），而有种种虚构的体相在心上现出来，其实这种种体相完全是没有的，这便是“遍计所执性”；在依他起上离开虚妄分别，便证到圆满成就的真实，或叫做“真如”，或叫做“实相”，这便是“圆成实性”。这三性可以用一个比喻来说明，遍计所执好像是夜间行路看见一条绳而误认为蛇，其实蛇没有而似有；依他起好比是绳，绳的体由因缘所生，只是假有；圆成实比如绳体的麻，则是真有。从三性的里面来观察，又有三无性：第一，遍计所执的相是没有的，这便是相无性；第二，凡夫认为自然而有的事物，只是因缘所生而已，这便是生无性；第三，诸法的实相，是空不可得，这便是胜义无性。

29问：“三性三无性”的说法，与龙树的二谛有什么不同？

答：“三性三无性”的说法仍然是以缘起性空论为基础的，但以前龙树的“一切皆空”论只是就三无性的一边说的，瑜伽系则同时主张三性，而且详于阐说三性一边的道理，它大量采用了有部的“名相”（即术语）而加以组织来分析说明一切法的类别和关系，特别指出在依他起中应当认识一切法都是识所变现，所谓“万法唯识”的道理，这是中观系所没有的。

30问：佛教既认为根（眼、耳等）境（色、声等）相合，才有识的发生，如何又说万法唯识呢？

答：唯识家认为我们眼识所见的色，耳识所听的声，鼻识所嗅的香，舌识所尝的味，身识所触的坚、湿、暖、动等，都不是事物的本身，而是五识依着五根托外界事物为“本质”而变起的“影像”。所以识有两种功能：一种就是能够变起影像的功能，叫做“相分”；一种是能够了别影像的功能，叫做“见分”。我们的一切知觉无非是自己识上的见分对相分的了别而已。

31问：这种说法，只能说明我们主观对客观世界的反映，并不能说明唯识的道理，因为照唯识家的说法，也必须先有外界事物才有相分，有了相分，才有见分，换句话说，仍然是根境相合才有识的发生，根与境都是离开识而存在的，倒是识不能离开根境而存在。

答：唯识家主张六识之外，还有两个识——第七末那识（mana）和第八阿赖耶识（ālaya）。末那意译为“意”，是第六意识所依之根，它有一个单纯的作用，就是恒常不断地执持“我”的思想。由于“我”的思想，人们在接触外界事物时，便有爱憎、好坏、是非、彼此种种意识活动。阿赖耶意译为“藏识”，它能保藏一切事物的“种子”不使失坏。“种子”在这里是一个借用的名词，它的实际意义是能力，或者是潜势力。阿赖耶藏的种子有两类：一是名言种子，“名言”用现代语说，就是概念。我们前七识所见闻觉知的东西留着印迹于阿赖耶识上面，用唯识家的术语，这叫做“薰习”，好像用香薰衣服，衣服便留着香气那样。薰习所成的便是作为潜势力而存在的种子。二是业种子，就是我们的意识所造的善业、恶业熏在阿赖耶识上的种子。由阿赖耶所藏的二类种子变起现在的五官（根身），外界（器界）以及现起前七识（所以根身、器界都是阿赖

职识所变现，它们是阿赖耶的相分）。这身心宇宙的变起，叫做“现行”（现在的活动）。于是再由现行薰习名言种子和业种子而有未来的身心宇宙的变现。这就是瑜伽系的“阿赖耶缘起论”。

32问：佛教是不承认灵魂的，但是阿赖耶识可否说是变相的灵魂？

答：佛教内部对这个问题也有争论，甚至后来瑜伽系的学者也有删去第七、第八识而只谈六识的。但主张阿赖耶缘起论的人认为阿赖耶不是一个常住不灭的东西，而是永远在迁流变化着的，这与一般灵魂的意义不同。好像远望中的瀑布，看上去以为是一片白布下垂那样，把极其急速而微细的迁流变化的阿赖耶识，认作是一个常住不变的“我”（或叫做灵魂）的存在，这是错觉。这个错觉，就是末那识。唯识家的目的仍然是破除我执，把有漏（烦恼）之识，转成为无漏之智。

33问：瑜伽系除建立了一套完整的唯心论体系之外，还有什么其他建树？

答：佛教的逻辑学——因明，到笈多时代有了很大成就。瑜伽系学者在这方面的贡献特别多。到了六世纪的陈那（Dinnāga）和七世纪的法称（Dharmmakirti），因明更为发展。这两人都是瑜伽系的大学者。

34问：印度大乘思想除中观、瑜伽两系外，还有其他派系没有？

答：正式形成学派的是中观、瑜伽两系，它们是印度大乘思想的主流。两系之间固然有学说上的争论，两系内部也各有不同流派的发展。此外，也还有不同于两系的思想上的支流，将来有机会再谈。

35问：笈多王朝以后的情况怎样？

答：笈多王朝后期（五世纪末）**吠** 哒族（一说是匈奴族，未确。

吠 哒族又称白匈奴，但与匈奴不是一族。）由阿姆河南下，占领印度西北部，建立王国。西北印佛教受到严重的破坏。印度终因异族的继续入侵，笈多王朝的覆灭，而陷于分裂割据的局面。其时，东印度一个王国西侵中印度，中印度佛教又一度受到破坏。后来中印伐弹那王朝的戒日王（Śīladitya）战胜了敌人，并统一了中印度，佛教始稍稍复兴。笈多时代已经开始兴建的那烂陀

寺，在伐弹那王朝继续得到增建，规模日益宏大，大乘学者们集中在那里讲学研习，蔚为当时印度最高学府。大约六世纪中叶至七世纪中叶，这一百年左右是那烂陀寺的最盛时期。我国玄奘法师在这里留学时（公元七世纪三十年代），瑜伽系的大论师戒贤（Silabhadra）和中观系的大论师智光（Jñānaprabhā）都在那烂陀寺讲学。戒日王曾在他的首都曲女城（Kanyakubja, 今名Kannauj）开群众大会召集学者们辩论哲理，可见当时佛教讲学风气之盛。

36问：这以后的情况如何？

答：戒日王死后，中印度又陷于混乱局面。当时印度分据各地的王国都崇奉婆罗门教，佛教日益削弱。独有东印度的波罗王朝历代崇信佛教。这个王朝起于七世纪中叶，延续到十一世纪末。它统治着摩揭陀以东的地方，那烂陀寺在它的境内，它又在那烂陀附近另建一超戒寺，规模更大。这一时期，密宗逐渐兴盛起来，九世纪以后，更为盛行，但佛教在学术思想方面则逐渐衰落下去。

37问：密宗是怎样创立的？

答：密宗，或称为真言陀罗尼宗，或称为密乘（大乘其他宗派相对而称显宗或显乘），传说是龙树开南天竺铁塔，取出秘密经典而传出来的。事实上，自龙树以来，流行的大乘经典中，就杂有密乘的成分（密咒），但独立而成立所谓密宗，则是远在龙树之后的事。

38问：真言陀罗尼是什么意思？

答：真言陀罗尼就是密咒。根据密宗的说法，密咒是佛内证的智慧的语言，是能够显示诸法实相的真实语言，所以叫做真言。陀罗尼（dhāraṇī）的意义是“总持”。密咒的一字一声，总含着无量教法义理，持有着无量威力和智慧，凭仗念诵密咒的威力，可以获得远比显宗迅速而伟大的成就。密宗着重在修习仪轨，按照一定的仪轨，结坛，设供，身结手印，口诵真言，意作观想等等，以求将自己的身口意三业，转成佛的身口意三密（佛的身口意作用微妙不可思议，所以称为三密），这样便可以迅速得到智慧、神通，乃至即身成佛。修习密法还有息灾、增福、降伏等作用。

39问：密宗佛像有许多是多头多手，有的是面貌狰狞，甚至不是人的形

状，这是什么道理？

答：密宗的像都是表示一定的意义的，如观音像的四臂六臂表示菩萨行的四摄六度，大威德金刚的三十四臂加上身、口、意表示三十七道品，又如佛座上的莲花表示出离心，月轮表示菩提心，日轮表示空慧（通达一切皆空的智慧），又如手中执持的种种器具也都是表示佛菩萨的种种誓愿、智慧、功德等。面貌凶猛的一般是金刚（有大威力的神）像，表示降伏魔军的威力和作用。此外，还有其他许多天神的像。

40问：密宗是否吸收了许多婆罗门教的内容和形式？

答：是的。从历史来看，佛教最初是反对婆罗门的教义和祭祀仪式的。佛教一度在孔雀王朝成为国教，大行其道，但不久即随王朝的更易而遭到排斥，其后虽得到某些地方王朝的护持，但一般说来是不断受到种种障碍的。为了随顺时势与世俗，佛教不得不采取一些“方便”，以推行其教化。同时婆罗门教虽在政治地位上居优势，但由于佛教哲学的发扬，不能不受到刺激而要求改进它的理论。因此双方在互相排斥中的互相影响，便成为自然的趋势。到笈多王朝，婆罗门教梵我论的建立，扩大和增强了它的影响。公元七世纪后期，婆罗门教学者鸠摩梨罗（Kumārila）和商羯罗（Śaṅkara）更吸收佛教的理论而大大发展它的神学，于是婆罗门教便以新的姿态大为兴盛起来（西方学者把这以后的婆罗门教称为印度教），而佛教当时则以人才寥落，相形见绌日见陵逼。适应这样时节因缘而兴起的密宗，在仪式上大量采取“方便”，吸收了婆罗门教的许多东西而加以不同的解释，确是事实。但是在教义上仍是以空、无我的理论为根本的。

41问：佛教在印度的最后情况是怎样？

答：从七世纪中叶开始，便有信奉异教的突厥族由中亚细亚侵入印度的西北部。到十世纪后半期，他们逐渐进展到五河地区，并向内地侵略，所到之处，印度原有宗教均受到破坏。到十一世纪波罗王朝末期和继起的斯那王朝时期，侵略势力渐达东印各地。佛教上师们星散避难，多经历尼泊尔、迦湿弥罗等地来到中国西藏。最后斯那朝王室也改变了信仰，超戒寺等重要学府先后被毁，留存的僧人寥寥无几。于是佛教残余不久便绝迹于印度本土，这大约是在十二世纪末叶的时候。

42问：近代印度佛教复兴的情况，可否介绍一些？

答：十九世纪末期，斯里兰卡一位达摩波罗（Dhammapāla）居士到印度瞻礼佛教圣地，看到那些地方的荒凉景象，他便努力从事复兴印度佛教的事业，于是印度又开始有了佛教的团体和活动。近几十年来，中国、缅甸、日本等国佛教徒也陆续在印度各佛教圣地——菩提伽耶、鹿野苑、拘尸那等处建立了一些佛寺。印度人民渐有归依佛教，而且也有到斯里兰卡出家受戒的，但是为数不多。直到1956年，突然有一个大规模的改宗佛教运动在“不可触种姓”的群众中发生起来，这是近代佛教史上一件大事。原来，有一位安贝德卡尔（B. R. Ambedkar）博士，是印度“不可触种姓”人民的领袖人物，1956年10月，他在那伽浦尔一次群众大会上宣布他改信了佛教，并宣传“人不是神创造的”和“一切众生平等”的佛教教义。参加大会的五十万“不可触者”响应他的号召，同时宣布放弃印度教信仰而归依佛教。安贝德卡尔于1956年12月突然逝世，但是改宗佛教运动不但没有停止，反而掀起了澎湃浪潮，向印度全国各地发展，成千成万的人相率归依佛教。据1962年5月《世界佛教》杂志报道，印度七千万不可触种姓人民中已经有二千万人改宗佛教。这个运动目前还在继续发展。

5 THE SPREAD, DEVELOPMENT AND EVOLUTION OF BUDDHISM IN CHINA

(I) The Introduction of Buddhism into China and the Translation of Buddhist Scriptures

¹Q: When was Buddhism first introduced into China?

A: It is difficult to ascertain the exact time of the introduction of Buddhism into China. In the early years of its introduction, its followers were few and may not have been noticed by the upper bureaucracy and historians. In the year 2 BC, Yi Cun, the envoy of the king of Great Kuṣāṇa (a kingdom established by a powerful minority ethnic group after its migration from Gansu, China, to Central Asia), arrived in Chang'an (present-day Xi'an), capital of the Han Dynasty. He recited Buddhist teachings to a high-ranking scholar-administrator named Jing Lu. This is the earliest record of the introduction of Buddhism into China. We may presume that 120 years before this, with the opening up of communication with the Western Regions by Emperor Wu of the Han Dynasty, Buddhism, which had spread from India to Central Asia, was probably already being carried eastward by travelers. According to another tradition, at the time of Qin Shihuang (who reigned during 246-210 BC, contemporaneously with Aśoka in India, who reigned during 272-226 BC), 18 Indian samaṇas—Sri Fang and others—came to Xianyang (near present-day Xi'an). After the Third Buddhist Council, held in about 250 BC during the reign of Aśoka, Buddhist missions were sent to various countries, so it is quite possible that a mission came to China. Besides, some identify the word "Xianmen" which appears in Song Yu's *Ode of Gao Tang* and the *Biography of Qin Shi Huang* in the *Annals of History* with the word "Samaṇa". Yet this is hard to verify since there are no extant

translations or other books on the matter.

²Q: If there are so many views concerning the first introduction of Buddhism into China, why is it widely held to have been at the time of the Emperor Ming of the Han Dynasty and his search for Dhamma?

A: According to historical records, in the 7th year of the Yongping Era (64 AD), the Emperor Ming of the Han Dynasty sent twelve emissaries to the Western Regions in search of the Buddha Dhamma. In 67 AD, they returned to Luoyang together with two Indian monks, Kāśyapa-mātaṅga and Dharmaranyā and also brought scriptures and statues of the Buddha back with them. They began to translate parts of Buddhist scriptures. One of these translations is believed to be the existing *Sutta of Forty-two Chapters*, an abridged version of the *Āgama*. At the same time, the first Buddhist temple in China was built in the capital, that is the Baima (White Horse) Temple, which is still standing today. It was named after the white horse that carried the scriptures and statues of the Buddha to China at that time. In view of this tradition, even if the introduction of Buddhism into China predates the Emperor Ming of the Han Dynasty, it can be said that Buddhism as a religion was first accepted and upheld by the royal court and began to lay its foundations in scale in China during the Emperor Ming's reign. In 73 AD, Ban Chao was sent as an envoy to the Western Regions, afterwards 36 kingdoms of this area were subjugated and communication with the Western Regions was made easy. Zhang Heng (78-139 AD), the famous scientist and writer at that time, mentioned "Sangmen" (samaṇa) in his work *Ode to the Western Capital*, which shows that the presence of Buddhist monks had already become a social phenomenon, attracting the attention of men of letters and learned scholars.

³Q: Is it possible that Buddhism spread to China not only by land route from the West to Central China, but also by sea to Wu and Chu (middle and lower Yangtze) area? This is suggested by the fact that the Prince of Chu, Liu Ying, who was the Emperor Ming's

brother, was a believer of Buddhism.

A: I agree with this view. According to historical records, it seems that Buddhism was more widespread in the Chu area than in Central China.

⁴Q: When did native Chinese monks first appear in China?

A: Native Chinese monks appeared quite early in China. The earliest on record was Liu Jun, Marquis of Yangcheng, who got Emperor Ming's permission to adopt monasticism. However, the monks in the early days merely adopted monasticism by following their masters, shaving their beards and hair, and abiding by certain rules, there was yet no ordination system according to the Vinaya rules. Not until 250 AD, when Dhammakāla from Central India established a regular ordination altar at Baima Temple in Luoyang to transmit the precepts, did China have genuine bhikkhus. Owing to the absence of foreign bhikkhunīs in China, women who renounced the world at first merely shaved their hair. Later on, their ordination was presided over by senior monks. A full system of ordination was not in place until 429 AD, when nineteen bhikkhunīs headed by Devasara (or Tissara) came from Sri Lanka. It was then that fully ordained bhikkhunīs came into existence in China.

⁵Q: When did the translation of Buddhist scriptures begin in China?

A: The propagation of Buddhism in China was closely associated with the translation of Buddhist scriptures. As was mentioned before, Kāśyapa-mātaṅga and Dharmaranyā began the translation of the "Sutta of Forty-two Chapters" at the time of the Emperor Ming of the Han Dynasty, together with some other suttas. These were the earliest translations.

⁶Q: Were there other famous translators later in the Han Dynasty?

A: Among the translators at the initial stage (2nd-3rd centuries AD), we must not omit such names as An Shigao of Parthia (around present day Iran), Lokasema of Kuṣāṇa, Saṃghavarman and

Samgiti of Semeg-kand Kingdom (in today's Kirghizstan), as well as Dharmarakṣa, a Chinese monk of Kuṣāṇa extraction, who was one of the earliest monks to go to the West in search of Dhamma. In addition, Zhu Shixing also went to the Western Regions in 260 AD to search for Dhamma. Owing to their endeavors, a large number of Sāvaka-yāna and Mahāyāna scriptures were translated to Chinese.

⁷Q: Were there any differences in the scriptures translated by these translators?

A: The translations fall into two main systems: one was the Hīnayāna School represented by An Shigao, primarily focusing on the *Āgama* and *Dhyāna* teachings; and the other was the Mahāyāna School represented by Lokasema, concentrating mainly on the *Prajñā-pāramitā-sūtra* and the Sukhāvati creed. The two schools existed side by side.

⁸Q: What was the effect of these early translations on the later development of Buddhism in China?

A: Translation at that time was in the initial stage. Due to various limitations, it was not yet possible to carry out well-planned and systematic translations. As a result, only a few of the scriptures were translated completely, and a consistent style of translation was yet to be formulated. Nevertheless, they rendered a valuable service as pioneers, helped to establish Buddhism in the Chinese intellectual circles and extend its influence.

⁹Q: Since the introduction of Buddhism into China, a great number of people have been engaged in the study and propagation of Buddhism. Who were some of the important figures in the Chinese Buddhist circles that contributed to the development of Buddhism in China?

A: The popularization of Buddhism in China dates from the 4th century AD. Ven. Dao An, a leader in the Chinese Buddhist circles, was an important figure playing a very active role at that time. He was one of the earliest zealous propagators who sent his followers

to various parts of the country to preach the Buddha Dhamma, and was the founding father of the first Saṅgha institution in China. He made every effort in search of precepts to supply the deficiency in Vinaya Piṭaka, and regularized rules and rites for monks and nuns to follow throughout the country. (For example, upon taking up monasticism, Chinese monks and nuns adopt the surname "Shi" (Sākya) in place of their former surnames. This was first advocated by Ven. Dao An himself.) He collected and collated the texts already translated, and made the first bibliography of Chinese Buddhism— *Jinglu (Bibliography of the Suttas)*. He energetically promoted and rewarded translation work and for the first time summarized the experience of translation. Under his guidance, many important scriptures were translated and quite a number of scholars and translators were gathered and trained, which provided favorable conditions for the subsequent large-scale translation work of Kumārajīva.

¹⁰Q: The establishment of Buddhism primarily rests upon Vinaya rules. What other texts of Vinaya were translated after Dao An?

A: The earnestness which Dao An and his disciples exhibited in search of disciplinary rules gave great impetus to the enrichment of the Vinaya Piṭaka. In his lifetime, Dao An collected a large number of books of disciplinary code (Pātimokkha) and translated some of them. Unfortunately these have been lost. Afterwards, with the help of Puṇyatāra and Dharmaruci from Kasmīra, Kumārajīva translated the Sarvāstivāda Vinaya which was widely disseminated by Kumārajīva's teacher Vimalākṣa in the Jiangxi region. Buddhayasas (another Kashmiri) translated the Dharmagupta Vinaya in 410 AD. Saṃghabhadra, who came to China from Sri Lanka with a mission sent by Ven. Buddhaghoṣa, translated *Samantapāsādikā* (the Vinaya commentary). Also in order to search for Vinaya rules, Ven. Faxian (Fahsien) travelled throughout India in the early 5th century and became a great Dhamma-seeker and traveler of ancient China. His immortal travelogue and other achievements might overshadow his initial motive of seeking

Vinaya as well as his other accomplishments in this respect. He brought back, in addition to many other books, the *Mahāsamghika Vinaya* and *Mahīśāsaka Vinaya*. The former was translated to Chinese by Faxian himself with help from Buddhabhadra of Kapilavastu (a part of Nepal today), the latter, by Buddhajīva (from Kashmir) after Faxian's death. Another great Dhamma-seeker, Yijing, of the 7th century also traveled abroad with the same aspiration of studying the Vinaya texts. He brought back and translated 11 works of the Sarvāstivāda School, thereby completing the Vinaya-piṭaka to a great extent. Thus, the Vinaya-piṭaka translated to Chinese includes the *Dharmagupta Vinaya* in 61 volumes, the *Sarvāstivāda Vinaya* in 157 volumes, another version of *Sarvāstivāda Vinaya* of 61 volumes, together with the texts of Kamma, Pātimokkha as well as commentaries on the various Vinayas, a total of about 500 volumes now exist. In addition, Chinese high monks wrote more than 500 volumes of treatises about Vinaya, which are also extant. As to the lineage of Bhikkhu precepts in China, during the period of the Northern and Southern Dynasties (3rd—4th centuries AD) *Dharmagupta Vinaya* prevailed in the North, *Sarvāstivāda Vinaya* in the South. When the Sui Dynasty united the whole of China, the North dominated over the South in politics and also in Buddhist disciplines. Thus the *Dharmagupta Vinaya* of the North has dominated since the Sui Dynasty. In the Tibetan Buddhist areas, the *Sarvāstivāda Vinaya* has always been in practice, while in the Dai-inhabited areas the Theravāda Vinaya spreads. This is of the same origin as the *Dharmagupta Vinaya*, and identical with that of Sri Lanka, Myanmar and other Theravādin countries.

¹¹Q: Your talk above gives a clear picture of the translation and spread of Vinaya Piṭaka. Could you please talk about the large-scale and systematic translation of the Sutta Piṭaka and Abhidhamma Piṭaka? When and with whom did the work begin?

A: The large-scale systematic translations of Sutta and Abhidhamma texts of Buddhism should date back to Kumārajīva in the early 5th

century.

¹²Q: What were the special characteristics of Kumārajīva's translations when compared with previous attempts? What effect did they have on Buddhism and on Chinese thought and culture subsequently?

A: Kumārajīva's translation work enjoyed unprecedented favorable conditions, being supported by the government (the Kingdom of Yaoqin) and assisted by a large group of volunteer monks with high learning under the influence of Dao An. However, his great achievements were mainly owing to his profound knowledge and perseverance. This brilliant master, who was born in Northwest China (Kucha in Xinjiang), of mixed Chinese and Indian blood, is the pride of both Chinese and Indian peoples. He and the later Dhammācariya Xuanzang were the two giants in the cause of translation. The 300-odd volumes of canonical works translated by Kumārajīva are not only the treasure of Buddhism but also an important literary heritage, having tremendous influence on the philosophical thought and literature of China. Under his teaching and guidance, thousands of intellects were fostered, enabling the enormous leap forward of Buddhism at the time.

¹³Q: You have said Kumārajīva's translations were systematic. Would you tell me about his system?

A: In the area of Buddhist studies, the most important contribution of Kumārajīva was his introduction of the books of the Mādhyamika School founded by Nāgārjuna. Owing to his effort, the Sutta and Abhidhamma texts of this school, such as the *Mūlamadhyamakārikā*, the *Śataśāstra*, the *Dvādaśamukha-śāstra*, the *Vimalakīrtinirdeśa*, the *Saddharmapundarīka-sūtra*, the *Mahāprajñāpāramitā-sūtra*, the *Cūlaprajñāpāramitā-sūtra* and the *Vajraccedikāprajñāpāramitā-sūtra* etc., as well as the *Mahāprajñāpāramita-śāstra* (the commentary on the *Mahāprajñāpāramitā-sūtra*) were introduced into China, thus laying a solid foundation for the Dhammatā School in China. Secondly, Kumārajīva translated the *Satyasiddhi-śāstra*, an important book of the Sāvakayāna, which was initially spread along with the three

śāstras of the Mādhyamika School (or four śāstras if we include the *Mahāprajñāpāramita-śāstra*). Later this evolved into an independent school, known to posterity as the Satyasiddhi masters, which reached its climax during the period of Northern and Southern Dynasties. This sect of the Sāvakayāna was closer to the Mahāyāna tradition.

¹⁴Q: Were there any other famous translators after Kumārajīva? What schools did they belong to?

A: Kumārajīva's translation work, which took place between 401-413 AD, mainly covered the doctrines of the Mahāyānin Suñña Sect as advocated by Nāgārjuna and Āryadeva in a comprehensive and systematic manner. After Kumārajīva, many important translators came to China in a continuous stream, and major Suttas and Abhidhamma texts were translated one after another. For instance, Buddhābhaddra translated the *Buddhāvataṃsaka-mahāvaiṣṭhīya-sūtra* in 418-421 AD, Dharmarakṣa translated the *Mahā-parinirvāṇa-sūtra* in 421 AD, Guṇabhadra translated the *Lankāvatāra-sūtra* in 443 AD, etc. The introduction of these canons produced a significant effect on the development of Chinese Buddhism. In the early 6th century (508 AD) Bodhiruci came to China and initiated the translation of Asanga and Vasubandhu's commentaries on the Yogācāra. Among their translations the *Daśabhūmika-śāstra* was particularly influential, and its students formed a school called the Daśabhūmika School with Southern and Northern branches. Later on, Tipiṭakācariya Paramattha (498-569 AD) came to China in 546 AD. He translated Asanga's *Mahāyāna-saṃparigraha-śāstra* and Vasubandhu's *Mahāyāna-saṃgraha-bhāṣya* in 563 AD, as well as the *Abhidhammakosa-śāstra* in 564 AD, which was retranslated between 566 and 567 AD. Paramattha was not only a great translator but also a master of Buddhist philosophy, and with his long sojourn in China, acquired an excellent command of the Chinese language. He could explain the sūtras and śāstras as he was translating them. His explanations were taken down by his students and resulted in good commentary books. The propagators

and students of these texts were known as masters of the *Samparigraha-sāstra*, or masters of Kosa. Though Paramattha suffered hardships of war for more than 20 years after his coming to China he still managed to translate more than 100 volumes of important sūtras and commentary works, which formed an important sect of Chinese Buddhism. He was one of the translators who made the greatest contributions during the 200-odd years between Kumārajīva and Xuanzang.

¹⁵Q: Xuanzang of the Tang Dynasty translated works of the Yogācāra School, so did Paramattha. Are there any differences between their translations of Yogācāra doctrines?

A: According to Xuanzang, Śīlabhadra was born in 528 AD, from which it may be inferred that Dhammapāla was born in about 530 AD. Paramattha was born in 498 AD, so Paramattha was 30-odd years older than Dhammapāla. Paramattha translated Dinnāga's *Ālambanaparīkṣā* (which was also translated by Xuanzang) and *Hastavālaprakaraṇa* (also translated by Yijing) into Chinese. Dinnāga was one of Vasubandhu's students and Dharmapāla's teachers. This suggests that Paramattha was a master of Yogācāra who lived between Dinnāga and Dharmapāla, while Xuanzang mainly dealt with Dharmapāla's theory. So Xuanzang's disciples regarded Paramattha's translation and scholars of the Bhūmiśāstra School as the old theory or the old translation, while regarding Xuanzang's as the new translation. The differences between them were summed up by Lingren of the Tang Dynasty (698-907 AD) into 14 points. For example, the former maintained that all beings possess the Buddha-nature, whereas according to the latter, there is a part of living creatures without the Buddha-nature (a-gotra); the former holds that the doctrines and wisdom (understanding and mind) of the fruit of Bodhi are identical, whereas according to the new theory they are different in that they result in momentary and permanent fruit respectively; according to the old theory, among the Three Characteristics, the parikalpita (illusory) and the paratantra (empirical) are relative truths, whereas according to the

new, parikalpita alone is relative; the old holds that the root of Dependent Origination lies in the eighth consciousnesses, whereas the new holds that all eight consciousness and the corresponding cetasika (constituents of consciousness) form the basis of Dependent Origination. In Paramattha's translation of *Trīṃśikā-vijñapti-mātratā-siddhi* (or *Pravṛtti-vijñāna-śāstra*), Ādānavijñāna was made the 7th consciousness, while in Xuanzang's the eighth. In addition, the Mahāyāna-saṃparigraha-śāstra School founded by Paramattha created the 9th consciousness, which was absent from the new translation.

In a nutshell, both new and old translations came from the same source—Yogācāra School, so they had similar basic principles. However, it is natural that there were slight discrepancies in interpretation due to the separation in time and later they each developed individual distinct doctrines. Paramattha's translation caused a great stir in the Chinese Buddhist circles during Sui and Tang and this motivated Xuanzang to go to India to make more profound studies. In the 80-odd years (546-627 AD) between Paramattha's arrival in China and Xuanzang's travel to India, Indian Buddhism also underwent radical changes. First, there arose the controversies between Dharmapāla and Bhāvaviveka over Suñña (emptiness) of Mādhyamika and Bhava (existence) of Viññāṇavāda. After that, strife between Buddhapālita (supported by Candrakīrti) and Bhāvaviveka led to the split of Suññatāvāda into two factions—Svātantrika (independent reasoning) and Prāsaṅgika (depending on opponent position). And then, Candrakīrti and Candragomin waged protracted polemics. Afterwards, Dharmakīrti, a disciple of Dhammapāla, also made revisions to the founding master Dinnāga's logic (Hetuvidyā). As former theories are usually improved and surpassed by later ones through differentiation and analysis, the doctrines inherited by Xuanzang were in general more circumspect and accurate than the previous translations.

¹⁶Q: Ven. Xuanzang, who went to India for further studies of the

doctrines of Yogācāra, of whom you speak—was he identical to the well-known figure of "Tang Seng" (Tang monk) or "Tang Sanzang" (Tripiṭakācārya of Tang) who went to "Western Heaven" in search of Buddhist scriptures (as described in the novel *Pilgrimage to the West*)?

A: Yes. But it's a mistake to apply the terms "Tang Seng" and "Tang Sanzang" to a single person. Tang was the title of the reigning dynasty of China at that time. So these two in modern Chinese mean, simply, "Chinese monk" and "Chinese Tripiṭakācārya". This is common knowledge among Buddhists, but I feel I need to explain since too many people in China have misunderstood the terms.

¹⁷Q: Then, could you please say something about his life?

A: Actually, it's not necessary to go into much detail about such a well-known figure as Dharmācārya Xuanzang. The great traveler who made a pilgrimage of 17 years single-handed, traveling 50,000 li all on foot, traversing 130 countries throughout the Western Regions and India, and left behind an immortal travelogue, *The Journey to the Western Regions of Great Tang*. A great Buddhist scholar who had a marvelous command of both Chinese and Indian languages, who thoroughly mastered the Tripiṭaka doctrines and elevated himself from a foreign student to the presiding lecturer in Nālandā—the highest seat of learning in India at the time. He was warmly and reverently received and respected by kings and common people alike, by the monastics and lay people of India and other countries of the Western Regions. He devoted his whole life to cultural exchange between China and India, and translated as many as 1,335 volumes (about half a million odes) of sūtras and śāstras. For his large scale and systematic translation, rigorous scholarship and tremendous achievements, he holds a place forever unsurpassed in the history of translation in China. His achievements and contributions are great and significant not only in the sphere of Buddhism, but also in the academic world in general. He translated not only

comprehensively and systematically the sūtras and śāstras of the Yogācāra School of Mahāyāna Buddhism, but also the cardinal sūtra of Suññatāvāda, the *Mahā-prajñāpāramitā-sūtra* with its 200,000 odes (or ślokas, each śloka consists of 32 syllables) into Chinese. In addition, he translated almost all important śāstras of the Sarvāstivāda School. Besides, he had exclusive possession of the esoteric works written and handed down secretly by Bodhisatta Dhammapāla, an unusually gifted Buddhist genius of India, such as the works of *Catuhśatakavṛtti* which synthesizes the theories of Suññatāvāda and Bhavavāda, and *Vijñaptimātratāsiddhi-śāstra*, which was edited by Xuanzang based on Dharmapāla's view. Both original texts were lost in India. It is thus evident that Xuanzang, who brought the Indian Buddhist studies to their highest development, was second to none. Therefore, nobody could speak out and challenge him when he sat aloft on the Lion Pedestal to proclaim his tenets, and present his views at the 18-day assembly (pañca-vārṣikamaha), which was convoked in honor of Ven. Xuanzang by Śīlāditya (Harṣa). He was hailed as the Mahāyānadeva (meaning the Deity of Mahāyāna) by Mahāyāna scholars, earning the highest academic honor of two ancient civilizations.

About a century later, a Japanese monk named Vajrasamādhi (who visited China about 818 AD), during his tour in India, found that in Buddhist monasteries in central India, the jute sandals worn by Xuanzang as well as the spoon and chopsticks he used were painted against the background of colorful clouds, and were worshipped on occasions of fast days (Upasatha) (see Vol. III of Part I and Vol. II of Part II of *The Anecdotes of You Yang*, by Duan Chengshi). Apparently Xuanzang's jute sandals were already honored and worshipped as venerably as the Buddha's footprints in India at the time. There is scarcely a parallel in history that a scholar enjoyed such high respect abroad except for the founders of various religions. Even today, the Japanese Buddhist scholars still assert that such a genius as Dharmācārya Xuanzang could only be produced by a great nation like China. Indeed, the great master

Xuanzang is the pride and glory of the Chinese people.

¹⁸Q: Can you tell us about some other historical figures similar to Dharmācārya Xuanzang?

A: Yes, Dharmācāryas Faxian and Yijing may be cited. As was mentioned before, Ven. Faxian set forth on his pilgrimage from Chang'an in 399 AD at the advanced age of 65. He traveled on foot over tens of thousands of kilometers, across deserts, trekking through the Hindu Kush mountains, left his footprints throughout North India, visiting holy places, studying Sanskrit and copying Buddhist scriptures for many years. Then he embarked for Ceylon (Sri Lanka of today), and returned to China via Java (now Indonesia). At the age of 80, he continued to translate the Buddhist scriptures with perseverance. His masterwork *Records of Buddhist Kingdoms* became an important historical document. Soon after Ven. Xuanzang, Ven. Yijing made his pilgrimage for the Buddha Dhamma by sea to India. In the course of 25 years, he visited more than 30 countries, searching for Vinaya-piṭaka and paying homage to the holy places. After returning home he translated more than 50 texts of Sūtra and Vinaya texts totaling more than 200 volumes, and wrote two books, namely *A record of the Buddhist Religion as Practiced in India and the Malay Archipelago* (another version is titled *A Journey to the South Seas and Back*) and *Biography of Eminent Monks of Great Tang Who Went to the Western Regions in Search of Dhamma*. Both Faxian and Yijing were like Ven. Xuanzang in indefatigably searching for truth with no thought of themselves, taking chances and risking death. Therefore, Lu Xun did not exaggerate when he eulogized them as the backbone of the Chinese nation. They have brought high honors for our great nation, added bright color to the magnificent oriental culture and scored unparalleled feats for the promotion of Buddhism. They are immortal translators, thinkers and travelers who left indelible marks on the development and enhancement of Chinese culture.

¹⁹Q: There were a lot of people in history engaged in the translation

and propagation of Buddhist scriptures aside from those mentioned above. Could you name a few more prominent figures?

A: The course of translating Buddhist scriptures into Chinese lasted 10 centuries (from the 2nd to the 11th century), and resulted in over 1,690 texts of Tripiṭaka being translated, totaling more than 6,420 volumes, with no less than 200 famous Chinese and foreign translators involved. In addition to the above-mentioned characters, well-known are Dharmarakṣa, Buddhabhadra, Bodhiruci of India, Jñānagupta and Dānapāla of Pakistan, Paññā of Afghanistan, Mandra and Saṅghapāla of Cambodia, as well as Tripiṭakācārya, Amoghavajra from Sri Lanka, who propagated Tantric Buddhism. Through the persevering, industrious efforts of so many people, the Buddhist theories of the Sāvakayāna, Dhammatā, Lakṣaṇa, Exoteric and Esoteric Schools were introduced into China, thereby forming the enormous treasures of Chinese Buddhism. In 1954, Mao Dun, Chairman of the Chinese Writers' Association, in his address to the All-China Conference of Literary Translation Workers, said, "The translation work of our country has a long history and a glorious heritage. The conscientious scientific approach of translation created by our predecessors in translating the Buddhist scriptures and their outstanding achievements are worthy of our pride and should be acknowledged as our models." Undoubtedly, the translation work of ancient China created a great spiritual heritage in the magnificent culture of the Chinese people which is beyond compare in the whole world. It is one of the splendid cultural traditions of which we are proud.

However, one very important aspect, which is often neglected and must not go unnoticed, is that China has been a multi-national community from ancient times, and each nationality has made significant and remarkable contributions to the creation of the culture of the nation as a whole, particularly in the sphere of Buddhism. During the period of the Tibetan kingdom, thanks to King Sroṅ-bstan-sgam-po's marriage with the two Princesses, Wen

Cheng and Jin Cheng of Tang, the culture of the great Tang Dynasty and the Buddhist faith were introduced into Tibet, and Tibetan writing, in use to this day, was created. During the reign of Khri-sroṅ Ide-btsan, the most eminent exoteric scholars Śāntarakṣita and Kamalaśīla, and Tantric master Padma saṃbhava and others were invited to Tibet from India to build monasteries, establish the Saṅgha Order, and make systematic translations. At the same time, monks of the Han nationality were invited from Sha Zhou of the Tang Dynasty to teach Zen Buddhism and the sūtras. During the reign of Khri-Ral Pa-can (815-836 AD), a number of Indian high priests (Bhadantas) were invited to standardize the nomenclature, revise the old translations and add new ones of sūtras and śāstras, with the help of Tibetan scholars. After the 10th century there was another period of Buddhist promulgation in Tibet. Great monks came and went in succession propagating or seeking Dhamma between India and Tibet. This continued for 3 or 4 centuries until the year 1203 AD when the Vikramasīlavihāra and all other large monasteries in India were destroyed by invading troops.

Take, for example, an outstanding monk among them, Ven. Ārya Atīśa (982-1053 AD). Born in Bengal, he was a master with the highest learning and moral integrity in India at that time. He went to Tibet in 1042 AD on invitation and founded the Bkah-gdam-pa Sect. His doctrine was later carried on by Master Tsoṅ-kha-pa(1357-1419AD) who founded the Dge-lugs-pa Sect (or the Yellow Sect), which spread over wide areas inhabited by Tibetans, Hans and Mongolians. Then there was Mar-pa of Tibet, who went to India three times to study the Buddha Dhamma and founded the Bkah-brgyud-pa Sect (or White Sect), which ruled Tibet for a long time during the Ming Dynasty. The world-famous Tibetan sage Mi-la Ras-pa was the second patriarch of this Sect. Other Bhadantas engaged in translating the scriptures and preaching the Buddha Dhamma are too numerous to mention. In the 500 years from mid-8th to mid-13th century, the Tripiṭaka scriptures translated into Tibetan, which are collected in Bkah-hgyur and Bstan-hgyur,

number more than 5,900 texts, consisting of approximately 3,000,000 lines, roughly equivalent to 10,000 volumes in the Chinese version. Since there are very few duplicate translations of the same text in Tibetan Tripiṭaka, the total contents must be far more than that in Chinese version. In particular, the śāstras of Suññatāvāda and Bhavavāda as well as books on Hetu-vidyā (logic), Cikitsā-vidyā (medicine) and Śabda-vidyā (linguistics), and Esoteric sūtras and śāstras which were popular in the late period of Indian Buddhism, are numerous in Tibetan but absent from the Chinese Tripiṭaka. Because it takes into account the inflectional endings and syntactic structures of Sanskrit grammar, the Tibetan version is easier to convert back into the original Sanskrit version. Therefore, contemporary Buddhist scholars attach great importance to Tibetan translations.

In addition, the translation of Tripiṭaka into the Manchurian language was carried out in the Qing Dynasty. In modern times, remnants of the Tripiṭaka in the Xixia language and in the ancient Uighur language have been discovered. Furthermore, the culture of the Dai nationality of China was not known to the outside world for a long time, not until after liberation was Dai found to have a very rich literature of its own, including the Dai translation of the Pāli Tripiṭaka of the Southern tradition. Thus it can be seen that the Tripiṭakas in the various minority languages in China are very lofty monuments in the cultural history of mankind, presenting the wisdom and toil of people of generations, embodying the perseverance and grandeur of our nation. This is an invaluable spiritual treasure worth our pride. Now, China has decided to collate and republish the Tripiṭaka as one of the important projects in re-editing the classical works. This is an event worth celebrating, not only by Chinese Buddhists, but also in the international cultural and academic circles, which have been eagerly awaiting the event for so long.

(II) The Emergence of Various Buddhist Schools

²⁰Q: Over the long course of propagation of Buddhism after its introduction into China, what developments and transformations have taken place? And what academic achievements have been made?

A: With the introduction of numerous canonical works into China, the doctrines of various schools of Indian Buddhism came into contact with the national culture of China, and after a long period of assimilation and digestion, gave rise to creative development. In the Sui and Tang Dynasties from the end of the 6th century to the mid-9th century, Chinese Buddhism underwent a period of florescence in which new developments took place in doctrine and theory and various schools emerged one after another, displaying a spectacle of a hundred flowers in blossoming.

²¹Q: How many schools or sects are there in Chinese Buddhism? Could you give a brief description?

A: In the past many schools existed within Chinese Buddhism. Nowadays there are 8 main schools:

(1) the Three Śāstras School (Mādhyamika School), also called the Dhamma Pakati School,

(2) the Yogācāra School or the Dhamma Lakkhaṇa School,

(3) the Tiantai School,

(4) the Xian Shou (or Hua Yan) School, the Avataṃsaka School,

(5) the Chan School (the Zen or Dhyāna School),

(6) the Pure Land School (the Sukhāvatīvyūha School),

(7) the Disciplinary School (the Vinaya School), and

(8) the Esoteric School (the Tantra School), also called the Mantrayāna School.

These eight major schools are commonly referred to in Chinese as: Xing, Xiang, Tai, Xian, Chan, Jing, Lü and Mi.

²²Q: Would you briefly describe what major distinctive theories each of them upholds? May the first question be why the Three Śāstras School is so named? What are its main doctrines?

A: This school was formed primarily on the basis of studying and transmitting the *Mūlamadhyamaka-kārikā*, the *Śata-śāstra*, and the *Dvādaśamukha-śāstra* translated by Kumārajīva. Because its basis is the Three Treatises (śāstras) of the Mādhyamika Sect, it is called the Three Śāstras School. The general principle of its doctrines is the double truth—the Ultimate Truth (P. Paramattha-sacca, S. Paramārtha-satya) and the Conventional Truth (P. Sammuti-sacca, S. Saṃvṛti-satya). The ultimate end is to perceive the reality of the Middle Path (P. Majjhima-paṭipadā, S. Madhyamā-pratipad).

²³Q: What is meant by the two truths—Ultimate Truth and Conventional Truth? What is the reality of the Middle Path?
